Unguentum Hamamelidis (B.P.C.). Contains 10% of the liquid extract. It is largely employed for piles. It may be filled into hollow suppositories. A combination [D·P1·81] with cocaine 2% is useful.

[P1] **Hæmorrhæline (Hewlett, London).** An ointment for hæmorrhoids containing lead acetate, witch hazel, morphine and lanolin.

Ficaria (B.P.C.). *Syn.* PILEWORT, LESSER CELANDINE. The fresh herb *Ranunculus Ficaria* (Ranunculaceæ). An old remedy for hæmorrhoids.

Unguentum Ficarise (B.P.C.) is prepared by digesting the herb in benzoated lard. Suppositories are also prepared from a mass made by melting together 4 parts of ointment and 1 part of spermaceti.

Lawsonia (B.P.C.). *Syn.* HENNA. The powdered leaf of *L. alba* (Lythraceæ). It is employed as a hair dye. In some cases cupric chloride and pyrogallol are used in conjunction with henna, and again borax is occasionally used as an adjuvant, the idea being no doubt that the pyrogallol oxidises more readily in alkaline solution. The quantities relative to the henna in such cases are exceedingly small.

Sambucus (B.P.C., Fr. Cx., P. Helv. V, P. Dan.). *Syn.* ELDER FLOWERS. The fresh or dried corollas and stamens of *S. nigra* (Caprifoliaceæ). An infusion is a domestic remedy for bruises, etc., also a pomade prepared by digesting the flowers in melted lard.

Sambuci Folium was formerly used for the preparation of *Unguentum Sambuci Viride* by digestion in lard and also of *Oleum Sambuci Viride* by digesting 1 of bruised fresh leaves in 3 of linseed oil.

Aqua Sambuci (B.P.C.). Triple elder-flower water diluted, immediately before use, with twice its volume of distilled water.

Aqua Sambuci Triplex (B.P.C.). The undiluted elder-flower water of commerce consisting of a saturated solution of the oil.

Unguentum Sambuci (B.P.C.). Triple elder-flower water 20% in simple ointment, coloured with chlorophyll.

HEPAR

(LIVER EXTRACTS, AND STOMACH PRODUCTS.)

The use of liver in the treatment of pernicious anæmia was founded on the observation (Whipple and co-workers, *Amer. J. Physiol.*, 1920, 53, 36) that the administration of liver to dogs which had been subjected to a hæmorrhage markedly accelerated the regeneration of blood. Successful experiments on human subjects with pernicious anæmia were described first by Minot and Murphy (*J. Amer. med. Ass.*, ii/1926, 470). The diet advocated included about $\frac{1}{2}$ lb. of cooked liver daily and was rich in proteins, iron, vegetables and fruit, and poor in fat. These results were confirmed and extended by Minot and Murphy (*Brit. med. J.*, ii/1927, 674), and others. The liver may be given either cooked

or raw. In the former case it may be cooked by any convenient method, but must not be subjected to prolonged boiling. Raw liver may be cut up into pieces and taken in cachets.

Following confirmation of the value of liver in the treatment of pernicious anæmia attempts were made to produce active extracts so as to avoid the difficulty of taking the large quantity necessary and also the tendency to produce nausea. Beginning with the work of Cohn (*J. Biol. Chem.*, 1927, 74, 69), who prepared an active extract known as "Fraction G," successive investigations have resulted in the production of extracts of increasing potencies.

For further details of early work on liver treatment see G. R. Minot's Nobel Lecture, "The Development of Liver Therapy in Pernicious Anæmia," *Lancet*, i/1935, 361.

Extractum Hepatis Siccum (B.P.).

Dose.—The quantity equivalent to about $\frac{1}{2}$ lb. (225 g.) of fresh liver.

It is difficult, if not criminal, to lay down any hard-and-fast rules concerning dosage. Response in different people is extremely variable. Orally, some patients require extract made from 3 lbs. of liver a day while others respond satisfactorily to a similar extract from $\frac{1}{2}$ lb. of liver and there is the same variability in response to parenteral administration. Moreover, extracts vary enormously in potency—even with two batches of extract prepared by the same process one may be active and the other not, and an extract made from 6 g. of liver may be more potent than one made from 100 g.—Janet Vaughan, *Lancet*, ii/1933, 64.

A selected fraction of an alcoholic extract of ox or sheep liver containing the specific principle active in pernicious anæmia. It contains not less than one-eleventh its weight of sodium chloride and occurs as a light brown hygroscopic powder with a meat-like odour and taste. A method of preparation, originally published by the Medical Research Council, is described in the B.P. See also J. B. Collip, *Canad. med. Ass. J.*, i/1928, 392.

In order to free liver extract of impurities, a paste of the water-soluble constituents of liver is mixed with 60 to 80% alcohol and cooled to not over -15°F. , at which temperature it is maintained sufficiently long to ensure complete precipitation of substances insoluble at this temperature. The precipitate is then separated from the alcoholic solution.—H. L. Keil, per *J. Amer. pharm. Ass., pharm. Abstr.*, 1939, 345.

Home-made Liver Extract. Extract 10 oz. of minced beef liver with cold water. Precipitate inert proteins by boiling and strain off. The clear yellow liquid obtained equals in activity the original amount of liver when ingested. Volume of liquid should be about 18 oz.—*Pharm. J.*, ii/1931, 50.

Uses. The administration of liver or of liver extract to pernicious anæmia patients produces a rise in the red blood cell count and a slower improvement in spinal cord symptoms. The furred tongue and diarrhoea disappear, but gastric acidity does not return and the administration of hydrochloric acid should be continued. The general health and strength of the patient return to normal except for severe cord symptoms. The reticulocytes, which are usually less than 2% before treatment, show an increase by the fourth day after commencing liver therapy and reach a peak between the seventh and tenth days; the height of the peak is inversely proportional to the initial red cell count. From an initial red cell count of 1 million a reticulocyte peak of 40% may

follow; from 2 million red cells the peak may be 20%, but initial red cell counts of over $3\frac{1}{2}$ million do not show any rise in reticulocytes. Within 3 weeks after the commencement of the treatment the reticulocyte count falls to normal level. A rise in hæmoglobin and red blood cell count usually occurs shortly after the reticulocyte peak and approximately normal values are obtained in 1 to 2 months.

Rest in bed is essential in all cases until the red cell count has reached 4 millions and the hæmoglobin 60 to 70%.

It is important to observe that liver therapy is of no value in hypochromic anæmias, chlorosis, and anæmias due to chronic hæmorrhage, all of which respond best to iron therapy.

Classification of the anæmias. So far, two prominent classifications have been offered. The first is that suggested by Janet Vaughan, who states that there are three essentially different mechanisms to which anæmia may be due. These are: (1) failure or abnormality in blood production (dys hæmopoietic anæmias); (2) abnormal loss of blood (post-hæmorrhagic anæmias); (3) excessive destruction of blood (hæmolytic anæmias). The second is that of Ottenburg, who divides anæmias into three ætiological groups: (1) deficiencies; (2) injury to blood-forming organs; (3) disintegration of blood. Another suggested classification groups the anæmias in terms of the erythrocytes and the hæmoglobin content: (1) hyperchromic macrocytic anæmias (pernicious anæmia and its allies); (2) normocytic anæmias (due to excessive hæmorrhage); (3) hypochromic microcytic anæmias (covering conditions of chronic hæmorrhage as well as chlorosis and nutritional forms).—*Prescriber*, 1939, 46.

Extractum Hepatis (U.S.P. XI). The dried soluble fraction of mammalian livers. It must be approved by the U.S.P. Anti-anæmia Preparations Advisory Board; clinical data must be supplied of cases of treatment of Addisonian pernicious anæmia and this data must show satisfactory results when the preparation was given in the dose stated on the label.

Extractum Hepatis Liquidum (B.P.).

Dose.—1 fl. oz. (30 ml.), equivalent to about $\frac{1}{2}$ lb. (225 g.) of fresh liver.

The extract obtained as described for Ext. Hepatis Siccum in the B.P. is dissolved in a menstruum such that the product contains per litre the equivalent of 8000 g. of the original liver, not less than 10% *v/v* of alcohol 95% and not less than 20% *v/v* of glycerin.

Liquor Hepatis (U.S.P. XI).

Like the dry extract, it must be approved by the U.S.P. Anti-anæmia Preparations Advisory Board.

Fish Liver Extract. An extract made from whiting, haddock and cod livers has been shown to be of remarkable potency in the treatment of pernicious anæmia, the red cell count and hæmoglobin percentage being doubled or trebled within a few days. Whiting-liver extract is more pleasant to take than that from haddock or cod, and is similar to but nicer than mammalian liver extract. The daily dose during the acute stage is the extract of 1000 g. of raw fish liver (= 500 g. of liver tissue).—L. S. P. Davidson, *Brit. med. J.*, ii/1932, 347.

Standardisation of Liver and Stomach Preparations for use in the Treatment of Pernicious Anæmia.

A U.S.P. unit is the minimum amount, which, when given daily to a suitable patient with pernicious anæmia in relapse, will cause an adequate hæmatopoietic response. Inasmuch as material derived from about thirty times as much liver must be given by mouth to produce the same response as when given by injection, it has been necessary to define the "unit" either as an oral unit or as an "injectable" unit. For the purpose of standardisation the material is given daily with proper hæmatopoietic checks to at least three patients whose red blood cell counts are taken before treatment, on the day treatment is started and on the

seventh and fourteenth day of treatment. The ideal test patient should have a red blood cell count between 1 and 2.5 million per cu.mm., and should not have received antianæmic medication or blood transfusion during the previous month. Infection, marked neurological involvement, extensive arteriosclerosis, severe diarrhoea, vomiting or marked gastro-intestinal complications are factors which must be taken into account in evaluating the response. During the complete period of the "reticulocyte response" daily reticulocyte counts are made. These data are submitted to the Anti-anæmia Preparations Advisory Board of the U.S.P., which evaluates them and assigns unitage. In assigning unitage the following points are also considered:—(1) The character and degree of the reticulocyte response; (2) the rate of increase of red blood cells; (3) clinical factors modifying these responses; (4) efficiency of the method of manufacture in preserving the potency of the product; (5) the following figures:—

Initial Red Blood Cell Count (Millions per Cu.Mm.)	Peak of Reticulocyte Curve (per cent.)
1.0	41.8
1.5	28.4
2.0	18.6
2.5	11.1
3.0	5.1

These figures are not to be considered as "standards" inasmuch as modifying factors, in each individual patient, may change the interpretation of the type and degree of the response.—N.N.R., 1940, 320. See also G. R. Minot and W. B. Castle, *Lancet*, ii/1935, 319.

Liver Extracts for Parenteral Administration. In a small percentage of cases oral administration of liver or of extracts of liver fails to produce a reticulocyte response, possibly due to the wall of the intestine being abnormally impermeable to the active principle. Attempts were therefore made to administer liver extracts by injection. The early extracts were unsuitable for administration in this way owing to the presence of too much protein and of a principle which caused a fall in blood-pressure and which it was not found possible to remove to a sufficient extent. In 1931, W. B. Castle and F. H. L. Taylor (*J. Amer. med. Ass.*, i/1931, 1198; *Lancet*, i/1931, 857) further purified Cohn's Fraction G (p. 567), obtaining a preparation active when given intravenously. To avoid the objections to intravenous administration, a further preparation was obtained (M. B. Strauss, F. H. L. Taylor and W. B. Castle, *J. Amer. med. Ass.*, ii/1931, 313) of which 2 ml., equivalent to 10 g. of liver, was given daily by intramuscular injection. In general, extracts for parenteral administration are prepared from an aqueous extract of fresh minced liver by precipitation of proteins and other extraneous matter by means of heat and fractional precipitation with alcohol. Finally the active fraction is precipitated by alcohol 95% and may be dissolved in water and the solution sterilised, an antiseptic being usually added.

Liquor Hepatis Purificatus (U.S.P. XI) is the liquid extract or solution prepared for injection; it must be sterile and may contain not more than 0.5% of cresol or phenol.

There is no doubt at all that for the treatment of pernicious anaemia the use of fresh liver or oral liver extracts does not give as good results as stomach preparations or parenteral liver extracts. Extracts for intravenous injection should only be used which have been guaranteed by the manufacturers to have been clinically tested and found active in the treatment of pernicious anaemia.—J. F. Wilkinson, *Fractitioner*, ii/1933, 412.

It is possible to state without hesitation that intramuscular treatment (as opposed to oral treatment) given at intervals of 2 or 3 weeks, is the cheapest and best method for maintaining a normal blood level in pernicious anæmia.—S. Davidson, *Med. Annu.*, 1935, 19.

Suggested treatment for an average case. In cases with a red blood cell count of 1,500,000 to 2,200,000 per cu. mm., and a hæmoglobin content of 30 to 45%, commence treatment by an intramuscular injection of 5 ml. and repeat this dose on the next day; then, on alternate days give 5, 5, 2, 2, 2, 2 ml. intramuscularly up to the end of the first fortnight. If there is a good reticulocyte response and the red cells show a satisfactory rise continue with one or two injections a week of 5 ml. intramuscularly until the blood count is normal. This treatment may be combined with the oral administration of liver, liver extract, or stomach extract, when the doses given intramuscularly may be reduced proportionately.

In very severe cases with collapse, and with a red blood cell count of 900,000 per cu. mm. and hæmoglobin content of 18%, an injection of a potent liver extract is given, preferably by intravenous injection, or 6 to 10 ml. intramuscularly. If this fails to bring about a reticulocyte response within 48 hours and shock is considered to be threatening life a blood transfusion must be given, and following this intramuscular injections of 5 ml. of liver extract daily until a satisfactory response to treatment results.

No case should be regarded as satisfactory unless the red cell count can be maintained at 5 million and the hæmoglobin at 90%. Stomach extract is the best oral preparation for maintenance purposes (from 4 to 5 oz. weekly); alternatively, from 5 to 10 ml. of liver extract intramuscularly (2 ml. = 1 lb. of liver) on two consecutive days from eight to twelve times a year.—Whitla, 8th Edn., 1938.

The dosage of injectable liver extracts should be thought of in terms of raw liver orally. The injectable preparation is 20 to 40 times more effective than the oral, hence 1 ml. of extract derived from 5 g. of raw liver actually represents 100 to 200 g. of raw liver. It is a safer plan to use a ratio of 20 in calculating the dosage.—E. A. Sharp, *J. trop. Med. (Hyg.)*, 1936, 53 and 65.

REFERENCES TO THERAPEUTIC USES OF LIVER EXTRACTS, ORAL AND PARENTERAL

For earlier references to treatment of pernicious anæmia with liver see 20th Edn. pp. 951 and 952.

AGRANULOCYTIC ANGINA. Treatment by liver extract orally and parenterally; remissions occurred in five cases.—Foran-Sheaff and Trimmer, *J. Amer. med. Ass.*, i/1933, 1917.

DISSEMINATED SCLEROSIS treated by liver, lightly cooked, $\frac{1}{2}$ lb. daily, with remarkable results. Method evolved in the hope that the nervous system might benefit, on the lines of pernicious anæmia.—A. Goodall and J. K. Slater, *Brit. med. J.*, i/1931, 789.

SPRUE. Intravenous injection of liver extract in doses equivalent to 50 g. of liver daily effective in the treatment of sprue.—Rhoads and Miller, *J. Amer. med. Ass.*, ii/1934, 387.

In London, at least 90% of patients with tropical sprue get completely well on combined liver extract *per os*, $1\frac{1}{2}$ lbs. (700 g.) daily, and graded high protein, low fat, and low carbohydrate diet, in the ratio 1.0 to 0.3 to 1.3, respectively commencing with 500 calories and working up to 3000.—N. Hamilton Fairley, *Proc. Mayo Clin.*, 1936, 190.

SUBACUTE COMBINED DEGENERATION. Complete arrest of the neural lesions occurred in 26 patients with advanced subacute combined degeneration of the spinal cord treated with liver extract by intramuscular injection for a period of thirty-four months (average). By appropriate treatment with parenteral liver extract the spinal cord lesions can be prevented from developing or, if present, may be completely cured.—M. B. Strauss and associates, *J. Amer. med. Ass.*, i/1935, 1587.

The most important point in treating patients with spinal cord involvement is the maintenance of the blood at or above normal level, for even with the red blood counts as high as 4 millions the development of cord lesions has been observed, while with red cells at 5 millions or higher this has not taken place.—B. M. Fried, *J. Amer. med. Ass.*, i/1929, 1260.

The point of view which has been advanced that while nerve lesions may improve, spinal cord lesions do not, is hardly in keeping with the disappearance

of the Babinski reflex and ataxia. The rate of improvement in spinal cord symptoms is inversely proportional to their duration, the outlook for complete recovery being much brighter if symptoms have been present only for a few months; but even those of years' duration may show improvement with prolonged intensive treatment.—R. West, *J. Amer. med. Ass.*, ii/1935, 432.

THROMBOPENIC PURPURA of moderately severe grade with oozing from gums and ecchymoses rapidly yielded to liver treatment.—F. H. Jacob, *Brit. med. J.*, i/1931, 33.

PROPRIETARY LIVER PREPARATIONS

Anabolin Solution (*Endocrines-Spicer, Watford*). Standardised extract of hepatic parenchyma free from protein and histamine, for reducing blood pressure due to toxæmia. 1 ml. reduces the arterial tension of a 10 kg. dog by 12 mm. *Dose*.—1 ml. intramuscularly every day or as found necessary. Also in tablets for oral administration, one tablet being equivalent to 1 ml. of solution. *Dose*.—1 tablet three times daily or as required.

Anti-Menorrhagic Factor Glanules (*Armour, London*). A non-saponifiable fraction of mammalian liver tissue, having the property of checking functional uterine hæmorrhage at any age. *Dose*.—2 capsules, three times a day during menstruation, or 1 capsule three times a day in the inter-menstrual period.

Binsemon Tablets (*Organon Laboratories, London*). A concentrated liver and hog's stomach preparation, tested clinically on cases of pernicious anæmia, in 0.3 g. tablets. Relapsed cases require 8 tablets daily, 4 tablets daily being the average maintenance dose.

Bioglan 'R' (*Bioglan Laboratories, Hertford*). Extract of calf's liver for injection, each 2 ml. ampoule containing the clinical equivalent of 80 g. of fresh liver.

Bioglan 'R' Forte (*Bioglan Laboratories, Hertford*). One 2 ml. ampoule contains 200 mg. of purified liver fraction. If the initial r.b.c. is above 2,000,000 one ampoule should be given at intervals of 3 weeks; if below 2,000,000, treatment should commence with an injection every week for 3 weeks, then every third week.

Campolon (*Bayer Products, London*). Liver extract for intramuscular injection. 2 ml. = 500 g. of liver *per os*. **Campoferron** is a form of Campolon containing 0.1% of iron and 0.003% of copper, suitable for oral administration. *Dose*.—1 to 2 teaspoonfuls three times daily.

Cofron (*Abbott Laboratories, London*). Each capsule represents approximately fresh liver 10 g., iron 7 mg., copper 0.27 mg. *Dose*.—3 to 5 daily. Also supplied as **Cofron Elixir**; average daily dose—6 drachms.

Elixir Feramin (*Duncan, Flockhart, Edinburgh*). Each fl. oz. contains the antanæmic principles of 4 oz. of fresh liver, in combination with vitamin B and iron and ammonium citrate. *Dose*.—2 tablespoonfuls twice daily. In secondary anæmia.

Erythgen Liver Extract (*Carmick, Newark, N.J.; Brooks & Warburton, London*). Each oz. is equivalent to 5 oz. of fresh liver. Also supplied for intramuscular injection (2.5 ml. equivalent to 600 g. of fresh liver).

Examen (*Glaxo Laboratories, London*). Liver extract for injection, containing in 2 ml. 10 to 15 mg. of solids equivalent to 100 g. of liver. *Dose*.—Initially 4 ml., then 2 ml. fortnightly until the blood count is normal. Maintenance dose, 2 ml. every 3 to 5 weeks; by intramuscular injection.

Exhepa (*Bencard, London*). Brand of dried liver extract.

Fercupar (*Richter, London*). Tablets each containing dry extract of liver $2\frac{1}{2}$ gr., ferrous chloride 1 gr., copper sulphate $\frac{1}{2}$ gr. *Dose*.—2 thrice daily.

Ferroglandoid (*Armour, London*). A concentrated fluid extract of liver containing 12 gr. of iron and ammonium citrate in each drachm. *Dose*.—1 to 2 teaspoonfuls three times daily. In pernicious and secondary anæmias and as a general tonic.

Ferroglandoid Glanules (*Armour, London*). 10 m. capsules containing 0.1152 g. of liver concentrate (1:125), 0.2 g. of iron and ammonium citrate, 0.02 g. of vitamin B adsorbate (standardised to contain 300 i.u. per g. of vitamin B), and 75 Sherman-Borquin units per g. of vitamin B₁₂, 0.2064 g. of vegetable oil. *Dose*.—1 to 3 capsules three times daily. In pernicious and secondary anæmias and as a general tonic.

Hæmatinic Compound (*John Wyeth, London*). One "Plastule" contains the equivalent of 210 gr. of fresh liver, with exsiccated ferrous sulphate 10 gr., and dried yeast 3 gr.

Hæmex (*Paines & Byrne, London*). A purified liver fraction solution. *Dose*.—From 2 to 4 ml. weekly by injection. Pernicious anæmia.

Hæmochromin (*G. W. Carnick, Newark, N.J.; Brooks & Warburton, London*). Each tablet contains 2½ grains of liver extract and the equivalent of 2½ grains of ferrous sulphate (U.S.P.). *Dose*.—1 to 2 thrice daily after meals.

Hebula Capsules (*Squibb, New York; Savory & Moore, London*). Contain liver extract from 16 g. of fresh liver, exsiccated ferrous sulphate 2 gr., vitamin B₁ 25 i.u., and vitamin B complex. Secondary anæmia, nutritional anæmia, and general debility.

Hepa Simplex (*Bencard, London*). Liver extract in powder form. Also supplied containing 1% of iron.

Hepamult (*Norgine, London*). Standardised liver extract in palatable granular form (10 g. = 8 oz. of fresh liver). *Dose*.—10 to 20 g. daily. **Ferro-Hepamult** is Hepamult with 1.7 g. of iron in 10 g.

Heparmone (*Lilly, London*). A sterile refined solution prepared from liver for the treatment of eclampsia. *Dose*.—10 ml. or more intramuscularly (or intravenously in emergency).

Hepastab (*Boots, Nottingham*). Liver extract for intramuscular injection. *Dose*.—2 ml. daily for 3 or 4 days; maintenance dose, 2 ml. at intervals of 2 to 6 weeks. **Hepastab No. 2** is a specially purified form. *Dose*.—2 ml. intramuscularly or intravenously.

Hepatex Oral (*Evans, Sons, Lescher & Webb, Liverpool*). A liquid extract. *Dose*.—1 dr. = 2 oz. fresh liver. Also supplied with iron (1 gr. per drachm). **Hepatex P.A.F.** is a purified and potent extract (5 ml. = 100 g. of fresh liver) given intravenously. Practically free from protein and does not affect blood pressure. *Dose*.—5 ml. undiluted injected in 2 to 2½ minutes, either per week or per day, according to severity of case. **Neo-Hepatex** is a potent extract for intramuscular injection. *Dose*.—In mild cases, 1 to 2 ml. on each of 3 successive days, then 2 ml. at 7 to 10 day intervals; in severe cases, 4 ml. [P1-81] **Hepatex Compound Intramuscular** (H.C.I.) contains in 1 ml. Neo-Hepatex 0.8 ml., soluble iron arsenite 0.03 g., strychnine nitrate 0.0005 g., sodium glycerophosphate 0.045 g. *Dose*.—1 to 2 ml. daily.

Hepatex—T (*Tropical*) (*Evans, Sons, Lescher & Webb, Liverpool*). A solution of the principles of mammalian liver including vitamin B₁ and vitamin B₂ complex effective in the treatment of nutritional macrocytic anæmia. Administered by intramuscular injection, the initial dose being 2 ml. and subsequent doses varied as required.

Hepol (*Allen & Hanburys, London*). Concentrated liver extract. Issued in both dry and liquid forms for oral use, and as elixir and capsules; also in ampoules for intramuscular and intravenous injection. **Ana-Hepol** is supplied in 2 ml. ampoules for injection.

Hepovite (*Evans, Sons, Lescher & Webb, Liverpool*). A preparation of Hepatex, with vitamin C, hæmoglobin and iron. *Dose*.—One tablespoonful twice daily. In secondary anæmia, debility and neurasthenia.

Heprona (*Evans, Sons, Lescher & Webb, Liverpool*). Preparation containing "Hepatex" liver extract, iron, sodium glycerophosphate and vitamins B₁, B₂, and C with traces of copper. For use as a tonic in secondary anæmias and convalescence. *Dose*.—2 to 4 drachms once or twice daily; for children, half this quantity.

Ivestron (*Wyleys, Coventry*). Compound liver extract containing the therapeutic principles of fresh liver and yeast, with iron, manganese and red bone marrow. *Dose*.—2 to 4 fl. dr. twice daily.

Jectemia (*Sharp & Dohme, London*). Liquid liver extract for intramuscular injection. 1 ml. contains the antianæmic principle derived from 100 g. of fresh calves' liver. *Dose*.—2 ml. repeated weekly until a normal blood count is attained. Pernicious anæmia.

Lextron (*Lilly, London*). Capsules contain liver-stomach concentrate 7 gr., green iron and ammonium citrate 3 gr. with vitamins B₁ and B₂, 20 Sherman units of each. *Dose*.—3 or more capsules thrice daily (9 capsules produce 75% as much hæmoglobin as 300 g. of fresh liver).

Lirimin (*Sharp & Dohme, London*). Capsules containing concentrated liver extract 0.24 g., exsiccated ferrous sulphate 0.3 g., vitamin B₁ 0.167 mg. (= 55 i.u.), vitamin B₂ 25 microgrammes, together with other natural factors of the vitamin B complex derived from liver. *Dose*.—1 or more capsules three times daily. Pernicious and secondary anæmias.

Livadex (*British Drug Houses, London*). Contains the whole of the hæmopoietic principles of fresh liver and conforms with the specifications for liquid extract of liver B.P., one fluid ounce possessing the antianæmic activity of half a pound of fresh liver.

Liver Extract Fraction A5 (*Sharpe & Dohme, London*). A dry liver extract of which 1 g. = 20 g. of fresh liver. Also available in capsules (0.5 g.) and as a liquid (1 oz. = 8 oz. of fresh liver).

Liveroid (*Oxo, London*). Liquid extract of liver.

Livogen (*British Drug Houses, London*). Liquid liver extract, hæmoglobin and vitamin B. A tonic in all anæmic conditions.

Livron (*Boots, Nottingham*). Compound extract of liver, malt, iron and yeast (1 oz. contains 90 gr. of iron and ammonium citrate). *Dose*.—1 tablespoonful twice daily. In secondary anæmias and as a general tonic.

Neobovinine 20 (*John Wyeth, London*). Organic compound of liver extract and beef blood. 1 fl. oz. contains 128 m. of liver extract and 2½ gr. of iron. *Dose*.—1 tablespoonful four times daily. Reconstructive tonic.

Parenamps (*Paines & Byrne, London*). Liver extract for intramuscular injection, 2 ml. = clinical equivalent of 5000 g. of fresh liver given orally.

Perhepar (*Richter, London*). Liver extract. 1 g. or 10 ml. = 100 g. of fresh liver. Supplied in tablets and ampoules.

Pernæmon Forte (*Organon Laboratories, London*). An aqueous concentrated solution of liver extract. *Dose*.—4 ml. on the first day, repeated in 3 or 4 weeks. By intramuscular injection. Subsequent treatment is varied to suit the patient. **Pernæmon Simplex** is a similar preparation but only one-fifth as potent.

Proethron (*Armour, London*). Sterile isotonic liver extract for intramuscular injection. *Dose*.—2 to 4 ml. as required. 2 ml. given daily for 3 to 4 days will produce maximum reticulocyte response in some cases. If cord lesions are present 4 ml. should be given daily for a protracted period, the dose being gradually reduced to the minimum which will prevent progression of neural symptoms. A monthly depot dosage of 2 to 4 ml. is often adequate.

Proethron Forte (*Armour, London*). A liver extract for intramuscular injection, each ml. representing the antianæmia principle from 100 g. of calf liver. *Dose*.—Initially 2 ml., then repeat every seven days. For maintenance: ½ ml. weekly, or 1 ml. every fortnight.

Reticulogen (*Lilly, London*). Solution of liver extract for injection combined with vitamin B₁. 0.5 ml. contains the therapeutic equivalent of 6½ to 10 lb. of fresh liver and 500 i.u. of vitamin B₁. The hæmopoietic activity is standardised on cases of pernicious anæmia in relapse. Vitamin B₁ is included for its possible effect on the central and peripheral nervous manifestations. *Dose*.—The average initial dosage for cases in relapse is 0.5 ml. on three successive days, followed by 0.5 ml. at intervals of 1 to 2 weeks.

Trephonyl (*Bengué, London*). Fetal liver extract, horse serum and embryonic juice. *Dose*.—10 to 20 ml. daily *per os*. In all types of anæmia and in convalescence.

Xorox (*Napp, London*). Hæmotonic prepared from liver, spleen, stomach and anterior pituitary. *Dose*.—In adults, 2 tablets thrice daily; smaller doses in children. In anæmia and debility and for backward children.

Hæmopoietic Principle in Liver.

The concentration of the active principle was carried a stage further by the work of Dakin and West (*J. biol. Chem.*, 1935, 109, 489). Starting with Cohn's "Fraction G" a yield of 1% of a highly potent product was obtained. The method adopted involved a complex series of precipitations in which, after removal of inert material with calcium acetate in alcoholic solution, the active

principle was precipitated with Reinecke salt (ammonium tetra-thiocyanatodiammino-chromium, $\text{NH}_4[\text{Cr}(\text{NH}_2)_2(\text{SCN})_4]\cdot\text{H}_2\text{O}$), regenerated by means of dimethylaniline and amyl alcohol and further purified by repeated precipitation with ammonium sulphate and magnesium sulphate. To this product the name **Anahæmin** was given. It is a light buff-coloured granular powder, soluble in water and dilute alcohol, but insoluble in dehydrated alcohol and in ether. On hydrolysis it yields an aminohexose and a number of amino-acids. Pyrimidine or purine bases are absent. The substance is slowly decomposed by pepsin and more rapidly by erepsin and alkalis. Pancreatic juice has no effect upon it. 30 mg. on injection gave a perceptible reticulocyte response and 80 mg. gave a maximum response.

More recent work has led to the conclusion that the hæmopoietic principle is a combination of two factors each having a different action. Thus, Wills, Clutterbuck and Evans (*Lancet*, i/1937, 311) reported the isolation of two factors from Campolon (a fractionated liver extract for parenteral use, *q.v.*), one soluble and the other insoluble in ammonium sulphate, the former being effective against the nutritional macrocytic anæmia of monkeys, and the latter, containing the anahæmin, being inactive against this anæmia but curative of pernicious anæmia.

The results in 36 cases of pernicious anæmia indicate that anahæmin is highly active for blood regeneration. Total quantities of 1 to 6 ml. (100 to 600 mg., average amount 359 mg.) administered, usually in divided doses, to 11 cases with initial red blood cell counts below 2 millions per c.mm. were sufficient to cause an average increase of erythrocyte concentration amounting to 2.31 millions in 40 days. Good responses followed the administration of amounts sometimes as small as 10 mg. daily or 100 to 200 mg. as a single dose. For maximal reticulocyte responses and for the production of red blood cells at a maximal rate, larger doses were usually required. There is not sufficient data to assess quantitatively the potency of anahæmin as compared with other liver extracts, but no other liver extract given in the small amounts used in the investigation produced such striking results.—C. C. Ungley, L. S. P. Davidson and E. J. Wayne, *Lancet*, i/1936, 349.

The fractionation of liver extracts containing the anti-pernicious anæmia principle by means of Reinecke acid to yield a more highly potent fraction has been confirmed. Using this method products have been obtained of which 58 mg. produced a maximal reticulocyte response and a rapid remission in a patient with pernicious anæmia. Applying this method to other methods of separation a further increase in hæmopoietic potency has been secured so that as little as 18 mg. of the product has been sufficient to initiate a maximal reticulocyte response and rapid remissions in pernicious anæmia.—J. F. Wilkinson, *Lancet*, i/1936, 354.

Further purification effected by solution in 2½% *v/v* of 95% phenol and fractional precipitation with anhydrous methyl alcohol. The second fraction was obtained as a light buff-coloured powder containing 14.3% of N. By administering the materials to be compared to the same individual in consecutive periods of 10 to 14 days it was found that 2 mg. of the purified fraction was more potent than 5 mg. of the original anahæmin.—C. C. Ungley, *Lancet*, ii/1936, 1513.

Purified liver extracts (anahæmin and Examen), fully active in pernicious anæmia, were found inactive in nutritional macrocytic anæmia of monkeys. Campolon can be fractionated by saturation with ammonium sulphate into insoluble and soluble portions. The insoluble part is also highly potent in untreated pernicious anæmia but inactive in the monkey anæmia, while the soluble part is highly active in both the human and the animal conditions. The monkey anæmia is therefore due, in part at least, to lack of an unidentified

factor, and some cases of pernicious anaemia may also be due to lack of this second factor. This accounts for the occurrence of those cases of pernicious anaemia which do not respond to purified extracts such as anahæmin but readily respond to cruder extracts such as Campolon. The distribution of the new factor in products such as yeast, Marmite, wheat-germ and liver suggests a relationship with the vitamin B complex.—L. Wills *et al.*, *Biochem. J.*, 1937, 2136.

Tropical macrocytic anaemia does not respond to the more highly purified liver extracts, which contain the liver principle curative in pernicious anaemia in relatively pure form. This fact further differentiates this disease from pernicious anaemia and demonstrates the presence of a new hæmopoietic factor in crude liver and autolysed yeast extracts. This factor is almost certainly identical with the one described in the production and cure of the nutritional macrocytic anaemia of monkeys; it is not vitamin B₁, B₆, lactoflavin, or nicotinic acid but has not yet been separated from the yeast-filler's earth filtrate of Edgar and Macrae.—L. Wills and B. D. F. Evans, *Lancet*, ii/1938, 416.

Nutritional macrocytic anaemia responds as readily to highly purified preparations such as anahæmin as it does to the cruder liver preparations.—H. Foy and A. Kondi, *Lancet*, ii/1939, 360.

Anahæmin B.D.H. (*British Drug Houses, London*). The active hæmopoietic principle of liver of Dakin and West. *Dose*.—2 ml. (200 mg.) injected monthly is an adequate dose for average cases, though in severe cases up to 4 ml. may be necessary.

Heparin.

Dose.—75 to 150 mg. (or 1 mg. per kilo bodyweight) intravenously in the form of a 5% saline solution.

Heparin is the anticoagulant substance prepared from liver. It has been obtained in the pure state by the crystallisation of its barium salt, and appears to be a polysulphuric ester of mucoitin, a complex of acetylglucosamine and glucuronic acid. The following formula has been proposed:— $C_{23}H_{29}O_{15}(OSO_3H)_5(COOH)_2(NH\cdot CO\cdot CH_3)_2$. The anticoagulant effect of heparin is expressed in terms of units, of which there are a number of definitions. The Toronto unit is the activity of 0.01 mg. of the crystalline barium salt. The Howell unit is the weight of heparin required to prevent the coagulation of 1 ml. of citrated and recalcified blood plasma for four hours at 37°; the latter unit is about one-fifth of the Toronto unit.

Uses. It is the most active of all anticoagulants, 1 mg. per kilo bodyweight given intravenously raising the coagulation time in man by about 40 minutes. Heparin is chiefly employed in blood transfusion, the solution being injected into the vein of a donor and blood withdrawn 10 minutes later. The coagulability of the donor's blood is reduced but not that of the recipient. Transfusion should be carried out within half an hour of injection. Alternatively heparin may be added to the blood after withdrawal, 20 mg. being sufficient for 500 ml. of blood.

Heparin may also be employed in the treatment of thrombosis and post-operatively for the prevention of thrombosis.

The therapeutic possibilities of heparin.—*Lancet*, i/1938, 677.

In the treatment of patients with heparin it is sometimes desirable to restore the original coagulation-time of the blood, as for instance, when heparin has been given during an operation on blood vessels or when hæmorrhages unexpectedly set in during the course of heparin treatment. For the purpose of neutralising the action of heparin the most effective method is the intravenous injection of protamine sulphate. In general an amount of protamine sulphate

which is 50 to 70% of the amount of heparin given will neutralise it. The protamine employed is a 2% solution of clupein sulphate in dilute hydrochloric acid, pH 2.7, sterilised in an autoclave. The administration of from 50 to 150 mg. of protamine sulphate by this means seems to be practicable. The hæmostatic action of protamine administered in this way against parenchymatous hæmorrhages was much more effective than that of Stypven, but protamine injections in such case must only be used as a last resort.—E. Jorpes *et al.*, *Lancet*, ii/1939, 975.

BLOOD TRANSFUSION. By adding heparin to the blood after withdrawal or by injecting it into the donor before transfusion a sufficient delay in coagulation can be achieved to enable a successful transfusion to be carried out without ill effects on the donor or the recipient. The heparin is injected into the donor, the blood withdrawn after some minutes, collected in an unparaffined syringe or bottle, and injected directly into the patient.—H. Knoll and O. Schürch, *Lancet*, i/1938, 1387.

The use of heparin as an anticoagulant in blood transfusions. It may be used either by heparinising the drawn blood or by heparinising the donor by intravenous injection (1 mg. per kilo bodyweight, or about 1.5 ml. of a 5% solution). None of the 23 donors so treated suffered any ill effects, either immediate or late, and no toxic effects were observed in the patients receiving the heparinised blood.—S. W. Sappington, *J. Amer. med. Ass.*, ii/1939, 22.

THROMBOSIS. In a group of 315 cases treated post-operatively with heparin injections not one case of phlebitis, thrombosis or pulmonary embolism occurred. Seven cases of pulmonary embolism with infarcts arising from thrombophlebitis were also treated and there was rapid clinical improvement within 24 hours. Embolectomy was carried out successfully in four cases of embolism, the injected heparin keeping the vessels clear. The method of administration was by intravenous drip, the injection being given in a superficial vein through an ordinary steel needle left undisturbed for three to eight days. Sufficient heparin was added to the salt solution to increase the clotting time to about 15 minutes. Usually the heparin addition was in the proportion of 10 units to 1 ml. saline, i.e., on an average 25 to 30 drops per minute. The injections were continued until the state of shock had passed and blood pressure and circulation had returned to normal. Heparin should not be employed when active hæmorrhage is present and should as a rule be deferred for 4 to 24 hours after operation. Twenty-eight cases of spontaneous phlebitis responded well to the treatment. In the selection of suitable cases, the blood-clotting time, prothrombin index, platelet count, bleeding time, and ordinary blood analyses must be taken and a family or personal history of embolism should be taken into account.—G. D. W. Murray and C. H. Best, *Ann. Surg.*, 1938, 108, 163.

Thrombosis of central vein of retina successfully treated by heparin intravenously, using a 5% solution of standard potency. Three to four daily doses of heparin of 1.66 mg. per kg. bodyweight were given during a period of about 10 days without any perceptible inconveniences.—N. Holmin and K. G. Floman, *Lancet*, i/1938, 664.

Thrombosis of the posterior-inferior cerebellar artery successfully treated by intravenous injections of 5% solution, with a dose of 150 mg. three times daily.—J. H. Magnusson, *Lancet*, i/1938, 666.

Liquemin (Roche Products, Welwyn Garden City). Solution of heparin containing 4 mg. per ml., corresponding to 2000 anticoagulant units as defined by Reinert and Winterstein. For blood transfusion 0.5 ml. is added to each 100 ml. of blood or 15 to 30 ml. may be injected intravenously into the donor before transfusion. For delaying the blood coagulation rate in other conditions the dose is 5 to 10 ml.

Stomach Tissue.

Acting on the suggestion of Castle (*Proc. R. Soc. Med.*, ii/1929, 58) that the stomach secretes a factor which reacts with meat to give a principle which is effective in pernicious anæmia, a desiccated preparation of whole stomach from the pig, freed from fat, of which 30 g. was equivalent to 218 g. of fresh stomach, was tested clinically by Sturgis and Isaacs (*J. Amer. med. Ass.*, ii/1929, 747) and found effective in doses of 15 to 30 g. daily, the activity being

equivalent to that of an active liver extract representing 300 to 600 g. of fresh liver.

Ventriculus Desiccatus (B.P.C.). *Syn. and Prop. Names.* DESICCATED STOMACH, ERYTHROID (Oxo, London), EUGASTROL (Allen & Hanburys, London), EXTOMAK (Benger's Food, Manchester), GASTER SICCATA (British Drug Houses, London), GASTREXO (Evans, Sons, Lescher & Webb, Liverpool), KYTOGEN (Oppenheimer, London), PEPSAC (Boots, Nottingham), VENTRÆMON (Organon Laboratories, London), VENTRICULIN (Parke, Davis, London).

Dose.— $\frac{1}{4}$ to 1 oz. (8 to 30 g.).

The fresh whole stomach of the pig, freed from extraneous fat, dried below 40° and ground; the dried material is defatted, dried without heat and ground to a coarse powder. Desiccated stomach should not be heated before administration to the patient.

The initial dose of desiccated stomach should not be less than 1 oz. and this dose should be maintained till the blood count has returned to normal or till the nervous symptoms have gone, when it may be reduced gradually, but it is wise to maintain a small regular dose indefinitely.

PERNICIOUS ANÆMIA. Desiccated hog stomach (30 g. = 190 g. of fresh tissue) and hog stomach defatted with petroleum benzine (30 g. = 218 g. fresh tissue) produce satisfactory remission. 15 to 30 g. equal in effect to 300 to 600 g. fresh liver.—E. A. Sharpe, *J. Amer. med. Ass.*, ii/1929, 749.

Undoubtedly better than liver. Erythrocytes and hæmoglobin increased 157% and 94% respectively, compared with 90% and 77% respectively with liver. Hydrochloric acid and pepsin do not appear to be necessary for relief of symptoms.—J. F. Wilkinson, *Brit. med. J.*, i/1931, 85. See also C. S. Don and C. E. Jenkins, *ibid.*, 158.

A highly potent extract is obtained by incubating Cohn's "Fraction G" with stomach tissue. 6 g. daily is a sufficient dose.—G. B. Walden and G. H. A. Clowes, *Proc. Soc. exp. Biol., N.Y.*, i/1932, 873.

Only tissue from the pyloric end of the stomach is effective.—E. Meulengracht, *Proc. R. Soc. Med.*, i/1935, 841.

The development of remedies for the treatment of pernicious anæmia—general discussion with bibliography.—W. B. Castle, *Amer. J. Pharm.*, 1936, 55.

PELLAGRA treated with desiccated stomach tissues.—T. D. Spies, *J. Amer. med. Ass.*, i/1935, 1377.

Extralín (Lilly, London). Liver extract which has been incubated with stomach tissue; capsules contain 0.5 g. Maintenance dose in pernicious anæmia, 3 or 4 capsules thrice daily.

Gastrocic Leo (Bencard, London). Desiccated hog's stomach issued in packets containing 10 g. = 100 g. of fresh stomach tissue.

Hogastrin (Giles, Schacht, Bristol). A liquid extract of hog stomach.

Dose.—1 to 2 dr.

Hoggex (Paines & Byrnie, London). Concentrated preparations of hog stomach. Available in powder, capsules and solution. *Dose* (of powder).— $\frac{1}{4}$ to 1 oz. daily up to 2 oz. in subacute combined degeneration. Maintenance dose, about 5 g. daily. Capsules (5 g.) and solution 1 oz. are each equivalent to 80 g. of fresh stomach.

Neo-Pepsac (Boots, Nottingham). Concentrated fraction of hog's stomach. *Dose.*—One or more cachets daily. In pernicious anæmia.

Perstomin (Richter, London). Concentrated hog's stomach extract. 1 part = 24 parts of fresh substance. *Dose.*—1 teaspoonful five times daily or 1 injection of 1 ml. subcutaneously or intramuscularly daily.

Ventron (Parke, Davis, London). Each capsule represents 15 gr. of Ventriculin, 2 gr. of iron and sodium citrate, 20 i.u. of vitamin B₁ and 5 Sherman units of vitamin B₂.

The Hæmopoietic Factor in Desiccated Stomach.

Castle (*Amer. J. med. Sci.*, ii/1929, 748; *ibid.*, ii/1930, 305; *Lancet*, i/1930, 1062) showed that gastric digestion liberates anti-anæmic principles from certain foodstuffs which before digestion have no anti-anæmic properties. He regards the anti-anæmic principle as something derived from the interaction of an intrinsic factor contained in gastric juice and an extrinsic factor contained in certain foods, the product being stored in the liver. The intrinsic factor, lack of which causes Addison's anæmia, is thermostable, being completely inactivated at 70°.

The view has been advanced that the extrinsic factor might be vitamin B₁₂—but this is now considered unlikely since several workers have failed to produce improvement in pernicious anæmia patients by administering gastric juice with various sources of vitamin B₁₂. It is probable that in those anæmias cured by suitable diets, the intrinsic factor is produced by the stomach, but the extrinsic factor is missing from the food, whereas in typical pernicious anæmia it is the intrinsic factor which is absent.

Pepsin is antagonistic to the anti-pernicious anæmia factor in stomach (Castle's "intrinsic factor"). His basic experiments may be explained by a mechanism which excludes the action of the so-called extrinsic factor. This is based on the demonstrated antagonism of pepsin towards the anti-pernicious anæmia factor and also on the known adsorptive capacity of protein for pepsin.—E. A. Greenspon, *J. Amer. med. Ass.*, i/1936, 270.

The above conclusions are criticised on the basis of experimental data obtained in 14 cases of pernicious anæmia. None of the findings in this investigation was incompatible with Castle's basic hypothesis.—C. C. Ungley and R. Moffett, *Lancet*, i/1936, 1233.

Hæmopoietin, the active principle in hog stomach, is much more stable than, and has different properties from, the active antianæmic principle in liver. Evidence indicates that it is of an enzyme nature and it is extremely sensitive towards heat and chemical treatment. It is present in the normal stomachs of man, carnivorous animals and omnivorous animals, but not in herbivorous animals. It is considered that the enzyme, hæmopoietin, by acting on some substance present in protein food, e.g., beef, may produce *in vivo* a substance which is stored as the active principle found in liver until it is required for red cell formation. The available evidence goes to show that true pernicious anæmia is a type of deficiency disease characterised by the absence from the gastric secretion of a specific enzyme (hæmopoietin), in addition to the pepsin and hydrochloric acid.—J. F. Wilkinson and L. Klein, *Lancet*, ii/1933, 632.

A thermo-stable hæmatopoietically active substance prepared by action of hæmopoietin on beef; similar to anti-anæmic principle of liver.—Klein and Wilkinson, *Biochem. J.*, 1934, 1584.

Addisin. A substance present in the normal gastric juice of man, destroyed by boiling, dialysable through collodion and exhaustible: withstands chemical treatment known to destroy enzymes. It has been found in the gastric juice of swine, dogs and cattle, and is believed to be widely distributed in the animal kingdom. One injection of 4 ml. of swine juice concentrated to a volume of 3 to 5%, given intramuscularly in a case of pernicious anæmia, resulted in 4 months in an increase of red blood cells from 1.6 to 4.5 millions, and of hæmoglobin from 50 to 93%. Indications are that addisin is the physiological hormone responsible for the normal state of the blood in health.—R. S. Morris and co-workers, *Brit. med. J.*, ii/1932, 1050.

Duodeni Membranum (B.P.C.). *Syn.* PULVIS DUODENALIS, DUODENAL POWDER. *Dose.*—3 to 10 grains (0.2 to 0.6 g.).

A greyish-brown hygroscopic powder containing one-fifth its weight of calcium phosphate. It is obtained from the upper portion of the duodenum of the pig, the mucous membrane being scraped off, scaled and powdered. It contains secretin, enterokinase, crepsin, invertase, lactase and maltase. Its

therapeutic use is based on the presence of enterokinase which produces trypsin from the trypsinogen of pancreatic juice.

Liquor Duodenalis.

A protein-free solution of the active constituents of duodenal membrane representing 10% of fresh duodenal mucous membrane. The solution is stable only if acid, sterile and stored in the dark. Has been administered by injection as a stimulant to the production of the external secretion of the pancreas, and slightly increases the secretion of bile.

Secretin. Extracted from the duodenal membrane with alcohol, sodium chloride or 0.4% hydrochloric acid, and nearly neutralising whilst boiling to precipitate proteins. The secretin will be left in the filtrate. It is soluble in water and alcohol. Secretin preparations are inactive *per os* since it is destroyed by pepsin and trypsin. Is usually administered as *Liquor Duodenalis*.

Secretogen Elixir (*G. W. Carrick, Newark, N.J.; Brooks & Warburton, London*). A preparation of secretin intended to replace pepsin and acid mixtures as indigestion remedy. It is stated to contain pyloric prosecretin (with $\frac{1}{10}$ % of hydrochloric acid to change it to secretin) and duodenal secretin. *Dose*.—1 to 2 drachms. **Secretogen Tablets** (5 gr.) containing the duodenal and pancreatic secretins are suggested particularly in faulty digestion of starch, with fermentation and flatulence.

Mucin. *Dose*.—5 to 10 grains (0.3 to 0.6 g.).

This is the essential constituent of the secretions of mucous membranes (buccal, nasal, pharyngeal, etc.). It is precipitated from these by alcohol and by acetic acid. The saliva produced by the submaxillary and sublingual glands contains it, but not the parotid. It may be procured from areolar or connective tissue, and from bile.

Taken internally, *e.g.*, in tablets containing mucin 5 gr., with sodium bicarbonate 5 gr., relieves painful digestion and gastritis. Larger doses, *e.g.*, from 2 to 4 g., given at two-hourly intervals, are of value in the treatment of peptic ulcer. In the form of a spray containing mucin 5 gr., sodium bicarbonate 5 gr., menthol 1 gr., lime water $\frac{1}{2}$ oz., distilled water $\frac{1}{2}$ oz., has been found of value in dry catarrhs, rhinitis, etc., pharyngitis, and where incrustations are present on the laryngeal lining.

Superior to all other treatment in many throat and stomach complaints, *e.g.*, gastric ulcer. Powdered hog's stomach possibly only acts by virtue of the mucin contained.—*W. Stuart-Low, Brit. med. J.*, ii/1931, 124.

Results from gastric mucin in doses of from 90 to 100 g. daily indicate considerable promise from this form of therapy. Gastric mucin is a very viscid unpalatable preparation, and the taste is somewhat difficult to disguise.—Preliminary report of Council on Pharmacy and Chemistry, *J. Amer. med. Ass.*, i/1934, 767.

Gastric mucin has been employed in the treatment of peptic ulcers. It probably exerts a protective action by virtue of its viscous nature and of its buffer action. Symptomatic relief reported in from 63 to 93% of cases studied.—*K. A. Martin, J. Amer. med. Ass.*, i/1936, 1468.

The use of four daily doses of gastric mucin, totalling from 4 to 8 g., together with frequent feedings and the frequent administration of antispasmodics has been more successful in reducing the incidence of recurrence in peptic ulcer than any other form of management.—*C. F. G. Brown and R. E. Dolkart J. Amer. med. Ass.*, ii/1939, 276.

Biomucine (*Robert et Carrière, Paris; Anglo-French Drug Co., London*). Natural mucin of the gastric mucosa, free from histamine. Supplied in cachets for treatment of hyperchlorhydria, gastric ulcer or duodenal ulcer.

Enteromucine (*Robert et Carrière, Paris; Anglo-French Drug Co., London*). Natural mucin of the intestinal mucosa, in granules for oral use in constipation; or in powder form for douches (2 teaspoonfuls in 250 ml. of water) in the treatment of recto-colitis, sigmoiditis, etc.

Spleen Substance Desiccated.

Dose.—5 to 10 grains (0.3 to 0.6 g.). 1 part represents 5 of the fresh spleen. Has been used in anæmia, tuberculosis, myxœdema, etc. Value in typhoid and malaria possibly due to splenic hormones.

Extract of pig's spleen stated to give 100% of recoveries in tuberculosis of first degree and 75% in all—several hundred cases treated since 1903. One or two injections of 5 ml. intramuscularly (thigh) or subcutaneously (abdomen) daily for adults. Oral route (in syrup) for prophylaxis, or adjuvant to injections; 4 tablespoonfuls given daily with meals to adults, representing 25 g. spleen tissue. Dose injected, or *per os*, proportionally less for children. Treatment absolutely harmless.—Bayle, *per J. Amer. med. Ass.*, ii/1925, 1434.

Calcium metabolism stimulated by spleen, preparing suitable calcium salts for the blood stream and body cells. Splenic and parathyroid extracts suggested for treatment of pulmonary tuberculosis.—*per Prescriber*, 1926, 227.

Spleen extract is a valuable adjuvant in the treatment of chronic malaria. It increases organic immunity, stimulates the reticulo-endothelial system and phagocytosis, improves the blood condition and general nutrition, and effects a marked reduction in the size of the spleen. It has no direct action on the malaria parasite and none on the fever.—A. Mangiacapra, *per Trop. Dis. Bull.*, 1937, 619.

Splenex (Plasmon, London). A liquid extract of spleen substance (4 oz. = 2½ lbs. raw spleen), sweetened and flavoured. **Dose.**—½ to 1 tablespoonful daily for 3 weeks, with a week's interval between courses.

Splenoxoid (Oxo, London). Liquid extract of spleen. Treatment of tuberculosis of lungs, bones, and joints, and of polycythemia.

Extracts of Muscle and Other Tissues.

Several preparations stated to cause vasodilatation have been suggested for use in the treatment of hypertension, angina pectoris and intermittent claudication. The substances employed for this purpose include extracts from striated muscle, liver, kidney, pancreas and urine. The nature of the active principles in these substances is still a matter of controversy.

According to Frey (1926) there is excreted in the urine a substance which has a pronounced effect on the cardiac rate and amplitude, and on the flow of blood through the coronary vessels. This substance is believed by Frey to be derived from certain tissues, especially the pancreas, and to be a specific "cardiac hormone." It is present in the blood, but in an inactive form which can easily be converted into the active form. It is present in smaller amounts in extracts of other tissues. When the pancreas is removed the amount of cardiac hormone excreted in the urine is reduced to about 20% of the amount normally excreted. Haberlandt in 1924 showed the presence in heart muscle of a substance which had a stimulating effect on the heart beat, and Schwartzman showed that extracts of skeletal muscle have a similar effect.

Extract of heart muscle in angina pectoris and intermittent claudication.—M. S. Schwartzman, *Brit. med. J.*, i/1930, 855; *ibid.*, i/1931, 493.

Intermittent claudication well treated by Lacarnol and Padutin.—M. Newman, *Brit. med. J.*, i/1933, 611. *See also Brit. med. J. Epit.*, i/1931, 82.

All have essentially similar action; none can replace digitalis in myocardial weakness or cardiac irregularity. Use not entirely without risk and caution necessary. Precise use and limitations still to be determined.—*Lancet*, ii/1931, 28.

Frey's hormone injected into the jugular vein produces a sharp fall in systemic blood volume. At the same time it increases the relative coronary outflow. The effects of muscle extract are very similar to those of pancreatic tissue extract, but more pronounced.—C. W. Greene, *J. Pharmacol.*, 1936, 57, 98.

[P1-81-84] **Angiolysin** (Coates & Cooper, London). Tablets contain adenosine-phosphoric acid 0.0012 g. and pyrrhodid (amidopyrine-rhodan compound) 0.125 g. In angina pectoris.

Angioxyl (Roussel Laboratories, London). An insulin-free extract of pancreas for treatment of hypertension. In 2 ml. ampoules for intramuscular injection, 1 to 4 times daily; also as a syrup for oral administration.

Cardone (Paines & Byrne, London). Muscle extract from heart and skeletal muscle, and also from the liver and pancreas. *Dose*.—10 to 25 drops on a lump of sugar 1 to 3 times daily before meals, or 1 ml. once or twice daily intramuscularly. Angina pectoris, vascular disease, etc.

Lacarnol (Bayer Products, London). A nucleoside preparation from organic tissues. *Dose*.—10 to 25 drops per os 1 or 3 times daily; 1 ml. once or twice daily subcutaneously or intramuscularly. In angina pectoris and allied vascular diseases when due to arteriospasm.

Manetil (Bayer Products, London). An extract of spinal cord having the property of decreasing the bleeding-time without exerting a specific effect on the rate of coagulation. It is supplied in dry ampoules with ampoules of sterile water, the solution being administered intramuscularly, and is standardised by tests on mice. Of value in all forms of hæmorrhage. *Dose*.—1 to 3 ampoules during 24 hours is usually sufficient; more may safely be given.

Padutin (Bayer Products, London). Preparation of a vasomotor hormone obtained from pancreas. For oral or intramuscular use in angiospasm, Raynaud's disease, and generally for regulating blood pressure.

Vagotonine (Byla, Paris; Anglo-French Drug Co., London). Preparation of a pancreatic hormone available in ampoules (0.02 g.) and tablets (0.025 g.). For arterial hypertension and paroxysmal tachycardia.

HEXAMINA

B.P.

Syn. and Prop. Names. HEXAMETHYLENETETRAMIN (P.G. VI, Fr. Cx.), HEXAMETHYLENAMINA (P. Helv. V, P. Dan., P. Ned. V, P. Jap., F.E. VIII, P. Belg. IV, P. Ital. V), METHENAMINA (U.S.P. XI), UROTROPINE, AMINOFORM, FORMIN, FORMAMINE, URISOL, METRAMINE (Oppenheimer, London), URITONE, VESALVINE (Martindale, London).

The trade-mark "Urotropine," No. 215652, was "avoided" in Gt. Britain by order of the Board of Trade.

Dose.—10 to 30 grains (0.6 to 2 g.) in a large volume of water. Very large doses may be given in conjunction with alkalis when not administered for urinary infections (*vide infra*). U.S.P. XI average dose 5 grains.

P. Ned. V max. single dose 1 g.; max. daily dose 4 g. For children, 3 to 4 grains in water to 5 times during the day.

Intravenously.—75 minims (5 ml.) of 40% solution. Larger doses have been given.

Colourless crystals, sublimable.

Soluble 1 in $1\frac{1}{2}$ of water giving alkaline solution. 1 in 8 of alcohol 90%, 1 in 12 of chloroform; almost insoluble in ether.

It burns with intense heat and without soot. A 5-grain tablet will boil a test tube half-full of water.

DECOMPOSITION ON STERILISATION. 25 and 40% solutions in ampoules were sterilised by tyndallisation at 60°, heating in steam for 30 minutes, and autoclaving at 110° for 15 minutes; other ampoules were unsterilised. After 3 months the free formaldehyde was determined colorimetrically by means of 1% phloroglucin in 33% potassium hydroxide solution; the pH of the solutions was also determined. Unsterilised 25% solutions showed 0.0688% of formaldehyde, with pH 9.50; tyndallised solutions contained 0.0882%, pH 9.81; steam sterilised solutions contained 0.125%, pH 10.12; autoclaved solutions contained 0.115%, pH 10.01. Results with 40% solutions were similar. Additions of gelatin, 1 or 2%, reduced the decomposition due to heat.—G. Toni, per *Quart. J. Pharm.*, 1937, 119.

Antiseptic Powers. Hexamine itself is not antiseptic if the liberation of formaldehyde is prevented by the presence of alkalis, and the antiseptic action is always parallel to the concentration of free formaldehyde. Although the amount of formaldehyde liberated from therapeutic doses of hexamine cannot be sufficient to kill *B. coli*, slow generation by the drug in the presence of an acid inhibits bacterial growth. It is necessary therefore to raise the acid index of the urine within reasonable limits.

Hair, Lepper and Martland found the greatest concentration of H-CHO in the urine, after giving hexamine, was 1 in 20,000, whereas anything less than 1 in 5000 is said not to be bactericidal. They found that only when the pH of the urine had fallen to 4 are effective doses of H-CHO liberated. The urine should be collected under toluene and the pH tested with phenol red.—D. Nabarro, *Brit. med. J.*, ii/1930, 417.

Toxic Effects. Though hexamine itself is non-irritant, large doses, with consequent liberation of comparatively large amounts of formaldehyde, may give rise in susceptible individuals to painful micturition, cystitis and hæmaturia.

Doses of 15 to 30 gr., although official, if given alone or with sodium acid phosphate, are liable to cause hæmorrhagic cystitis.—A. F. Hurst, *Pharm. J.*, ii/1934, 678.

Hæmaturia caused in a case of acute encephalitis due to hexamine in doses of 20 gr. every 6 hours.—Sir Thomas Horder, *Brit. med. J.*, i/1927, 995.

Uses. Hexamine is one of the most effective of the urinary antiseptics, though it has been to some extent superseded during recent years by mandelic acid and sulphanilamide (*q.v.*). Since its antiseptic action is only exerted in an acid urine it is usually administered in conjunction with sodium acid phosphate, which is preferably given in a dose of 1 or 2 g. an hour or so before the hexamine.

Hexamine is of value in the treatment of cystitis, pyelitis, urinary retention, and in the pyuria of tabes dorsalis. It is a valuable drug in chronic cholecystitis and, combined with biliary drainage, it forms the most effective method of treatment in the majority of cases; for this purpose large doses of hexamine are given with simultaneous administration of *alkalis* (*vide infra*).

In a dose of 10 gr. three times daily hexamine has been employed in the treatment of typhoid carriers, on the theory that the bacilli are harboured in the gall-bladder and passed out in the urine.

CHOLECYSTITIS. It has been shown by Knott that bile obtained through a duodenal tube, after the administration of large doses of hexamine, is strongly antiseptic, although alkaline. Formerly the maximum dose of hexamine which could be given with safety was limited by the supposed necessity for keeping the urine acid, but just as efficient an action as a biliary antiseptic can be obtained

when sufficient alkali is given to prevent the formation of formaldehyde. Under such conditions enormous doses of hexamine can be given without causing any bladder irritation. A mixture containing 60 gr. each of sodium bicarbonate and sodium citrate is given after breakfast, after tea and the last thing at night after drinking a glass of milk or water. The reaction of the urine is tested every time it is passed; as soon as it is found to be constantly alkaline, if necessary after the dose of alkalis has been increased, 100 gr. of hexamine is added to the mixture, so that 300 gr. is given daily. The treatment can be continued for six weeks. The hexamine sterilises the bile ducts and gall-bladder, and when combined with non-surgical biliary drainage by means of Epsom salts, it results in the cure of most cases of cholecystitis. This treatment should be given for a week or two before and after operations on the gall-bladder and bile ducts in order to guard against septic complications. In severe infective cholangitis with jaundice, high temperature and rigors, it has appeared to save life.

CHOREA in children well treated intravenously. In one case 18 injections, increasing from 2 to 6 ml. of a 5% solution, were made in 6 weeks. More recently 10% solution has been used with good results.—*Per J. Amer. med. Ass.*, ii/1925, 1098. Seems to give best results by intravenous injection when the chorea is associated with an infection, e.g., encephalitis or polyarthritis.—*De Capua, J. Amer. med. Ass.*, ii/1929, 808.

PYELITIS. In the acute stages of severe pyelitis 5 ml. of 40% solution intravenously once or twice daily till temperature falls exceedingly effective.—*Hamilton Bailey, Practitioner*, i/1933, 346.

Hexamine in well acidified urine cures at least one third of the cases of non-surgical pyelitis and cystitis, but there is no method of determining which case will respond.—*D. R. Mitchell and J. M. Scott, Brit. J. Surg.*, 1933, 225.

PYELITIS OF PREGNANCY. A single injection of 10 fl. of the solution is often sufficient.—*A. Jacobs, Practitioner*, ii/1927, 219.

RETENTION OF URINE has been treated by 5 to 10 ml. of 40% hexamine solution intravenously.

TYPHOID. 20 grains or more 3 times in 24 hours with an equal quantity of sodium citrate and sodium bicarbonate, starting from the beginning of the second week onwards. If cholecystitis appears give 10 20-gr. doses with sufficient alkali in 24 hours and apply Antiphlogistine over gall-bladder region.—*A. E. Gow, Lancet*, i/1930, 96.

Mistura Hexaminæ (U.C.H.). No. 1: Hexamine 10 gr., chloroform water to 1 dr. half an hour before food; No. 2: Sodium acid phosphate 30 gr., chloroform water to 1 dr. half an hour after food.

Tabellæ Hexaminæ (B.P.C.) contain 5 gr. (0.3 g.).

Tabella Hexaminæ Composita (C.X.H.). Hexamine 4 gr., sodium glycocholate 1 gr., sodium taurocholate 1 gr., sodium salicylate 5 gr. *Dose.*—1 or 2 tablets.

Acitetramin (Richter, London). Hexamine acid phosphate. *Dose.*—1 or 2 8-grain tablets 3 times a day. Urinary antiseptic; contraindicated in tuberculous cystitis.

Coerulamin (Richter, London). Hexamine acid phosphate 0.1 g., methylene blue 0.02 g. per tablet. *Dose.*—2 to 3 tablets daily. Also issued in ampoules containing hexamine 32 gr., methylene blue $\frac{1}{2}$ gr. *Dose.*—3 to 6 per week by intravenous injection. For pyelitis, nephritis, gonorrhœa, etc.

Cylotropin (Schering, London). Ampoules of 5 ml. contain 30 gr. of hexamine, 12 gr. of sodium salicylate, and 3 gr. of caffeine sodium salicylate. *Dose.*—5 ml. intravenously or intramuscularly daily or on alternate days. In infective urinary conditions.

Mirion (Schering, London). A preparation of hexamine with organic iodine for injection in ampoules containing 1 and 3 ml. For use in arthritis deformans, surgical tuberculosis, prostatitis, epididymitis, etc.

Solvurate (Richter, London). Granules containing in 5 g.: hexamine 0.4 g., piperazine 0.1 g., lithium carbonate 0.05 g., sodium benzoate 0.05 g. *Dose.*— $\frac{1}{2}$ oz. thrice daily. Pyelitis, renal calculus.

Uraseptine (Rogier, Paris; Anglo-French Drug Co., London). Granules of hexamine and hexamine citrate, with benzoates and diethylenediamine. *Dose.*—3 to 6 teaspoonfuls daily. Urinary antiseptic and in the uric acid diathesis.

Hexamine Benzoate. $(\text{CH}_2)_6\text{N}_4 \cdot \text{C}_6\text{H}_5 \cdot \text{COOH} = 262.2$.

Dose.—5 to 15 grains (0.3 to 1 g.).

Small scaly crystals containing about 53% of the base. Made by combining equivalent quantities and crystallising. Soluble 1 in 50 of water and 1 in $2\frac{1}{2}$ of alcohol 90%.

Uses. A urinary antiseptic.

Cystazol (*Allen & Hanburys, London*). Hexamine sodio-benzoate in 10 gr. tablets. *Dose.*—1 to 3 dissolved in water twice or thrice daily, in bacterial infections of the urinary tract. Also available in effervescent granules.

Uro-Hexoids (*British Drug Houses, London*). Tablets of hexamine and lithium benzoate. *Dose.*—1 or 2 after each meal, taken whole or crushed and dissolved in water. Urinary antiseptic, diuretic and anti-lithic.

Hexamine Camphorate. *Prop. Name.* AMPHOTROPIN (*Bayer Products, London*). $[(\text{CH}_2)_6\text{N}_4]_2 \cdot \text{C}_6\text{H}_{14}(\text{COOH})_2 = 480.4$.

Dose.—8 to 12 grains (0.5 to 0.8 g.). Tablets 8 grains (0.5 g.).

A white crystalline powder made by combining in alcohol, chloroform, etc.

Soluble in water 1 in 10 with acid reaction. Solutions are hydrolysed to a great extent.

Uses. Urinary antiseptic. An alkaline urine is rendered neutral or acid by administration. In chronic cystitis, bacilluria, nephritis.

Amphotropin Solution (*Bayer Products, London*). 40% solution of hexamine camphorate. For intravenous injection in urinary affections.

Hexamine Salicylate. *Syn. and Prop. Name.* VESALVINE "S" (*Martindale, London*), SALURENE. $(\text{CH}_2)_6\text{N}_4 \cdot \text{C}_6\text{H}_4 \cdot \text{OH} \cdot \text{COOH} = 278.2$.

Dose.—5 to 15 grains (0.3 to 1 g.) in water before meals.

Colourless prismatic crystals with agreeable sweetish saline taste, containing approximately 50% of each constituent. Prepared by combining equimolecular proportions.

Soluble 2 in 1 of water and 1 in 2 of alcohol. A saturated aqueous solution will remain clear for months, whilst vigorous rubbing on the sides of the vessel will cause a deposition of salicylic acid crystals.

Incompatible with acids, alkalis, carbonates and salicylates, hence best administered alone. It decomposes on heating in water or alcohol.

Uses. A urinary and intestinal antiseptic in cystitis, bacilluria, gastro-intestinal catarrh, colitis, dysentery, diarrhoea, dyspepsia, and all cases beneficially treated by hexamine. It splits up on passing through the system into its two constituents—the salicylic acid enhancing the effect of the hexamine. It does not irritate the bladder like other antiseptics.

Neohexal (*Riedel-de Haen, Berlin; Endocrines-Spicer, Watford*). Combination of hexamine and sulphosalicylic acid in 0.5 g. tablets. *Dose.*—1 or 2 tablets dissolved in water thrice daily. Affections of the urinary tract.

Hexamine Sodium Acetate.

$(\text{CH}_2)_6\text{N}_4 \cdot 2\text{CH}_3\text{COONa} \cdot 6\text{H}_2\text{O} = 412.3$.

Dose.—30 grains (2 g.). A crystalline salt made by evaporating

solutions of the components in the above proportions. Contains approx. 34% of hexamine. In gonorrhœa and cystitis.

Cystopurin Tablets (*Genatosan, Loughborough*). Contain 1 g. of hexamine sodium acetate.

Hexamine Triborate. *Prop. Name.* BOROVERTIN (*Bayer Products, London*) (*P. Ned. V.*). $(\text{CH}_3)_6\text{N}_4 \cdot 3\text{HBO}_3 = 271.9$.

Dose.—15 to 60 grains (1 to 4 g.) daily.

Crystalline powder containing about 50% of hexamine, made by combination of 1 mol. of hexamine and 3 mols. of boric acid. Soluble in water 1 in 13. Urinary antiseptic, *e.g.*, in gonorrhœal cystitis, pyelitis, renal calculus and tuberculosis of the bladder and kidneys.

Formamol (*B.P.C.*). *Syn. and Prop. Name.* HEXAMINE ANHYDROMETHYLENECITRATE, HELMITOL (*Bayer Products, London*).

Dose.—8 to 15 grains (0.5 to 1 g.). White crystals soluble 1 in 5 of water, sparingly soluble in alcohol. Is similar to hexamine in its action and is used in infections of the genito-urinary tract.

Neotropin (*Schering, London*). Butyloxydiamino-azopyridine. A urinary antiseptic for oral use. *Dose.*—Two dragees (each 0.1 g.) three times a day. Urinary tract infections, cystitis, pyelitis, etc.

Pyridium (*Pyridium Corporation, New York; Menley & James, London*) is phenyl-azo-alpha-diamino-pyridine hydrochloride. A red, microcrystalline powder, slightly soluble in water, readily soluble in hot water. *Dose.*—3 gr. 3 times daily. In hyperacidity dose should be regulated and given immediately after meals. It possesses anti-bacterial action against cocci and *B. coli*, and is eliminated through the genito-urinary tract. Is used in gonorrhœal infections, *B. coli* and mixed infections, pyelitis and cystitis. Also used locally as antiseptic in the form of a 1% solution, or ointment (10%).

Contraindications. Idiosyncrasy towards the compound when given internally is indicated by colic, nausea, headache and vertigo; reduced dosage may, however, establish tolerance, but if not discontinue. Kidney disease is a contraindication, and it should not be given in severe hepatitis, where excretion is slow, nor in uræmia. Use with caution in severe chronic gastro-intestinal disorders. The compound should not be used simultaneously with mercurial irrigations.

HYDRARGYRUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

Hg = 200.61.

[P1] "Mercury, oxides of; nitrates of mercury; mercuric ammonium chlorides; potassio-mercuric iodides; mercuric oxycyanides; mercuric thiocyanate."

[P2] "Mercuric chloride; mercuric iodide; organic compounds of mercury."

[S1] "Mercuric chloride except substances containing less than 1% of mercuric chloride; mercuric iodide except substances containing less than 2% of mercuric iodide; nitrates of mercury except substances containing less than the equivalent of 3%, weight in weight, of mercury (Hg); potassio-mercuric iodides except substances containing less than the equivalent of 1% of mercuric iodide; organic

compounds of mercury except substances containing less than the equivalent of 0.2%, weight in weight, of mercury (Hg)."

[83] "*Mercuric chloride—in batteries.*"

"Mercuric chloride; mercuric iodide; organic compounds of mercury—in dressings on seeds or bulbs."

"Mercury, nitrates of—in ointments containing less than the equivalent of 3%, weight in weight, of mercury (Hg)."

[86] "*Mercury, organic compounds of—specify proportion as the proportion of organically-combined mercury (Hg) contained in the preparation.*"

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.); by intramuscular injection, $\frac{1}{2}$ to 1 grain (0.03 to 0.06 g.).

Mercury has a sp. gr. of about 13.5, a f.p. of -38.8° and a b.p. of about 358° .

Antidotes to Acute Poisoning by Mercurial Salts. Give raw white of egg in water in unlimited quantities, but remove it from the stomach as soon as possible by emetic or stomach tube, as albuminate of mercury formed is soluble in excess of albumin and sodium chloride. It is now stated by many authorities that medicinal charcoal in suspension is much more efficacious than white of egg; it should be given and quickly removed, as above.

Discussed point as to whether to give antidote or emetic first—probably best to give whichever comes first to hand, but it is important to remember that much white of egg may lessen efficacy of emetic.

Keep patient warm; give brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water; alkalising demulcent drinks freely. Saline and 5% dextrose intravenously. Sodium thiosulphate intravenously said to be of doubtful value; sodium formaldehyde sulfoxylate more effective.

Sodium formaldehyde sulfoxylate said to be most efficient chemical antidote for mercuric chloride. Details of 10 cases treated. Suggested technique: gastric lavage with 5% solution, 200 ml. to be left in the stomach; 10 g. in 100 to 200 ml. of water intravenously slowly over 20 to 30 minutes. Later, after 4 or 6 hours, 5 to 10 g. intravenously repeated.—Rosenthal, *J. Amer. med. Ass.*, i/1934, 1277.

Sodium formaldehyde sulfoxylate is a powerful reducing agent more stable in the body than sodium thiosulphate and sodium hydrosulphite. Owing to its low toxicity as much as 10 to 15 g. may be given intravenously in 10% solution, 5 to 10% as gastric lavage, leaving 100 to 200 ml. in the stomach, and a 5% solution by enema. Treatment is repeated in severe, acute cases within 4 to 6 hours, and again in 24 hours. In 1 case reported, treatment consisted of 6 intravenous injections over a period of 4 days. In cases of severe poisoning with mercuric chloride, intravenous injection should be accompanied by oral use and enemas to avoid tissue destruction.—W. E. Robertson and V. L. Tuck, *per J. Amer. pharm. Ass.*, 1935, A-343.

Suggested that 10 ml. of 10% solution of sodium hypophosphite with 5 ml. of hydrogen peroxide in a glass of water, administered by mouth, and used for gastric lavage, is a suitable antidote for mercury poisoning.—J. R. Ross and A. Brown, *Canad. publ. Hlth J.*, 1935, 26, 237.

Immediate gastric lavage important, but subsequently of little effect—first lavage should be thorough. Enemas if diarrhoea is absent. Continuous intravenous drip saline useful, but waterlogging must be avoided.—*Lancet*, i/1936, 617.

Therapeutic effects of gastric lavage, alkalis and intravenous saline described—43 out of 46 cases of mercurial poisoning so treated recovered.—W. B. Porter and C. E. Simons, *Amer. J. med. Sci.*, 1934, 188, 375.

Massive alkalisation has given good results in treatment of acute mercurial poisoning during 8 years of trial.—Nanu-Muschel, V. Ciocalteu and C. Ciocalteu, *J. Prat., Paris*, Apr. 16., 1935.

Treatment of poisoning by mercuric chloride. Gastric lavage with saturated solution and colonic irrigation with 5% solution of sodium bicarbonate, internal administration of it in dosage sufficient to keep urine alkaline to litmus; 500 ml. of 5% solution intravenously after lavage.—*Brit. med. J.*, i/1935, 400G.

Uses. Mercury is used as a purgative, cholagogue and anti-syphilitic.

Emplastrum Hydrargyri (B.P.C.) contains about 33% of mercury. A more satisfactory preparation is produced by omitting the sulphur.

Emplastrum Hydrargyri et Phenolis contains about 20% of mercury and 3 to 5% of phenol in rubber adhesive plaster. The machine-spread plaster is usually made with about 4 ounces of mass per square yard spread on bleached cotton cloth of plain weave.

Hydrargyrum cum Creta (B.P.). *Syn.* GREY POWDER.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Contains 33% of mercury. Liable to oxidise in the air or during storage, but this can be prevented by the presence of certain sugars and the addition of 1% of dextrose has been recommended. A mild purgative, especially for children.

Hydrargyrum cum Creta (U.S.P. XI).

Average dose.—Laxative, 4 grains (0.25 g.). Mercury, honey and a little water shaken together for 10 hours or longer if necessary, chalk made into a paste with water, and the two parts then mixed and dried, first between bibulous paper and then in a dish at ordinary temperature.

Injectio Hydrargyri (B.P.). *Syn.* MERCURIAL CREAM.

Dose.—5 to 10 minims (0.3 to 0.6 ml.) by intramuscular injection. Weekly injections are given into the upper and outer quadrant of the gluteal region.

Contains about 10% w/v of mercury with camphor and creosote in wool fat and olive oil. *B.P. Add. III* allows the use of arachis oil, in place of olive oil, in making injection of mercury.

For combined treatment of syphilis with neoarsphenamine and mercury, *see* p. 231.

Toxic Effects. Malaise, stomatitis, dermatitis, nephritis and, rarely, colitis may occur. Malaise is an indication for a reduction in dosage. Stomatitis is the most common symptom. It may be prevented by oral hygiene and by the use of potassium chlorate lozenges. If necessary, sodium thiosulphate may be injected. Must be given with care to those with kidney disease, owing to the irritant action of mercury.

Cremor Mercurialis (N.H.). Staff Surgeon Adams' Formula.

Dose.—5 minims (= 1 grain of mercury) given once a week. Mercury 20, wool fat 30, chlorbutol 2, all by weight, liquid paraffin to 100 by measure.

Injectio Hydrargyri Fortis (B.P.C.). *Syn.* OLEUM CINE-REUM, GREY OIL.

Dose.—1 to 2 minims (by intramuscular injection). Contains 40% w/v of mercury.

Huile Mercurielle (*Fr. Cx.*). *Syn.* HUILE GRISE, OLEUM CINEREUM. Mercury 40, wool fat 26, Vaseline oil (*Fr. Cx.*) 55, guaiacol 2, camphor 3, all by weight. Measures 100, i.e., 40% *w/v* of mercury. *P. Ned. V* and *P. Belg. IV* are similar but without guaiacol and camphor. *F.E. VIII* is made with chloroform and contains castor oil, with guaiacol and camphor as preservatives.

Suppositories containing the 40% grey oil in various strengths have been used in syphilis. Efficacious, simple and safe.

Lanolinum Hydrargyri.

Mercury 100, lanolin (hydrous) 200, mercurial ointment 5, mutton suet 50. For inunction in syphilis (effect is rapid); used daily 4 to 8 times after a hot bath.

Linimentum Hydrargyri (B.P.C.).

Contains about 30% *w/v* of mercury ointment (equivalent to 9% *w/v* of Hg) with ammonia and liniment of camphor.

Useful stimulant for enlarged joints and glands.

[P2-81] **Massa Hydrargyri (U.S.P. XI).** *Syn.* BLUE MASS, BLUE PILL.

Average dose.—3 grains (0.2 g.).

Mercury 33, mercury oleate 1, liquorice 10, althea 15, glycerin 9, honey 32. Same strength as mercury pill, *B.P.*

Pilula Hydrargyri (B.P.). *Syn.* BLUE PILL.

Dose.—4 to 8 grains (0.25 to 0.5 g.).

Contains 33% *w/w* of mercury.

In raised arterial tension, when indicative of danger, a pill twice or thrice weekly, followed by saline, is beneficial.

In syphilis, begin with 1½ grains after the first and last meals, increasing the daily dose by 1 grain each week till patient is taking 2 grains thrice daily. An average dose is 2 grains twice a day.

In cardiac dropsy it seems to act complementarily to digitalis, and to prove efficient where latter has failed to increase urinary secretion materially. It is to be avoided if renal disease is present. When diuresis is fully established discontinue mercury and give a mixture of caffeine and spirit of nitre with infusion of scopolium.

[P1-81] **Pilulæ Hydrargyri cum Creta et Opii (B.P.C.).** *Syn.* HUTCHINSON'S PILLS.

Dose.—1 pill. Contain 1 gr. of grey powder and 1 gr. of Dover's powder (*exempt* [D]). For syphilis; the opium tends to counteract the irritant action of the mercury.

For a preparation of similar composition also *exempt* [D] see p. 1140.

Pilulæ Hydrargyri cum Rheo (B.P.C.).

Dose.—1 pill. Contain 2½ gr. each of mercury pill and compound rhubarb pill.

Unguentum Hydrargyri (B.P.).

Mercury, 30% *w/w*, in suet and benzoinated lard. *B.P. Add. III* allows the use of sufficient white beeswax, in place of an equal weight of benzoinated lard, to produce an ointment of the required consistence. Principally used for inunction in syphilis; also to relieve local inflammation and to destroy pediculi.

P. Svec. contains Hydrargyrum Extinctum 36 (i.e., mercury "killed" by rubbing with wool fat, and containing 83.5% of Hg), benzoinated lard 44, suet 20, i.e., about 30% mercury.

For the inunction treatment of cerebrospinal syphilis, 5 g. of ointment should be rubbed firmly, but not vigorously, for 20 to 30 minutes on successive nights into alternately the thighs, buttocks, calves, abdomen, back, and chest. Following inunction the area should be covered with a piece of lint and lightly bandaged, the bandage being removed on the following night and applied to the area freshly treated. A bath should be taken once or twice a week and the treatment continued for three or four weeks or longer, care being taken to watch for signs of intolerance.

Pommade Mercurielle Faible (*Fr. Cx.*) contains 12½% of mercury in benzoinated lard.

Pommade Mercurielle à Parties Égales (*Fr. Cx.*). *Syn.* ONGUENT NAPOLITAIN. Mercury 1, benzoinated lard (containing 0.15% of added cholesterol) 1. [P1-81] **Pommade Mercurielle Belladonnée** (*Fr. Cx.*) contains mercury ointment (*Fr. Cx.*) 80, extract of belladonna 10, glycerin 10, by weight.

P2-81 Unguentum Hydrargyri Forte (*U.S.P. XI*). *Syn.* STRONG MERCURIAL OINTMENT.

Mercury 50, oleate of mercury 2, wool fat 30, white wax 5, white petrolatum 13.

Unguentum Hydrargyri Compositum (*B.P.*).

Mercury ointment 10, yellow beeswax 6, olive oil 6, camphor flowers 3. Contains 12% of mercury.

B.P. Add. II allows the use of either arachis, cottonseed or sesame oil in place of olive oil in the preparation of compound mercury ointment.

For enlarged glands, chronic synovitis and syphilitic nodes. Swelling of the ankles is well treated with it. Is usually supplied for Scott's Dressing.

Unguentum Mercuriale (*B.P.C.*). *Syn.* ONGUENTUM HYDRARGYRI MITE, BLUE OINTMENT, TROOPER'S OINTMENT. A dilution of ointment of mercury 33½% with lard. Contains 10% Hg.

For destroying lice.

To promote the removal of the effusion of pleurisies, the rubbing into the chest of half a drachm of mercurial ointment twice daily is often useful.

Unguentum Hydrargyri Mite (*U.S.P. XI*). *Syn.* MILD MERCURIAL OINTMENT.

Strong mercurial ointment 60, white wax 2, white petrolatum 38.

Mercury Amalgam.

This is one of the most popular of dental fillings. Black (*Cosmos*) suggests: Silver 68.5, tin 25.5, zinc 1, gold 5.

In use, the alloy is worked up in a glass mortar with an equal quantity of mercury, and the excess of mercury is squeezed out immediately before filling in. It is the general rule to employ a double filling, *i.e.*, to insert an initial filling of zinc oxysulphate or oxyposphate, and afterwards an amalgam when a metal filling is employed, and where depth of the cavity will allow.

Amalgam fillings of teeth may cause mercury poisoning in susceptible people.

[P1] **Hydrargyrum Ammoniatum** (*B.P., U.S.P. XI, P. Svec. X, P. Ned. V, P. Jap. V*). *Syn.* MERCURIC AMMONIUM CHLORIDE, WHITE PRECIPITATE. $\text{NH}_2\text{HgCl} = 252.1$.

A white powder obtained by the interaction of ammonia and mercuric chloride, insoluble in water but soluble in hydrochloric

acid. On prolonged contact with water a yellow basic salt is produced.

[P1] **Unguentum Hydrargyri Ammoniat** (*B.P.*).

Strength 5% in simple ointment.

In pruritus and other skin affections.

[P1] **Unguentum Hydrargyri Ammoniat Dilutum** (*B.P.C.*). Equal parts of the *B.P.* ointment and simple ointment.

Pustular eczema, resulting from pediculosis capitis in weakly children, is well treated with equal parts of this ointment and olive oil, enclosing the head in an oiled paper cap.

[P1] **Unguentum Hydrargyri Ammoniat et Zinci Oxidi** (*B.P.C.*). Equal parts of ointment of ammoniated mercury and ointment of zinc oxide.

[P1] **Unguentum Hydrargyri Ammoniat** (*U.S.P. XI*).

Ammoniated mercury 10, wool fat 5, white wax 5, white petrolatum 80.

Tinea circinata can be rapidly cured by this ointment.

[P1] **Hydrargyri amido chloridum pultiforme** (*P. Dan.*) is a 20% paste of freshly precipitated ammoniated mercury in wool fat and white soft paraffin for preparing ointments.

[P1] **Unguentum Hydrargyri cum Paraffino** (*St. G.H.*). Ammoniated mercury 12 gr., oil of geranium 4 m., yellow soft paraffin to 1 oz. To be used sparingly with a camel hair brush, to the nose.

[P2-81] **Hydrargyri Benzoas.** *Syn.* MERCURIC BENZOATE.

(C_6H_5COO)₂Hg.H₂O = 460.7.

Dose.—*Per os*, $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.0025 to 0.006 g.); by hypodermic injection—a daily dose of 1 to 2 ml., rising to 5 ml., of a 1% solution, made with the aid of 0.75% of sodium chloride in water: in preference with the addition of 0.75 to 1% of cocaine hydrochloride. Or weekly, 0.25 g. in 10% paraffin suspension.

A white crystalline powder, practically insoluble in cold water, but soluble with addition of salt, also soluble about 1 in 180 of alcohol 90%. Has been used for treatment of syphilis and as a urethral injection (1 in 2000 to 1 in 1000 in gonorrhœa).

Hydrargyri Bromidum. *Syn.* MERCURIC BROMIDE. HgBr₂ = 360.4.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.004 to 0.016 g.). Silvery scales. Soluble 1 in 250 of water, decomposes on boiling.

In syphilis, in solution with sodium bromide thus:—Mercuric bromide 1.8 g., sodium bromide 1.03 g., water 100 ml., is employed in dose of 1 to 2 ml. of the solution (= 0.01 to 0.02 g. Hg) intramuscularly into the buttock. A platinum-iridium needle is essential. Some pain may be caused.

[P1-81] **Hydrargyri Cyanidum** (*B.P.C., Fr. Cx., P.G. VI, P. Belg. IV*). *Syn.* MERCURY CYANIDE, CYANURETUM HYDRARGYRI. Hg(CN)₂ = 252.6.

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.004 to 0.008 g.). *Fr. Cx.* has max. single dose $\frac{1}{8}$ grain, max. during 24 hours $\frac{1}{4}$ grain approximately.

Intravenous dose.—1 ml. of 1% solution considered a max. single dose, but more has been given, *see below*.

White or colourless, prismatic crystals. *Soluble* 1 in 13 of water, 1 in 3 of hot water, 1 in 4 of glycerin and 1 in 20 of alcohol 90%. It is not decomposed by alkalis.

Uses. It is used as a lotion to syphilitic sores, and given in pills of $\frac{1}{16}$ gr. twice daily. Has also been employed intravenously in syphilis, in 1% solution, in association with nearsphenamine, and intravenously or intramuscularly, in doses of 0.04 to 0.05 g., as a diuretic in cardiac disease. Used in diphtheria, $\frac{1}{16}$ gr. frequently, with 1 m. of tincture of aconite in honey, employing also a gargle, 1 in 10,000. Solutions of 1 in 1000 have been used in ophthalmia.

ACUTE SYPHILITIC NEPHRITIS. Albuminuria disappeared after 15 days treatment with intravenous injections of 0.005 to 0.02 g., thus rendering possible the use of arsenic and bismuth, which were previously contraindicated.—Petges, *J. Amer. med. Ass.*, i/1929, 1488.

[P1-S1] **Hydrargyri et Zinci Cyanidi (B.P.C.).** *Syn.* MERCURO-ZINC CYANIDE, LISTER'S SALT.

A white powder, sometimes supplied tinted with rosalane (mauveine hydrochloride), obtained by precipitation from a cold saturated solution of the cyanide of mercury and potassium by adding a cold saturated solution of zinc sulphate in equimolecular proportions, or by adding in similar solutions mercuric chloride to zinc potassium cyanide. The maximum percentage of mercuric cyanide found is 38.5, and the body is usually regarded as an intimate mixture of the constituent cyanides.

Solubility. Very slight in water, more so in dilute acids.

[P1] **Carbasus Hydrargyri et Zinci Cyanidi (B.P.C.).** *Syn.* DOUBLE CYANIDE GAUZE. Contains 0.5 to 1.5% of Hg, as $\text{Hg}(\text{CN})_2$, and 1.5 to 3.0% of Zn, as $\text{Zn}(\text{CN})_2$. It is a popular dressing for applying direct to wounds. It is not so irritant as some of the other mercurial dressings, and has the advantage of keeping well without the mercurial salt becoming reduced by the cotton. It may be damped before use with 1 in 20 phenol solution. Double cyanide wool and bandages contain the equivalent of about 3% of the double salt.

[P1] **Curatio Normalis I (B.P.C. Supp.).** *Syn.* STANDARD DRESSING No. 1, DOUBLE CYANIDE DRESSING.

Mercury and zinc cyanide gauze 36 inches by 12 inches, absorbent cotton wool 180 gr., and an open-weave bandage 1 inch by 3 yards. It must be supplied in a sterile condition in the original sealed packets.

When this dressing is supplied for *N.H.I.* purposes the following directions must be clearly shown on the label:—"Directions for use. In the absence of any special directions by the doctor, the dressing should be used as follows:— (1) Cleanse the wound with plain boiled water or antiseptic solution; (2) apply the gauze so as to cover the wound; (3) apply the cotton wool so as to cover and overlap the gauze; and (4) apply the bandage."

[P1-S1] **Mercury and Zinc Cyanide Cream** may be made by triturating the powder with carbolic lotion 1 in 20 *g.s.*, for applying to hairy parts adjacent to wounds.

[P1-S1] **Mercury and Zinc Cyanide Paste.** Mercury and zinc cyanide 400, tragacanth 2, phenol 20, water 800, mix. For a first dressing for wounds. *Caution: Not to be supplied in metal tubes—especially lead. The paste must be rubbed on in as thin a layer as possible.*

[P1-S1] **Mercury and Zinc Cyanide Lotion**, of strength 1 in 5000 to 1 in 1000, is used for wounds. *Caution: Shake bottle—not dissolved.*

Hydrargyri Iodidum Flavum (B.P.C., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V). *Syn.* YELLOW MERCUROUS IODIDE.
HgI = 327.5.

Dose.— $\frac{1}{8}$ to $\frac{1}{2}$ grain (0.008 to 0.03 g.). *U.S.P. XI* average dose

$\frac{1}{2}$ grain. *Fr. Cx.* and *P. Helv. V* have max. single dose approx. $\frac{1}{2}$ grain, max. per day 3 grains.

Prepared by double decomposition between solutions of mercurous nitrate and potassium iodide. (Must not be confounded with the yellow variety of mercuric iodide).

Pills and tablets contain $\frac{1}{2}$ grain. Employed in syphilis.

[P1-81] *Pilules d'Iodure Mercureux Opiacées* (*Fr. Cx.*). *Syn.* RICORD'S PILLS.

Fresh mercurous iodide 0.05 g., opium 0.02 g., liquorice root 0.03 g. Mass with honey to make one pill (*exempt* [D]).

[P2-81] *Hydrargyri Iodidum Rubrum* (*B.P., Fr. Cx., P. Helv. V, P. Dan.*). *Syn.* MERCURY BINIODIDE, MERCURIC IODIDE, HYDRARGYRUM BINODATUM (*P. Jap. V*). $HgI_2 = 454.5$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.002 to 0.004 g.). *Fr. Cx.* has max. single dose $\frac{1}{2}$ grain; max. during 24 hours $1\frac{1}{2}$ grains approximately.

Intravenously.— $\frac{1}{2}$ grain (0.005 g.) in 75 minims (5 ml.) is usual, but $\frac{1}{2}$ grain (0.03 g.) in 150 minims (10 ml.) has been given.

—See R. L. Spittell's formula below.

Red powder, *soluble* in solutions of other iodides, and in solution of mercuric chloride, forming double salts, *cf.* mercuric potassium iodide; also 1 in 230 of olive oil, 1 in 25 of castor oil (100 parts of the latter will dissolve 8 of this iodide with 5 of mercuric chloride), about 1 in 150 of ether, 1 in 300 of alcohol 90%.

Uses. A powerful antiseptic, less irritant than mercuric chloride. As a lotion for the hands or eyes 1 in 5000. For wounds 1 in 7000, vaginal douche 1 in 10,000.

More potassium iodide must be used to dissolve mercuric iodide than is indicated by the formation of the compound $HgI_2 \cdot 2KI$, otherwise HgI_2 is precipitated on standing; at least an equal weight of potassium iodide should be used.

The strength of biniodide preparations should be expressed in terms of the active constituent, HgI_2 . Statements of strength based on the theoretical content of double salts such as $HgI_2 \cdot 2KI$, or $HgI_2 \cdot KI \cdot 1\frac{1}{2}H_2O$ are misleading. A 1 in 1000 solution of $HgI_2 \cdot 2KI$ is equivalent to less than 1 in 1700 of biniodide, and 1 in 1000 of $HgI_2 \cdot KI \cdot 1\frac{1}{2}H_2O$ is equivalent to less than 1 in 1400.

If a douche is required in midwifery, 1 in 1000 biniodide always used.—A. P. Murtz, *Lancet*, ii/1926, 728.

[P1] *Injectio Hydrargyri Iodidi Rubri* (Ragazzoni).

Dose.—2 to 6 minims (0.12 to 0.4 ml.).

Mercuric iodide 1 gr., sodium iodide *q.s.*, in 64 m.

In syphilis can be used in large doses, but is painful.

[P2] *Injectio Hydrargyri Iodidi Intravenosa* (R. L. Spittell).

Dose.—120 to 180 minims (8 to 12 ml.).

Mercuric iodide 3.24 g., sodium or potassium iodide 28.42 g., N/1 sodium hydroxide 40 drops or *q.s.*, water to 1000 ml. The solution is carefully rendered neutral, using phenolphthalein, the soda being added last. Often a single injection will produce an effect as marked as arsphenamine. Used in conjunction with latter in syphilis. *Caution:* An average dose of this contains 0.03 g. ($\frac{1}{2}$ grain).

[P2] *Soluté Injectable d'Iodure Mercurique* (*Fr. Cx.*).

Mercuric iodide 1%, sodium iodide 1%, sodium chloride 0.7% in distilled water. Sterilise in the autoclave for 20 minutes at 110°.

[P1-81] Injectio Hydrargyri Biniodidi (pro vagina).

Mercuric chloride 8 gr., potassium iodide 24 gr., water to 1 oz. 1 drachm of this to a pint makes 1 in 10,000 approx.

[P1] Lotio Hydrargyri Biniodidi (L.H.).

Mercuric chloride 3 gr., potassium iodide 8½ gr., alcoholic solution of rosolic acid *q.s.*, distilled water to 10 oz. Strength of double salt 1 in 500.

[P1] Lotio Hydrargyri Biniodidi Spirituosus. Syn. BINIODIDE SPIRIT LOTION.

Mercuric iodide 1, potassium iodide 1, alcohol 70% to 1000. For gonorrhœa dilute solutions are used, also as a pigment or spray for throat in scarlatina and diphtheria.

[P1] Mistura Hydrargyri Biniodidi (K.C.H.).

Dose.—1 ounce (30 ml.).

Solution of mercuric chloride 30 m., potassium iodide 10 gr., ammonium carbonate 5 gr., decoction of cinchona to 1 oz.

[P1] U.C.H. has solution of mercuric chloride 60 m., potassium iodide 4 gr., water to 1 oz.

[P1] Mist. Hydrarg. et Pot. Iod. (N.I.F.).

Solution of mercuric chloride 1 dr., potassium iodide 5 gr., concentrated infusion of calumba 30 m., water to ½ oz.

The mercury in these mixtures is more rapidly eliminated than when given alone. The potassium iodide acts as a diuretic.

[P1-81] Pilula Arsenii et Hydrargyri Iodidi.

Dose.—1 or 2, two or three times a day.

Arsenious iodide, mercuric iodide, of each 1 gr., distilled water *q.s.* to dissolve, sugar *q.s.* to make 12 two-grain pills. May be combined with 2 gr. of iodide of iron.

[P2-81] Pilula Hydrargyri Iodidi Rubri (½ gr.) et Potassii Iodidi (4 gr.).

Dose.—1 twice daily.

[P2-81] **Solvellæ Hydrargyri Iodidi (B.P.C.)** contain 8½ gr. of mercuric iodide with sufficient potassium iodide, and eosin to tint; one dissolved in a pint of water gives a 1 in 1000 solution of mercuric iodide. The red colour of the eosin rapidly fades when solutions of these tablets are exposed to bright sunlight; solutions should not, therefore, be exposed to daylight for any length of time.

[P2] Sirop d'Iodure Mercurique (Fr. Cx.). Syn. GIBERT'S SYRUP.

Mercuric iodide 0.5 g., potassium iodide 25 g., water 24.5 g., simple syrup 950 g.

[P2-81] Unguentum Hydrargyri Iodidi Rubri (B.P.C.). 1 in 25.

For tinea may be applied to small spots, but not to large surfaces. Too strong for general use on the skin. Exophthalmic goitre has been treated by daily use of this ointment half strength.

PARENCHYMATOUS GOITRE treated by dilute mercuric iodide ointment locally. Improvement in patient's general condition and comfort.

[P1] Unguentum Hydrargyri et Potassii Iodidi.

Mercuric iodide 1, potassium iodide 1, water 13, lard 35, hydrous wool fat 50.

[P1] Wool, Mercuric Iodide. ½%.

Impregnate absorbent wool 400 under pressure with a solution of mercuric iodide 1 and potassium iodide 1, and spread out to dry.

[P1-81] Hydrargyri et Potassii Iodidum. $HgI_2.KI.1\frac{1}{2}H_2O = 647.5$.

A compound of this composition is obtained by crystallisation from the filtrate obtained on removing mercuric iodide formed by mixing solutions of mercuric chloride and potassium iodide. It is soluble 1 in 1 of alcohol 90%, 1 in 1 of ether and 1 in 2 of glacial acetic acid. It is not soluble in water except in presence of more potassium iodide. It is used for the same purposes as mercuric iodide.

Hydrargyri Iodidum Viride (B.P.C.). *Syn.* GREEN MERCUROUS IODIDE, MERCURY PROTOIODIDE.

Dose.— $\frac{1}{4}$ to 1 grain (0.01 to 0.06 g.) gradually increased to 3 grains. Pills contain $\frac{1}{4}$ and $\frac{1}{2}$, $\frac{1}{4}$ and $\frac{1}{2}$ grain, and tablets contain $\frac{1}{4}$ grain—with opium and pepper to prevent looseness of bowels.

Incompatible with other iodides.

A yellowish-green, odourless, tasteless powder containing mercurous iodide with free mercury. It should be kept from light, otherwise the mercurous iodide decomposes. Employed in syphilis.

[P1-81] **Hydrargyri Nitras (P. Helv. V).** *Syn.* MERCUROUS NITRATE. $\text{Hg}_2(\text{NO}_3)_2, 2\text{H}_2\text{O} = 561.3$.

In colourless monoclinic crystals, generally damp (from adhering acid) and soluble in water, or yellow tinted (from basic salt), then not perfectly soluble in water. Used in syphilitic sores, 1 in 30 or more, as a lotion or ointment, and occasionally internally in same dose as mercuric chloride.

[P1-81] **Liquor Hydrargyri Nitratis Acidus (B.P.C.).**

Contains the equivalent of 33 $\frac{1}{3}$ % w/w of Hg dissolved in nitric acid.

Used as a caustic for syphilitic warts, and lupus.

Diluted 1 in 1000, or more, is used as a urethral injection in gonorrhœa and as a gargle for syphilitic sore throat.

An intractable and extensive case of destructive facial lupus in a boy of 11 cured by painting the lesions on three occasions. Local reaction purulent and violent but no diarrhœa and no mercurial poisoning.—W. J. O'Donovan, *Brit. J. Dermat.*, 1935, 353.

[P1] **Nebula Hydrargyri Nitratis (T.H.).** Strong ointment of mercuric nitrate 40 gr., yellow soft paraffin 40 gr., olive oil $\frac{1}{2}$ oz., liquid paraffin to 1 oz.

[P1] **Pigmentum Hydrargyri Nitratis (B.P.C.).** *Syn.* GUTTÆ HYDRARGYRI NITRATIS.

Dilute mercuric nitrate ointment 1 in 16 in arachis oil.

L.H. has strong ointment of mercuric nitrate 60 gr., wool fat 30 gr., olive oil $\frac{1}{2}$ oz., liquid paraffin to 1 oz.

[P1] **Pigmentum Hydrargyri Nitratis cum Menthole (B.P.C.)** resembles the preceding paint, but contains 1% w/v of menthol.

[P1] **"Nasal Oil" (St. M.H.)** is dilute mercuric nitrate ointment 20 gr., menthol 2 gr., lavender oil 5 m., olive oil to 1 oz.

[P1] **Oil pro Naso (P.M.H.).** *Syn.* NASAL OIL. Dilute ointment of mercuric nitrate 30 gr., menthol 5 gr., olive oil to 1 oz.

[P1] **Unguentum Hydrargyri Nitratis Forte (B.P.).** *Syn.* CITRINE OINTMENT, MERCURIC NITRATE OINTMENT, UNG. HYDRARGYRI NITRATIS, STRONG OINTMENT OF MERCURIC NITRATE.

Prepared by dissolving mercury in concentrated nitric acid in the cold, and adding the solution to a mixture of lard and olive oil heated to 150°, the heating being continued above 90° until frothing ceases. Contains about 1 of mercury in 15 of the finished ointment.

B.P. Add. III allows the use of arachis oil, in place of olive oil, in making strong ointment of mercuric nitrate.

Antiseptic and stimulant. Was formerly much employed in parasitic skin diseases, e.g., impetigo, sycosis, ringworm, etc.

The following formula is suggested to overcome the disadvantage of the usual preparation:—Mercuric nitrate 11.34 g., nitric acid 1.35 g., distilled water 32.31 g., white wax 5 g., cholesterol 1.5 g., white soft paraffin 48.5 g. Mix the mercuric nitrate with 1 ml. of water in a mortar, add the nitric acid and stir until dissolved. Add the remainder of the water slowly with constant stirring. Melt the soft paraffin, cholesterol (in fine powder) and white wax, and heat to 80° until the cholesterol is dissolved. Stir the mixture until it congeals. Slowly

incorporate the solution of mercuric nitrate into the base with constant trituration. Avoid contact with metal instruments. When first prepared the ointment is white, but gradually assumes a permanent light yellow colour.—Kuever and Burnside, *per Pharm. J.*, i/1940, 41.

Unguentum Hydrargyri Nitratis Dilutum (B.P.).

Contains 20% of strong ointment of mercuric nitrate with yellow soft paraffin.

In tinea tarsi of great value, employed with a brush to the eyelids, also in chronic eczema, psoriasis and herpes preputialis. In pustular eczema, after removing crusts, this checks further infection; Lassar's paste and soothing lotions may then be used.

Unguentum Hydrargyri Nitratis Dilutum (R.L.O.H.). Strong ointment of mercuric nitrate 40 gr., yellow soft paraffin to 1 oz.

[P1] Unguentum Hydrargyri, Plumbi et Zinci (B.P.C.).

Syn. UNGUENTUM METALLORUM.

Equal parts of strong ointment of mercuric nitrate, ointment of lead subacetate and ointment of zinc oxide.

K.C.H. is same as *B.P.C.* except for lead acetate ointment instead of lead subacetate ointment. *M.H.* is same as *B.P.C.* except for dilute mercuric nitrate ointment instead of strong. *W.H.* has equal parts of dilute mercuric nitrate ointment, lead acetate ointment and ointment of zinc oxide. *L.S.H.* and *St. J.H.* have mercurous chloride 10 gr., zinc oxide 20 gr., lead acetate 10 gr., strong ointment of mercuric nitrate 10 gr., benzoinated lard to 480 gr.

Unguentum Hydrargyri cum Plumbo (St.M.H.) contains lead acetate 10 gr., mercurous chloride 10 gr., zinc oxide 24 gr., strong mercuric nitrate ointment 24 gr., olive oil *q.s.*, lard to 480 gr.

Ung. Metallorum (P.M.H.). *Syn.* COMPOUND LEAD AND MERCURY OINTMENT.

Calomel 5 gr., strong solution of lead acetate 10 m., ichthammol 10 gr., strong ointment of mercuric nitrate 10 gr., soft paraffin to 1 oz.

[P2-81] Phenylmercuric Nitrate. *Prop. Name.* MERFENIL (*Pharmaceutical Specialities (May & Baker) Ltd., London.*)

An almost white basic salt, $C_6H_5HgOH, C_6H_5HgNO_3$, melting at about 180° with decomposition.

Sparingly *soluble* in water, alcohol and glycerin; more soluble in diethylene glycol.

It may be obtained by adding a solution of nitrogen tetroxide in ice-cold chloroform to an ice-cold solution of diphenylmercury in chloroform. After standing overnight at 0° the product is filtered. The precipitate is recrystallised from moist alcohol.

Uses. As a germicide and fungicide with low toxicity and only slightly less active in presence of body fluids. It is claimed to be 78 times as active as mercuric chloride against gram-positive cocci, and 64 times as active against fungi. 1 in 3000 for skin disinfection, 1 in 1500 for wounds, fistulae, etc., 1 in 1000 for mycotic infections, and 1 in 30,000 as vaginal douche.

Clinical studies indicate that this preparation is of great utility in the treatment of a wide variety of infections due to bacteria and fungi. Infections with the protozoon *T. vaginalis* also yield to basic phenylmercuric nitrate. It is used in the form of an aqueous 1 in 1500 solution. That given to the patient

for dilution in the preparation of a douche is a 1% solution in diethylene glycol, a drachm to a quart of warm water making approximately a 1 in 25,000 solution.—L. H. Biskind, *Lancet*, ii/1935, 1049.

TINEA AND EPIDERMOPHYTOSIS. Affected parts thoroughly cleansed with soap and water and a soft brush, and a 1 in 1500 ointment in a hydrophilic base containing cholesterol derivatives, gently rubbed in night and morning (over-treatment must be avoided). 205 out of 265 cases cured.—B. Levine, *J. Amer. med. Ass.*, ii/1933, 2108.

[P2-S1] **Phenylmercuric Acetate.** $C_6H_5HgO \cdot CO \cdot CH_3 = 336.75$.

Phenylmercuric acetate is made by heating a solution of mercuric acetate in glacial acetic acid with thiophene-free benzene. It occurs in small, white prisms, melting at 146° to 147.5° . Soluble 1 in about 600 of water; also soluble in alcohol and benzene.

Phenylmercuric acetate possesses properties and uses similar to those of phenylmercuric nitrate.

[P2] **Mersagel** (*Glaxo Laboratories, London*). Non-greasy preparation containing phenylmercuric acetate 1 in 750, in a water-soluble jelly base. Advocated for the treatment and prevention of mycotic affections of the skin.

[P2] **Volpar** (*British Drug Houses, London*). A contraceptive issued in the form of paste and gels containing phenylmercuric acetate.

[P1] **Hydrargyri Oxidum Flavum** (*B.P., Fr. Cx., P. Helv. V*). $HgO = 216.6$.

An orange-yellow amorphous powder obtained by interaction of mercuric chloride and sodium hydroxide.

Insoluble in water or alcohol 90%.

Incompatible with iodides and sulphides.

Uses. In ointments for inflamed eyelids. Should not be used whilst patient is taking iodide—violent irritation may be produced. Syphilitic sores and eczema may be treated by the 1% ointment.

[P1] **Lotio Hydrargyri Flava** (*B.P.C.*). *Syn.* YELLOW WASH.

Contains mercuric oxide precipitated from 0.5% w/v of mercuric chloride by solution of calcium hydroxide.

[P1] **Oculentum Flavum** (*B.P.C.*) contains 10% of moist yellow mercuric oxide ointment equivalent to 1% of yellow mercuric oxide.

[P1] **Oculentum Hydrargyri Oxidi** (*B.P.*) contains 1% of yellow mercuric oxide.

[P1] **Pagenstecher's Ointment** was originally prepared with a basis of spermaceti ointment. In this country yellow mercuric oxide 4% in yellow soft paraffin is usually supplied.

[P1] **Pasta Flava** (*Gt. Orn. H.*). Yellow mercuric oxide 15 gr., zinc paste to 1 oz. (Zinc paste contains starch 108 gr., zinc oxide 108 gr., simple ointment to 1 oz.).

[P1] **Unguentum Hydrargyri Oxidi Flavi** (*B.P.C.*). 2% in yellow soft paraffin. *Fr. Cx.* has 5%.

[P1] **Unguentum Hydrargyri Oxidi Flavi** (*U.S.P. XI*).

Yellow mercuric oxide 1, liquid petrolatum 1, wool fat 5, yellow wax 5, petrolatum 88.

[P1] **Unguentum Hydrargyri Oxidi Flavi** (*R.L.O.H.*) contains 2, 4 or 8 gr. of freshly precipitated mercuric oxide, pressed as free from moisture as possible, in yellow soft paraffin to 1 oz. The precipitation may be carried out as described in the *B.P.C.* for Ung. Hydrarg. Ox. Flav. Humid.

[P1] **Unguentum Hydrargyri Oxidi Flavi Humidi** (*B.P.C.*) contains 10% of freshly precipitated and very finely divided yellow mercuric oxide in a wool fat and soft paraffin basis. To be diluted for ophthalmic use as required.

[P1] **Hydrentum** (*Allen & Hanburys, London*). Neutral ointment of yellow mercuric oxide in strengths of 0.25 to 5%; also with [P1-81] atropine 0.5 and 1%. For ophthalmic use.

[P1] **Hydrargyri Oxidum Rubrum** (*B.P.C., Fr. Cx., P. Helv. V*). *Syn.* RED PRECIPITATE. $\text{HgO} = 216.6$.

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.004 to 0.016 g.).

A red crystalline powder obtained by heating mercurous nitrate; chemically it is identical with the yellow oxide.

[P1] **Unguentum Hydrargyri Oxidi Rubri** (*B.P.C.*). *Syn.* RED PRECIPITATE OINTMENT. 1 in 10.

For use in chronic skin affections.

[P1] **Pommade à l'Oxyde Mercurique Rouge** (*Fr. Cx.*). Red mercuric oxide 5%, in yellow soft paraffin.

[P1] **Hydrargyri Oxycyanidum** (*B.P., P. Helv. V, P. Dan.*). $\text{HgO}, 3\text{Hg}(\text{CN})_2 = 974.5$.

Dose.—By intramuscular injection, $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.005 to 0.01 g.); by intravenous injection, $\frac{1}{2}$ grain (0.01 g.). $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.004 to 0.01 g.) may be given orally.

CHEMICAL COMPOSITION. Contains the equivalent of about 21% of HgO and 78% of $\text{Hg}(\text{CN})_2$. It is a mixture of approximately 34% of mercury oxycyanide and 66% of mercury cyanide. The true oxycyanide is liable to explode on heating.

The *B.P.* standards differ from those of most other European pharmacopœias, and it has been recommended that the chemical formula should be deleted from the *B.P.* monograph and the standards altered to 14.5 to 16.5% of HgO and 83.5 to 85.5% of $\text{Hg}(\text{CN})_2$. The official substance would then be approximately equivalent to that required by *Fr. Cx., P.G. VI, P. Ned. V Supp. II, P. Jap. V*, etc.

Soluble 1 in about 18 of water. The solubility varies with the proportion of HgO present.

Uses. It is stated to have greater antiseptic power than mercuric chloride, and to be less irritant, since it does not precipitate albumin. It is widely used in France in the treatment of syphilis, usually by the intravenous route.

In the treatment of syphilis during first week 0.05 g. in pill *per diem* as an average has been given—to be taken when the stomach is full. Should not be used with potassium iodide.

As a wound lotion 0.2 to 0.6% solutions have been employed, 1 in 10,000 to 1 in 5000 as bladder irrigant, in eye work 1 in 5000 to 1 in 1000, and 1 in 200 for instruments, which it is said not to attack. Gonorrhœa has been treated by irrigation with a 1 in 2000 solution.

[P1] **Lotio Hydrargyri Oxycyanidi** (*R.L.O.H.*). $\frac{1}{2}$, $\frac{1}{8}$ or $\frac{1}{16}$ gr. in water 1 oz.

Hypopyon ulcers treated by subconjunctival injections.—*T. L. de Courcy, Brit. med. J.*, ii/1921, 737. *Cf. Injectio Hydrargyri Cyanidi.*

[P1] **Lotio Hydrargyri Oxycyanidi cum Zinci Sulphate** (*R.L.O.H.*).

Mercuric oxycyanide $\frac{1}{2}$ gr., zinc sulphate $\frac{1}{2}$ gr., water to 1 oz.

[P1] **Pasta Hydrargyri Oxycyanidi** (*L.H.*).

Mercuric oxycyanide 24 gr., tragacanth 192 gr., glycerin 4 oz., distilled water to 20 oz. Sterilise.

[P1] **Solvellæ Hydrargyri Oxycyanidi** (B.P.C.) contain 4.375 gr. of mercuric oxycyanide coloured with eosin. One dissolved in 1 pint of water gives a 1 in 2000 solution.

[P2-S1] **Hydrargyri Peptonas**. *Syn.* MERCURY PEPTONATE.

Dose per os.— $\frac{1}{4}$ grain (0.03 g.) increased with caution; hypodermically $\frac{1}{4}$ grain. A brown powder containing 10% of mercuric chloride, soluble in water.

Fr. Cx. 1908 gives method of manufacture of a solution.

[P2-S1] **Hydrargyri Perchloridum** (B.P., *Fr. Cx.*).

Syn. HYDRARGYRUM BICHLORATUM (*P. Helv. V, P. Jap. V*), HYDRARGYRI BICHLORIDUM (*U.S.P. XI*), MERCURIC CHLORIDE, HYDRARGYRI CHLORIDUM CORROSIVUM, CORROSIVE SUBLIMATE. $\text{HgCl}_2 = 271.5$.

Dose.— $\frac{1}{32}$ to $\frac{1}{16}$ grain (0.002 to 0.004 g.), but it may be increased to $\frac{1}{4}$ grain. *Fr. Cx.* has max. single dose $\frac{1}{4}$ grain; max. during 24 hours $\frac{1}{2}$ grain approximately. Intravenously $\frac{1}{32}$ grain increased.

In heavy colourless crystalline lumps or white powder.

Antidotes and Treatment of Mercurial Poisoning. In addition to the references below, see p. 586.

It is rare for patients to die who have not swallowed more than 7 $\frac{1}{2}$ grains. Gastric lavage only helpful in first 15 minutes; repeated venesections and transfusions worth while also biliary drainage and colonic irrigation.—E. R. Mintz, *per Brit. med. J. Epit.*, ii/1933, 64.

Some measure of success (only 3 deaths in 48 cases) in corrosive sublimate poisoning from a therapeutic scheme comprising gastric lavage and colonic irrigation by a 5% solution of sodium bicarbonate and an internal administration of the salt in a dosage sufficient to maintain the urine alkaline to litmus.—W. B. Porter and C. E. Simons, *Amer. J. med. Sci.*, Sept., 1934, 375.

A fatal case following the self-application to the vagina of a solution of a 7-grain tablet in a pint of warm water.—B. Russell, *Brit. med. J.*, i/1934, 756.

Acute mercurial poisoning following the insertion into the vagina of two tablets containing mercuric chloride. Recovery following sodium formaldehyde sulphoxylate intravenously, together with repeated washings of the stomach and rectum, and vaginal douches with the same solution. The toxicity of mercuric chloride when used as a vaginal douche appears to be very great, especially when the mucosa is not intact.—I. M. Rabinowitch, *Canad. med. Ass. J.*, ii/1938, 429.

Acute mercury poisoning following inunction with an ointment containing 1 part in 8 of mercuric chloride successfully treated with sodium formaldehyde sulphoxylate, 10 g. in 10% solution being given intravenously daily for three days.—J. Barnes, *Lancet*, i/1939, 89.

Soluble 1 in 18 of water, 1 in 4 of alcohol 90%, 1 in about 14 of ether, 1 in 13 of glycerin. More soluble double salts are formed in solution with sodium, ammonium and other chlorides. These solutions contain fewer mercuric ions and are hence less poisonous (taking same weights of mercury) than HgCl_2 . They are not more antiseptic.

Incompatibles. It precipitates most alkaloids from solutions and should therefore not be ordered with them. Interaction also occurs with alkalis and their salts and with the salts of silver and lead. Steel surgical instruments should not be dipped in this solution. It forms insoluble compounds with albuminous fluids, and is also incompatible with bodies containing tannin, soap, iodine and potassium iodide.

Uses. As antiseptic, but is precipitated by proteins. For the skin and for general use, a 1 in 1000 solution is used. The antiseptic action is more marked if alcohol 70% is used as the solvent.

For irrigation of wounds and for fistulæ 1 in 10,000, and for vaginal douches 1 in 100,000, but stronger solutions are frequently used. In eye lotions and in mouth-washes for glossitis and syphilitic ulceration 1 in 10,000 to 5000 may be used. Urethral injections in gonorrhœa may contain 1 in 4000. The 1 in 1000 solution with hydrochloric acid 2 in 1000 is often effective in prickly heat.

Solutions have a corrosive action on metallic instruments and cause rubber to deteriorate. Concentrations of 1 to 5% are irritant to the intact skin and may cause vesication, and absorption through the skin may cause systemic poisoning.

Internally, the perchloride has been given in syphilis. It has also been employed by intravenous injection in the form of a 1% solution (using a glass syringe and platinum-iridium needle) in syphilis, septicæmia, and acute bacterial infections. Intramuscularly its use is too painful.

CATARACT OPERATION. By washing the eyes with mercuric chloride 1 in 6000 before and after cocaine anesthesia, sepsis is abolished.—E. R. Shetti, *Brit. med. J.*, ii/1930, 1098.

EMPHYEMA, PNEUMOCOCCAL. Irrigation of the pleural cavity with 1 in 40,000 mercuric chloride, in treatment. (1 in 20,000 kills the pneumococcus in 2 hours—Choyce's *Surgery*).—F. J. Hathaway, *Brit. med. J.*, i/1925, 632.

GUINEA WORM. Emily, a French naval surgeon, succeeded in killing the parasite by injecting mercuric chloride solution 1 in 1000 into the body of the worm.

OPHTHALMIA NEONATORUM. Dangerous in treatment of (especially in conjunction with silver nitrate drops)—4 recent cases quoted. Frequent washing out with normal saline or saturated boric acid solution safe and effective.—D. Forbes, *Lancet*, ii/1931, 1102.

SUPPURATIVE OTITIS MEDIA. Mercuric chloride in glycerin 1 in 1000 successful where all other treatments have failed. Phenol in glycerin equally good.—T. P. Lowe, *Lancet*, ii/1928, 256.

[P2] **Carbasus Hydrargyri Perchloridi (B.P.C.).** *Syn.* **SUBLIMATE GAUZE.** Contains about 0.1% of mercuric chloride when fresh, but the strength is very variable.

[P2] **Lint, Absorbent Wool or Wood Wool,** may also be impregnated with $\frac{1}{2}$ % each of corrosive sublimate and glycerin.

[P2] **P. Jap. V** may be mercuric chloride 2, potassium chloride 2, water 1500, wool 1000, i.e., 0.2%. Faintly coloured with scarlet or fuchsin "S."

[P2] **Collyrium Hydrargyri Perchloridi (B.P.C.).** 0.02% w/v.

[P2] **Collyrium Hydrargyri Perchloridi (N.I.F.).**

Mercuric chloride solution 1, distilled water to 3. For use dilute with equal quantity of hot water: strength when diluted 1 in 6000.

[P1] **Mackenzie's Eye Wash.**

Mercuric chloride 1, ammonium chloride 6, extract of belladonna 10, cochineal 1½, proof spirit 55; rub together and add water to 330. Mix with equal parts of boiling water to bathe the eyes. *Caution.*—This is about five times as strong as usually employed.

[P2] **Collyr. Acid. Boric c. Hydrarg. Perchlor.** (N.I.F.). Solution of mercuric chloride: 1½ oz., boric acid 75 gr., distilled water to 6 oz.

For use dilute with an equal quantity of hot water.

[P2] **Gargarisma Hydrargyri Perchloridi (1 in 1750).** Mercuric chloride ½ gr., hydrochloric acid 1 m., glycerin 30 m., water to 1 oz.

For influenza, sore throat, especially quinsy, solution of mercuric chloride 1, acid infusion of rose petals 1. 1 tablespoonful in a teacupful of hot water as a gargle.

[P2] *Gargarisma Hydrargyri Perchloridi* (T.H.). Mercuric chloride $\frac{1}{18}$ gr., glycerin 24 m., water to 1 oz.

[P2-81] *Glycerinum Hydrargyri Perchloridi* (R.L.O.H.).

Mercuric chloride 4, 8 or 16 gr., glycerin to 1 oz. [P2] U.C.H. has 0.1%. L.H. uses mercuric chloride $17\frac{1}{2}$ gr., water 6 dr., glycerin to 2 pints, tinted blue. To be distinguished from the following:—

[P2-81] *Glycerinum Hydrargyri Perchloridi Alcoholicum* (U.C.H.). Syn. GLYCERIN-ALCOHOL-PERCHLORIDE. Mercuric chloride 35, glycerin 50, methyl blue 0.05, methylated spirit to 100. For disinfecting urine 1 dr. to a pint.

[P2] *Injectio Hydrargyri Perchloridi* (Intravenous) (Gt. Orm. H.) contains $\frac{1}{10}$ gr. (0.0015 g.) in normal saline 85 m. (5 ml.) for children under 2 years. For older children $\frac{1}{10}$ gr. (0.002 g.) in the same volume. May be repeated on three successive days.

[P2] *Liquor Hydrargyri Perchloridi* (B.P.). Syn. VAN SWIETEN'S SOLUTION (Fr. Cx.). 1 in 1000, $\frac{1}{18}$ gr. in 1 drachm approx.

Dose.— $\frac{1}{2}$ to 1 drachm.

[P2] *Harrington's Solution*.

Mercuric chloride 0.08, alcohol 90% 64, hydrochloric acid 6, water 30 parts. For pre-operative preparation of the skin.

[P2] *Liquor Hydrargyri Perchloridi Acidus* (St. T. H.). Syn. TYPHOID SOLUTION. Mercuric chloride 1 oz., hydrochloric acid (strong) 25 oz., water to 500 oz. Used only as disinfectant for excreta.

[P2] *Lotio Hydrargyri Acetica*.

Mercuric chloride 1, acetic acid 75, glycerin 75, alcohol (90%) 250, rose water 500. To destroy pediculi and detach their ova.

[P2] *Lotio Hydrargyri cum Acido Carbólico* (P.E.H.C.).

Solution of mercuric chloride 20 m., dilute acetic acid 40 m., oil of turpentine 2 dr., solution of phenol (1 in 40) to 1 oz. For pediculi.

[P2] *Lotio Hydrargyri cum Oleo Terebinthinæ* (U.C.H.).

Mercuric chloride 0.6, industrial methylated spirit 12.50, oil of turpentine to 100.

[P2] *Lotio Hydrargyri Perchloridi* (U.C.H.). Mercuric chloride 0.2% coloured with turquoise blue. St. T. H. is the same, coloured with methylene blue. L.H. (coloured with turquoise blue) and C.H.W. are 1 in 1000. R.L.O.H. $\frac{1}{18}$ or $\frac{1}{16}$ grain in 1 ounce. The last two are not coloured. W.H. has $\frac{1}{18}$ gr. in 1 oz. with 15 m. of glycerin.

[P2] *Lotio Parasitica* (St. M. H.).

Mercuric chloride $\frac{1}{2}$ gr., acetic acid 2 dr., water to 1 oz.

[P2] *Mistura Hydrargyri Perchloridi* (Gt. Orm. H.). (Dose for 1-year-old child.)

Solution of mercuric chloride 5 m., glycerin 5 m., water to 1 dr. For infective diarrhoea of infants, in conjunction with small (5 m.) doses of castor oil.

[P2] *Mist. Hydrarg. Perchlor.* (N.I.F.).

Solution of mercuric chloride 1 dr., concentrated infusion of calumba 30 m., water to $\frac{1}{2}$ oz.

[P2] *Mist. Hydrarg. et Pot. Iod.* (N.I.F.).

Solution of mercuric chloride 1 dr., potassium iodide 5 gr., concentrated infusion of calumba 30 m., water to $\frac{1}{2}$ oz.

[P2-81] *Pigmentum contra Tineam*.

Mercuric chloride 1, salicylic acid 9, phenol 10, glycerin 80. Efficient in ringworm.

[P2-81] *Pigmentum Hydrargyri Perchloridi* (T.H.).

Mercuric chloride 1, glycerin 25, water 75. A potent solution to be used with very great caution and by the surgeon only. Not more than one application to be made.

[P1-81] *Pilules de Chlorure Mercurique Opiacées* (Fr. Cx.). DUPUYTREN'S PILLS.

Mercuric chloride 1, extract of opium 2, extract of agropyrum 2, powdered liquorice q.s. For 100 pills. Each pill contains mercuric chloride 0.01 g. and extract of opium 0.02 g. (except [D]).

[P2-81] **Solvellæ Hydrargyri Perchloridi (B.P.C.)** contain $8\frac{1}{2}$ gr. of mercuric chloride with sodium chloride, and methylene blue to colour. One dissolved in 1 pint of water gives a 1 in 1000 solution.

[P2-81] **Toxittabellæ Hydrargyri Bichloridi Magnæ (U.S.P. XI).** *Syn.* LARGE POISON TABLETS OF MERCURY BICHLORIDE, LARGE CORROSIVE SUBLIMATE TABLETS.

They contain 0.42 to 0.52 g. of HgCl_2 in each tablet, and must be of a distinctive colour and not discoid in shape; the *U.S.P. XI* requires that when sold for household use they must be packed in glass bottles of distinctive angular shape with irregular or roughened sides or edges, with a red label marked "POISON" and the weight of HgCl_2 in each tablet stated thereon.

[P2-81] **Toxittabellæ Hydrargyri Bichloridi Parvæ (U.S.P. XI).** *SMALL POISON TABLETS OF MERCURY BICHLORIDE.*

They contain about 0.125 g. of HgCl_2 , and must be prepared and packed as described above (see *Toxittabellæ Hydrargyri Bichloridi Magnæ, U.S.P.*).

[P2] **Unguentum Desinficiens (NEISSER-SIEBERT) (P. Spec. X).** Triturate tragacanth 20 g. and wheat starch 40 g. with glycerin 170 g. Dissolve separately gelatin 7 g. in warm water 500 ml. and add mercuric chloride 3 g. and sodium chloride 10 g. to this solution. While still warm add with stirring the tragacanth mixture. Warm on water bath until homogeneous. When cool add alcohol 90% 250 g. in small lots.

[P2] **Unguentum Hydrargyri Perchloridi Compositum (L.H.).**

Mercuric chloride 2 gr., phenol 20 gr., glycerin 10 m., olive oil 40 m., zinc ointment to 1 oz.

[P2-81] **Sublamin (Schering, London).** MERCURY SULPHATE ETHYLENEDIAMINE. A non-irritating substitute for sublimate; superior in penetration because of absence of albumin precipitation. Supplied in 15-grain tablets.

[P1] **Sal Alembroth.** *Syn.* AMMONIO-MERCURIC CHLORIDE.

$(\text{NH}_4)_2\text{HgCl}_4 \cdot \text{H}_2\text{O} = 396.5$.

A crystalline powder. Soluble 2 in 1 of water, 1 in 4 of alcohol 90%, also in glycerin. Is a powerful antiseptic, but does not combine with albumin quickly and hence is not very irritating.

Uses. Formerly used for [P1] medicating dressings, bandages, gauze, wool gauze, and wool tissue, 1 or 2% (which are dyed blue), also as an intramuscular injection for syphilis. (*Dose.*—10 minims of 5% solution. Painful. Slowly eliminated.)

[P2-81] **Hydrargyri Salicylas (B.P.C., U.S.P. XI, P. Helv. V).**

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.003 to 0.02 g.). Intramuscularly, $\frac{1}{10}$ grain in 10 minims of liquid paraffin, increased up to 1 grain. *U.S.P. XI* average dose, intramuscularly, 1 grain twice a week. *P.G. VI* gives max. single dose $2\frac{1}{2}$ grains (0.15 g.). It is also official in *P. Ital. V*.

A white powder containing 54 to 59.6% of Hg .

When produced by the interaction of mercury oxide and salicylic acid, the chief constituent is anhydro-hydroxy-mercuric-salicylic acid of formula

Almost *insoluble* in water (but soluble in solutions of sodium hydroxide and sodium carbonate), scarcely soluble in alcohol 90%. This is the basic mercuric salicylate as distinguished from the neutral or normal salt (see below).

Uses. As an antiseptic and antisymphilitic and as a dusting powder or ointment for sores. It has the advantage of causing

relatively little pain when given by injection. Should not be given in large doses with potassium iodide.

As an injection for gonorrhœa 15 minims of a mucilage suspension 1-300 has been used.

BELL'S PALSY. Three to four injections intramuscularly in 10 to 14 days of 10 m. of 1% suspension of mercury salicylate in liquid paraffin gave excellent results.—P. A. Harry, *Prescriber*, 1926, 290.

LOCAL SKIN AFFECTIONS well treated with mercury salicylate in liquid paraffin injections intramuscularly, 1 gr. per ml. dose.—W. A. Elliott, *Brit. med. J.*, i/1925, 551.

[P2-81] **Hydrargyri Salicylas, Neutrale.** $(C_6H_4 \cdot OH \cdot COO)_2Hg = 474.7$.

Dose.—Hypodermically $\frac{1}{2}$ to 1 grain suspended 1 in 10 in liquid paraffin. Comparatively non-irritant.

Quinine-urea (2%) added as follows relieves pain:—

Quinine-urea 2, water 2, dissolve and mix with wool fat 20. To this add mercuric salicylate 10, liquid paraffin q.s. to 100.

[P2-81] **Merthiolate (Lilly, London).** SODIUM ETHYLMERCURITHIOSALICYLATE, $C_6H_5 \cdot Hg \cdot S \cdot C_6H_4 \cdot COONa$.

[S3] "Sodium ethyl mercurithiosalicylate—in therapeutic substances containing less than 0.1% of sodium ethyl mercurithiosalicylate as a preservative."

Contains 49% of Hg in organic combination. A potent germicide for sterilising tissue surfaces. Readily soluble in normal saline solution or cold water. Less toxic than mercuric chloride. For general application and for sterilising instruments 1 in 1000 solution; for mucous membranes 1 in 5000 to 1 in 2000; for ophthalmic use 1 in 5000; for bladder irrigation 1 in 10,000 to 1 in 5000.

[P2] **Merthiolate Cream.** Contains Merthiolate 1 in 1000 incorporated in a vanishing cream basis made by emulsifying stearic acid and lanolin with triethanolamine. For use in mycotic skin infections and in acne vulgaris and acne pustulosa.

[P2] **Merthiolate Suppositories.** 10 g. suppositories containing Merthiolate 1 in 1000 in a glycerin and gelatin base. For use in non-specific infections and inflammations of the cervix and upper vagina.

Hydrargyri Subchloridum (B.P.). *Syn.* MERCUROUS CHLORIDE, CALOMEL (*P. Dan.*), SUBCHLORIDE OF MERCURY, MERCURIUS DULCIS (*P. Ned. V*), HYDRARGYRI CHLORIDUM MITE (*U.S.P. XI*), HYDRARGYRUM CHLORATUM (*P. Helv. V, P. Jap. V*), PRÉCIPITÉ BLANC (*F.E. VIII*) (distinguish from British and *P. Belg. IV* white precipitate which is Hydrargyrum Ammoniatum). $HgCl = 236.1$.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.); by intramuscular injection $\frac{1}{2}$ to 1 grain (0.03 to 0.06 g.). *U.S.P. XI* average laxative dose $2\frac{1}{2}$ grains. *Fr. Cx.* has maximum single dose 15 grains, maximum during 24 hours, 15 grains. *P. Helv. V* has approx. 3 grains and 10 grains respectively.

Heavy white powder. It can also be obtained as small, soft, scaly crystals for eye work (*see* Duret's calomel, Vol. II). *Fr. Cx.* contains Precipitated Mercurous Chloride (*syn.* WHITE PRECIPITATE), an amorphous powder, and Sublimed Mercurous Chloride (*syn.* CALOMEL) minutely crystalline.

Insoluble in water, ether or alcohol.

Incompatible with acids, alkalis (*see* Lotio Nigra), with sodium and potassium chloride and with bromides, iodides, sulphur, cherry laurel water, and phenazone.

Uses. Alterative, purgative and antisyphilitic. It is not suitable for long-continued use internally on account of its systemic

actions. Was always considered a cholagogue, but at the present time is thought to empty the gall-bladder only, not to increase the actual amount of bile formed. Most useful purgative for congested liver and dyspepsia generally. To be given at bed-time followed by morning saline draught. Useful where there is intestinal putrefaction, *e.g.*, in dysentery, faecal accumulation, typhoid. For torpid liver $\frac{1}{4}$ -grain doses hourly valuable, and repeated small doses, *e.g.*, $\frac{1}{8}$ gr. every hour for 12 to 18 hours, are of value in follicular tonsillitis and may abort a quinsy if administered before suppuration occurs. As dusting powder to ulcers and many skin diseases (but not to cornea of the eye if potassium iodide is being given). It is non-irritant and may be employed in any concentration. Applied dry it relieves pruritus ani and as an ointment relieves the pain of hæmorrhoids. Administered by intramuscular injection in syphilis, calomel is painful but highly active. Ointments containing from 25 to 33% of calomel are effective venereal prophylactics if applied within four hours of exposure.

HÆMORRHOIDS. In the early stages, as a palliative measure, an ointment composed of one part of calomel and seven parts of Vaseline is of value. A small amount is inserted into the anal canal overnight on retiring and in the morning after defecation. It is slightly astringent and sedative. Ointments containing strong astringents should be avoided.—Ivor Back, *Med. Pr.*, ii/1936, 203.

Injectio Hydrargyri Subchloridi (B.P.). *Syn.* CALOMEL INJECTION.

Dose.—By intramuscular injection, 10 to 20 minims (0.6 to 1.2 ml.).

Contains about 5% *w/v* of very finely powdered mercurous chloride with camphor and creosote in wool fat and olive oil. *B.P. Add. III* allows the use of arachis oil, in place of olive oil, in making injection of mercurous chloride.

Although calomel injections are highly effective they have gone largely out of use, since it is impossible to control their absorption, and they are apt to produce excessive stomatitis.

[P2] **Injectio Hydrargyri Subchloridi Hypodermica.** Lambkin's original formula.

Dose.—10 minims injected once a week.

Calomel 10 gr., suspended in $\frac{1}{2}$ oz. of sterile olive oil containing 2% of phenol. Morphine $\frac{1}{2}$ gr. may be given afterwards to relieve pain.

[P] **Gargarisma Hydrargyri et Potassii Chloratis (T.H.).**

Black wash 2 dr., gargle of potassium chlorate $\frac{1}{2}$ oz. (gargle of potassium chlorate contains potassium chlorate 12 gr., sodium bicarbonate 6 gr., potassium bicarbonate 6 gr., water to 1 oz.).

[P1] **Lotio Hydrargyri Nigra (B.P.).** *Syn.* BLACK MERCURIAL WASH, BLACK WASH.

Contains mercurous oxide equivalent to 0.7% of mercurous chloride with glycerin and solution of calcium hydroxide.

[P1-S1] **Pilulæ Hydrargyri Subchloridi Compositæ (B.P.C.),** *syn.* PLUMMER'S PILLS, *dose*—1 or 2 pills, contain mercurous chloride 1 gr., sulphurated antimony 1 gr., guaiacum resin 2 gr.

Pil. Calomel et Menthol. (N.I.F.). Each pill contains calomel, menthol and powdered ginger, of each $\frac{1}{2}$ gr.

Pilula Hydrargyri Subchloridi, Rhei, Cascaræ et Capsicini.

Calomel $\frac{1}{2}$ gr., extract of rhubarb 2 gr., extract of cascara 1 gr., capsicin $\frac{1}{2}$ gr. Relieves constipation, e.g., that arising from large doses of bismuth.

[P1-81] Pulvis Basilicus.

Dose.—For a child of 2 years, 4 grains (0.25 g.); of 6 years or upwards, 8 grains (0.5 g.).

Mercurous chloride 3, scammony 3, potassium acid tartrate 3, jalap 1, ginger 1, antimonial powder 1.

Pulvis Hydrargyri Subchloridi Compositus (St. J. H.).

Mercurous chloride 2, boric acid 7, starch 7.

Unguentum Hydrargyri Subchloridi (B.P.). *Syn.* CALOMEL OINTMENT. Mercurous chloride 1, simple ointment 4. To relieve irritation.

Calomel ointment prepared with a wool fat and soft paraffin basis is less effective as an antiseptic than one prepared with soft paraffin only. The difference appears to be due to the increased viscosity caused by the incorporation of the wool fat.—L. C. Britt, *J. Amer. pharm. Ass.*, 1937, 646.

IMPROVED OINTMENT. A suspension of calomel in gelatin is obtained by adding 3% mercurous nitrate to an equal volume of 2% gelatin, containing 1.2% sodium chloride, washing by dialysis and concentrating to contain 1 g. calomel in 3 g. of suspension. Incorporation in an ointment base gave a product of higher antiseptic value than the usual preparations.—*J. Amer. pharm. Ass.*, 1937, 26, 1241.

[P1] Unguentum Hydrargyri Subchloridi Compositum

(B.P.C.). *Syn.* CALOMEL CREAM, PROPHYLACTIC OINTMENT.

Mercurous chloride 25%, and mercuric oxycyanide 0.075%, in a wool fat and paraffin basis. As a prophylactic measure against syphilis. "Preventive Capsules" (P.M.H.) contain 36 gr. of an ointment of similar composition.

Suspicious cracks or hangnails should have this ointment well rubbed in:—Calomel 33, soft paraffin 10, wool fat 57.

[P2-81] Hydrargyri Succinimidum (U.S.P. XI). *Syn.* IMIDO-SUCCINATE OF MERCURY. $[\text{C}_2\text{H}_4(\text{CO})_2\text{N}]_2\text{Hg} = 396.7$.

Dose.—By injection, $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.016 to 0.02 g.).

Mercury succinimide is a white powder, soluble in water about 1 in 28. Hypodermically in syphilis has been used in 2½% solution. Addition of cocaine nitrate diminishes pain. Compared with other salts of mercury its solutions are said to be relatively non-irritating.

Hydrargyri Sulphidum Rubrum. *Syn.* VERMILION, CINNABAR (P. Jap. V), CHINESE RED. $\text{HgS} = 232.7$. Brilliant red powder insoluble in water and dilute acids prepared by subliming a mixture of mercury and sulphur. Both this and the black variety, **Hydrargyri Sulphuretum cum Sulphure** (*syn.* HYDRARGYRUM SUBSULPHIDUM NIGRUM, ETHIOP'S MINERAL), of same composition are now rarely employed therapeutically.

Unguentum Hydrargyri Bisulphidi (L.H.). *Syn.* UNGUENTUM CINNABAR ET SULPHURIS.

Mercuric sulphide 4 gr., precipitated sulphur 15 gr., yellow soft paraffin to 1 oz.

[P1-81] Æthiops Antimonialis. A mixture of equal parts of black mercuric sulphide and grey antimony sulphide.

Hydrargyri Persulphas. *Syn.* MERCURIC SULPHATE, HYDRARGYRI SULPHAS. $\text{HgSO}_4 = 296.7$.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

A white powder made by dissolving mercury in boiling strong sulphuric acid. Water decomposes it with formation of yellow turpeth mineral, Hydrargyri Subsulphas (Fr. Cx.) or mercuric oxysulphate, $\text{HgSO}_4 \cdot 2\text{H}_2\text{O} = 729.9$.

It is a prompt emetic in dose of 2 to 5 grains which was given to children in croup and diphtheria to expel false membrane. Does not produce purging. Turpeth mineral ointment, Bazin's ointment, is 1 in 30 of benzoinated lard. Used for ringworm and seborrhœa capitis.

[P2-81] **Hydrargyri Tannas** (B.P.C.).

Dose.—1 to 2 grains (0.06 to 0.12 g.), in pills or tablets, often with opium to prevent diarrhœa.

In brownish-green powder or scales containing 40 to 50% of Hg. Has been used in syphilis.

[P1-81-84] **Merbaphenum** (U.S.P. XI). *Prop. Name.* NOVASUROL (Bayer Products, London).

Average dose.—2½ gr. by hypodermic injection. Is usually given intravenously or intramuscularly as a 10% solution.

A double salt of sodium mercurichlorophenylxyacetate with barbitone. A white crystalline powder containing about 34% of Hg. Soluble in water giving an alkaline solution.

Uses. Causes profuse and rapid diuresis, especially in cardiac dropsy, but liable to produce toxic symptoms and superseded now by mersalyl.

[P2-81] **Mercurochromum** (B.P.C.). *Syn. and Prop. Names.*

MERCUROCHROME-220 SOLUBLE, DI-SODIUM DIBROMOHYDROXY-MERCURI-FLUORESCIN, MERCUCROCOL (Evans, Sons, Lescher & Webb, Liverpool), MERCUROME (Martindale, London), PLANOCHROME (Pharmaceutical Specialities (May & Baker) Ltd., London).

$C_{20}H_7O_8Br_2 \cdot HgOH \cdot Na_2 = 750.5$.

It is patented in U.S.A. and in some other countries but not in England, and "Mercurochrome" is a trade mark in U.S.A. and some other countries, but not in England.

Dose.—By intravenous injection 0.002 to 0.005 g. per kilo, i.e., 0.13 to 0.32 g. per 10 stone (63½ kilo) man, preferably in 0.5% or greater dilution.

Iridescent green scales giving a red solution which shows a green fluorescence when dilute. It contains 25 to 28% of Hg.

The B.P.C. requires mercurochrome when used for intravenous injection to comply with a biological test to ensure that its toxicity is not greater than that of a standard sample of mercurochrome kept by the Pharmaceutical Society of Great Britain. (See Vol. II.)

Soluble readily in water, 1 in 185 of dehydrated alcohol, 1 in 65 of alcohol 90%. Insoluble in acetone, but soluble in a mixture of acetone and diluted alcohol. Insoluble in chloroform and ether. *Solutions should not be boiled or autoclaved.*

Incompatible with acids, alkaloidal salts, and with most local anæsthetics.

Uses. Mercurochrome has been extensively advocated as an antiseptic but most recent experiments show that, *in vitro*, its action is relatively weak. Intravenously in septicæmic conditions it is now regarded as of little value, and mercurial poisoning may result. Intravenous injections are usually followed by high temperature and vomiting, sometimes leading to prostration and collapse, and should only be employed as an emergency hospital procedure. As a vesical injection in cystitis, pyelitis, and in gonorrhœa the 1% solution is used.

As a non-irritant antiseptic for local use a solution of mercurochrome 2 in water 35, alcohol 95% 55, and acetone 10 is employed.

BURNS. Preferable to tannic acid (comparison of 2696 cases). It is an effective antiseptic in the presence of protein; the crust formed is thin and transparent; bed linen is not destroyed; it is non-irritant to tissues; a 2% aqueous solution is stable indefinitely; epithelisation under the scab is rapid. No general anæsthetic is given, all dead tissue is stripped off and the denuded area swabbed with normal saline and then with 2% aqueous solution of mercurochrome; the surface is then dried with an electric drier. On the first day 4 applications are given; on the second, 3; and on the third, 2. The area is dried off after each application and is always kept exposed to the atmosphere.—A. C. Turner, *Brit. med. J.*, ii/1935, 995.

CHRONIC CERVICITIS. Responded well when treated with a douche or paint.—L. C. Rivett, *Brit. med. J.*, ii/1930, 866.

In cervical discharges (other than gonorrhœa) apply a 10% solution to the cervix on a swab and leave in place; paint the vagina with the same solution.—Colonel L. W. Harrison, *Lancet*, i/1932, 452.

CYSTITIS. Intractable cystitis with frequent micturition and pyuria well treated, especially amongst women.—K. W. Heritage, *Brit. med. J.*, ii/1930, 866.

CONJUNCTIVITIS. Painted on both lids at once it cuts short duration. Invaluable in chronic cases. Superior to silver, is less irritating and cannot damage cornea. Two paintings a week. PARINAUD'S CONJUNCTIVITIS cleared up. Maternity Department of Bristol Royal Infirmary issues 1% solution instead of silver for the eyes of new-born babies. Decrease of ophthalmia neonatorum. CORNEAL ULCERS can be painted with benefit. BLEPHARITIS benefited by painting. In ophthalmic surgery 1% is painted over the skin of the eyelids.—E. R. Chambers, *Brit. med. J.*, ii/1930, 992.

Parinaud's conjunctivitis cleared up in 2 weeks by drops; also useful in tuberculous conjunctivitis and in chronic dacryocystitis.—J. Cole Marshall, *Brit. med. J.*, ii/1930, 1102.

MUSTARD GAS POISONING. Patients contaminated with mustard gas were treated with mercurochrome solution with the result that the pain was reduced and no secondary infection occurred. These experiments are not conclusive, but suggest that it would be desirable to try out the application of mercurochrome on patients when opportunity offers.—*Per Quart. J. Pharm.*, 1940, 192.

OBSTETRICS. Induction of labour by 0.5% mercurochrome in glycerin through a catheter into the uterus. Succeeded in about 66% cases. In uterine sepsis 1% by intrauterine injection almost invariably cures.—R. Kelson Ford, *Brit. med. J.*, ii/1930, 727.

OTORRHOEA. In the subacute stage a 1% solution often acts like a charm, but should not be used for more than a fortnight as it is a definite tissue poison.—E. Watson-Williams, *Brit. med. J.*, ii/1933, 49.

POST-OPERATIVE RETENTION. A special technique to promote post-operative voiding after operations in the region of the bladder consists of instilling into the bladder 1 ounce of 0.5% aqueous solution of mercurochrome in the operating room. The results after pelvic laparotomies have been very gratifying, the incidence of catheterisation having been reduced from 51% in a control series to 6.5% in a series of 500 cases in which this procedure was used.—J. D. Woodruff and R. W. Te Linde, *J. Amer. med. Ass.*, ii/1939, 1451.

[P2-S1] **Metaphen** (*Abbott Laboratories, London*).

The anhydride of 4-nitro-5-hydroxymercuri-o-cresol, a relatively non-irritating germicide. It is dissolved in water with the aid of sodium hydroxide which forms a sodium salt.

For use on infected areas, skin sterilisation and instruments and hands, and in wounds and open cuts; also for instillation in gonorrhœa, and in ophthalmology. Stated to be 11 times more potent than mercuric chloride. Usually employed in 1 in 5000 solution, though up to 1 in 1000 may be used.

IMPETIGO CONTAGIOSA. Thoroughly cleanse skin round infected area and paint the lesion with several layers of Metaphen in flexible collodion 1 : 5000 which is permitted to dry layer by layer. In 24 hours the easily removable layers are removed, the adherent part is left on and the mixture reapplied in several layers: repeat procedure on third day. On the 4th day all the Metaphen-collodion preparation is removed with the underlying incrustation. If the underlying skin is dry apply 2% ammoniated mercury ointment, but if still moist repeat the Metaphen-collodion treatment for another 3 days. Over 200 cases treated with success.—L. Hollander and J. J. Hecht, *Amer. J. Dis. Childh.*, Aug., 1934, 269.

UNDULANT FEVER. Prompt decline in temperature and improvement of symptoms in ten cases treated with Metaphen intravenously in doses of 10 ml. of 1 in 1000 solution, the number of injections ranging from two to thirteen. Injections were given daily for the first week and twice weekly afterwards. No toxic reactions were observed.—K. H. Abbott *et al.*, *per Prescriber*, 1938, 250.

[P2-81] **Neptal** (*Pharmaceutical Specialities (May & Baker) Ltd., London*). α -Hydroxymercuripropionamidocarboxyphenoxycetic acid. A mercurial diuretic used in nephritis, oedema of cardiac or renal origin, and in pleural or pericardial effusions. It is stated to be free from toxicity in therapeutic doses, and to have rapid and prolonged action. Ampoules of 1 ml. contain 0.092 g. of active product, and suppositories contain 0.5 g. with 5% theophylline.

Dose.—0.8 to 1.5 ml. intramuscularly daily or every other day, or, in urgent cases, the same dose intravenously diluted to 10 ml. with normal saline.

[P2-81] **Novurit** (*Chinoin A.G., Budapest; Martindale, London*). Known in the U.S.A. as **MERCURIN**.

A mixture of 20% of the β -methoxy- γ -hydroxy-mercuripropylamide of trimethylcyclopentanedicarboxylic acid and 80% of the sodium salt. It is a white, bitter powder, slightly soluble in water and ether, more soluble in alcohol and dilute sodium hydroxide.

Suppositories contain 0.5 g. of Novurit, ampoules contain 0.1 g. with 0.05 g. theophylline in 1 ml. **Dose.**—1 to 3 intramuscular or intravenous injections a week, commencing with a dose of 0.5 to 1 ml. and increasing to 2 ml.; suppositories, 1 or 2 a week. In cardiac oedema, ascites, hepatic cirrhosis, cardiorenal oedema.

Ten cases of congestive heart failure with oedema have been treated with this suppository and also with Novurit intravenously and with Salyrgan intravenously. The average twenty-four hours' excretion of urine per dose was for the suppository 87.2 oz., for Novurit intravenously 121.1 oz., for Salyrgan intravenously 91.8 oz. The previous administration of ammonium chloride results in an increased diuresis. With the suppositories 68.7% of the diuresis occurred within the first twelve hours, while the corresponding figure for Salyrgan intravenously was 81.7%. The diuresis does not extend beyond twenty-four hours. No toxic or irritative effects of the suppository have so far been detected. It is concluded that Novurit suppository is an effective and safe diuretic.—J. Parkinson and W. A. R. Thomson, *Lancet*, i/1936, 16.

[P2-81] **Mersalylum** (*B.P. Add. I*). *Syn. and Prop. Name.* MERCURGAN, SODIUM SALICYL- $(\gamma$ -HYDROXYMERCURI- β -METHOXY-PROPYL)-AMIDE-O-ACETATE, SALYRGAN (*Bayer Products, London*) (available only in 10% solution for injection).
 $(\text{HgOH})\text{CH}_2\cdot\text{CH}(\text{OCH}_3)\text{CH}_2\cdot\text{NHCO}\cdot\text{C}_6\text{H}_4\cdot\text{O}\cdot\text{CH}_2\cdot\text{COONa}$

= 505.7.

Dose.—No dose is given in *B.P. Add. I*, which states that for injections the official *Injectio Mersalyli* should be used.

White deliquescent powder containing 38.5 to 40.5% of Hg calculated on the dried substance.

Soluble 1 in 1 of water, 1 in 3 of alcohol 95%, 1 in 2 of methyl alcohol; insoluble in ether and chloroform. Aqueous solutions containing sodium chloride or other salts decompose with formation of toxic compounds except in the presence of some substance such as theophylline, which inhibits decomposition.

[P2-81] **Injectio Mersalyli** (*B.P. Add. I*).

Dose.—8 to 30 minims (0.5 to 2 ml.) by intramuscular or intravenous injection. The smaller dose is given to test tolerance. It is usually given intravenously.

Mersalyl 10 g., theophylline 5 g., in sterilised water to 100 ml., with sodium hydroxide *q.s.* to give a pH of about 7.8. The addition of theophylline enhances the action.

Contraindicated in acute disease of the kidneys and advanced nephritis, and in entero-colitis, fever, or hæmorrhagic states.

Uses. Chiefly used as a diuretic in ascites and œdema of cardiac and cardio-renal origin, and in ascites resulting from cirrhosis of the liver.

Intravenous route gives better and quicker response. Diuresis begins in 1 to 4 hours and is complete in 8 to 12 hours; best given in the morning. Ammonium chloride, 8 to 15 g. daily for 3 or 4 days before injection, improves response.—G. W. Collins, per *Prescriber*, 1929, 71.

Severe toxic effects from intravenous injection of doses larger than stated *ante*.—C. T. Andrews, *Lancet*, ii/1931, 132.

Found to rank second in importance to digitalis in treatment of heart failure. Not only causes diuresis but frequently a considerable diminution in frequency of attacks in cardiac asthma. No evidence of renal damage.—H. T. Hyman and N. M. Fenichel, per *Lancet*, ii/1932, 139.

Salyrgan should never be employed to start diuresis in cases of acute anuria; when renal insufficiency exists in the form of uremia, it is hazardous to use it and it is likely to increase renal insufficiency. Its use is not advised if the blood urea is greater than 50 or 75 mg. per 100 ml., or if erythrocytes are present to any degree in the urine. Salyrgan is most successful in those cases of minimal renal insufficiency, namely, œdema due to cardiac decompensation, nephrosis, polyserositis, and in the œdemas of indeterminate origin. 0.5 ml. is first given intravenously, and if no toxic effect is noted, 2 ml. may be given the following day and repeated every third or fourth day.—M. W. Binger, *Proc. Mayo Clin.*, October 7, 1936, 649.

Salyrgan given intramuscularly is useful in reducing localised œdema after injuries (e.g., following fractures), though some cases fail to respond.—M. J. Petty, *Brit. med. J.*, ii/1938, 944.

CARDIAC ŒDEMA. Salyrgan can be used without interruption and without fear of toxic effects. In one case a total of 270 injections was given over 5 years. Beneficial not only in relief of œdema but in staving off symptoms of early cardiac insufficiency.—I. M. Dixon, *New Engl. J. Med.*, i/1934, 800.

[P2-S1] **Dilurgen** (*Richter, London*). Oxy-mercuric-allyl-succinyl-carbamide. A mercurial diuretic with a mercury content of 44 to 46%. Ampoules of 1 ml. contain 0.1 g. of Dilurgen and 0.043 g. of theophylline. *Dose*.—1 or 2 ml. intramuscularly daily or every other day. Also supplied in the form of suppositories containing 0.5 g. of Dilurgen Sodium.

[P2-S1] **Esidrone** (*Ciba, Horsham*). The sodium salt of pyridinedicarboxy- β -mercuri- ω -hydroxypropylamidetheophylline, containing 31.2% mercury in a non-ionisable form and 28% theophylline chemically combined. *Dose*.—One ampoule of 1.1 ml. intravenously or intramuscularly two or three times weekly. A diuretic for use in cardiac œdema, dropsy, ascites and for reduction of obesity. The action is enhanced by previous acidification of the organism with ammonium chloride. The mercury is rapidly eliminated.

HYDRASTIS

B.P.C., Fr. Cx., P. Jap. V, P. Helv. V.

Syn. GOLDEN SEAL, YELLOW ROOT.

Dose.—10 to 30 grains (0.6 to 2 g.).

The dried rhizome and rootlets of *Hydrastis canadensis* (Ranunculaceæ). *Fr. Cx.* and *P. Helv. V* require 2.5% of hydrastine.

Uses. Internally, it exerts an astringent and tonic action in congestion and chronic inflammation of the mucous membranes of the respiratory and genito-urinary tracts, and is of value in

catarrhal affections of the nose and throat and in chronic catarrhal gastritis and enteritis. The drug and its alkaloids cause uterine contraction and are used in menorrhagia and dysmenorrhœa.

Externally, it is of value in chronic inflammation of the mucous membrane, also for cracks and fissures of the nipple. It stimulates indolent ulcers, and as a lotion (1 in 20 of liquid extract) checks profuse sweating. In gonorrhœa, an injection of a 1% solution of the liquid extract has been employed. It is also used, in the form of suppositories or ointment, in the treatment of hæmorrhoids.

Extractum Hydrastis Liquidum (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.) Contains 2% of hydrastine. Large doses, 30 m. twice daily, have been given with success in chronic constipation with hypochlorhydria. A preparation containing 1.5% of hydrastine has been recommended as a more practical proposition.

Extractum Hydrastis (B.P.C.). Syn. HYDRASTIN.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.). A dry alcoholic extract containing 8% of hydrastine. It is sometimes difficult to prepare an extract of this strength, and a standard of 5% of hydrastine has been recommended.

Aperient, cholagogue, stomachic, and tonic; 3 to 6 grains in a pill, followed by effervescing sodium sulphate, is a useful biliary stimulant.

[P1-81] Mistura Hydrastis et Ergotæ.

Liquid extracts of hydrastis and ergot of each 30 m., chloroform water to 1 oz. for a dose.

Stated to be a potent remedy in menorrhagia.

Tinctura Hydrastis (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Prepared with 10% of the liquid extract in alcohol 60%.

Fr. Cx. requires not less than 0.4% of alkaloids.

Liquor Sedans (Parke, Davis, London). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A specialty stated to contain in 1 oz. hydrastine representing fluid extract of hydrastis 30 m., black haw (*Viburnum prunifolium*) 60 gr., Jamaica dogwood (*Piscidia piscipula*) 30 gr., with aromatics.

As ovarian and uterine sedative; for dysmenorrhœa, threatened miscarriage, etc.

Hydrastina. $C_{21}H_{21}O_8N = 383.2$.

Dose.— $\frac{1}{2}$ to 1 grain (0.016 to 0.06 g.).

An alkaloid in white prismatic crystals, slightly soluble in water, but soluble 1 in 120 of alcohol 90%, 1 in 2 of chloroform and 1 in 83 of ether; taste very bitter. ~~It~~ may be distinguished from extract of hydrastis, sometimes called hydrastin.

Hydrastinæ Hydrochloridum (B.P.C.). $C_{21}H_{21}O_8N.HCl = 419.6$.

Dose.— $\frac{1}{2}$ to 1 grain (0.016 to 0.06 g.) orally, or hypodermically as a 10% solution.

A crystalline soluble salt, constricts peripheral vessels and said to cause uterine contraction and arrest hæmorrhage.

Hydrastinina (Fr. Cx.). $C_{11}H_{13}O_8N$. *Dose.*— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.016 to 0.03 g.) increased up to 1 grain (0.06 g.). *Fr. Cx.* gives max. single dose 0.05 g.; max. in 24 hours 0.15 g.

Is obtained by the oxidation of hydrastine. In white or faintly yellow crystals soluble in alcohol, ether and chloroform, moderately soluble in hot water.

Hydrastininæ Hydrochloridum (B.P.C., Fr. Cx., P. Ital. V, P.G. VI, P. Helv., P. Dan., P. Belg. IV).

$C_{11}H_{15}O_2NCl = 225.6$.

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.016 to 0.03 g.) hypodermically. Orally the dose may be increased up to 1 grain (0.06 g.). Fr. Cx. has max. single dose $\frac{1}{2}$ grain; max. during 24 hours $2\frac{1}{2}$ grains approx.

In pale citron yellow crystals, soluble 1 in 1 of water. Has been used for internal hæmorrhage hypodermically.

Useful in menorrhagia and dysmenorrhœa.

Beberinæ Sulphas (B.P.C.). Syn. BEBEERINE, BUXINE or PELOSINE SULPHATE. **Dose.**—1 to 5 grains (0.06 to 0.3 g.).

A mixture of alkaloidal sulphates with various impurities obtained from nectandra (bebeeru) bark, the stem bark of *Nectandra Rodiei* (Lauraceæ). It occurs in bitter translucent scales containing about 30% of beberine. Soluble 1 in about 1 of water; sparingly soluble in alcohol. Antipyretic and tonic similar to quinine, useful in menorrhagia.

Beberine Hydrochloride is also occasionally used. In reddish-brown scales.

Berberidis Cortex (B.P.C.). Barberry bark is the dried bark of the stem of *B. vulgaris*, and has been administered as Tinctura Berberidis Corticis (1 in 10), dose— $\frac{1}{2}$ to 1 drachm, or as a decoction (1 in 20) or infusion (1 in 20).

Berberinæ Sulphas (B.P.C.). Syn. BERBERINE (or BERBERINIUM) ACID SULPHATE. $C_{20}H_{18}O_4N(HSO_4) = 433.2$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

The acid sulphate of berberine, an alkaloid present in hydrastis and calumba but obtained mainly from *B. vulgaris*. In bright yellow acicular crystals or as a dark yellow powder with bitter taste.

Soluble 1 in 150 of water and in alcohol (90%).

Uses. Has been given for indigestion, diarrhœa, malaria, and sickness in pregnancy. Is administered by injection in oriental sore.

Berberine sulphate in water said to be effective in oriental sore. Inject into the sore, and repeat after a week.—R. L. Varma, *Indian med. Gaz.*, 1927, 62, 84. A grain of the sulphate in 1.5 ml. of water. Hypertonic and isotonic saline strongly recommended in conjunction. Better than tartar emetic intravenously.—P. V. Karamchandani, *Lancet*, i/1930, 78.

Successful treatment of oriental sore with 3 ml. of 2% berberine acid sulphate. Two to four injections effected a cure in 6 cases.—*Prescriber*, 1931, 355.

Berberine acid sulphate is of undoubted value in cutaneous leishmaniasis. 1 or 2 ml. of a 1 per cent. aqueous solution is infiltrated by means of a fine needle into the margins of the lesion. Four or five punctures are made and the infiltration is evenly spread. The injections are given once a week, the part being kept covered. Three treatments is frequently sufficient; occasionally a large number is necessary.—R. N. Chopra, B. B. Didshit, and J. G. Chowlan, *Indian med. Gaz.*, 1932, 194.

Analysis of treatment of over 300 cases. All those who received 5 or more injections (132) were definitely cured. If persevered with, the injections are a certain cure for oriental and possibly other sores.—E. W. Hayward, *Indian med. Gaz.*, May, 1933.

Orisol (*Pharmaceutical Specialities* (May & Baker) Ltd., London). Berberine acid sulphate in 2% solution for injection in the treatment of oriental sore.

Dose.—0.5 to 1.5 ml. is infiltrated round the edge of the sore and the procedure repeated at the end of a week.

Berberina, $C_{20}H_{18}O_4N$, crystallises in yellow needles with m.p. about 144°.

Berberinæ Carbonas, $C_{20}H_{18}O_4N(HCO_3)_2 \cdot 2H_2O$. Yellowish-brown crystals soluble in hot water and in alcohol; insoluble in cold water.

Berberinæ Hydrochloridum is the neutral salt, $C_{20}H_{11}O_4 \cdot NCl \cdot 2H_2O$, occurring in bright yellow crystals soluble in water about 1 in 400.

Berberinæ Phosphas is the acid phosphate, $C_{20}H_{11}O_4N(H_2PO_4)_2 \cdot H_2PO_4 \cdot 1\frac{1}{2}H_2O$. Bright yellow crystals soluble 1 in 15 of water.

Berberis (*B.P.C.*). The dried stem of *B. aristata* (Berberidaceæ). A bitter tonic used in intermittent fevers. An extract from various species, combined with opium, is used in India as a local application in affections of the eye.

Liquor Conc., *I.c. Add.*, 1900. *Dose*.— $\frac{1}{2}$ to 1 drachm. Alcohol 20%, 1 in 2.

Tinctura Berberidis (*B.P.C.*). *Dose*.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10. Berberis berries (Baies) are official in *Fr. Cx.* as ingredient in Electuaire diascordium.

[P1-81] **Cotarninæ Chloridum** (*B.P.C.*). *Syn. and Prop. Names.* COTARNINE HYDROCHLORIDE (*P. Ned. V, F.E. VIII, P.G. VI, P. Helv. V*), OKISTYPTIN (*Richter, London*), STYPTARNIN (*Allen & Hanburys, London*), STYPTICIN (*Merck, Darmstadt; Martindale, London*). $C_{12}H_{15}O_3NCl \cdot 2H_2O = 291.6$. *P. Helv. V* has $1\frac{1}{2}$ to 2 H_2O .

[P1] "*Alkaloids, the following; their salts, simple or complex:—Cotarnine.*"

[81] "*Alkaloids, the following; their salts, simple or complex:—Cotarnine except substances containing less than 0.2% of cotarnine.*"

Dose.— $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.02 to 0.1 g.) internally or hypodermically in special cases up to 4 grains in 10% solution.

The salt of the base cotarnine, in primrose coloured, deliquescent granular crystals, very soluble in water and alcohol.

Uses. The salts of cotarnine excite the isolated uterus on contact and they have been employed locally and systemically to check bleeding, especially in menstrual disorders, but the evidence as to their therapeutic value is contradictory. They do not affect the coagulation-time of the blood.

They have been employed internally in menorrhagia and in bleeding from uterine fibroids, or a 1 to 2% solution may be used locally on a tampon.

Erysipelas, eczema and shingles have been treated with a 5% ointment. A 2% ointment in a basis of wool-fat ointment is said to be useful in herpes and ulcerative balanitis. In more acute similar complaints up to 10% strength can be employed.

[P1-81] **Cotarnine Phthalate.** *Prop. Name.* STYPTOL (*Knoll, London*). $(C_{12}H_{15}NO_4)_2C_6H_4COOH \cdot COOH = 640.3$.

Dose.— $\frac{1}{2}$ grain (0.05 g.), but much larger doses are given by some practitioners, e.g., 10 grains, without unpleasant effects, every 2 to 3 hours.

A pale yellow crystalline powder, m.p. 113° , consisting of the acid phthalate. Soluble 1 in 60 of water. Contains 59% of cotarnine.

Lodal (*Burroughs Wellcome, London*). 6-7-Dimethoxy-2-methyl-3:4-dihydroisoquinolinium, an oxidation product of laudanone, in 1 gr. tablets. For the control of uterine hæmorrhage. *Dose*.—1 or 2 tablets thrice daily.

U*

[P1-81] **Cotarnina**, $C_{17}H_{15}O_4N$, is obtained by oxidising narcotine with nitric acid. In colourless needles, m.p. 132° to 135° , sparingly soluble in water, soluble in alcohol and ether.

Cotarnine is generally regarded as anomalous in containing water which cannot be removed, while the dried hydrochloride is anhydrous. But if the latter is regarded as cotarnine chloride and the base as cotarnine hydroxide, there is nothing anomalous.—D. B. Dott, *Chem. & Drugg.*, i/1932, 14.

HYDROGENII PEROXIDUM

$$H_2O_2 = 34.02.$$

Liquor Hydrogenii Peroxidi (B.P., U.S.P. XI). *Syn.* LIQUOR HYDROGENII DIOXIDI, HYDROGENIUM PEROXYDATUM DILUTUM (P. *Helv.* V), SOLUTÉ OFFICINAL D'EAU OXYGÉNÉE (Fr. Cx.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

May be prepared by the action of diluted sulphuric acid on barium peroxide in presence of water. A colourless liquid with harsh metallic taste.

1 ml. yields about 10 ml. of oxygen, equivalent to 2.5 to 3.5% w/v of H_2O_2 . 20 and 100-volume strengths are also available.

Incompatibility. It readily decomposes, especially in contact with metallic oxides and readily oxidisable substances. Among the more important incompatibilities are alkalis, ammonia, arsenious salts, glycerin, hypophosphites, iodides, mercurous salts, phenol, potassium bromide, chlorinated soda and chlorine water.

Ether restrains decomposition and is used for making ozonic ether.

Uses. Internally is non-poisonous, and has been given for pertussis, flatulent dyspepsia and other affections, but now it is mostly employed locally as an antiseptic not precipitated by albumin. It is useful for assisting in removing surgical dressings which adhere obstinately. It is valuable used *undiluted* as a pigment, or diluted 1 in 8 as a spray, for diphtheria, tonsillitis, hay fever, laryngeal tuberculosis, putrid bronchitis and non-syphilitic ozæna; and as an antiseptic mouth-wash or gargle. For tuberculous and syphilitic ulcers, gangrene, malignant pustule and for purulent discharges it is antiseptic. It is astringent, e.g., in epistaxis, and styptic in removing polypi. May be used locally for favus and other skin affections, also in gonorrhœa (up to 10-volume strength) occasionally. Wasp and hornet stings are at once relieved. It is sometimes used as an eye lotion, undiluted, in gonorrhœal conjunctivitis, or diluted 1 in 10 in diphtheritic conjunctivitis.

The 10-volume solution, preferably diluted with an equal volume of water, may be used in otorrhœa and otitis. After syringing out with weak boric acid lotion, allow to remain in 15 minutes, syringe out again, and dry carefully. Neutralising hydrogen peroxide solution with calcium carbonate and filtering is said to obviate the pain caused by syringing wounds in the ear with the

ordinary acid preparation. This, of course, must be done only at the time of use as the neutral solution rapidly loses its strength.

The 20-volume strength can be used for acute or chronic and gouty periodontitis by syringing out pockets around affected teeth, and also for septic root canals.

Solution of hydrogen peroxide is also used for bleaching hair and fabrics, but gangrene of the scalp has been known to follow the use of a 30% solution.

ACHLORHYDRIA. In about 75% of cases of achlorhydria the power of secreting acid can be restored by dieting, removal of septic foci and lavage of the stomach, when fasting in the morning, with dilute hydrogen peroxide ($\frac{1}{2}$ oz. to the pint) to remove mucus. Treatment is continued daily until the washings are clear.—A. F. Hurst, *Pharm. J.*, ii/1934, 675.

OTITIS MEDIA. Peroxide drops dangerous, and increase percentage of mastoid infections.—Sir R. Woods. Its use should be abandoned in all cases.—J. B. Hogan. Opposed to its use.—H. Barwell—Discussion B.M.A. Ann. Meeting, 1933; *Brit. med. J.*, ii/1933, 255.

Dangers of hydrogen peroxide in treatment of otorrhœa. In contact with pus it yields a large quantity of oxygen which may cause serious symptoms and even death.—*Prescriber*, 1926, 69.

Preservatives. The following substances have been added to solution of hydrogen peroxide as preservatives:—benzoic acid 0.05%, phenacetin 0.1%, ethyl alcohol 10%, and acetanilide 0.002% with hydrochloric acid 0.02% (but *vide infra*).

The variation in the efficacy of hydrogen peroxide solutions is not due to a loss of strength, but to the stabiliser it contains. Sulphuric acid is shown to be unsuitable for the purpose as it inhibits the action of the catalase enzyme in blood, pus and saliva, which decomposes the hydrogen peroxide. From experiments described it would appear that suitable stabilisers are urea, phenazone and possibly hexamine, which do not inhibit the action of catalase.—S. M. Tritton, *Quart. J. Pharm.*, 1939, 446.

Nipagin is the best preservative for hydrogen peroxide; after storage in the absence of light and air for 2 years a 7.3% solution containing 0.1% of Nipagin still contained 7.1% of H_2O_2 . Without preservative no H_2O_2 was present. Acetanilide is oxidised by hydrogen peroxide to nitrobenzene and is a dangerous stabiliser.—K. Hill, *Apothekerztg. Berl.*, 1939, 54, 946.

Solutio Hydrogenii Peroxydi Concentrata (*P. Helv. V, P. Ned. V Supp. II*). *Syn. and Prop. Name.* SOLUTÉ CONCENTRÉ D'EAU OXYGÉNÉE (*Fr. Cx.*), PERHYDROL (*Merck, Darmstadt; Savory & Moore, London*).

A solution of hydrogen peroxide containing about 30% w/v of H_2O_2 and yielding a hundred volumes of oxygen. It is more stable than weaker solutions and can be conveniently used for their preparation.

Collutorium Hydrogenii Peroxidi. Hydrogen peroxide solution (20 volume) 500, oil of peppermint 1, elixir of saccharin 30, thymol water 470.

Astringent Hydrogen Peroxide Mouth-Wash. The above with 5% of solution of aluminium acetate added. *Dilute either of the above with 7 parts of water.* For painful ulcers of the mouth in syphilis.

Gargarisma Hydrogenii Peroxidi. Hydrogen peroxide solution 1 dr., sodium chloride 5 gr., glycerin 30 m., water to 1 oz.

Guttæ Hydrogenii Peroxidi et Spiritus (*St. T. H.*).

Hydrogen peroxide solution and industrial methylated spirit, equal parts. Used as ear drops.

Best dispensed in separate bottles because on standing acetaldehyde and acetic acid are formed, and may cause irritation or a stinging sensation when used.—W. A. Woodard and J. Pickles, *Quart. J. Pharm.*, 1934, 413.

Unguentum Hydrogenii Peroxidi.

Hydrogen peroxide solution 10, anhydrous wool fat to 100. To be freshly made. Useful in eczema and other parasitic skin affections.

Bidrox (Evans, Sons, Lescher & Webb, Liverpool). A stable brand of hydrogen peroxide.

Dioxogen (Allen & Hanburys, London). A 12-volume solution of hydrogen peroxide.

Ozonic Ether.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Prepared by shaking a strong solution of hydrogen peroxide with ether and separating the ethereal layer. It yields 4 to 5 volumes of oxygen.

It is miscible with alcohol and with water in all proportions up to 3 times its volume. Is more stable than solution of hydrogen peroxide. In conjunction with tincture of guaiacum, it is employed as a test for blood, v. Vol. II. Has been given internally for whooping cough.

Solid Hydrogen Peroxide. *Prop. Name.* HYPEROL (Richter, London).

A solid compound of hydrogen peroxide and urea, stabilised with a trace of citric acid. The compound contains about 35% of hydrogen peroxide and is stable below 60°. A 10% solution is approximately the same strength as solution of hydrogen peroxide (10 volume).

Calcii Peroxidum (B.P.C.). *Syn.* CALCII SUPEROXYDUM, GORIT.
 $\text{CaO}_2 = 72.08$. Crystals containing $8\text{H}_2\text{O}$ are obtainable.

Dose.—3 to 8 grains (0.2 to 0.5 g.) daily.

A white crystalline powder slightly soluble in water, evolving oxygen. It explodes if mixed with glycerin or formalin.

A useful intestinal antiseptic, given in milk, for infants, e.g., in summer diarrhoea. Recommended in hyperacidity; also in soil-contaminated wounds and in dentifrices.

Magnesii Peroxidum (B.P.C., *Fr. Cx.*). $\text{MgO}_2 = 56.32$.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 g.).

A white tasteless powder insoluble in water, containing not less than 15% of MgO_2 with magnesium oxide. *Fr. Cx.* requires not less than 25%.

Used where increased oxidation is desired; given in diarrhoea of phthisis, vomiting, anorexia, flatulence and pyrosis. 10 gr. every four hours are administered in typhoid fever. 5 to 10% added to precipitated or prepared chalk powder makes a good dentifrice.

Dentifricium Oxidans (R.D.H.). Powdered hard soap 30 gr., powdered orris 30 gr., magnesium peroxide 1 dr., menthol 1 gr., oil of clove 2 m., precipitated chalk to 1 oz.

[P1] **Magnocarbon** (Richter, London). Charcoal 4 gr., magnesium peroxide 4 gr., extract of belladonna $\frac{1}{2}$ gr. *Dose.*—1 or 2 tablets thrice daily. In hyperacidity, dyspepsia, flatulence and ulcer.

Magnozon (Richter, London). Magnesium peroxide. *Dose.*—5 to 30 grains in tablet form.

Magnesium-Perhydrol (Merck, Darmstadt; Saxory & Moore, London) contains 25% of MgO_2 .

Sodii Peroxidum. *Syn.* SODIUM DIOXIDE, F.E. VIII; OXYLITH, "SOLID OXYGEN." $\text{Na}_2\text{O}_2 = 77.99$.

A yellowish white amorphous hygroscopic powder, dissolves in water with production of heat and evolution of oxygen. 50% solution has been used in dentistry to whiten stained teeth. Technically used as bleach for sponges, wool, bones, oils, etc.

Unguentum Sodii Peroxidi. 20% in soft white paraffin may be tried with caution in acne.

Zinci Peroxidum (*Fr. Cx.*, *P. Dan.*). *Syn.* DERMAGEN.

A mixture of zinc oxide and zinc peroxide ($\text{ZnO}_2 = 97.38$) containing about 35% of the latter. It is a white powder *insoluble* in water.

Used locally in skin affections. Promotes healing of chronic ulcers. For burns and wounds.

DIABETIC GANGRENE. Zinc peroxide markedly inhibits the growth of the hæmolytic streptococci and all anaerobic bacteria, including the organisms causing gas gangrene and the anaerobic streptococci. It neutralises or inactivates the toxins formed by these organisms and stimulates the formation of granulation tissue. The zinc peroxide should be suspended in sterile distilled water and applied to every part of the wound surface, which is then covered with fine meshed gauze soaked in the same suspension. This is covered with compresses saturated with sterile distilled water, and these in turn covered with impermeable material. The dressing should be changed every 24 hours, the old material irrigated off, and a new dressing applied.—F. L. Meleney, per *J. Amer. med. Ass.*, i/1940, 623.

MALIGNANT LESIONS. The use of zinc peroxide paste in radio-necrotic ulcers, with and without tumour growth, is effective in controlling fetor, infection and pain. The wound is cleaned with peroxide and saline sprays, free necrotic tissue removed and the wound again sprayed. A preparation of sterilised zinc peroxide is mixed with an equivalent amount of sterile distilled water, and more water added until the paste has a consistency of about 40% cream; this is applied by syringe to the entire lesion. Gauze is soaked in the suspension and applied throughout the lesion. The whole is covered with sterile pads soaked in distilled water, and the wound packed against evaporation by several layers of petrolatum or zinc oxide gauze, the dressing being secured by a larger pad and bandage. The wound never requires dressing more than twice a day. In the treatment of oral lesions the zinc peroxide is applied as a thick paste every 3 hours, and a 1 to 3 suspension is used as a mouth-wash. Throat lesions receive a spray of a 1 to 2 suspension and a paste applied directly to the lesion.—B. S. Freeman, *J. Amer. med. Ass.*, ii/1940, 181.

ULCERS. Zinc peroxide in powder suspended in an equal quantity of sterile distilled water, making a mixture of cream consisting of about 40% is a valuable treatment for open wounds and chronic ulcers.—F. L. Meleney, *N. Y. St. J. Med.*, 1939, 39 2188.

Ulcers due to microærophilic streptococci have been successfully treated with a paste made of zinc peroxide and water.—B. Fantus and H. A. Dyniewicz, *J. Amer. pharm. Ass.*, 1939, 548.

HYOSCYAMUS

B.P., *U.S.P. XI*, *Fr. Cx.*, *P. Jap. V*, *P. Helv. V*, *P. Dan.*

Syn. HYOSCYAMI FOLIA, HYOSCYAMUS LEAVES, JUSQUIAME (*Fr. Cx.*), HENBANE LEAVES.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Atropine; Hyosine; Hyoscyamine.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Atropine except substances containing less than 0.15% of atropine; hyosine except substances containing less than 0.15% of hyosine; hyoscyamine except substances containing less than 0.15% of hyoscyamine.*"

Dose.—3 to 6 grains (0.2 to 0.4 g.). *U.S.P. XI* average dose 3 grains. *P. Helv. V* has max. single dose 15 grains, max. in 24 hours 45 grains.

Hyoscyamus consists of the dried leaves and flowering tops of *Hyoscyamus niger* (Solanaceæ); it contains not less than 0.05% of alkaloids calculated as hyoscyamine. *Fr. Cx.* specifies the

leaves collected during the flowering stage and containing 0.2% of alkaloids, and the seeds.

Uses. Similar to those of belladonna and stramonium.

Colocynthis and other strong purgatives in pills are rendered less painful in action by addition of extract of hyoscyamus.

Antidotes. Treat as for poisoning by atropine, *see* p. 237.

[P1] **Extractum Hyoscyami Liquidum (B.P.).**

Dose.—3 to 6 minims (0.2 to 0.4 ml.).

Contains 0.05% of alkaloids calculated as hyoscyamine. 6 minims contain about $\frac{3}{16}$ gr. of alkaloids.

[P1-S1] **Extractum Hyoscyami Siccum (B.P.).** *Syn.* EXTRAC-
TUM HYOSCYAMI.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.). The dose in the B.P. '14 was 2 to 8 gr.; the reduction was made to bring the dose of extract into line with that of other hyoscyamus preparations.

It is prepared by the same method as Ext. Belladonnæ Siccum. It conforms with I.A., and is standardised to 0.3% of alkaloids, *P. Helv. V, P. Ital. V and F.E. VIII*, 0.5% of alkaloids, and *P. Ned. V Suppl. II* 0.125 to 0.150%; *P.G. VI* contains 0.5% of hyoscyamine. *Fr. Cx.* has 1.5% of total alkaloids in a firm extract containing 10% of water.

Extractum Hyoscyami (*P. Ned. V*) is required by the 2nd supplement to contain 0.125 to 0.150% of alkaloids. Extracts obtained by the author contained from 0.20 to 0.65%, and hence often required the addition of sugar equivalent to 4 times the weight of the extract to reduce the alkaloid content to the required figure, the preparation thus obtained being more correctly described as "Syrupus."—J. A. C. Van Pinxteren, *Pharm. Weekblad.*, 1939, 76, 1629.

[P1-S1] **Extractum Hyoscyami (U.S.P. XI).** *Average dose.*— $\frac{1}{8}$ grain (0.05 g.).

In two forms, pillular and powdered; they contain 0.15% of alkaloids and are therefore about half the strength of the B.P. 1932 dry extract.

[P1-S1] **Succus Hyoscyami (B.P.C.),** *dose*— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.), is the juice expressed from fresh hyoscyamus and preserved with alcohol.

[P1] **Tinctura Hyoscyami (B.P.).**

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1 drachm contains about $\frac{3}{16}$ gr. of alkaloids.

Prepared with 10% v/v of liquid extract of hyoscyamus in alcohol 70%, and contains 0.005% w/v of alkaloids. *Fr. Cx.* prepares by percolation of the leaves (1 in 10) with alcohol 70%.

Some samples give a precipitate of green colouring matter on dilution with water.

[P1] **Tinctura Hyoscyami (U.S.P. XI).** *Average dose.*—30 minims (2 ml.). Contains 0.004% of alkaloids and is therefore about four-fifths the strength of the B.P. tincture.

[P1] **Huile de Jusquiame Composée (Fr. Cx.).** *Syn.* BAUME TRANQUILLE. Macerate powdered leaves of belladonna, hyoscyamus, *Solanum nigrum*, poppy and stramonium, of each 50, with alcohol 200, and allow to stand 24 hours; then add poppy seed oil 5000, warm for 6 hours at 60° to 70°, press and allow to deposit, and finally add oils of lavender, peppermint, rosemary and thyme, of each 1, and filter.

[P1] **Hyoscyami Semen (B.P.C.).** *Syn.* HENBANE SEED.

The seeds of *H. niger*, containing about 0.05 to 0.1% of alkaloid, chiefly hyoscyamine, and 20% of oil.

[P1] **Meglin's Pills.** Hyoscyamus extract, valerian extract, and zinc oxide each 1 grain. In sciatica.

Mictasol (Bengal, London). Tablets of malva purpurea, hexamine and camphor bromide. *Dose.*—2 to 3 thrice daily. [P1] Suppositories are similar, but contain also extract of hyoscyamus. For nephritis, cystitis, hæmorrhoids, etc.

[P1-81] **Herba Hyoscyami mutici (P. Helv. V).** *Syn.* JUSQUILAME D'ÉGYPTE, EGYPTIAN HENBANE. From *H. muticus*, and contains not less than 0.8% of alkaloids, chiefly hyoscyamine. *P. Helv. V* permits it to be used for making standardised galenicals, but it must not be dispensed for hyoscyamus.

[P1-81] **Hyoscyamina (Fr. Cx.).** $C_{17}H_{23}O_3N = 289.2$.

Dose.— $\frac{1}{100}$ to $\frac{1}{1000}$ grain (0.0003 to 0.0006 g.), in cases of mania increased to $\frac{1}{8}$ or $\frac{1}{4}$ grain, dissolved in water by means of diluted sulphuric acid, or in a pill.

An alkaloid obtained from various Solanaceous plants, *Hyoscyamus muticus* being the best source. It is the *lævo* isomer of atropine (which is *dl*-hyoscyamine) into which it can be converted by heating or by the action of alkali. It is in light, snow-white crystals, m.p. 108° to 109°.

Soluble 1 in 120 of water, freely in alcohol, 1 in 1 of chloroform, 1 in 48 of ether, 1 in 110 of benzene and slightly in light petroleum.

Antidotes. Treat as for poisoning by atropine, *see* p. 237.

[P1-81] **Hyoscyaminæ Hydrobromidum.** $C_{17}H_{23}O_3N.HBr = 370.1$.

Dose.— $\frac{1}{100}$ to $\frac{1}{1000}$ grain (0.0003 to 0.0006 g.), increased.

In small white crystals, m.p. 152°, soluble about 2 in 1 of water, also soluble in alcohol 90%.

[P1-81] **Hyoscyaminæ Sulphas (B.P.C.).**

$(C_{17}H_{23}O_3N)_2.H_2SO_4 = 676.5$.

Dose.— $\frac{1}{100}$ to $\frac{1}{1000}$ grain (0.0003 to 0.0006 g.), increased up to $\frac{1}{10}$ grain (0.006 g.) in mania.

In small white granular deliquescent crystals, soluble 2 in 1 of water and about 1 in 4½ of alcohol 90%.

Uses. As a mydriatic it acts like atropine, but with greater intensity, while the duration of effect is about equal.

It removes the pain of neuralgia, and is given for mental excitement, *e.g.*, delirium tremens. In mania $\frac{1}{8}$ grain may be given hypodermically. It is used to relieve the tremor, rigidity, and excessive salivation in paralysis agitans. Is useful for prevention of sea-sickness; tablets or granules of $\frac{1}{100}$ gr. may be taken occasionally a day or two beforehand, and for the first few days on board; hourly if required.

[P1-81] **Hyoscina.** *Syn.* SCOPOLAMINE. $C_{17}H_{21}O_4N = 303.2$.

A thick syrupy alkaloid, contained in *Hyoscyamus niger*, different species of *Scopola*, *Datura alba*, the flowers of which yield 0.5%, and other solanaceous plants. It may be obtained from the mother liquors of the preparation of hyoscyamine.

Antidotes. Treat as for poisoning by atropine, *see* p. 237.

Uses. Hyoscine base is used as a mydriatic in oily solution or as an ointment. Mydriasis is quick in onset and of short duration. For the preparation of aqueous solutions and for oral and hypodermic use a water-soluble salt is used, usually the hydrobromide.

[P1-81] **Oleum Hyoscinae (R.L.O.H.)**. Hyoscine 4 gr. dissolved in minimum amount of chloroform and mixed with castor oil at 61° to 1 oz. Causes a mydriasis which is certain, quick in onset and of short duration.

[P1-81] **Oleum Hyoscinae (P.Helv. V)** is 1% in arachis oil,

[P1-81] **Unguentum Hyoscinae (R.L.O.H.)**. *Syn.* UNGUENTUM SCOPOLAMINÆ. Hyoscine 1 or 2 gr. dissolved in minimum amount of chloroform and mixed with yellow soft paraffin at 61° to 1 oz.

[P1-81] **Hyoscinae Hydrobromidum (B.P.)**. *Syn.* SCOPOLAMINÆ HYDROBROMIDUM (*U.S.P. XI, Fr. Cx., P. Ned. V, P. Jap., P. Belg. IV, F.E. VIII, P. Dan., P. Ital. V*).

$C_{17}H_{21}O_4N \cdot HBr \cdot 3H_2O = 438.1$. *P. Helv. V* has $2H_2O$.

Dose.— $\frac{1}{100}$ to $\frac{1}{10}$ grain (0.0003 to 0.0006 g.). The dose may be increased to $\frac{1}{50}$ grain. *Fr. Cx.* and *P.G. VI* have max. single dose 0.001 g., max. daily dose 0.003 g. *U.S.P.* average dose $\frac{1}{100}$ grain.

The hydrobromide of *l*-hyoscine. In white rhombic crystals, *soluble* 1 in 2 of water, 1 in 13 of alcohol 90%. Melts at 194° to 196° after drying at 100° (*U.S.P. XI* 190° to 192°).

Uses. Produces prompt depression of the motor area of the brain, and acts as a powerful hypnotic; especially useful in acute mania and delirium, including delirium tremens, calming the excitement and rapidly inducing sleep. For this purpose a dose of $\frac{1}{50}$ gr. with morphine $\frac{1}{4}$ gr. is said to give excellent results. Occasionally a short stage of excitement precedes sleep and, in general, it is a less reliable hypnotic than chloral hydrate or morphine. It is also useful in chorea, asthma and pertussis, and is employed in the intensive withdrawal treatment of morphine addiction (*see under Morphina*). Hyoscine hydrobromide is extensively used in the symptomatic treatment of paralysis agitans and post-encephalitic parkinsonism; doses of $\frac{1}{100}$ to $\frac{1}{50}$ gr. thrice daily *per os* often greatly relieve the tremors and muscular rigidity. If pilocarpine is given simultaneously to prevent dryness of the mouth and paralysis of accommodation the dose can frequently be increased to $\frac{1}{50}$ gr. and occasionally to $\frac{1}{4}$ gr. thrice daily. In conjunction with morphine, hyoscine is used for the induction of "twilight sleep" in labour (*vide infra*). Hyoscine hydrobromide is also used as a mydriatic in 1% aqueous solution or as the eye ointment or lamella.

BASAL NARCOSIS. The following combination of drugs offers practically all the advantages of Avertin as a pre-anæsthetic without certain of its disadvantages in the hands of inexperienced anaesthetists. About an hour before the operation the patient receives a subcutaneous injection of morphine hydrobromide $\frac{1}{4}$ gr., hyoscine hydrobromide $\frac{1}{100}$ gr., and atropine hydrobromide $\frac{1}{200}$ gr. (*Tab. Hyoscinae Co., P.D. & Co.*) and an intragluteal injection of Somnifaine 2 ml. The combined action of these drugs leaves the pupil practically normal, so that the size of the pupil still provides a useful guide to the depth of chloroform or ether anaesthesia. The amount of ether required is about half that which would be required without the addition of Somnifaine, the post-anæsthetic vomiting is greatly reduced, and amnesia is complete in about 90% of cases and usually continues for about 24 hours. There is a long post-anæsthetic sleep lasting about 6 hours. With this combination there is a noticeable freedom from shock.—*W. N. Leak, Brit. med. J., ii/1939, 1162.*

ENCEPHALITIS, EPIDEMIC. Hyoscine of undoubted value, though effect is temporary. Start with $\frac{1}{100}$ grain once a day hypodermically, increased if necessary to $\frac{1}{50}$ grain. *Per os* larger doses may be employed thrice daily, preferably after meals.—*P. K. McCowan and co-workers, Brit. med. J., i/1926, 779; Lancet, i/1926, 802.*

INFANTILE CEREBRAL PALSY. This condition, which is characterised by one or more of the following features: spasticity, tremor, inco-ordination, choreiform and athetoid movements and mental deficiency, responds well to hyoscyne treatment. The usual maintenance dose is $\frac{1}{8}$ gr. of hyoscyne hydrobromide twice daily by mouth. Drooling was stopped, athetosis lessened, confidence increased, relaxation improved and progress in retraining more rapid. One child learned to walk in three days. The favourable response came early or not at all.—I. C. Nicholls and S. R. Watson, *New Engl. J. Med.*, ii/1939, 888.

PARALYSIS AGITANS. The medicament of choice.—W. Freeman, *J. Amer. med. Ass.*, ii/1927, 1320.

Paralysis agitans treated. Give a mixture of hyoscyne $\frac{1}{8}$ gr. with pilocarpine nitrate $\frac{1}{8}$ gr. and solution of strychnine hydrochloride 3 m. 4 times daily, gradually increased until the tremor is controlled.—A. F. Hurst, *Brit. med. J.*, i/1926, 845.

POST-ENCEPHALITIC PARKINSONISM. Hyoscyne hydrobromide produces quite definite and even marked improvement.—A. J. Hall, *Brit. med. J.*, i/1926, 129.

Chronic encephalitis treated with hyoscyne hydrobromide $\frac{1}{8}$ gr. thrice daily, and with harmin.—*Lancet*, ii/1929, 794.

Marked relief in chronic cases of parkinsonism and disturbance of sleep, following continued administration of hyoscyne hydrobromide $\frac{1}{8}$ gr. thrice daily by mouth, but not curative and symptoms returned on suspension.—A. G. Robb, *Brit. med. J.*, ii/1925, 646.

[P1-§1] **Guttæ Hyoscinæ (R.L.O.H.).** 1 or 2 grains to 1 ounce.

[P1] **Hauftus Hyoscinæ (Mid. H.).**

Hyoscyne hydrobromide $\frac{1}{8}$ gr., compound tincture of lavender 5 m., chloroform water to 1 oz. For the sequelæ of encephalitis lethargica.

[P1-§1] **Lamellæ Hyoscinæ.** *Syn.* LAMELLÆ SCOPOLAMINÆ (R.L.O.H.) contain $\frac{1}{8}$ gr., $\frac{1}{16}$ gr. or $\frac{1}{32}$ gr. grain.

[D-P1-§1] **Nebula Hyoscinæ Composita (B.P.C.).** An aqueous spray containing hyoscyne hydrobromide 0.057% w/v, cocaine hydrochloride about 0.8% w/v, and atropine sulphate about 0.1% w/v.

[P1] **Oculentum Hyoscinæ (B.P.).** 0.125% of hyoscyne hydrobromide in simple eye ointment.

Scopolamine-Morphine Anæsthesia.

Hyoscyne hydrobromide, $\frac{1}{8}$ gr. to $\frac{1}{4}$ gr. or more, and a salt of morphine $\frac{1}{4}$ to $\frac{1}{2}$ gr., are injected on the evening before the operation, and a similar or higher dose in the morning before the operation. This alone may suffice to produce deep sleep. If not, ether or chloroform may be given until complete anæsthesia occurs. Patients sleep for hours through the first painful periods after the operation.

Morphine-scopolamine narcosis advocated for routine use as a preparation for surgical anæsthesia in children over one year of age. The solution, given hypodermically, contains 0.01 g. of morphine and 0.0005 mg. of scopolamine per ml. At 12 years the whole dose is injected; under 10, three-quarters; under 6, a half; under 4, a third; under 2, a quarter. Anæsthesia begun and consciousness regained with much less distress, and danger of syncope at onset reduced. Employed without ill-effect in over 800 children.—P. F. Armand-Delille, *Bull. Acad. Méd., Paris*, 1932, 890.

The "Twilight Sleep" method of inducing child-birth was introduced with the object of enabling the woman to pass through labour without either the consciousness or remembrance of pain. One of the physiological effects of scopolamine is to induce temporary loss of memory, and it is employed for this purpose in conjunction with morphine, both drugs being given by hypodermic injection. The first injection is given as soon as labour has begun and consists of $\frac{1}{4}$ to $\frac{1}{2}$ gr. of morphine and $\frac{1}{16}$ to $\frac{1}{8}$ gr. of

scopolamine, the larger dose in each case being reserved for the strong, robust type of primipara. The patient is put to bed and the room darkened and all noise excluded. *The morphine must not be repeated*, but the scopolamine may be repeated as often as is necessary to produce amnesia, the second injection of $\frac{1}{4}$ gr. being given at the end of the first hour and subsequently at hourly intervals.

While the method has certain advantages, it is not as successful as was originally claimed, and it is subject to some serious disadvantages, of which the most important are the frequency of cyanosis, both of mother and child, the constant supervision required, and the complete failure to produce narcosis in a certain number of cases. See also Gwathmey's Synergistic Theory (Magnesium Sulphate and Morphine), p. 150.

Scopolamine-morphine narcosis in labour. In 25% of cases result very good, in 15% good, and in 10% no benefit.—J. S. Quin, *Lancet*, i/1929, 668. "Twilight Sleep" given as routine in hundreds of cases.—G. W. Theobald, *Brit. med. J.*, ii/1930, 664.

Three doses of hyoscine hydrobromide given hypodermically at $\frac{1}{2}$ -hourly intervals when regular pains commence (in primiparae when cervix is three fingers dilated), and repeat every 2 hours as long as labour lasts. Up to $\frac{1}{8}$ gr. used without ill effect. Chloroform given in second stage. Important not to omit last (third) injection, even if child about to be born. Excellent results and no ill effects on babies.—A. M. Clay, *Brit. med. J.*, ii/1931, 12.

Hyoscine $\frac{1}{16}$ gr. in 2 ml. of 50% magnesium sulphate solution adopted as routine as a reasonable analgesic in labour. Safe and fairly effective. One dose usually enough.—R. Kelson Ford, *Brit. med. J.*, ii/1930, 726.

An analysis of 50 cases of amnesia in labour using hyoscine hydrobromide alone. Entirely safe for mother and child. Labour not delayed, puerperal morbidity not increased, and babies born without circulatory or respiratory defects: not suitable for domiciliary midwifery.—T. Barnet, *Brit. med. J.*, i/1934, 940.

[P1-81] **Genoscopolamine** (*Amido Laboratories, Paris; Wilcox, Jozseau, London*). Nitrogen oxide of scopolamine in granules containing 0.5 mg. (dose—2 three times daily), drops (dose—20 drops = 1 mg. of Genoscopolamine, three times daily), or ampoules of 1 ml. (= 1 mg.) for subcutaneous injection. Has a therapeutic action similar to that of scopolamine but is less toxic.

[P1-81] **Vasano** (*Schering, London*). Camphoric acid salts of L-scopolamine and L-hyoscyamine. Dose.—2 dragées each of 0.0075 gr. Prophylactic against travel sickness.

[P1-81] **Duboisine Sulphate**. Dose.— $\frac{1}{40}$ to $\frac{1}{20}$ grain (0.00025 to 0.001 g.). An alkaloidal sulphate from *Duboisia myoporoides* (Solanaceae) consisting chiefly of hyoscyamine sulphate. A deliquescent yellowish-white crystalline powder. Used as a mydriatic in solution (0.2 to 0.5%) or ointment.

Samples of Australian *Duboisia myoporoides* contain hyoscine but no trace of hyoscyamine. In addition they contain four new alkaloids: tiglyl-pseudo-tropeine, mono-isovaleryl-dihydroxytropeine, isovaleryl-nortropeine, and *d*- α -methylbutyrylnortropeine. A commercial sample of duboisine sulphate was found to consist almost entirely of hyoscyamine sulphate with no trace of hyoscine.—G. Barger, W. F. Martin and W. M. Mitchell, *J. chem. Soc.*, 1937, 1820; *ibid.*, 1938, 1885.

[P1-81] **Guttæ Duboisinæ** (*R.L.O.H.*). Duboisine sulphate 1 gr., sterilised water to 1 oz.

[P1-81] **Dulcamara** (*B.P.C.*). *Syn.* WOODY NIGHTSHADE, BITTER-SWEET (*Fr. Cx.*).

The dried stem and branches of *Solanum Dulcamara* (Solanaceæ). Alterative and diuretic; was formerly used in dropsy and in psoriasis and other skin diseases. Now practically obsolete.

[P1] **Infusum Dulcamaræ**. 1 in 10. *Dose*.—1 to 2 ounces.

[P1] **Lactuca** (B.P.C.). *Syn.* LETTUCE, WILD LETTUCE.

The fresh flowering herb, *L. virosa* (Compositæ). A mild sedative and hypnotic; used in irritable cough. Contains traces of a mydriatic alkaloid, possibly hyoscyamine.

[P1] **Extractum Lactucæ** (B.P.C.). *Dose*.—5 to 15 grains (0.3 to 1 g.).

A soft extract prepared from the fresh juice. A mild sedative for cough.

Lactucarium. *Syn.* LETTUCE OPIUM. *Dose*.—5 to 15 grains (0.3 to 1 g.).

The dried latex of lettuce. Brownish masses with opium-like odour and bitter taste, partly soluble in alcohol and in ether.

[P1-S1] **Scopolia** (B.P.C.). *Syn.* SCOPOLA.

Dose.—1 to 2 grains (0.06 to 0.12 g.). The dried rhizome of *S. carniolica* (Solanaceæ).

Contains about 0.4% of alkaloids, chiefly hyoscyamine. Resembles belladonna in action but is seldom used.

[P1-S1] **Folium Scopoliæ** (P. Jap. V). The dried leaves of *S. japonica*, known as Japanese belladonna, and containing not less than 0.15% of hyoscyamine.

ICHTHAMMOL

B.P.

Syn. and Prop. Names. AMMONIUM ICHTHOSULPHONATE (Fr. Cx.), AMMONIUM SULPHO-ICHTHYOLATE (P. Ital. V, F.E. VIII, P. Jap. V), AMMONIUM SULFOBITUMINOSUM (P. Helv. V), AMMONIUM BITHIOLICUM (P. Belg. IV), ICHTHOSULPHOL, ICHTHYOL, PERICHTHOL (British Drug Houses, London), SUBITOL (C. Zimmermann, London).

Dose.—5 to 10 grains (0.3 to 0.6 g.).

A viscous, almost black substance with a disagreeable odour, consisting chiefly of the ammonium salts of the sulphonic acids of an oil prepared from a bituminous schist.

It contains not less than 10.5% of organically combined sulphur, and sulphur as sulphates is not more than one-quarter of the total S. It contains not more than 50% of water.

Soluble in water; partly soluble in alcohol 90% and in ether; miscible with glycerin and fixed oils.

Uses. Internally it is mildly antiseptic and irritant to the gastro-intestinal tract and has been given for rheumatism and skin affections, and as an intestinal antiseptic in constipation and dyspepsia. Externally it is used in chronic skin diseases, such as eczema, furunculosis, psoriasis and acne. Applied on wool as vaginal tampon, and used as pessaries and suppositories in cervicitis and vaginal discharges. For pruritus and ulcers a 10% solution is used, and may be combined with lead and mercury without the formation of sulphides. For burns it may be used mixed with zinc oxide or bismuth (the powder being spread

evenly over the surface), or in ointment (10 to 50%). In mumps the swelling and pain are said to be rapidly relieved by inunctions of equal parts of ichthammol and lanolin. Gonorrhœa has been treated by intramuscular injection of 2% solution (diluted just before use) in doses of 3 ml. every second or third day.

ROSACEA. In the first and second stages ichthammol is a most useful therapeutic agent; it should be applied locally in the form of lotions or ointments and internally in the form of pills or capsules commencing with 5 gr. on an empty stomach, morning and evening, increased to 7½ and then 10 gr. and upwards until the desired results are obtained.—A. Furniss, *Prescriber*, 1939, 382.

Collodium Ichthammolis (B.P.C.). Ichthammol 1 in simple collodium q.s. to 8. Used for eczema, erysipelas and other skin diseases.

Collodium Ichthammolis cum Æthere (B.P.C.). Ichthammol 1 in ether and simple collodium q.s. to 4.

Gelatinum Zinci et Ichthammolis (B.P.C.). *Syn.* PASTA ZINCI ET ICHTHAMMOLIS, UNNA'S PASTE WITH ICHTHAMMOL.

Ichthammol about 2% in a basis of zinc oxide and glycerogelatin.

Glycerinum Ichthammolis (B.P.C.). Ichthammol 10% w/w in glycerin.

LYMPHANGITIS well treated with glycerin and ichthammol.—H. W. Webber *Brit. med. J.*, i/1931, 206.

Parogenum Ichthammolis (B.P.C.). *Syn.* ICHTHAMMOL VASOLIMENT. 10% w/v.

Oculentum Ichthammolis cum Zinci Oxido (Mid. H.).

Ichthammol 1, zinc oxide 15, yellow soft paraffin to 100. For chronic blepharitis.

Pasta Ichthammolis (B.P.C.). *Syn.* GELATINUM ICHTHAMMOL. Ichthammol 10% in a glycerogelatin basis.

Pessus Ichthammolis contains 10 gr. (0.6 g.) in glycerin suppository basis to 120 gr. For leucorrhœa.

Ichthammol pessaries are sometimes required to be made with oil of theobroma basis. They are also made with resorcinol 3%, and these must be made with oil of theobroma.

Pilula Ichthammolis.

Ichthammol 2½ gr., compound tragacanth powder ½ gr., powdered liquorice 1½ gr. Make a pill on hot plate if necessary.

Suppositorium Ichthammolis (B.P.C.) contains 3 grains of ichthammol in glycerin suppository basis.

Suppositories may contain 3 grains (0.2 g.) with a basis of theobroma 12 grains. The mixture must be almost "set" whilst pouring into the moulds, otherwise it may separate. The addition of beeswax is not desirable; indeed a large proportion will render the suppository quite insoluble. Ichthammol pessaries or suppositories in a glycerogelatin base must not be overheated or they may become insoluble.

If a stiffer preparation is required than that obtained with glycerin suppository mass, the following proportions are satisfactory:—Ichthammol 10, glycerin 60, gelatin 16, water 14.

Tampons may be prepared with 5, 10 or 20% of ichthammol in glycerin.

Unguentum Ichthammolis (B.P.C.). 10% in wool-fat ointment.

Unguentum Ichthammolis Compositum (B.P.C.). Ichthammol 9%, with sulphur, starch, resorcinol, betanaphthol and salicylic acid in wool-fat ointment.

Unguentum Ichthammol et Zinci Oxidi (*R.L.O.H.*) has ichthammol 8 gr., zinc oxide 15 gr., yellow soft paraffin to 1 oz.

Ichtholdine (*Sharp & Dohme, London*). A preparation containing ichthylol, iodine, phenol, hydrastine hydrochloride, boroglyceride and eucalyptol. For treatment of chronic inflammatory conditions of the mucous membranes, *e.g.*, endometritis, ulceration of the cervix and vagina, etc.

Thigenol (*Roche Products, Welwyn Garden City*) is the sodium salt of a synthetic sulpho-oleic acid, containing 2.85% of S. Soluble in water, glycerin, alcohol; miscible with fats and oils. A 5% ointment relieves eczema. Tampons and pessaries also available.

[P2] **Vaginoids** (*Sharp & Dohme, London*). Suppositories containing ichthylol 1½ gr., phenol 2 gr., iodine (combined) ½ gr., zinc phenolsulphonate 1 gr., in a glyco-gelatin basis. For ulcerations of the cervix and vaginal inflammations.

Sphagnol (*Peat Products, London*). A native tar product produced from peaty deposits. In blepharitis, eczema, piles, sores and burns. Detergent and relieves insect bites in tropical countries. Ointment (10%), Medical Soap (15%), Toilet Soap (5%), Shaving Soap (5%) and Suppositories (3 gr., for piles) are made.

INFUSA

Infusions are dilute solutions of the water-soluble extractives of vegetable drugs, prepared by macerating the drugs in hot or cold distilled water for a short period of time, usually 15 minutes, and then straining. Cold water must be used if the drugs contain an appreciable amount of starch. Infusions are chiefly used as vehicles for other drugs, and are consequently of either an aromatic or bitter nature.

The infusions in the *B.P.* and *B.P.C.* are of two types:—(a) freshly prepared infusions which must be used within 12 hours of preparation, and (b) infusions prepared by diluting concentrated preparations with 7 times their volume of distilled water.

Tisanes. Infusions or teas (usual strength 1 in 10) of herbs are largely used by the laity in France, Italy, etc.

Preservation. Freshly-made infusions are preferable to preserved or concentrated infusions, but if it is necessary to store infusions the following methods are recommended in descending order of preference:—(1) Fresh infusions sterilised by heat and drawn off aseptically. (2) Concentrated infusions made with water and treated similarly. (3) Concentrated infusions preserved with alcohol, 10% being required for infusions of clove and senna and 15% for all others. Fresh infusions of quassia, calumba and senna should be boiled after preparation. Resistant organisms in calumba should be destroyed by boiling the aqueous extracts during the preparation of the concentrated infusion or by boiling the finished product.—K. Bullock and C. J. L. Elsdon, *Quart. J. Pharm.*, 1937, 413.

Decocta.

Decoctions of drugs are usually prepared 5% (unless otherwise stated) by boiling the drug in coarse powder with distilled water for 10 minutes and straining. If necessary a few drops of chloroform will preserve fresh decoctions for a reasonable period of time. For various decoctions consult index.

Concentrated decoctions are prepared commercially as a general rule "1 to 7." They should contain at least 20% of alcohol as a preservative. Fresh decoctions are preferable.

INSULINUM

B.P., Fr. Cx., P. Belg. IV.

Syn. ORDINARY INSULIN, REGULAR INSULIN, SOLUBLE INSULIN.
[P1] "*Insulin.*"

[86] "*Insulin—specify the number of units as defined in the British Pharmacopœia contained in a specific quantity of the preparation.*"

[87] *Medicines made up ready for the internal treatment of human ailments containing insulin must be labelled with the words "Caution. It is dangerous to take this preparation except under medical supervision" instead of the word "Poison."*

The original patent (Br. Patent No. 203,778) was taken out by F. G. Banting, J. B. Collip and C. H. Best in the name of Toronto University, and the British rights were given to the Medical Research Council.

The Therapeutic Substances Act, 1925, and Regulations, 1931, control the manufacture under licence, standard, quality, containers, etc. Further Regulations, Part III, Sec. 9 (2), Aug. 1, 1931, provide for the addition of preservative to preparations like insulin, sealed in containers holding more than one dose.

The relation of the pancreas and diabetes was established by the experiments of Von Mering and Minkowski; extirpation of the pancreas in dogs was followed by persistent glycosuria. The pancreas consists of two types of tissue, the *acinar*, secreting the pancreatic juice (*external* secretion), which reaches the intestine through the pancreatic duct, and groups of cells, known as the "*islets of Langerhans.*" The latter show pathological changes in varying degree in most patients dying of diabetes mellitus.

The islets of Langerhans were proved to contain a substance which lowers the blood sugar, and diminishes or abolishes excretion of sugar in the urine of diabetic dogs. Subsequently, by extracting foetal or adult normal pancreas with alcohol, an extract was made which caused a lowering of blood sugar, and of the glucose in the urine, when injected into a boy suffering from the disease. The alcohol evidently prevented the destruction of the principle by the digestive ferments.

On injection, it converts glucose into the active form, and if given at proper intervals blood sugar is maintained at normal level, and the urine remains free of sugar. Fat is completely oxidised. Acetone bodies disappear from the urine and diabetic acidosis and coma are prevented—a restoration to normal metabolism.

It is now becoming generally recognised that no tissue, other than that of the pancreas itself, contains insulin that can be extracted by the methods now available. Best and his co-workers have developed improved methods and repeated much of the earlier work on the extraction of insulin from various substances. Not only have they failed to find any evidence of the presence of insulin-like substances in various vegetables, but they have failed to find any extractable insulin in the blood, liver, spleen, kidney or muscle. Consequently, when an extract which acts like insulin is obtained from a tissue other than the pancreas, it is reasonably certain that the tissue concerned must be of pancreatic origin.—M. H. Power, R. W. Cragg and M. C. Lindem, *Proc. Mayo Clin.*, 1936, 101.

The old concept that every case of clinical diabetes was due to a dysfunction of the islands of Langerhans should be abandoned, and in its place should be substituted the broader concept that many, if not all, the characteristic features of clinical diabetes may be produced by agencies acting outside the pancreas. This concept does not in any way diminish the paramount importance of insulin in the regulation of carbohydrate, fat, and protein metabolism.—C. N. H. Long, *Proc. Mayo Clin.*, 1937, 238.

Manufacture. The method described in the *B.P.* involves the extraction of minced pancreas, which must be used fresh or kept frozen, with alcohol and hydrochloric acid. The filtrate is evaporated and treated with stronger alcohol, and the filtrate treated with dehydrated alcohol. The resulting precipitate is collected, dissolved in water and the active material separated by adjusting to the isoelectric point (which corresponds to a pH of between 5 and 6), or by treatment with trinitrophenol (picric acid). In the former case, the precipitate is dried and powdered. In the *picrate method* used in Gt. Britain (Brit. Patent 216,978, M.R.C. and H. W. Dudley), the precipitate is dissolved in an acidified aqueous-alcohol solvent, the insulin re-precipitated by pouring into acetone, and the precipitate dried.

[P1-87] **Crystalline Insulin.** The first crystalline insulin was obtained by Abel (*Proc. nat. Acad. Sci.*, 1926, 12, 132) by precipitating impurities from crude insulin in weak acetic acid solution by means of brucine, and then precipitating the insulin by the addition of N/6 pyridine. A potency of 40 units per mg. was claimed. Although other workers have claimed the isolation of crystals with activities very much greater than this—even up to 400 units per mg.—these results have not been confirmed. Culhane *et al.* (*Biochem. J.*, 1929, 397) found the activity of preparations obtained by Abel's and other methods to be 23 to 27 units per mg. Scott (*Biochem. J.*, 1934, 1532) showed that crystalline insulin contained zinc, and if electro-dialysed to remove the metal it could not be crystallised. Crystallisation was found to be facilitated also by the presence of salts of other metals such as cadmium, nickel and cobalt. The ashes of crystalline insulins prepared with each of these metals contained a constant proportion of metal, and were proportional to the atomic weights of the metals each contained, thus indicating that the metal was in chemical combination in the crystals.

Ordinary commercial insulin was found to contain appreciable amounts of zinc, and in view of the action of zinc in slowing up the action of insulin, a plea is made for the standardisation of zinc-content of the commercial substance.—*Pharm. Weekblad.*, 1938, 1939, per *Analyst*, 1939, 129.

The administration of zinc to diabetic patients increases the blood sugar. Zinc also increases the antidiuretic activity of the pituitary posterior lobe and the secretory action of histamine, while with adrenaline it produces hyperglycæmia. It is essential therefore that the zinc content of commercial insulin should be standardised.—E. H. Vogelenzang and L. A. Hulst, *Acta med. Scand.*, 1939, 97, 307.

Chemical Composition and Stability.

The empirical formula obtained for Abel's crystalline insulin is $C_{45}H_{78}O_{17}N_{12}$. Values for the molecular weight vary from about 10,000 to 37,000 according to the method, most results being

nearer the higher figure. Insulin obtained by precipitation at the isoelectric point is an amphoteric protein giving soluble salts with weak acids or alkalis. Strong acids precipitate the solutions and strong alkalis destroy the activity. It is most stable in acid solutions at low temperatures. Heating at 80° with 1% sodium chloride for 1 to $1\frac{1}{2}$ hours causes coagulation. It is inactivated by proteolytic enzymes, e.g., trypsin, pepsin or papain, hence the ineffectiveness of insulin *per os*.

[P1-87] **Insulin in Solution (B.P.)** is obtained by dissolving the dry powder in water acidified to give a reaction between pH 3 and pH 4. *B.P. Add. I* requires that when insulin is prescribed, insulin in solution containing 20 units per ml. shall be dispensed unless some other strength, or insulin in tablets, is specified. It was originally required to contain an antiseptic at least as effective as 0.5% of phenol when distributed in containers holding more than one dose. *B.P. Add. I* makes the addition of an antiseptic optional, stating that "it is usual to add a sufficient proportion of some antiseptic to prevent the growth of any organism which may be accidentally introduced in the process of removing a portion of the contents of the container."

Solutions with pH 3 to 4 are themselves germicidal, but a slight increase of alkalinity destroys germicidal action and actually converts it into a culture medium if no preservative is present; the presence of the usual proportion of phenol suffices to keep it germicidal.—P. Hartley, *Lancet*, ii/1931, 584. Insulin and preservatives.—*Prescriber*, 1931, 406.

While insulin alone in normal dosage has no effect on the size of the heart-beat of the rabbit, and in 16 times the normal dosage the size of the beat decreases only very slightly, solutions containing cresol or phenol in the concentration in which they are normally used as preservatives cause a marked decrease in the size of the heart-beat. The alleged slowing of the heart-beat by insulin is due to the preservative used in commercial insulin solutions.—M. M. O. Barrie, *Quart. J. Pharm.*, 1936, 485.

[P1-87] **Insulin in Tablet Form (B.P.)** is obtained by compressing the dry powder mixed with a neutral diluent.

Units. A unit was originally taken as the amount of insulin which on subcutaneous injection lowers the percentage of blood sugar to 0.045 within 4 hours in a rabbit weighing about 2 kg. from which food has been withheld for 16 to 24 hours. Such insulin was first prepared so that 1 ml. contained 1 unit.

Subsequently the "clinical unit" was adopted. It was one-third the original Toronto unit, and was defined as one-third of the amount of material required to lower the blood sugar of a 2 kg. rabbit which has fasted for 24 hours from the normal level of 0.118% to 0.045% in 5 hours. In 1925 a unit based on a definite weight of a sample of crystalline insulin hydrochloride prepared by the National Institute for Medical Research was accepted internationally. Simultaneous determinations of the activity of this sample made by the National Institute, the Insulin Committee of the University of Toronto, and three other laboratories in the U.S.A. and in this country, varied only between 8.4 and 8.8 clinical units per mg. of the dried preparation. It was agreed to

regard this sample as containing 8 units. In 1935 the Permanent Commission on Biological Standardisation decided that henceforth *one international unit would be defined as the specific activity contained in $\frac{1}{5}$ mg. of the new standard crystalline insulin preparation held by the Insulin Committee of Toronto University and the National Institute for Medical Research.* The unit of the B.P. is the activity contained in such an amount of this standard preparation as the M.R.C. may indicate to be equivalent to the international unit.

Dose.—(B.P.). By subcutaneous injection, 5 to 100 units.

Commence with 5 units twice a day—half an hour before breakfast and supper respectively. Most of the food should be taken in these two meals. If after 3 days of this dosage glycosuria still persists, the dose must be raised gradually, first to 10 and 10, and later 15 units or more, if required. On the 7th day test every 2 hours to get a further idea of the effect. By the 11th day all sugar and acetone may have disappeared from the urine, and the blood picture may have become normal. This may represent the permanent balance of diet and insulin, but more often the patient's pancreas improves so that by the 13th day 15 and 10 units are too much—12 and 8 units may suffice. Patient's tolerance may continue further, and still less insulin may be needed.

The most common error is to give too little insulin. Many doctors seem afraid to give doses of more than 10 units twice a day. The proper dose is that which the patient needs, and is always an individual one. Another difficulty is the necessity of varying dosage from time to time. No patient can continue on the same dose of insulin year in and year out, and if the necessary adjustments are not made, the patient will not be kept well. In added illness, especially a febrile one, the whole blood sugar picture moves upwards with the same dose of insulin, and ketosis might result and the patient be liable to go into diabetic coma. Therefore, in any added illness, it is essential to increase the insulin; this is most easily done by adding to the two daily doses a third in the middle of the day. When sickness and vomiting occur, if the patient can keep nothing down, it is a mistake to cut off the insulin entirely, but half the usual dose should be given, otherwise the blood sugar will rise.—R. D. Lawrence, *Brit. med. J.*, ii/1935, 1066.

Technique of Injection. Insulin is given subcutaneously (it may be given intravenously in coma), the skin having been previously sterilised. Wherever possible, patients should always be taught to give their own injections, the best sites being the front of the thighs, the abdomen and the lower part of the chest. Before breakfast the abdomen is a good site, and during the day the thigh in women and the skin below the knee in men are the most convenient. Pain is minimised by using a fine sharp needle and inserting at right-angles to the skin. It is less painful to inject the insulin quickly than slowly, and stinging is less likely to be felt if the site of injection is pinched as the insulin enters. The stinging due to the acidity of the injection can be entirely prevented by mixing in the syringe one-quarter the volume of 6% sterile sodium bicarbonate. The alkali must not be introduced into the insulin bottle. To avoid local fatty atrophy the site of injections is changed every week or 10 days, and no two punctures should be made in exactly the same spot within 24 to 48 hours.

Insulin Suppositories. Tests with insulin suppositories made on rabbits and healthy human beings showed that the action of insulin introduced in this manner attains its maximum in 30 to 40 minutes and then subsides rapidly. Larger doses of insulin increase the intensity and duration of action. Suppositories of cocoa butter were ineffective, but a mixture of palmitic acid and cocoa butter in the proportion of 15 to 85 proved effective in preserving the efficacy of the insulin. The suppositories proved to be of clinical value.—B. Brahn, *Lancet*, i/1940, 829.

Diet must be strictly controlled, especially as regards carbohydrate content. It is obviously impossible to devise a standard diet, since the dietetic requirements must be varied to suit the individual case. According to Lawrence (*The Diabetic Life*, 1939) a satisfactory diabetic diet must be flexible and able to meet the following requirements: (1) It must supply the correct calorific requirements of the individual; (2) It must contain sufficient carbohydrate to prevent ketosis; (3) It must satisfy the patient in quantity and quality as far as possible; (4) It must be accurate, simple to calculate, and varied. In order to meet these requirements, Lawrence devised the "*Line-Ration*" diet scheme. This is presented in the form of a card (H. K. Lewis & Co. Ltd.) printed in two colours, the left-hand column in black giving a list of carbohydrate foods, and the right-hand column in red giving a list of protein and fat foods. One black portion contains 10 g. of carbohydrate and one red portion $7\frac{1}{2}$ g. of protein and 9 g. of fat, and any black portion may be taken with any red portion to form one "line-ration." Equal numbers of black and red portions must usually be taken together, but the doctor at his discretion may prescribe more blacks than reds, especially for insulin cases. A suitable diet on which to begin insulin treatment is 15 blacks (150 g. of carbohydrate) and 10 reds, with most of the carbohydrate given at breakfast and the evening meal before which insulin is injected. In cases that do not require insulin a qualitative diet without preoccupation with total calories is sufficient, but with insulin cases it is always essential to give a regular fixed amount of carbohydrate to balance the correct dose of insulin.

High Carbohydrate Diet. Some workers have advocated diets containing a normal amount of carbohydrate, i.e., up to 350 or 400 g. per day, with a very low intake of proteins and fats. Rabinowitch has shown that by keeping the calories low, with very little fat, no more insulin is needed than with moderate carbohydrate and higher fat diets. Each patient is placed initially on a diet containing carbohydrate 133 : fat 61, further carbohydrate being added according to the patient's requirements in the form of Rabinowitch equivalents, which are as follows:—Any one of the following may be substituted for one slice of bread = 1 oz.: Two apples; two oranges; two grapefruit; three level dessertspoonfuls of cream of wheat; three level dessertspoonfuls of any one of the following: Wheat, barley, buckwheat, corn, cornmeal; two level dessertspoonfuls of rice; four heaped dessertspoonfuls of oatmeal; two heaped dessertspoonfuls of dried beans; two heaped dessertspoonfuls of dried whole peas; one cupful of toasted cornflakes;

one banana; one potato; five soda biscuits; four teaspoonfuls of jam or marmalade; three teaspoonfuls of sugar. Any one of the following may be substituted for one and one-half slices of bread = $1\frac{1}{2}$ oz.: One shredded wheat; macaroni, eight strips, each being 8 inches long. (*N.B.* The cereals must be measured uncooked.)

Experience has shown that the assumption that increase in carbohydrate necessitates a proportional increase in insulin dosage is entirely false; although generally speaking it is true that 1 unit of insulin is required to metabolise 1 g. of glucose, this only holds good for the first 15 or 20 units; thereafter large amounts of carbohydrates may be added to the diet only with a relatively small increase of insulin. In America as much as 300 to 350 g. of carbohydrates have been included in the diabetic diet with striking results, though this often necessitates dosage of 100 units daily. Special diabetic foods are not only unnecessary but actually objectionable. High carbohydrate diet clears up the arteriosclerosis common in diabetics by reducing the blood pressure.—S. C. Dyke, *Lancet*, i/1932, 979.

A method of treatment, the fundamental idea of which is to give glucose covered by the necessary amount of insulin, as opposed to the general practice of insulin covered by glucose, i.e. give the maximum of sugar and the minimum of insulin. Blood-sugar estimations unnecessary. Diet chart given. Steady and automatic recovery of 41 cases at U.C.H.—H. P. Himsworth, *Lancet*, ii/1932, 165.

Obese patients do well on a low-calorie diet without insulin, with resulting weight reduction. If such patients are put on a diet that maintains their weight large doses of insulin are needed to control the diabetes.—F. Fetter et al., *J. Amer. med. Sci.*, 1938, 195, 781.

Hypoglycæmia: Effects of Excessive Dose. There is a rapid fall of blood sugar to below normal following the injection of an overdose of insulin, a minimum being reached in 3 to 5 hours, the effect passing off in 5 to 12 hours according to the dose. The normal amount of blood sugar is 0.08 to 0.12% (fasting), or 0.13 to 0.17% after a carbohydrate meal. If the level falls to 0.06 to 0.07% symptoms of hypoglycæmia appear. In untreated diabetics who have become accustomed to a higher level, symptoms of hypoglycæmia may occur at higher levels.

The early symptoms are weakness, shakiness of the limbs, hunger, nervousness and fear. Mental confusion and diplopia may occur, with sweating and palpitation. Later, convulsions and coma may occur. The condition comes on gradually and is never dangerous if treated within 15 minutes of onset. Glucose or 2 lumps of ordinary sugar should be taken at once with water, and may be repeated in 15 minutes if needed. If coma occurs dextrose should be given intravenously (1 oz. in 20 to 50% solution), or sugar may be given orally, by stomach tube or *per rectum*. At the same time 1 ml. of 1 in 1000 adrenaline solution hypodermically or 1 ml. of pituitrin intramuscularly should be given.

Suitability of the Case. All cases, except those in whom immediate insulin treatment is indicated (*vide infra*), should be given a basal maintenance diet but not put to bed unless severe weakness is present.

The diet must be restricted as to carbohydrates, with a moderate amount of protein and fat. If at the end of the week's treatment on basal diet, the urine is not free of sugar, the patient requires

insulin. If the urine becomes sugar-free on this diet, insulin is unnecessary and the diet should be gradually increased, especially the carbohydrate, until it is adequate for the patient's ordinary duties.

There is no evidence as yet that the treatment is curative, but the disease can certainly be arrested and health restored by insulin. It is not recommended unless the treatment can be continued. The initial stages of treatment should be carried out in connection with facilities for blood and urine sugar estimations.

Patients Suitable for Immediate Treatment by Insulin.

All child diabetics, except those of the mildest degree; patients at all ages who show under-nutrition, ketosis and dehydration; diabetics who are found to be suffering from an acute septic infection such as carbuncle or whitlow, or from a generalised acute infection such as influenza; diabetics on whom it is proposed to perform a surgical operation requiring a general anæsthetic; all patients in whom it is evident that coma is threatening.

There is considerable evidence that two types of diabetes can be differentiated on the basis of the speed with which they react to insulin. In one type, the *insulin-sensitive* type, insulin comes into action rapidly; in the other, the *insulin-insensitive* type, insulin comes into action slowly. The evidence is compatible with the suggestion that the disease in the sensitive type is due to deficiency of insulin, while in the insensitive type the disease is due not to a lack of insulin but to impairment of insulin action. At present, although there is evidence that the anterior pituitary gland may be responsible for the diabetes associated with hyperpituitarism the indictment of the pituitary gland as a primary factor in ordinary cases of human diabetes mellitus rests purely on analogy.—H. P. Himsworth, *Brit. med. J.*, i/1940, 719.

Complications. While there are no contraindications to the use of insulin certain complications arising during the treatment may necessitate modifications in dosage, etc.

Acute infections, such as influenza and pneumonia, cause a lowering of the sugar tolerance and an increased hyperglycæmia and ketosis, and necessitate a large increase in the dose of insulin, and the administration of sufficient fluids and dextrose.

Local septic conditions, such as boils, carbuncles, septic teeth, also give rise to increased hyperglycæmia and ketosis and call for additional carbohydrates in the diet and larger doses of insulin. Similar steps are necessary in the preparation of diabetic patients for emergency surgical operations.

Pregnancy. In the latter half of pregnancy hyperglycæmia is likely to occur, requiring the use of more insulin, while after childbirth hypoglycæmia is a probable emergency calling for a reduction of insulin.

Heart disease. In elderly subjects, or those suffering from myocardial disease, care must be taken to avoid too sudden a lowering of the blood sugar, and insulin dosage must be increased gradually. It must be used with great care in patients with a tendency to angina.

Gangrene. In elderly and arteriosclerotic patients great care must be taken to avoid gangrene of the feet, e.g., by the wearing

of warm socks and comfortable shoes. These patients should also be warned against cutting their corns.

DIABETIC NEURITIS. On the basis of the theory that most of the neuritic symptoms commonly met with in diabetics are due to the ischæmia of endarteritis, sodium chloride 15 to 90 g. daily by the mouth has been given in order to produce a vasodilating effect. All cases so treated obtained complete or marked relief of the symptoms.—H. R. Sandstead and A. J. Beams, *Arch. int. Med.*, 1938, 61, 371.

Treatment of Coma. Treat as for collapse, clear bowels with enema, or wash out the stomach and give as much fluid as possible orally, *per rectum*, or preferably intravenously if the patient cannot swallow. If not completely comatose, 2 drachm doses of sodium bicarbonate should be given 2-hourly to counteract acidosis, until the urine becomes alkaline. Give also insulin 40 or 50 units with dextrose 40 or 50 g. *per os*, repeating every 4 hours until the ketonuria disappears, reducing the insulin if the urinary sugar is decreased in amount. During this treatment give abundance of fluid by the mouth. If coma is complete, large quantities of injection of sodium chloride and acacia should be given intravenously, together with insulin and dextrose in quantities as above, the initial dose of each being given intravenously.

Severe cases of coma can only be effectively dealt with in hospital, and in these cases the practitioner is advised to give 50 units of insulin intravenously, with sugar and fluids if possible, and to pass on the case at once.

As a result of a study of 86 patients with diabetic acidosis, the following treatment is recommended:—(1) Immediate parenteral administration (one half intravenously, the remainder subcutaneously and intraperitoneally) of 60 ml. of a sixth-molar solution of racemic sodium lactate per kg. of body weight. (2) Immediate administration of 2 units of insulin per kg. of body weight. (3) Administration of 40 ml. of Ringer's solution per kg. of body weight as soon after the administration of sodium lactate as possible. (4) Repeated administration of insulin 6 hours later in a dose of 0.5 unit per kg. of body weight. (5) Transfusion of citrated whole blood or plasma (20 ml. per kg. of body weight) if oedema due to reduced plasma protein develops.—A. F. Hartmann and M. Morton, *Arch. intern. Med.*, 1935, 413.

Administration of vitamins B₁ and B₂ has been found successful in interrupting coma in non-reversible cases of insulin shock. Patients who previously had awakened with 33% dextrose solution in quantities of 70 to 140 ml. and then failed to do so with 50% dextrose solution (400 ml.) were roused in 20 or 30 minutes by the administration of 800 units of "Betaxan" or yeast emulsion. In other cases it was possible to lessen the hypoglycæmic state before the administration of dextrose.—R. Freudenberg, *Wien. klin. Wschr.*, i/1937, 535.

Rules for Distinguishing Insulin Coma from Diabetic Coma:

IN INSULIN COMA:—(1) Skin usually very white, but may be normal in colour. (2) Breath does not smell of acetone. (3) Respiration shallow. (4) Eyeball tension normal or raised. (5) Urine usually sugar-free, but may contain sugar if bladder has not been emptied for some hours. (6) Urine need not contain acetoacetic acid to Rothera's test, but may do so if bladder has not been emptied for some hours. (7) Blood sugar below 70 mg. per 100 ml. and may be as low as 40 mg. per 100 ml. **IN DIABETIC COMA:**—(1) Skin usually flushed. (2) Breath smells of acetone. (3) Respirations deep. (4) Eyeball tension much lower than usual. (5) Urine always contains large amounts of sugar. (6) Urine always contains large amounts of acetoacetic acid. (7) Blood sugar is over 200 mg. per 100 ml., and may be up to 500 to 800 mg. per 100 ml.—G. Graham, *Med. Pr.*, 1934 (Symposium No. 1).

Testing Expired Air for Acetone. Moisten a watch-glass with Scott-Wilson reagent and hold close to patient's mouth and nose for 2 or more minutes. Acetone reaction shown by clouding of the reagent. Of practical value in the differential diagnosis of the unconscious state, e.g., diabetic coma.

Other Uses of Insulin. Apart from its use in the treatment of diabetes mellitus, insulin is of great value in many cases of non-diabetic malnutrition and during convalescence after serious illness. In these conditions it has a marked tonic action and leads to a gain in weight and to an improvement in the general health and mental outlook. The insulin is given subcutaneously two or three times a day before meals, the treatment being continued for four or five weeks. Dosage varies with the individual case and according to whether the patient is in hospital or is ambulatory. In the former case an initial dosage of 5 units three times daily is given, increased by 5 units daily up to 20 or 30 units three times daily; in ambulatory patients the dosage must be smaller. This tonic action of insulin has also been found of value in the treatment of pulmonary tuberculosis; it is in no sense a causal treatment, but it improves the general health and well-being of the patient and increases his resistance.

During recent years hypoglycæmic shock therapy has been used with success in the treatment of schizophrenia. Treatment consists in the administration of insulin in increasing doses until the "shock phase" is reached. Commencing with 10 to 20 units, the dose is raised by 5 to 10 units every day until a state of hypoglycæmia results; in some cases, doses as high as 190 units have been given. Remarkable results have been obtained, but the treatment is dangerous and should only be carried out in an adequately equipped mental hospital, and it is essential to have immediately available suitable solutions of dextrose for intravenous injection to interrupt the hypoglycæmic state.

In addition to its parenteral uses, insulin has been employed to some extent locally as a stimulant dressing to chronic ulcers, septic abrasions and bed sores. Good results have been claimed, but this form of therapy has not met with any wide measure of support.

GENERAL REFERENCES

DIABETES. In 1922 the average life of a diabetic was 6 years; to-day patients who started treatment with insulin on its introduction 9 years ago are still alive, and a growing percentage outline their life expectancy.—E. P. Joslin, *J. Amer. med. Ass.*, ii/1931, 595.

The answer to the question "Will insulin cure me?" is that insulin cures diabetes as food cures hunger. Hunger recurs after a few hours, and the need for insulin also recurs. A wooden leg enables a lame man to walk, but not to grow a new leg. When the artificial leg is removed he falls to the ground. But the disease can certainly be arrested and health restored by insulin. It is wrong and untrue to offer more.—R. D. Lawrence, *The Diabetic Life* (1939).

Prognosis of diabetes in children. "Before the discovery of insulin the mortality of diabetes in childhood was nearly 100%, and to-day diabetes as a cause of death in the young has disappeared nearly to the vanishing point." (Priscilla White, *Diabetes in Childhood*.) No gloomy prognosis is justified in this insulin era, but continuous care and treatment are certainly necessary, and in practically every case insulin injections. A cure is not possible, but growth and development proceed normally and average weight is maintained.—R. D. Lawrence, *Lancet*, i/1934, 807. See also L. Cole, *ibid.*, 947, 998.

DYSMENORRHOEA. In a group of twelve patients, all nulliparas, suffering from primary or essential dysmenorrhœa, ten received practically total relief from menstrual pain by using insulin (from 7 to 10 units daily) from 3 to 7 days before or during the period. One patient obtained relief in one period with one type of insulin and no relief during another period with another type of insulin. Another patient was only partially relieved.—A. Altschul, *J. Amer. med. Ass.*, i/1936, 1383.

The cramp-like pains of dysmenorrhœa may be relieved by a single injection of 5 to 7 units of insulin with a supply of carbohydrate to counteract the anti-diabetogenic effect produced by the insulin.—E. W. Schrick, *Amer. J. Obstet. Gynec.*, May, 1939.

HEART DISEASE. Of value in congestive heart failure, especially in arterial and coronary syndromes. Six cases of intractable angina pectoris successfully treated with 5 units of insulin before breakfast and before the evening meal, each dose followed by 30 g. of dextrose taken with the meal, the patients continuing to take any remedies they had previously been taking. Treatment continued for from 2 to 17 weeks.—K. Shirley Smith, *Brit. med. J.*, i/1933, 696.

PREGNANCY, VOMITING OF. Combined use of dextrose intravenously with insulin hypodermically—about 2 g. dextrose in 10% solution to each unit of insulin—of value in excessive vomiting of pregnancy and in eclampsia.—*J. Amer. med. Ass.*, i/1926, 557.

PULMONARY TUBERCULOSIS. Increased appetite and progressive increase in weight with subcutaneous injections of 5 units before meals.—Morin and Bouessée (Leysin), per *Prescriber*, 1928, 187.

While insulin is not to be regarded as a cure for tuberculosis, and its systematic use in all cases is to be discouraged, it should be generally recognised as an important therapeutic measure in restoring normal appetite and digestion, and in combating loss of weight and resistance. Its use should be avoided when there is fever, active pulmonary disease, hæmoptysis, marked hypotension, and when severe reaction follows the injections. Begin with 5 units hypodermically 20 minutes before the principal meal, and follow three hours later with a glass of milk or a tablespoonful of glucose. The injection of 5 units is continued daily for the first week and increased by 5 units weekly, so that by the sixth week 30 units daily are given (15 before lunch and 15 before dinner), with milk or glucose three hours after lunch or dinner. This maximum daily dose is repeated for four or more weeks, and the whole course can be repeated at intervals, though in many cases the effects of insulin are maintained after the first course has been discontinued.—P. Ellman, *Practitioner*, i/1937, 613.

SCHIZOPHRENIA. Treated by hypoglycæmic shock, produced by means of huge doses of insulin. Method is dangerous, but 70% of full remissions claimed, although these were all early cases.—*Lancet*, i/1936, 1018.

Shock treatment of schizophrenia.—G. W. B. James and Co-workers, *Lancet*, i/1937, 1101.

In 34 cases treated by insulin shock eight obtained complete remission, i.e., disappearance of every abnormality indicative of schizophrenia, and in 15 there was improvement. An undesirable effect of the treatment is its diminution of the patient's resistance to infections, and it was often necessary to discontinue the treatment because of sore throats or boils.—E. Küppers, *Dtsch. med. Wschr.*, 1937, 377.

One year's experience leads to the conclusion that the insulin-hypoglycæmia treatment is a promising therapeutic approach to the schizophrenic problem, but since experience plays such a large role in determining efficacy and forestalling danger the method should not be attempted save in an adequately equipped mental hospital or under the immediate supervision of a well-trained psychiatrist, who should also be capable of meeting the emergencies that may arise.—E. Cameron and R. G. Hoskins, *J. Amer. med. Ass.*, ii/1937, 1246; see also C. A. Rymer *et al. ibid.*, 1249.

For the interruption of therapeutic hypoglycæmic coma the most satisfactory nasal feed is 600 ml. of 33% sugared tea. For its interruption by intravenous injection 100 ml. of 33% glucose is necessary to ensure a normal blood-sugar for a further half-hour, independent of absorption from the stomach. To ensure a normal blood-sugar for an hour after interruption by intravenous injection when absorption from the stomach cannot be relied on 250 ml. of 33% glucose should be given. For cases of "irreversible" coma or with persistent vomiting

during recovery an immediate intravenous injection of 250 ml. of 33% glucose should be given.—R. Fraser and D. A. Stanley, *Lancet*, i/1939, 140.

TONIC ACTION. Of value for increasing the weight of persistently thin people, the dose being 10 units 3 times a day about 20 to 30 minutes before meal, accompanied by a liberal, unmeasured diet. Treatment continued for several weeks. Patients gained weight rapidly and immediately, the increase tending to become less marked as weight approached normal standard, and the weight remaining constant, or continuing to increase, on omission of insulin. Local skin hypersensitiveness occurs in some cases, but hypoglycæmic reactions rare. Insulin serves as an admirable tonic both physiologically or psychologically.—H. Blotner, *J. Amer. med. Ass.*, i/1933, 91.

The majority of 100 patients so treated maintained the added weight and the improved general condition for as long as six years after discontinuing insulin and a few continued to gain. Insulin induced at least a temporary improvement even in those who did not retain the weight, and in a number of cases various complicating factors were adequate causes for the loss of the gained weight.—H. Blotner, *New Engl. J. Med.*, i/1938, 371; *Med. Pr.*, i/1939, 277.

VARICOSE ULCERS. Insulin injected, and locally, found of value.—*Pharm. J.*, ii/1925, 180. Ulcers of leg well treated.—*Brit. med. J. Epit.*, ii/1925, 10.

Several of 30 cases are described in which insulin, either in aqueous solution or as an ointment, was applied in chronic septic cases such as varicose ulcers and septic abrasions. In many of the cases treated other treatments had proved ineffective, while relief after insulin applications was very prompt.—per *Chem. & Drugg.*, i/1939, 193.

In general it may be concluded that insulin is no more satisfactory as an external dressing than a similar solution of tricresol containing no insulin.—A. R. Hunter, *Brit. med. J.*, i/1939, 773.

Insulin applied locally (12 units twice a day in the form of a wet dressing) completely healed a resistant non-diabetic ulcer of 5 months' standing in 10 days.—Per *J. Amer. med. Ass.*, ii/1925, 473.

PROTAMINE INSULIN COMPOUNDS

One of the chief drawbacks to the use of ordinary or soluble insulin is the transitory nature of its action, which necessitates the administration of two, three or even four injections daily. In 1936 Hagedorn and his Danish colleagues introduced a relatively insoluble compound, protamine insulinate, which was absorbed more slowly than ordinary insulin and thus had a more prolonged effect on the blood sugar. This new compound, though representing an important advance in insulin therapy, still suffered from certain disadvantages, one being its relative instability (it is not guaranteed to remain active for more than a few weeks) and another that even with very large doses it is seldom possible to control severe diabetes with only one dose a day.

D. A. Scott of Toronto, who had already shown that zinc is a constituent of crystalline insulin (see p. 625) and that the effect of insulin is modified by its presence, found that protamine insulinate when freed from such traces of zinc was no more prolonged in action than ordinary insulin. By the addition of small traces of zinc to protamine insulinate and the adjustment of the pH to 7.2 he produced a protamine zinc insulin compound which has a much more prolonged action than protamine insulinate and much greater chemical stability. Although, in practice, it has not been found possible to employ protamine zinc insulin in place of ordinary insulin in every case of diabetes requiring insulin treatment, its use, either alone or in conjunction with ordinary

insulin, is becoming increasingly recognised as a procedure of established therapeutic value.

[P1·87] **Protamine Insulinate.** *Syn. and Prop. Name.* PROTAMINE INSULIN, INSULIN-P, DELAY INSULIN, LEO INSULIN RETARD (*Nordisk Insulin Laboratorium, Copenhagen; Bencard, London*).

This is a compound obtained by combining insulin hydrochloride with a protamine derived from the sperm of a species of trout, *Salmo iridius*. Owing to its relative instability in a buffered solution it is issued in two bottles, one containing 5 ml. of soluble insulin (40 units per ml.) and the protamine in acid solution, and the other a 1% solution of sodium phosphate. In use, 1 ml. of the sodium phosphate solution is injected into the bottle of protamine insulinate. This produces a precipitated insoluble compound, which must be used within a month. The mixture must be vigorously shaken on every occasion before use.

Protamine insulinate has a more prolonged effect than ordinary insulin, its action lasting for about 12 hours, so that it is possible to ensure a normal fasting blood sugar concentration in the morning by giving an adequate dose in the evening. Except in fairly mild cases, however, it is usually necessary to give two injections a day, and Hagedorn himself states that the best results are usually obtained by giving ordinary insulin in the morning and protamine insulinate at night. In some cases successful results may be obtained by giving two nearly equal doses of protamine insulinate before breakfast and before the evening meal and spreading the day's carbohydrate equally over four meals a day.

For references to original papers on Protamine Insulinate see Vol. I, 21st Edn.

[P1·87] **Protamine Zinc Insulin.** *Syn.* ZINC PROTAMINE INSULIN, PROTAMINE INSULIN (WITH ZINC) SUSPENSION.

Dose.—As initial dose, about two-thirds the number of units of ordinary insulin necessary daily to maintain the patient sugar-free. It is usual to administer sufficient to maintain the patient on a single daily dose, *i.e.*, between 20 and 60 units given subcutaneously about one hour before breakfast.

Prepared by the addition of a small trace of zinc to protamine insulin and adjusted to a pH of 7·2 by the addition of solution of sodium phosphate. Protamine zinc insulin occurs in the form of a suspension, and the container should be shaken on each occasion before use. In cases where ordinary insulin is also required it may be taken up in the same syringe and injected with the protamine zinc insulin; the ordinary insulin should be drawn into the syringe first.

Method of Administration. Protamine zinc insulin may be used either alone or in conjunction with ordinary insulin. According to Lawrence, in mild insulin cases requiring 10 to 30 units a day, who previously had two doses of 5 to 15 units of ordinary insulin, protamine zinc insulin acts admirably when given in one

dose before breakfast, while severe cases can usually be satisfactorily controlled by the addition of ordinary insulin before breakfast; in the most severe cases an extra dose of ordinary insulin is required in the afternoon or evening. Although Lawrence now treats all new cases, initially, with protamine zinc insulin, supplemented if necessary with ordinary insulin, he does not recommend changing cases who are in good health, contented, and well controlled by two doses of ordinary insulin.

With regard to diet, most patients on protamine zinc insulin manage well on 150 g. of carbohydrate daily, which may suitably be distributed as follows: Breakfast 30 g., lunch 30 g., tea 30 g., dinner 40 g., bedtime 20 g. Where ordinary insulin is given in addition it is advisable to supply additional carbohydrate at breakfast time. It is important to remember that regularity in the time of meals is essential, since delay in the taking of a meal may precipitate an attack of hypoglycæmia.

It is difficult to devise rigid rules for changing from ordinary insulin to protamine zinc insulin, but the following scheme outlined by Chase (*Canad. med. Ass. J.*, ii/1938, 267) may be found of value. Add the total number of units the patient is taking in 24 hours. If the total is under 40 add 5 to obtain the initial dose of protamine zinc insulin and in addition give 5 units of ordinary insulin for 5 days before breakfast. As soon as all tests for 24 hours are sugar-free the dose of protamine zinc insulin is reduced 5 units a day, and when the dose gets below 20 units it is reduced 2 units a day. If the total units of ordinary insulin taken in 24 hours are more than 40 add 10 to obtain the initial dose of protamine zinc insulin and in addition give 10 units of ordinary insulin before breakfast. The protamine zinc insulin is reduced 10 units a day as soon as all tests are sugar-free.

ADVANTAGES AND DISADVANTAGES. Although protamine zinc insulin possesses certain obvious advantages over ordinary insulin, in particular its greatly prolonged action, resulting in the complete absence of ketosis throughout the twenty-four hours, and the practicability in many cases of a single daily injection, it also possesses certain disadvantages which necessitate caution in its use; of these the most important are the late and insidious hypoglycæmia and the lack of uniformity in action owing to its variation in rate of absorption. For the treatment of diabetic coma protamine zinc insulin is not sufficiently rapid in action and cannot replace ordinary insulin, though it may be given as an adjuvant.

At present zinc protamine insulin is the only insulin, besides soluble insulin, generally used in this country, the use of Hagedorn's original protamine insulin having been largely discontinued. During the past year 150 out-patient diabetics have been converted from soluble to zinc protamine insulin alone or to zinc protamine insulin with some soluble insulin in addition. As the result of observations on these patients it would seem to be usually unnecessary to hospitalise patients during the process of conversion, except in the case of those who originally required very large doses of soluble insulin. 45% of the patients had no recurrence of glycosuria during the transition period, 33% had an insignificant and very temporary return, and in only 22% was the return of glycosuria at all severe or prolonged. The average dose of zinc protamine insulin necessary

for stabilisation over a series of 102 cases was 26.7 units, in contrast to an average total daily dose of 30.8 units of soluble insulin. It is necessary to see out-patients at frequent intervals while the conversion is being carried out. In individual cases the previous total daily dose gives only a rough estimate of the amount of zinc protamine insulin which will eventually be required. Where the total daily dose of soluble insulin was small—25 units or less—the patient can be started with the same dose of zinc protamine insulin, to be altered as required later. Where a larger total dose of soluble insulin was needed it is better to start with three-quarters of the dose in the form of zinc protamine insulin, the other quarter being given as soluble insulin—this latter can be abandoned in the course of a few days. Approximately 77% of the cases were able to do without soluble insulin at all relying entirely on a single dose of zinc protamine insulin; in the remainder a small dose of soluble insulin had to be continued to deal with the hyperglycaemia induced by the breakfast carbohydrate, the dose of zinc protamine insulin being appropriately reduced to avoid hypoglycaemic symptoms in the evening or at night. The insulin is given as early as possible before breakfast. Where soluble insulin has to be given in addition it is injected first. The syringe is then disconnected from the needle, a new needle is then fitted on to the syringe and the dose of zinc protamine insulin is sucked in. The syringe is then again connected to the original needle and the zinc protamine insulin injected. Thus the two forms of insulin are not mixed in the syringe and the patient only has one prick with the needle. A new case of diabetes can be started straight away on zinc protamine insulin alone, provided the case is a moderate one. 10 or 12 units can be given to begin with and dose gradually increased by 4 units at a time, allowing four days to elapse between each increase. If the new case, however, is a severe one soluble insulin is used entirely at first, and conversion to zinc protamine insulin alone or with soluble insulin carried out when the patient is stabilised. Hypoglycaemic reactions are less numerous and generally less frequently severe with zinc protamine insulin than with soluble insulin, but when severe reactions do occur they are more severe and more difficult to treat. Patients should be warned that the symptomatology of the zinc protamine insulin reactions differs from that of soluble insulin. In the latter, sweating, palpitations and tremors are characteristic but in the former general malaise, nausea and vomiting and particularly headache are the most frequent. Children respond extremely well to zinc protamine insulin, and the advantage of having to give only one injection daily makes it particularly suitable in such cases.—D. M. Dunlop, *Edinb. med. J. (Trans. Medico-Chirurg. Soc. Edinb.)*, 1938, 194.

In adjusting the dose, increases should not be made oftener than every 2 to 4 days and then only by 5 units or less at a time. Patients who get reactions must be observed over a prolonged period after the administration of glucose, since the administrations may need to be repeated several times in succession.—C. W. Howe and D. W. J. Bell, *New Engl. J. Med.*, i/1937, 1095.

Observations of the effect of protamine zinc insulin on the glycosuria of diabetics receiving constant diets (usually in three half-hourly feedings) indicate that a large and possibly maximal insulin effect is exerted on carbohydrate metabolism within 3 to 6 hours of the injection, and that the total duration of effect of doses lying between 15 and 100 units is 15 to 60 hours.—R. S. Aitken, *Lancet*, ii/1938, 788.

Ordinary insulin is much more potent when given in conjunction with protamine zinc insulin than when given alone, and in such circumstances the initial doses of ordinary insulin should be limited to 4 or 6 units and raised by 2 unit increases to about 12 to 14 units once or twice a day, before breakfast, dinner, or both, as the usual safe upper limit.—H. O. Mosenthal and M. F. Mark, *J. Amer. med. Ass.*, ii/1939, 17.

Allergic reactions are decidedly more common with protamine insulin than with standard insulin, and annoying local reactions may occur at the site of injection of more than 1 ml. of protamine insulin, in the form of hard, firm, inelastic nodules which persist for two or three days and are gradually absorbed without discoloration.—H. M. Feinblatt, *J. Lab. clin. Med.*, 1939, 24, 340.

Local reactions at the site of injections of protamine zinc insulin are sufficiently frequent to assume clinical importance. It is suggested that the insulin sensitivity is induced as the result of the more prolonged action of the antigen (insulin) in the course of its slower absorption from a precipitated state.—R. A. Kern and R. H. Langner, *J. Amer. med. Ass.*, ii/1939, 198.

It is the practitioner's insulin for choice, but in severe cases it is rarely possible

to keep the urine constantly sugar-free without risk of hypoglycæmia. The dose should be reduced if all the urine tests are free for even one day, and certainly for two days, otherwise hypoglycæmia is sure to occur. These patients ought to pass some sugar after breakfast and usually some after supper. If a patient never passes sugar after supper or before breakfast the basal dose is too high and should be reduced, perhaps by 4 units; if he never passes sugar after breakfast the soluble insulin should be reduced.—R. D. Lawrence, *Brit. med. J.*, i/1939, 1077.

It is more economical and ensures more accurate balancing to give soluble insulin and zinc protamine insulin in separate injections. If drawn into one syringe they must not be allowed to mix.—G. M. Wauchope, *Lancet*, i/1940, 962.

OTHER INSULIN PREPARATIONS

Alum-precipitated Insulin has been recommended as less likely than the zinc compound to cause delayed and serious hypoglycæmic reactions. It can be given in one single dose and its action begins within two hours, thus obviating a supplementary injection of ordinary insulin to cover the after-breakfast rise of blood-sugar, while its effects wear off in twenty-four hours, thus eliminating the fear of a delayed reaction.—L. Rosenthal *et al.*, *Amer. J. med. Sci.*, 1939, 198, 98.

Hexamine Insulin. A compound of hexamine insulin has been prepared, using 0.25 g. of hexamine to 1000 units of insulin. This gives a very fine precipitate which can be dissolved on either the acid or the alkaline side and reprecipitates at the pH of the body tissues. This preparation can be buffered and is non-irritating. The alkaline-buffered solution is as stable as protamine insulin and, when cleared, can be used in any concentration. Fourteen severe cases of juvenile diabetes, including patients treated with ordinary, crystalline, and protamine insulin, were treated with a single daily dose of hexamine insulin. It was found that a single dose of hexamine insulin may be substituted for 2 to 4 divided doses of ordinary insulin, producing a similar blood-sugar curve but with decided constriction in the range fluctuations of blood-sugar. The absence of ketonuria was as striking with hexamine insulin as with protamine insulin, and it has a specific effect in decreasing polyuria in those patients who complained of it both with ordinary and with protamine insulin. Shocks caused by hexamine insulin respond immediately to the ingestion of small amounts of carbohydrates.—H. M. Feinblatt, *J. Lab. clin. Med.*, 1939, 24, 337.

Insulin-Tannic-Acid-Zinc-Suspension. A mixture consisting of insulin and tannic acid in the proportion of 1 to 2, with the addition of zinc, 1 g. to 500 units of insulin, may be used successfully in diabetic patients in place of protamine-insulin-zinc, and in the same dosage in patients who show no cutaneous reactions, but a trial injection is first necessary since it is liable to produce irritant skin reactions in some patients.—C. N. Jenkinson and K. J. G. Milne, *Brit. med. J.*, i/1938, 380.

The addition of tannic acid prolongs the hypoglycæmic action of insulin, and the action is still further prolonged by the addition of zinc to the tannic acid-insulin complex. If the ratio of tannic acid to insulin is 2 : 1 the tannic acid-insulin-zinc suspension produces a hypoglycæmia as prolonged as that produced by protamine-insulin-zinc suspensions. With this ratio of tannic acid to insulin 99 to 100% of the insulin is precipitated. Clinical trial is suggested of a preparation of tannic acid-insulin-zinc containing tannic acid-insulin in the ratio of 2 : 1, and 1 mg. of zinc to each 500 units of insulin.—W. A. Broom and E. M. Bavin, *Quart. J. Pharm.*, 1937, 334.

Pectin-Insulin. A pectin-insulin preparation, which has been given the name "decurvon," has been found to exert a protracted action. The best results are obtained with solutions of 4 to 5% of pectin, with a pH of 4.0 to 4.4, in which the insulin is dissolved. Absorption of the insulin sets in immediately after injection and is regular and prolonged. In healthy fasting men the blood-sugar decreases for at least three hours after the injection of 10 u. of decurvon and does not begin to rise until after six hours. In contrast with depot insulin decurvon can also be injected intravenously.—B. Brahn, *Lancet*, i/1940, 1078.

PREPARATIONS FOR ORAL USE IN DIABETES

In view of the obvious disadvantages of the administration of insulin by injection, numerous attempts have been made to produce compounds which

would withstand the action of the digestive enzymes and thus be active when given orally. Although success has been claimed with a variety of compounds, none of these claims has so far been substantiated. Among the compounds which have been tried are compounds or mixtures of insulin with saponin, bile acids, and blood serum.

Substances or preparations for oral use other than insulin have been advocated from time to time in the treatment of diabetes, but in no case can they be regarded as complete substitutes.

[P1-81] **Synthalin** (*Schering, London*). $C_{12}H_{22}N_4Cl_2 = 329.32$.

Dose.—0.01 to 0.03 g. daily. Issued in tablets containing 0.01 g.

Synthalin is decamethylene-guanidine dihydrochloride. It is a white, odourless crystalline powder melting at 193° ; soluble in water.

Uses. Synthalin reduces glycosuria and blood sugar when given orally and is used in mild cases of diabetes mellitus or in conjunction with insulin. Treatment should commence by rendering the patient sugar-free by diet, and then giving carbohydrate so that excretion of sugar in the urine is 25 to 40 g. per day.

From the clinical point of view, it can reduce acetone and sugar excretion by some 10 to 30 g. a day, but it cannot replace insulin in severe cases and does not have the same effect as insulin in milder cases of increasing strength and energy. It has the great disadvantage of causing toxic symptoms in many people, general depression, gastro-intestinal disturbances, nausea, vomiting and diarrhoea. Its continued administration must be stopped after weeks or months, and in the interval recourse must be had to insulin. One must hesitate to use a drug whose action is a toxic one and whose effect in checking sugar excretion is brought about by a pathological depression of metabolism unlike the physiological action of insulin therapy. Considered opinion in this country has always been against it. An oral preparation is an ideal which unfortunately has not yet been achieved.—R. D. Lawrence, *The Diabetic Life*, 1939.

[P1-81] **Synthalin B** (*Schering, London*) is dodecamethyl-diguanidine hydrochloride and possesses similar properties to Synthalin. It is milder in action but better tolerated, and is given in doses of 0.005 to 0.01 mg. daily.

[P1-81] **Anticoman** (*Riddell Products, London*). Decamethylene-diguanide bitartrate, pancreas ferment (lipase), sodium phosphate. Tablets, each containing 3.6 mg. of decamethylene-diguanide, for the oral treatment of diabetes: in severe cases as adjuvant to insulin injections.

On oral administration (in rabbits) 50 mg. of decamethylenediguanidine bitartrate per kilo are lethal. 40 mg. produce a slight hypoglycæmia, smaller doses have no effect. On subcutaneous injection doses over 6 mg. per kilo are effective in producing hypoglycæmia but are fatal. The effect of the drug is to produce tubular nephritis, similar to that obtained in mercuric poisoning. From these results the drug cannot be expected to be of value in clinical cases.—P. L. Ewing and H. Segenreich, *J. Lab. clin. Med.*, 1936, 181.

Galega. Doses of 80 to 100 drops twice daily by mouth of a liquid extract of galega, standardised to contain 3% of the alkaloid, galegine, of value in diabetes. Its action resembles that of Synthalin (*vide antea*), and it is quite harmless and without contraindications. It is active both in mild and in moderately severe diabetes, and is especially useful in insulin-resistant cases.—G. Parturier and G. Hougnot, *Pr. méd.*, 1935, 258.

Galegine, the alkaloid of *Galega Officinalis*, has a similar constitution to Synthalin, and has been used for reducing blood sugar, replacing 20 to 30 insulin units. No secondary effects observed.—*Pharm. J.*, ii/1927, 563.

Glucosone, or aldofructose (one of the oxidation products of dextrose or fructose) has similar properties to insulin and is given by the mouth.—P. T. Herring, *Lancet*, i/1927, 1000.

For a full account of the chemistry and physiology of insulin with several hundred references to original papers see "*Insulin, its Production, Purification and Physiological Action*," by D. Hill and F. Howitt (1936). For the treatment of diabetes, see "*The Diabetic Life*," by R. D. Lawrence (1939).

IODOFORMUM

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

$\text{CHI}_3 = 393.8.$

Syn. TRI-iodomethane.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.).

Yellow crystals or unctuous powder with characteristic odour. Contains 96.7% of I. M.p. 120° to 122° .

To cover its odour it may be mixed with coumarin, 1 in 50, or with menthol, phenol, thymol, oils of anise, eucalyptus, geranium, peppermint, rosemary or sassafras, about 1 or 2%.

To remove the smell from the hands, utensils, etc., rub with a little crushed linseed and wash afterwards.

Soluble 1 in 8 of ether, 1 in 10 of ether (sp. gr. 0.735), 1 in 10 of chloroform, 1 in 7.5 of benzene, 1 in 100 of 90% alcohol, 1 in 14 of eucalyptus oil, 1 in 10 of collodion, 1 in 60 of soft paraffin and oil of almonds, and about 1 in 30 of olive oil. Almost insoluble in water, but soluble 1 in 10 of Rubini's solution of camphor, which disguises its odour.

Antidotes. Give sodium bicarbonate freely, in plenty of water. Keep patient warm and give brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water. Bromides, in 60 gr. doses, if necessary.

Uses. Taken internally iodoform is gradually absorbed and is partially decomposed, liberating inorganic iodine. It has been used internally in syphilis, goitre and phthisis, originally with the idea that it would act as an iodide, but it is only partly broken up and its action is quite different from the inorganic iodides. Nevertheless, it is stated to be of value in early pulmonary tuberculosis, beginning with $\frac{1}{2}$ or $\frac{1}{4}$ gr. after meals thrice daily and increased by $\frac{1}{4}$ or $\frac{1}{2}$ gr. weekly or fortnightly to the point of tolerance, the treatment being continued with intermissions for 6 months or a year. It has also been employed hypodermically or intramuscularly in various forms of pulmonary affection and in tuberculosis of the bones and joints, employing a dose of 0.5 to 2 ml. of a 1% solution in oil once or twice daily.

Externally it is employed for its antiseptic action and to promote granulation; it exerts a marked anæsthetic action on mucous membranes and raw surfaces. Its chief value is as an external application to painful ulcers and as an antiseptic dressing to wounds, especially in the form of a paste with bismuth subnitrate and liquid paraffin (see *B.I.P.P.*, p. 314). It is stated to be almost specific in the local treatment of chancroid and syphilitic ulcers. It is also of undoubted value as a topical application to tuberculous abscesses and especially in tuberculous laryngitis with ulceration, when it may be used as an insufflation, 2 to 5 gr. of undiluted powder (well triturated), or with equal parts of starch powder or boric acid.

Caution. Many cases of poisoning have been reported from its free use as a surgical antiseptic, and it is advisable that in ordinary cases not more than 2 g. should be used as a wound dressing. Apart from this some people have a marked idiosyncrasy to iodoform, and its use even in small doses by local application may give rise to an erythematous rash.

AMEBIASIS. Nine cases of subacute and chronic amœbic colitis satisfactorily treated. Patient kept in bed on a fluid or very light diet, and after a preliminary purge (magnesium sulphate 15 g.), iodoform is given in the form of keratinised capsules containing 0.05 g., 1 or 2 capsules 3 or 4 times a day for 12 to 15 days. The treatment may be repeated after an interval of 1 week. Toxic symptoms not noted except in one patient who complained of vertigo. No rash noted.—Sir A. Castellani, *J. trop. Med. (Hyg.)*, 1935, 268.

Eight cases of amœbic colitis treated with excellent results by administration of iodoform in keratinised capsules containing 0.05 g. for each dose. Begin with an initial daily dose of 0.05 to 0.10 to 0.15 g., reaching a maximum daily dose of 0.20 to 0.30 g., the treatment lasting about 12 to 20 days. There were no symptoms of intolerance and no rash.—C. Scotti, *J. trop. Med. (Hyg.)*, 1937, 174.

LEPROUS ULCERS well treated by application of 16 gr. to 1 oz. of acetone for small ulcers and 10% iodoform in eucalyptus oil for large and sloughing ones.—M. C. Lang, per *Med. Annu.*, 1931, 278.

PLEURITIC EFFUSION. Iodoform intrapleurally, as an emulsion in glycerin, olive oil and ether (1 in 9), in 1 or 2 doses of 1 to 2 ml., gave good results.—Per *Practitioner*, i/1928, 264.

Carbasus Iodoformi (B.P.C.). IODOFORM GAUZE. 5%.

Glycerinum Iodoformi (B.P.C.). *Syn.* EMULSIO IODOFORMI.

Iodoform, in fine powder, 1, alcohol 90% *q.s.* to moisten, glycerin 7, sterilised water 2. Mix well in above order. *K.C.H.* has iodoform (washed with 1 in 20 phenol solution) 1 part, glycerin 9 parts.

For injection, well diluted, into the bladder and into sinuses. Most effective before caseation has occurred. For filling a cavity in the bone, after removing caseating tissue, iodoform 1 and boric acid 4 is useful.

Guttæ Iodoformi Compositæ (Brompton H.). (For the ear).

Iodoform 5 gr., ethyl acetate 2 dr., alcohol 90% 2 dr., glycerin to 1½ oz.

Injectio Iodoformi. (For bladder injection.)

Iodoform in fine powder 1, mucilage of tragacanth 2, water 7. This is less irritating than the glycerin emulsion (should be diluted 20 to 40 times with warm water).

Insufflatio Iodoformi.

Iodoform 2, starch (carefully dried) 1. In specific affections of the throat, antiseptic and mildly caustic.

Oculentum Iodoformi (B.P.). 4% in Oculentum Simplex.

[P2] **Pasta Iodoformi (R.D.H.).**

Iodoform 6, tannic acid 1, liquefied phenol *q.s.* to make a paste.

Cinnamon Paste (Iodoform Paste) is used by dentists and understood to mean iodoform mixed into a paste with cinnamon oil. Used for treating septic root canals.

Pasta Zinci et Iodoformi. *Syn.* Z.I.P.P.

Zinc oxide 1 oz., iodoform 1 oz., liquid paraffin 10 fl. dr.

A modification of bismuth and iodoform paste (*see* p. 314), which is said to be safer and more effective since there is less risk of iodoform poisoning accompanying its use. It is used in the treatment of wounds, ulcers, etc.

ULCERS. All forms of chronic ulcers except those with a circular outline and clean-cut edges heal rapidly when treated with "Zipp." The "Zipp" is spread thickly on three or four thicknesses of gauze cut to a size to cover the whole ulcerated surface, pressed evenly on to the part affected, covered with a bandage made of several thicknesses of gauze bound evenly and firmly over it, and a plaster of Paris bandage then applied. The dressing should be left for three weeks or longer, by which time the ulcer may be found healed. If there is sloughing the bandage may need taking down and a new one applying after a week, at all events as soon as any discharge appears on the surface of the plaster, or tracks down below the lower end of the plaster.—W. C. Dale, *West African Med. J.*, Nov. 1935, 16, per *Trop. Dis. Bull.*, 1936, 630.

It may be used as a routine in the treatment of chronic ulcers and in the post-operative treatment of acute osteomyelitis, the affected limb being afterwards encased for at least a week in plaster of Paris. The paste also has a remarkable deodorant action on offensive discharge.—W. K. Connell, *Brit. med. J.*, i/1940, 273.

Pigmentum Iodoformi Compositum (B.P.C.). *Syn.* IODOFORM VARNISH, WHITEHEAD'S VARNISH.

10% w/v with benzoin, storax and balsam of tolu in ether. For surgical use.

Pigmentum Iodoformi (Gt. Orm. H.). WHITEHEAD'S VARNISH MODIFIED. Iodoform 1 dr., benzoin varnish 10 dr. (Benzoin varnish is: Benzoin 4 dr., colophony 3 dr., balsam of tolu 1 dr., ether (0.720) 5 oz.).

Cheap and effective: does not retract the skin, dries well, and remains elastic. Clean, antiseptic, and mildly stimulating.—J. W. Peck, *Brit. med. J.*, ii/1931, 681.

Pulvis Iodoformi et Acidi Borici (B.P.C.). Iodoform 1, boric acid 3.

Suppositorium Iodoformi (B.P.) contains 3 gr. of iodoform in oil of theobroma. 1 gr. and 5 gr. suppositories are also made. For fissure of the anus and irritating hæmorrhoids.

Unguentum Iodoformi (B.P.C.). 10% in simple ointment. *R.L.O.H.* has 60 gr. in yellow soft paraffin to 1 oz. *Fr. Cx.* has 10% in soft paraffin.

[P1-81] **Unguentum Iodoformi cum Atropina (R.L.O.H.).**

Iodoform 1 dr., atropine 2 gr., yellow soft paraffin to 1 oz. Heat the yellow soft paraffin to 61°, add the atropine dissolved in sufficient chloroform to make a saturated solution, and finally add the iodoform. Stir till cold.

Unguentum Iodoformi et Eucalypti (B.P.C.). Iodoform 2% and oil of eucalyptus 20% in a paraffin basis.

Mencière's Solution "A." As a wound dressing. Iodoform 10, Peruvian balsam 30, guaiacol 10, eucalyptol 10, ether 100.

Solution "B" is the same with ether to 1000.

Æthyleni Periodidum (Fr. Cx.). *Syn.* DI-iodoform, ETHYLENE TETRAIODIDE. $C_2I_4 = 531.7$.

Yellow crystalline substance, odourless and containing about 95.5% of I. Insoluble in water, alcohol and ether; soluble in chloroform, benzene and carbon disulphide. It decomposes in light and is used as a substitute for iodoform. *M.p.* 192°.

IODUM

B.P., *U.S.P. XI*, *Fr. Cx.*, *P. Jap. V*, *P. Helv. V*, *P. Dan.*

I = 126.9.

Dose.—*U.S.P.* average dose $\frac{1}{2}$ grain. *Fr. Cx.* has max. single dose 0.02 g.; max. in 24 hours 0.2 g.

In heavy, bluish-black crystals or plates. Is obtained from kelp or from the mother liquors of Chili saltpetre.

The following medicinal inorganic iodides contain the halogen approximately in these proportions:—Ammonium iodide 87.5%, lithium iodide, 94.75%, potassium iodide 76.4%, sodium iodide 84.6%, strontium iodide ($\text{SrI}_2 \cdot 6\text{H}_2\text{O}$) 56.45%.

Soluble. About 1 in 5000 of water, 1 in 12 of alcohol 90%, 1 in 4 of ether, 1 in 30 of chloroform, 1 in 65 of glycerin, 1 in 6 of carbon disulphide and 1 in 9 of benzene. Very soluble in concentrated solutions of potassium iodide.

Incompatible with alkalis, alkaloids, starch, soluble lead and mercury salts, phenol, chloral hydrate and sodium thiosulphate.

Antidotes. Give copious draughts of mucilage of starch, or flour, etc., and water; or 20 to 30 gr. of sodium thiosulphate in water. Then empty stomach by emetic or by stomach tube, using thin starch or dilute sodium thiosulphate solution. Keep the patient warm; give demulcent drinks freely. Strychnine, $\frac{1}{2}$ gr., hypodermically. Morphine, $\frac{1}{2}$ gr. hypodermically, if pain is severe.

The fatal dose is usually about 2 or 3 g., but recovery is said to have occurred after 10 g. The prognosis is generally favourable.

During a 21-year period (1915 to 1936) 27% of all the patients admitted to the Boston City Hospital after suicidal attempts had ingested iodine, usually in the form of tincture. The number of these cases was 327 out of 1195 attempted suicides. Not one death due to iodine poisoning occurred among these patients. Between 1931 and 1937 there were 18 successful suicides by iodine in New York City, the dose ingested varying between 1 and 8 ounces. Death in all cases occurred within 48 hours.—M. Moore, *New Engl. J. Med.*, 1938, 219, 383.

Iodine burns may be successfully treated by the use of dressings soaked in a 1 in 200 aqueous solution of sodium thiosulphate. This solution will also quickly remove iodine stains from the skin.—H. P. Towle and J. L. Grund, *New Engl. J. Med.*, ii/1937, 475.

IODIDE ERUPTION, a case of granulomatous form which is rare. Treatment was sodium chloride 10 to 20 gr. three times daily after meals. Said to have been attended with dramatic effect in cases of bromide eruption. Slow recovery.—H. C. Semon, *Lancet*, ii/1926, 803.

Fatal dermatitis following iodine spirit ($2\frac{1}{2}\%$ in industrial methylated spirit) for operation; sodium thiosulphate used to counteract. Pronounced idiosyncrasy no doubt.—R. C. Alexander, *Brit. med. J.*, ii/1930, 101.

Further cases.—D. G. De Bouk, *Brit. med. J.*, ii/1930, 162. A man applied Tinct. Iodi Mit. to the arm for rheumatism. Caused a mass of blisters from head to foot. In bed 6 weeks.—L. Schapera, *ibid.*, 194.

Free application to the arms caused dermatitis. Vesicles turning to pustules. Temperature 103°F . Starch poultices used, also sodium bicarbonate, subsequently Lin. Calcis. Alcoholic iodine solutions are in their nature irritants. Their application to areas already denuded of surface protection open to risk.—O. Thomas Jones, *Brit. med. J.*, i/1931, 15.

Uses. Iodine is an antiseptic and irritant. *Internally*, small doses cause mild irritation of the mucosa of the stomach and improve appetite, but more frequently they give rise to nausea, discomfort, and vomiting, and repeated small doses may result in iodism, namely, nasal catarrh, gastric upset, and lachrymation. Iodine is absorbed in the form of iodides and its fate in the body is precisely similar to that of iodides which have replaced it for most therapeutic purposes for internal use.

The most important use of iodine is in the treatment of thyroid disease, and in particular in Graves' disease, where it is used as a pre-operative procedure to produce a rapid remission of symptoms in order to lessen the risk of thyroidectomy. For this purpose 5 m. of Lugol's solution is administered three times daily in milk. There is usually a striking improvement in the patient's symptoms within three days from the commencement of this treatment. The beneficial effects usually reach their maximum within 10 days to 3 weeks, and operation is best done during this period, the administration of iodine being continued for a few weeks subsequently. The medical treatment may actually be found sufficient of itself to clear up mild cases, especially the mild hyperthyroidism associated with a puberty goitre or post-operative hyperthyroidism.

Iodine has been used in the past in a variety of chronic conditions such as syphilis and tuberculous disease of the bones and glands, and of other organs, but has now been almost entirely superseded by iodides.

Doses of 1 or 2 m. of the weak solution in $\frac{1}{2}$ ounce of water every half hour are stated to be beneficial in cases of vomiting, and good results are claimed from the use of the tincture in a dose of 5 drops twice daily (2 drops for children) in the treatment of acute diarrhoea or chronic colitis.

Externally, iodine acts as an irritant. Applied to the intact skin it exerts a mild lasting irritation which induces some congestion of the subcutaneous tissues, and it is employed in the form of tincture or ointment in the treatment of numerous chronic inflammatory conditions such as pleurisy, phlebitis, periostitis, arthritis, enlarged cervical glands and orchitis (after the acute inflammation has subsided). Blepharitis is also benefited from the application of the weak tincture to the lid margins after removal of crusts, and corneal ulcers, especially the herpetic forms, may with advantage be touched with the tincture after cocaineization. Applied in concentrated solution to the skin it may cause blistering and vesication.

Iodine has a powerful germicidal action and is used for disinfecting the skin prior to operation. It is generally employed in a strength of $2\frac{1}{2}$ to 5% in 10% potassium iodide solution or in alcohol, and is painted on the site of operation a few minutes before an incision is made. Unfortunately, its bactericidal action is much reduced by proteins, and in the treatment of open and infected wounds it has now been largely replaced by acriflavine. It is of interest to note that iodine is no longer used for wound antisepsis in the Army Medical Services.

The application of a $2\frac{1}{2}$ to 5% alcoholic solution has also been found of value in infections of the cervix uteri, vagina and vulva, and a $1\frac{1}{2}$ % solution with potassium iodide in glycerin (Mandl's paint) is a useful application in tonsillitis.

Iodine also possesses a marked parasiticial action and a 1 to 5% tincture is of value in ringworm of the scalp or body and in mycotic affections such as athlete's foot, dhobie's itch, etc.

Although it has been used in various forms and by various routes, the *parenteral administration* of iodine has not met with any great measure of success apart from its employment in the form of iodised oil in the X-ray diagnosis of bronchiectasis. Hydrocele has been treated by the injection of tincture of iodine or Lugol's solution into the sac after aspiration, but the treatment is extremely painful and the end-result uncertain. Intravenous injections have been employed in numerous acute conditions such as pneumonia, plague, septicæmia, etc., but their value is doubtful and their use not without risk.

For *inhalation* a few drops of the weak solution are added to hot water, often with the addition of creosote or phenol, and the vapour inhaled in phthisis or chronic bronchitis.

Various articles containing small proportions of free or combined iodine such as lozenges, soap and socks have been marketed, but their therapeutic effect is very doubtful and their action probably purely psychological.

REFERENCES TO IODINE THERAPY

ACTINOMYCOSIS. Tincture of iodine in milk. *Dose*.—5 to 10 minims in half a cup of water three times a day. "Effect almost incredible."—H. Chitty, *Brit. med. J.*, i/1926, 419; i/1929, 347. See also *Prescriber*, 1929, 345.

CORNEAL ULCERS treated by a 1:20 or 1:30 tincture of iodine after preliminary use of cocaine. The iodine is taken up on a probe or glass rod and held in the air a minute or two for the alcohol to evaporate, then the ulcer touched with it. The iodine is therefore almost solid and cannot diffuse. See also Eye affections, under Intravenous Iodine *postea*.

TONSILS. Diseases of, due to fungi, well treated by application of dilute tincture of iodine and large doses of potassium iodide—as much as 30 gr. thrice daily.—Sir A. Castellani, *Prescriber*, 1930, 67.

TUBERCULOUS ULCERS and others treated by sodium iodide internally, 15 gr. three times a day with hydrogen peroxide and a little acetic acid locally on cotton wool.—S. A. Pfannenstill, *Brit. med. J.*, i/1925, 732.

The administration of minute amounts of iodine ($\frac{1}{16}$ or $\frac{1}{8}$ gr. every 5 days in butter-scotch) was found to give great improvement in pre-tubercular children when cod-liver oil, etc., had failed. Chronic bronchitis and allied conditions also respond well.—K. Fraser, Cumberland, School M.O. Report, 1925.

VARICOSE ULCERS. In most patients the best of all local dressings for leg ulcer is starch iodide paste which, combined with sufficient rest in bed, controls pain after 24 hours' use, allows of discharge in three days or so, and will heal even multiple extensive ulcerations of the leg of so hopeless an aspect as almost to compel amputation. The best formula for the paste is: Starch 1 oz., glycerin 2 oz., distilled water 6 oz. Boil together and when nearly cold stir in $\frac{1}{2}$ oz. of strong solution of iodine (*B.P.* 1885). The result is a non-greasy homogeneous paste, clean in use, which is spread half an inch thick on to the smooth surface of lint and applied, then covered with wool and a very firm bandage.—S.W. Smith, *Brit. med. J.*, i/1940, 147.

VARICOSE VEINS have been treated by injecting 1% solution of iodine made with potassium iodide (Schiassi's method).

WHITLOW may be successfully treated by the application of iodine to the gaping junction of the skin and nail-plate in the neighbourhood of the lunula; it is essential that the iodine should run completely round the nail, and if this does not occur spontaneously the skin above the lunula should be slightly raised. The treatment should be carried out twice daily and also when the hands are washed.—W. G. Harvey, per *Practitioner*, ii/1939, 122.

Intravenous Iodine Injection.

EYE AFFECTIONS. For papillitis, retinitis pigmentosa, optic atrophy, or optic neuritis, treat root cause. Give iodine intravenously: ($\frac{1}{2}$ gr. each of iodine and

potassium iodide in 10 ml. of distilled water) every 3 or 4 days up to 6 injections, rub mercurial ointment into the temples daily and give deep injections of $\frac{1}{2}$ to 1 ml. of mercuric cyanide 1 in 2000 with procaine hydrochloride. Marked progress with this treatment, a notable feature being the rapidly improved vision after iodine injections. Where there are no prominent veins, the following is given intramuscularly—Sodium iodide 250 gr., iodine 200 gr., liquefied phenol 3 dr., distilled water 4000 ml., 10 ml. injected into gluteal muscles every 6 or 8 days. The mixture should not be stirred up.—E. R. Shetti, *Brit. med. J.*, ii/1930, 1098.

PLAGUE. Early cases of bubonic plague well treated with iodine intravenously, 5 to 10 ml. daily for 4 days of solution of iodine 18 gr. and potassium iodide 36 gr. in normal saline 4 oz., together with a mixture containing potassium iodide and stimulants, every 4 hours. Buboes treated by $\frac{1}{2}$ gr. of mercuric chloride in 2 ml. of water hypodermically in lymphatic area drained by groups of glands in which bubo formed.—*Indian med. Gaz.*, 1926, 63.

PNEUMONIA AND CELLULITIS have been treated with initial dose of weak solution 20 m. in 10 ml. of normal saline, increased by 10 or 20 m., according to reaction, up to 60 m.—A. B. de Castro, *Indian med. Gaz.*, 1925, 141, and S. N. Datta, *ibid.*, 579. See also *J. trop. Med. (Hyg.)*, 1927, 225.

Pneumonia, erysipelas, cellulitis, rheumatism, septic wounds and bad cases of phagedenic ulcers well treated. Iodine 24 gr., potassium iodide 36 gr., distilled water to 1 oz. *Dose.*—1 to 2 ml., diluted with 8 ml. distilled water and given once or twice weekly.—E. Burke, *Brit. med. J.*, ii/1927, 1062.

Colloidal iodine intravenously of value in pneumonia. 10 ml. of a 0.4% solution is given every four hours from noon to midnight (i.e., four doses). A striking and constant result is the immediate fall of the temperature by lysis. Fever usually terminates before the seventh day, patients are easier to nurse, and mortality is diminished.—A. Goodall, *Edinb. med. J.*, ii/1937, 133.

Balneum Iodi (B.P.C.). Contains 4 oz. of strong solution of iodine per 30 gallons.

Cataplasma Iodi (B.P.C.). Weak solution of iodine, 2 dr., in linseed poultice.

[P1] **Chloroformum Iodi.** 1 in 30.

Stains less and does not promote desquamation, itching or dermatitis like the alcoholic solution.

Collodium Iodi (B.P.C.). Iodine 6 $\frac{1}{2}$ % w/v in flexible collodion.

Glycerinum Iodi. Iodine 1, glycerin 50. Heat carefully until dissolved.—A useful pigment; the skin does not harden by repeated application, nor peel off. Water helps solution, cf. Morton's Fluid.

For internal use this preparation is quite suitable diluted with water, with which it mixes temporarily. *Dose.*—On lines of the Tinctura Iodi *Fr. Cx.* 1908 method of use. It is approximately $\frac{1}{2}$ the strength.

[P2] **Inhalatio Iodi Composita (L.H.).** *Dose.*—10 minims on an oro-nasal mask.

Cresote 2, phenol 2, spirit of chloroform 2, weak solution of iodine 1, spirit of ether 1.

For early pulmonary tuberculosis by inhalation from a "Burney Yeo" inhaler. It must be continuous and in operation the whole of the 24 hours, excepting meal times. Six to 8 drops are used on the sponge of the inhaler every hour during the day, and two to three times during the night if awake. Non-irritating, beneficial and does not cause hæmoptysis. Allays pyrexia and cough.

Injectio Iodi (C.L.T.H.). *Syn.* MORTON'S FLUID. Distinguish from the *douche*, which is also called "Injection." Iodine 10 gr., potassium iodide 30 gr., water 25 m., dissolve and add glycerin to 1 oz. Glycerin Iodi (*St. T. H.*) is the same without the water.

In spina bifida 30 m. have been injected into the tumour, also into a soft solid goitre.

Injectio Iodi (C.H.W., L.H.). IODINE DOUCHE. Weak solution of iodine 1 dr., water 1 pint. For injection in puerperal sepsis. Gangrene of the vulva, vagina and cervix has been treated by a douche of normal saline, cutting away the gangrenous parts, then giving a weak iodine douche, followed by packing with balsam of Peru gauze.

Injectio Iodi Fortissima. *Dose.*—3 to 5 minims.

Iodine 360 gr., potassium iodide 360 gr., distilled water $4\frac{1}{2}$ dr. Measures exactly 1 oz. and contains $\frac{1}{2}$ gr. of free iodine in each minim. For fibrous bronchocele.

A grain of iodine may be held in solution in a minim of fluid, by employing sodium iodide in the proportion of iodine 3, sodium iodide 2, and water *q.s.* to 3 volumes.

Insufflatio Iodi et Acidi Borici (Aural) (U.C.H.). *Syn.* PULVIS ACIDI BORICI CUM IODO.

Iodine 0.75, boric acid 99.25. Dissolve the iodine in alcohol and triturate with the boric acid.

The following formula is suggested:—Iodine 2 gr., potassium iodide 1 gr., anæsthetic ether 90 m., boric acid in powder 260 gr. Dissolve the iodine and the potassium iodide in the ether in a glass mortar. Add the boric acid, previously sifted. Stir for exactly three minutes for the ether to evaporate. The presence of potassium iodide gives the powder increased stability, and the use of ether as the solvent greatly reduces the amount of iodine lost during preparation.—H. Finemore, *Aust. J. Pharm.*, 1939, 1038.

Sulzberger's formula for iodine-boracic powder for aural insufflation specifies a mixture of one part of resublimed iodine in 99 parts of boracic powder. If stored in green stoppered bottles it keeps satisfactorily for some weeks.—*Practitioner*, i/1939, 230.

OTORRHEA, CHRONIC. Cures nearly 95% of chronic cases. The discharge is mopped or sucked out and the powder blown through the perforation into the middle ear until the deepest part of the meatus is full. The powder readily dissolves in the discharges within 48 hours.—R. Scott Stevenson, *Brit. med. J.*, i/1933, 95.

Insufflation of boric acid with 0.75% of iodine is more satisfactory than any other method. 98 cases treated with history of 4 weeks to 25 years—all dried up with from 1 to 30 treatments.—R. H. Bettington, *Med. J. Aust.*, 1935, 747.

Boro-Iodine (Duncan, Flockhart, Edinburgh). A finely divided mixture of iodine 1% in boric acid for the treatment of chronic uncomplicated suppurative otitis media.

Iodocholeate. Iodine combines with bile acids to form tri-iodo derivatives which are soluble in water and in alcohol, but not in other organic solvents. Although the compounds give the starch reaction for iodine and the iodine content can be determined by direct titration with thiosulphate, aqueous solutions can be concentrated in open containers on a water-bath practically without any loss of iodine. Solutions of equivalent iodine content are more effective germicides and are less irritating than the pharmacopœial solutions.—P. Goedrich, *J. Amer. pharm. Ass.*, 1937, 509.

An aqueous solution with an addition of 15 to 20% alcohol is the most desirable form, and for therapeutic purposes a solution of 1 to 2.5% is most suitable. A 2.5% ointment may also be prepared as in the following formula:—Iodocholeate powder 11.7 g., oxycholesterol-petrolatum base 38.3 g., distilled water 10 ml. Because the iodine in iodocholeate is adsorbed to the bile salt it is less volatile and combines less readily with protein. Thus, compared with tincture of iodine, it is less irritating, has greater fungicidal power in the presence of protein, and is active over a longer period. Either in solution or ointment it has proved valuable in the treatment of fungous infections of the skin.—W. F. Lever, *Arch. Derm. Syph.*, ii/1939, 19.

Liquor Iodi Æthereus (B.P.C.). *Syn.* TINCTURA IODI ÆTHÆREA. $2\frac{1}{2}\%$ *w/v* in ether.

Liquor Iodi Aquosus (B.P. Add. I). *Syn.* LUGOL'S SOLUTION (*Fr. Cx.*), LIQUOR IODI COMPOSITUS.

Dose.—5 to 15 minims (0.3 to 1 ml.).

Iodine 5% *w/v* and potassium iodide 10% *w/v* in water. 15 m. contains about $\frac{1}{2}$ gr. of free I and about 2 gr. of total I.

B.P.C. is similar but has 5% *w/v* of each. U.S.P. XI is same as B.P. Add. I with wider limits. *Average dose.*—3 minims.

Liquor Iodi Decoloratus (B.P.C.). *Syn.* TINCTURA IODI DECOLORATA.

This solution contains ammonium iodide and ammonium iodate equivalent to about 3% *w/v* of iodine. A useful application for chilblains and for painting on exposed affected parts.

Liquor Iodi Decoloratus Fortis (*syn.* TINCTURA IODI DECOLORATA FORTIS) is occasionally ordered. It is prepared by dissolving iodine 2.85 g. in alcohol (90%) 27.5 ml., adding strong solution of ammonia 6.25 ml., and keeping in a warm place until decolorised.

Liquor Iodi Fortis (B.P.). *Syn.* TINCTURA IODI FORTIS, STRONG TINCTURE OF IODINE, PIGMENTUM IODI, LINIMENTUM IODI.

Contains 10% *w/v* of iodine and 6% *w/v* of potassium iodide in distilled water and alcohol 90%. Conforms with *I.A.*

Churchill's Tincture of Iodine. Iodine 1200 gr. and potassium iodide $\frac{1}{2}$ oz. dissolved in water 4 oz. and diluted with alcohol (90%) to 16 oz.

Liquor Iodi Mitis (B.P.). *Syn.* TINCTURA IODI MITIS, TINCTURA IODI, TINCTURE OF IODINE.

Dose.—5 to 30 minims (0.3 to 2 ml.).

Iodine $2\frac{1}{2}\%$ *w/v*, and potassium iodide 1.5% *w/v*, in water and alcohol 90%. The proportion of potassium iodide is not sufficient to keep the iodine in solution when diluted with water; this can be overcome by increasing the proportion from 1.5 to 2.5%.

Tinctura Iodi Mitis (U.S.P. XI).

Iodine 2 and sodium iodide 2.3 in sufficient diluted alcohol (48.4 to 49.5% *v/v*) to make 100.

Liquor Iodi Oleosus (B.P.C.). *Syn.* TINCTURA IODI OLEOSA.

Iodine 8% *w/v* and castor oil $16\frac{1}{2}\%$ *v/v* in alcohol 90%.

Repeatedly applied does not crack the skin as the tincture does.

Ethidol (*Burroughs Wellcome, London*). Ethyl iodoricinoleate, a stainless non-irritating compound containing 20% of I. It may be heated to 150° for sterilisation. Used by inunction or spread on dressing in all cases in which the application of iodine is indicated.

Liquor Iodi Simplex (B.P.).

Dose.—3 to 15 minims (0.2 to 1 ml.); 15 m. contains about $1\frac{1}{2}$ gr. of iodine. The dose may be gradually increased up to 25 or 30 m. thrice daily.

Iodine 9% *w/v*, in alcohol 95%. This corresponds to approximately 10% *w/v* and it is therefore the same strength as **Teinture d'Iode** (*Fr. Cx.* 1908) (also *P. Hung.*), sometimes called French tincture of iodine.

It is unfortunate, since the use of this preparation is in considerable vogue, that the above tincture of *Fr. Cx.* 1908 is superseded by **Teinture d'Iode** (*Fr. Cx.* 1937). This latter preparation which is therefore now the official French tincture of iodine, contains iodine 10 g., potassium iodide 4 g., alcohol 90% 126 g., and water 10 g., but it is *not* the preparation usually required when French tincture is asked for in this country. Unless otherwise directed **Liquor Iodi Simplex (B.P.)**, equivalent in strength to the original tincture of *Fr. Cx.* 1908, should be dispensed for "French Tincture of Iodine."

Loss of free iodine is rapid during the first two months after manufacture but equilibrium is reached in about eight months with a total loss of about 20% of free iodine.

The "intensive iodine treatment" of tuberculosis was advised by L. Bourdreau. The treatment is also of value in arthritic cases, chronic gout and "rheumatic gout." *As much as 10 grains of iodine per diem can be given.* There may be slight catarrh of the nasal mucous membrane, but no iodism as from potassium iodide. The iodine is probably deposited on the stomach lining and slowly absorbed. The patient places the dose (15 drops equal approx. 10 minims) in a glass and adds half a tumbler of water. It may also be given in milk or as a mixture of equal volumes of simple tincture of iodine, spirit of chloroform and glycerin which form a clear solution containing 1 gr. of iodine in about 30 m.

Nebula Iodi Composita (B.P.C.). Iodine 1% *w/v* and phenol $\frac{1}{2}$ % *w/v* in light liquid paraffin.

Nebula Iodi et Mentholis (B.P.C.). Iodine 2% *w/v* and menthol 4% *w/v* in light liquid paraffin.

Neb. Iodi c. Phenol. (N.I.F.).

Iodine 2 gr., phenol 8 gr., menthol 5 gr., camphor 2 gr., light liquid paraffin to 1 oz.

Parogenum Iodi (B.P.C.). *Syn.* IODINE VASOLIMENT, LINIMENTUM IODI PETROLATUM. 10% *w/v*.

Vasogen Iodine (Pearson, Mitcham) (previously marketed as IODINOSOL). Preparations containing 6% or 10% of iodine in a partly oxygenated mineral oil for use by inunction. Also available in capsules containing 10 m. of the 6% preparation.

Pigmentum Iodi Compositum (B.P.C.). *Syn.* PIGMENTUM MANDL, MANDL'S PAINT.

Iodine $1\frac{1}{2}$ % *w/v*, with potassium iodide and oil of peppermint, in a glycerin medium. It should be well shaken before use since the oil of peppermint is insoluble and rises to the surface on long standing. Used as a throat stimulant and in tonsillitis.

Pigmentum Iodi et Ætheris Acetici (J. Dundas Grant).

Equal parts of simple solution of iodine, ethyl acetate and glycerin. This mixes quite well and is not unpleasant.

Pigmentum Iodi cum Formaldehydo (M.H.).

Solution of formaldehyde 10 m., weak solution of iodine 1 dr., oil of peppermint 2 m., glycerin to 1 oz. For granular pharyngitis.

Pigment. Iod. Fortis. (N.I.F.).

Iodine 44 gr., potassium iodide 27 gr., boric acid 9 gr., distilled water 48 m., industrial methylated spirit without acetone to 1 oz. It contains about 10% of I.

Pigment. Iod. Mit. (N.I.F.).

Strong iodine paint (N.I.F.) 120 m., boric acid 7 gr., industrial methylated spirit without acetone to 1 oz. It contains about 2.5% of I.

Pigment. Iod. (N.I.F.).

Strong iodine paint (N.I.F.) 4 dr., boric acid 5 gr., industrial methylated spirit without acetone to 1 oz. It contains about 5% *w/v* of iodine.

Pigmentum Olei Picis cum Iodo (B.P.C.). *Syn.* PASTA IODI ET PICIS, COSTER'S PASTE.

Iodine 1 by weight dissolved with the aid of gentle heat in rectified oil of tar 4 by volume.

Uses. For ringworm of the scalp; after well shaking the bottle the paint is well brushed in with a stiff brush. A scab will be produced which should be removed in a few days, the part cleansed by soaking with oil, and then soap and warm water; after drying, more paste should be applied. It seldom causes pain.

Syrupus Iodotannicus (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 ml.).

Iodine and tannic acid, 1% *w/w* of each, in syrup and syrup of lemon.

The *Fr. Cx.*, *P. Ital. V*, *F.E. VIII*, *P. Belg. IV*, and *P. Ned. V* syrup is only $\frac{1}{2}$ this strength, *viz.* 0.2% of iodine.

Uses. Of value for enlarged glands in children and also as a tonic after removal of tonsils and adenoids.

Specially useful in cases of chronic lymphadenitis associated with or independent of adenoids. In atrophic rhinitis has given good results especially when combined with arsenic, also in simple bronchocele. In arteriosclerosis it is often more valuable than iodides.

Syrupus Iodotannicus cum Phosphate (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 ml.).

Contains about $2\frac{1}{2}$ gr. of calcium phosphate per dr. of iodotannic syrup. *Fr. Cx.* has 2% of calcium phosphate.

Unguentum Iodi (B.P.C.).

Iodine 4% with potassium iodide, in a simple ointment basis.

Unguentum Iodi (U.S.P. XI). Iodine 4, potassium iodide 4, glycerin 12, wool fat 5, yellow wax 5, petrolatum 70. It must contain from 6.5 to 7.5% of total iodine.

Unguentum Iodi Denigrescens (B.P.C.). *Syn.* NON-STAINING IODINE OINTMENT. Contains iodine in arachis oil and soft paraffin.

For use in rheumatic affections, enlarged glands, and sprains.

Non-staining iodine ointment shows large variations in iodine content due often to the method of preparation. Alternative methods are proposed and it is pointed out that in all methods of preparation subsequent heating after the incorporation of the iodised oil with the soft paraffin will yield a deposit of resin-like substance.—J. C. Penman, *Quart. J. Pharm.*, 1939, 380.

Unguentum Iodi Infictum.

Iodine 1, oleic acid 4; mixed to effect absorption and mix with yellow soft paraffin 14 and hard paraffin 1 previously melted together.

Iodex (Menley & James, London). A stainless iodine ointment containing 4% of iodine. Also made with methyl salicylate 5%. Suppositories are made equivalent to $\frac{1}{2}$ gr. of iodine in a neutral base.

Iodermiol (Hewlett, London). An ointment containing about 5% of iodine which does not harden or discolour the skin. Also made with methyl salicylate.

[P2] Vapor Iodi Æthereus (B.P.C.). Ethereal solution of iodine 25% v/v, phenol 25% w/v, creosote 12.5% in alcohol 90%. 10 m. to be used in an inhaler.

Oleum Iodisatum (B.P. Add. I). *Syn. and Prop. Names.* OLEUM IODATUM (*U.S.P. XI*), IODATOL (*British Drug Houses, London*), IODINOL (*Martindale, London*), IODIPIN (*Merck, Darmstadt; Martindale, London*), LIPIODOL (*Guerbert, Paris; Bengué, London*), NEO-HYDRIOL (*Pharmaceutical Specialities (May & Baker) Ltd., London*), OLIOLASE (*Corbière, Paris; Anglo-French Drug Co., London*).

Iodised oil is an iodine-addition product of poppy-seed oil and may be prepared by treating poppy-seed oil with hydriodic acid. It is a colourless or pale yellow viscous oil with slightly alliaceous odour and contains 39 to 41% of combined iodine.

Weaker preparations, containing 10% or 25% of iodine, are also available under the above proprietary names. They are usually preferred to the 40% oil for internal administration, and can also be given hypodermically.

Iodised oils are prepared by saturating fatty oils containing unsaturated fatty acids with reagents such as iodine monochloride. One method consists of treating iodine trichloride 75 g., with 200 ml. of cold water until a clear orange solution is obtained. The resultant mixture, which contains iodine monochloride, is cooled in ice and 100 ml. of sesame oil previously cooled to 0° is added in small quantities with constant shaking during the course of 15 minutes. The mixture is vigorously shaken until a thick white emulsion is obtained. The emulsion is allowed to stand in the dark for one hour, transferred to a separating funnel with the aid of 100 ml. of chloroform, shaken, and allowed to stand in the dark to separate. The organic solution is run off, washed with water and dried over calcium chloride. The solvent is removed and the residual liquid cooled.—S. Rangaswami, *Indian J. Pharm.*, 1940, 2, 3.

Contraindications. High fever, marked intolerance to iodine, grave septic conditions of the lung and active tuberculosis.

Uses. Iodised oils containing 40% of iodine are employed to render the bronchi and their ramifications opaque to X-rays, their chief value lying in their ability to show the presence or absence of non-obstructive bronchiectasis, and when present, even in the early stages, its locality, extent and type. They are non-irritant to the mucous membrane, etc. After injection in the bronchi they are absorbed in the lung, and iodine can be detected in the urine for many days after; hence, they are antiseptic agents rational in the treatment of chronic affections of the lower respiratory tract. There are various methods of administration of the oil, the simplest being by the mouth. The patient should be seated with his head on his hand and his elbow on a rest, the operator in front. The tongue is protruded and a blunt-ended cannula placed over its base between the pillar of the fauces and the uvula. The warm oil (100°F.) is given with a 20 ml. syringe, while the patient breathes slowly and regularly. If the patient heaves it is useless to continue. He should lean to the side injected and be semi-recumbent with head lowered. This method is unsuitable, however, for children and nervous patients, to whom the oil is administered by injection into the trachea through the crico-thyroid membrane (for further details of this and other methods see Vol. II, 21st Edn.). In all cases the patient should first be tested for iodine intolerance with potassium iodide. The amount of iodised oil used varies from 5 ml. to 40 ml., the average being 20 ml. For outlining the bronchial tree from 6 to 10 ml. is sufficient.

The possible dangers from the use of the procedure are symptoms of iodine poisoning (this only applies with the crico-thyroid route), injury to local tissues in the neck, and bronchopneumonia resulting from dissemination of infection throughout the lung. Minor symptoms, which normally disappear in 24 hours, are injection malaise, anorexia, and headache. In pulmonary tuberculosis the injections are undesirable, and its use is dangerous in patients with advanced bronchiectasis with foul secretion.

The resulting pictures are excellent and there is no irritation of the mucous membrane.—F. G. Chandler, *Brit. med. J.*, ii/1928, 1157.

The injection of iodised oils is essentially a surgical procedure, introducing a foreign and possibly irritant body and involving more or less risk, which should be weighed against the presumptive advantages in comparison with the relative advantages and disadvantages of other measures. Cautions which should be especially borne in mind are (1) aged and darkened oils should never be used.

(2) Subarachnoid injections should only be used when all other means of diagnosis have been exhausted. (3) Intratracheal and intrapleural injections should be avoided in tuberculosis of the respiratory organs. (4) Injection pressure should be carefully controlled so as not to lacerate tissues. (5) Intravaginal injections should only be made under fluoroscopic examination. (6) Iodised oil should not be used for renal pyelography except as an emulsion, and injections stopped if pain is felt. (7) Intravascular injections appear too dangerous.—Council on Pharmacy and Chemistry, A.M.A., *J. Amer. med. Ass.*, ii/1932, 1946.

X-RAY PICTURES OF THE MALE URETHRA. Shadows obtained with Iodinol 40% very satisfactory. No irritation of the urethral mucous membrane. A urethral pouch demonstrated at the Midland Medical Society.—G. P. B. Huddy, June 6th, 1929.

For giving shadows of the uterus and fallopian tubes found satisfactory at Cardiff Royal Infirmary. No toxic symptoms.—W. Panes, June 20th, 1929.

Diodone. *Syn. and Prop. Names.* DIODRAST, PER-ABRODIL (*Bayer Products, London*), PYELOSIL (*Glaxo Laboratories, London*).

Dose.—20 ml. of a 35% *w/v* solution; for children 8 to 10 ml., and for infants 2 to 3 ml.

A mixture or a loose combination of 3, 5-diiodo-4-pyridone-N-acetic acid, $C_6H_5ONi_2 \cdot CH_2 \cdot COOH$, and diethanolamine. It is a clear, almost colourless liquid containing 49.8% of iodine.

Contraindications. Nephritis, renal and hepatic insufficiency, tuberculosis and other forms of grave general illness.

Uses. Diodone is used as a contrast agent for excretion pyelography, and also for the contrast radiography of arteries, veins, joints and the biliary tract. The patient should be given an aperient on the night preceding the examination and on the day of the examination food should be withheld. In addition, fluid intake should be restricted for several hours before injection to increase the concentration of the diodone. Prior to injection the solution should be warmed to about 37°, and then injected through a moderately fine needle, the time of injection being about 1 to 3 minutes.

Iodoxylum (*B.P. Add. III*). $C_8H_5O_5Ni_2Na_2 = 493.0$. *Syn. and Prop. Names.* NEO-IOPAX (*N.N.R.*), PYELECTAN (*Glaxo Laboratories, London*), PYLUMBRIN (*Boots, Nottingham*), UROPAC (*Pharmaceutical Specialities (May & Baker) Ltd., London*), URO-SELECTAN B (*Schering, London*).

Dose.—150 to 225 grains (10 to 15 g.), usually given as a 75% aqueous solution. For children the dose is reduced proportionate to age.

The disodium salt of N-methyl-3 : 5-diiodo-4-pyridone-2 : 6-dicarboxylic acid, a white, crystalline, odourless powder containing about 51.5% of iodine.

Soluble 1 in 1.2 of water, 1 in 100 of alcohol 90%, but insoluble in other organic solvents.

Contraindications. Acute nephritis, severe renal and hepatic insufficiency, and where the urinary disease is accompanied by severe general disease.

Uses. Iodoxyl is used as a contrast medium for intravenous pyelography. Before use the solution should be warmed to about

blood temperature and then injected slowly through a moderately thin needle. The time of injection should not be less than five minutes. The patient should be prepared by the administration of an aperient on the day previous to the examination, and on the day itself should have no food. Further, the fluid intake should be greatly reduced for three hours before injection to increase the concentration of the iodoxy in the urinary tract. Weaker solutions are also employed for retrograde pyelography.

For anatomical information only, a single pyelogram 20 to 30 minutes after the injection suffices, but for urological purposes exposures are made at 10, 30, and 50 minutes. Before the second and third exposure the bladder should be emptied. When renal function is normal the best films are often obtained in 2 to 5 minutes after injection; with function abnormal the best results may not be obtained for 6 to 24 hours, and if function is completely suspended it is impossible to obtain a pyelogram.

The indications for intravenous urography in children are much the same as for adults. For children of 5 to 7 years give one-third the adult dose, with a reduction for younger children, but never less than a quarter of the adult dose. First film taken within 10 minutes and further films at 30 and 50 minutes after injection. To prevent gas collection in the alimentary tract (common in children) give Pulv. Glycyrrhizae Co. 48 hours before injection, and, if possible, have child up and about. With the Lysholm Fixed Bucky grid, exposures can be made in a fraction of a second. No untoward reactions. For the first time a practical routine method is provided for visualising the upper urinary tract in children.—C. G. Teall, *Brit. med.-J.*, ii/1932, 788.

Sodium Ortho-iodohippurate. *Prop. Name.* IODO-RAY (*Martindale*, *London*) (Known in U.S.A. as HIPPIURAN).
 $C_9H_9I \cdot CONH \cdot CH_2COONa \cdot 2H_2O = 363.0$.

A white crystalline powder containing approximately 35% of I. Soluble readily in water and alcohol.

Contraindications. Hepatic disease, nephritis, uræmia, and iodine idiosyncrasy. It should not be administered orally to patients with any gastric lesion.

Uses. Is used for intravenous, retrograde or oral pyelography. For intravenous use it is administered as a 50 to 60% solution in doses of 24 ml. for adults. For retrograde pyelography it is used in 15 to 30% solution. It may also be given orally in aqueous solution in doses of 180 grains (12 g.). Oral administration is usually less satisfactory except for children and when cystograms only are required. Following intravenous use, radiograms may be taken after about 10, 15 and 20 minutes. After oral administration pictures are usually taken in 1, 1½, 2 and 2½ hours.

Suppression of urine of a severe and alarming degree may follow the injection of the usual innocuous pyelographic mediums (Diodrast, Skiodan and Hippuran) when these are used in an amount too large to be passed successfully through a normal single kidney (four cases recorded). It seems wise in cases of unilateral or bilateral reduction of normal renal function to repeat pyelographic studies, especially by both the excretory and retrograde methods, only after a 48-hour interval.—W. C. Quinby and G. Austen, *New Engl. J. Med.*, ii/1939, 814.

Abrodil (*Bayer Products, London*) (SKIODAN in U.S.A.). Monoiodomethanesulphonate containing 52% of I and supplied in 40% solution. For excretion pyelography, dose—40 ml. of 40% solution by intravenous injection, and for retrograde pyelography, dose—10 to 20 ml. of 20% solution, instilled by means of a catheter.

Tenebryl (*Bengué, London*) is sodium diiodomethanesulphonate for intravenous urography. Dose.—15 g. in 75 ml. of water.

For further details concerning the use of contrast media see *X-ray Diagnosis*, Vol. II.

IODINE COMPOUNDS FOR INTERNAL USE

The following preparations containing organic compounds of iodine are given internally in place of the inorganic iodides for all conditions in which the latter are indicated. The organic compounds are stated to be better tolerated and less likely to produce iodism. They are administered in syphilis, actinomycosis, goitre, arthritis, bronchial asthma, scrofula, etc.

Calcii Iodobehenas (*U.S.P. XI, P. Ned. V Supp. II*). ($C_{21}H_{19}IOO$) $_2$ Ca. *Prop. Name.* SAJODIN (*Bayer Products, London*). *Dose.*—5 to 15 grains (0.3 to 1 g.) up to 90 grains per diem after meals. *U.S.P. XI* average dose 8 grains. A tasteless powder containing not less than 23.5% of I. Insoluble in water.

Iodo-Casein. *Dose.*—10 to 15 grains (0.6 to 1 g.).

A yellowish brown powder containing 15% of I, used as a substitute for inorganic iodides. Insoluble in acid, and partially dissolved in alkaline solutions.

Iodicin (*Burroughs Wellcome, London*). A calcium salt of iodoricinoleic acid, containing 33% of I, in capsules containing the equivalent of 1 gr. of iodine (*dose.*—1 to 3, 3 or 4 times daily) and also in chocolate tablets containing the equivalent of $\frac{1}{2}$ gr. of iodine (*dose.*—1 weekly to 1 daily) for goitre.

Iodalbin (*Parke, Davis, London*). An iodo-protein compound containing 21.5% of I. *Average dose.*—5 grains after meals.

Iodamelis (*Anglo-French Drug Co., London*). A combination of iodine and hamamelidin for use in the treatment of nutritional and circulatory affections. *Dose.*—20 to 30 drops in water twice daily.

Iodoprotein (*Martindale, London*). A brown powder containing about 10% of I. Also available in 5 and 10-gr. tablets. *Dose.*—10 to 15 grains (0.6 to 1 g.), or more if desired.

Iodo-Scilline (*Anglo-French Drug Co., London*). Iodopeptone 0.01 g., powdered squill 0.02 g., scammony resin 0.02 g. in each pill. *Dose.*—2 to 6 pills daily.

Iodostarin (*Roche Products, Welwyn Garden City*).

Di-iodotartaric acid, $CH_2(CH_2)_4Cl \cdot Cl(CH_2)_4COOH = 534.1$, in 8-gr. tablets. It contains 47.5% of I. *Dose.*—1 to 3 tablets thrice daily. Tablets containing 5 mg. of Iodostarin are available for the prophylaxis and treatment of endemic goitre.

Iolase (*Anglo-French Drug Co., London*). Combination of iodine with yeast albumoses (10% I) in solution.

Lipolodine-Ciba (*Ciba, Horsham*). The ethyl ester of di-iodobrassicic acid, containing 41% of I. Tablets contain 0.3 g. To be taken (in place of the inorganic iodides) after the chief meals, masticating thoroughly.

Oridine (*Lilly, London*). Iodine in organic combination with fatty acids in chocolate tablets, each containing $\frac{1}{2}$ gr. of iodine. *Dose.*—Prophylactic, 1 or 2 tablets until 40 are taken; treatment, 2 or 3 daily over a considerable period.

Riodine (*Astier, Paris; Wilcox Jozeau, London*). A 66% solution in oil of iodised glyceryl ester of ricinoleic acid (iodised castor oil), containing about 17% of iodine. Capsules contain 0.2 g. of iodised oil (= $\frac{1}{2}$ gr. of iodine). *Dose.*—2 to 6 capsules daily. Indications as for potassium iodide; has the advantage of slow oxidation, assimilation and excretion.

Seroden Capsules (*Allen & Hanburys, London*). Gelatin capsules containing 1 gr. of iodine in combination with serum proteins. *Dose.*—1 to 3 capsules 2 or 3 times daily.

Colloidal Iodine.

Colloidal iodine solution may be prepared by acting upon sodium iodide with sodium nitrite in acid dextrose solution. The nitric oxide evolved must be removed. The usual strength is 1 in 2000.

Dose.—1 to 4 drachms (4 to 16 ml.) *per os*. Commercial preparations are frequently solutions containing iodine in combination

with proteins. Colloidal solutions are administered in place of inorganic iodides.

Alphidine (*Oppenheimer, London*). Preparations of a highly assimilable, non-toxic modification of iodine for the treatment of thyroid deficiency. Tablets each contain the equivalent of $\frac{1}{4}$ gr. of iodine. Also available as a solution (0.4% of iodine), and in combination with thyroid, etc.

Iodeol (*Bengué, London*). Electrically prepared colloidal solution of iodine in oil for intramuscular injection in doses of 1 ml. containing 0.2 g. of I. Used in pulmonary and rheumatic affections. Also available in capsules (= 0.25 g. of I) and suppositories.

Iodargol (*Bengué, London*) is a similar preparation containing 0.4 g. of I per dose, for urethral injection in infections of the urinary tract.

IPECACUANHA

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, P. Dan., etc.

Syn. IPECAC.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Emetine.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Emetine except substances containing less than 1% of emetine.*"

[S3] "*Alkaloids—Emetine—in Ipecacuanha; extracts and tinctures of ipecacuanha; substances less than 0.05% of emetine.*"

The dried root of *Cephaelis Ipecacuanha* (*syn. Uragoga Ipecacuanha*) (Rubiaceæ) from Brazil, containing not less than 2% of total alkaloids. The commonest variety is known as Rio or Matto Grosso ipecacuanha. A second variety is the Minas ipecacuanha also from Brazil. Other varieties are the Indian and Johore from the same plant, grown in Straits Settlements. They contain about 2 to 3% of total alkaloids of which about 60 to 70% is emetine.

Owing to shortage of Matto Grosso ipecacuanha, the original *B.P.* requirement that not less than two-thirds of the total alkaloids should be non-phenolic has been altered to a requirement of not less than three-fifths, the change allowing the use of varieties such as Minas and Bahia ipecacuanhas which were formerly excluded (*B.P. Add. II*).

Cartagena ipecacuanha from *Psychotria acuminata*, is not official; about 30 to 40% of the total alkaloids is emetine. It is thicker, the annulations less marked (taking the form of narrow merging ridges) and its starch-grains are somewhat larger. *U.S.P. XI* allows both *Cephaelis Ipecacuanha* (Rio) and *C. acuminata* (Cartagena) if yielding not less than 2% of ether-soluble alkaloids.

When ipecacuanha is prescribed Ipecacuanha Pulverata must be dispensed.

Antidotes. Emetics probably unnecessary as patient usually vomits. Give large doses of medicinal charcoal, stirred up in water. Keep patient lying down and quiet. When vomiting ceases, stimulants may be given. Morphine, $\frac{1}{4}$ gr. hypodermically, if required.

Uses. In small doses ipecacuanha is an expectorant, but large doses are irritant to the gastric mucosa and produce vomiting and diarrhoea. It is employed as an expectorant in acute bronchitis when the sputum is scanty, and it gives great relief in the dry cough of laryngitis and tracheitis. It is well tolerated by children and is used in croup and whooping-cough. Combined with opium, as in Dover's Powder, it is of value as a diaphoretic in the early stages of febrile affections and especially to abort incipient colds. Although it is somewhat slow in action (taking about 20 to 30 minutes), it is probably the safest of the emetics and is valuable in broncho-pneumonia in children to empty the air-passages by vomiting. Given by the mouth, 20 gr. of powdered ipecacuanha at bedtime, in amœbic dysentery, it destroys amœbæ on the surface of the bowel wall and prevents cyst formation, but it does not affect amœbæ in the substance of the bowel wall.

To prevent vomiting after administration of ipecacuanha in the treatment of amœbic dysentery, the patient should first swallow 20 m. of Tinct. Opii (for a child $\frac{1}{2}$ gr. of luminal is substituted for the opium), the ipecacuanha being given 30 minutes later, the patient lying on his back with the head turned to one side. Saliva is allowed to dribble out on a towel or is wiped off; it must not be swallowed and the head must not be raised. It is best given on an empty stomach the last thing at night. Another method is to mix the ipecacuanha with tannic acid in the proportion of two of ipecacuanha to one of tannic acid. This mixture (or the ipecacuanha alone) may be given in cachets or in a draught of water with mucilage. The dose of ipecacuanha is from 10 to 30 gr. once daily, and a course lasts for a fortnight. The tendency to nausea diminishes after a few days.—J. W. Barnett, *Med. Pr.*, ii/1936, 125.

An assessment of the expectorant properties of potassium iodide and ipecacuanha conducted under controlled conditions on 17 consecutive cases of chronic bronchitis, showed that the output of sputum was unchanged by the use of these drugs.—S. Alstead, *Lancet*, ii/1939, 932.

Acetum Ipecacuanhæ (B.P.C.).

Dose.—10 to 30 minims (0.6 to 2 ml.).

Contains 5% *v/v* of liquid extract of ipecacuanha in alcohol, water and acetic acid. Alkaloidal content, 0.1%.

[P1-S1] Applicatio Arsenicalis Composita (*Gt. Orm. H.*).

Arsenical solution 2 dr., tincture of ipecacuanha 2 dr., glycerin 2 dr., peppermint water to 1 oz. For application to the tongue and gums dilute 3 drops with $\frac{1}{2}$ dr. of water and use on a piece of gauze.

[P1-S1] Collutorium Arsenicalis (*T. H.*).

Tincture of ipecacuanha 3 dr., glycerin 5 dr., arsenical solution 5 dr., hydrogen peroxide 5 oz., water to 8 oz. Used diluted with an equal quantity of water for Vincent's angina.

Elixir Ipecacuanhæ (B.P.C.).

Dose.—10 to 30 minims (0.6 to 2 ml.).

Contains 5% *v/v* of liquid extract of ipecacuanha in a flavoured basis. Alkaloidal content, 0.1%.

Extractum Ipecacuanhæ (*Fr. Cx.*). Extract the root with 70% alcohol, and evaporate to a firm extract. It contains 6 to 8% *w/w* of total alkaloids.

Dose.—Max. single dose 0.3 g.

The water-soluble extractive under the name Emetin has been administered in pills or solution as an expectorant in doses of $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.004 to 0.006 g.) and as an emetic in doses of $\frac{1}{2}$ to 1 grain (0.03 to 0.06 g.).

Extractum Ipecacuanhæ Liquidum (B.P.).

Dose.— $\frac{1}{2}$ to 2 minims (0.03 to 0.12 ml.); emetic dose, 10 to 30

minims (0.6 to 2 ml.). 2 minims contain $\frac{1}{2}$ gr. of total alkaloids calculated as emetine.

Fluidextractum Ipecacuanhæ (U.S.P. XI). *Average dose.*—Expectorant, 1 minim (0.06 ml.); emetic, 15 minims (1 ml.).

Contains 28 to 33% of alcohol, and hydrochloric acid, and also differs from B.P. liquid extract by being standardised to 2% of ether-soluble alkaloids instead of total alkaloids. *P. Helv.* V has liquid extract containing "at least 2% emetine and cephaeline."

[P1-81] **Ipecacuanha Pulverata (B.P.).** *Syn.* PULVIS IPECACUANHÆ. *Dose.*— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.); emetic dose, 15 to 30 grains (1 to 2 g.). 2 grains contain about $\frac{1}{2}$ gr. of total alkaloids.

Ipecacuanha in fine powder adjusted by admixture with stronger or weaker powder, or lactose, to contain 2% of total alkaloids calculated as emetine, of which not less than two-thirds consists of non-phenolic alkaloids calculated as emetine.

[P1] **Mist. Expect. (N.I.F.).** Ammonium carbonate 3 gr., liquid extract of ipecacuanha $\frac{1}{2}$ m., camphorated tincture of opium 15 m., water to $\frac{1}{2}$ oz.

Mist. Expect. Alk. (N.I.F.).

Potassium bicarbonate $12\frac{1}{2}$ gr., ammonium carbonate 3 gr., liquid extract of ipecacuanha $\frac{1}{2}$ m., liquid extract of squill 2 m., chloroform water to $\frac{1}{2}$ oz.

Mistura Ipecacuanhæ Composita (B.P.C.). *Syn.* MISTURA EXPECTORANS. *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains vinegar of ipecacuanha 24 m. and strong solution of ammonium acetate 15 m. with oxymel of squill, glycerin and chloroform water to 1 oz.

Mist. Ipecac. c. Scill. (N.I.F.). Liquid extract of ipecacuanha $\frac{1}{2}$ m., liquid extract of squill 2 m., concentrated solution of ethyl nitrite $2\frac{1}{2}$ m. (equivalent to spirit of ethyl nitrite 20 m.), strong solution of ammonium acetate 15 m., water to $\frac{1}{2}$ oz.

[P1] **Mistura Ipecacuanhæ Salina (Gt. Orm. H.).** (*Dose* for 1 year old child).

Camphorated tincture of opium 2 m., tincture of ipecacuanha $1\frac{1}{2}$ m., spirit of nitrous ether 4 m., solution of ammonium acetate 15 m., syrup of tolu 4 m., water to 1 dr.

[P1] **Mistura Pertussis (St. T.H.).** Tincture of belladonna 5 m., tincture of ipecacuanha 5 m., syrup of tolu 30 m., cinnamon water to 1 dr. *Dose.*— $\frac{1}{2}$ to 1 drachm.

[P1-81] **Pigmentum Ipecacuanhæ et Arsenici (R.F.H.).** *Syn.* BOWMAN'S PAINT.

Tincture of ipecacuanha 2 dr., arsenical solution 2 dr., glycerin 2 dr., water to 1 oz. For a child dilute 5 m. to 1 oz. of water and rub into the gums, increase strength if child can be taught to expectorate. For use in pyorrhœa. To be painted on the ulceration. *A drop or two only to be used.*

VINCENT'S STOMATITIS. A local arsenic preparation that is widely used is Bowman's mixture (paint). 5 or 6 drops of this are added to a teaspoonful of water and applied by cotton wool to the mouth and gums.—John Craig, *Practitioner*, ii/1939, 610.

[P1-81] **Pigmentum Arsenicallis (R.N.H.).** Arsenical solution and tincture of ipecacuanha, of each equal parts.

[P1-81] **Pilulæ Ipecacuanhæ cum Scilla (B.P.C.).** *Dose.*—1 or 2 pills. Each pill contains 2 gr. of Dover's powder and $\frac{2}{3}$ gr. each of squill and ammoniacum (*exempt* [D]).

[P1-81] **Pulvis Ipecacuanhæ et Opii (B.P., U.S.P. XI).** *Syn.* PULVIS OPII ET IPECACUANHÆ COMPOSITUS (I.A.), PULVIS IPECACUANHÆ COMPOSITUS, DOVER'S POWDER, PULVIS OPII COMPOSITUS (P. Ned. V).

Dose.—5 to 10 grains (0.3 to 0.6 g.). 10 grains contain $\frac{1}{10}$ gr. of anhydrous morphine.

Contains 10% each of powdered ipecacuanha and powdered opium, with lactose (*exempt* [D]). Is diaphoretic and anodyne; for an acute catarrh or coryza take 10 gr. at bedtime followed at once by a hot drink and 5 gr. of quinine next morning.

[D-P1-S1] **Poudre d'Ipecacuanha Opiacée** (*Fr. Cx.*). *Max. single dose* 15 grains; *max. during 24 hours* 60 grains. Is the same but has equal parts of potassium nitrate and potassium sulphate *vice* lactose.

[P1-S1] **Pulvis Doveri** (*P. Jap. V*) contains opium 10%, ipecacuanha root 10% and potassium sulphate 80% (*exempt* [D]).

Syrupus Ipecacuanhæ (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Contains 50% *v/v* of vinegar of ipecacuanha.

P.G. VI and *I.A.* have ipecacuanha tincture 1, syrup 9.

Fr. Cx. has "Sirop" 1% of extract made by dissolving extract 1 in alcohol 70% 4, and mixing with syrup to 100; intended as an emetic. That of *I.A.* is not emetic in usual doses.

Syrupus Ipecacuanhæ (U.S.P. XI). *Average dose.*—Expectorant, 12 minims (0.75 ml.); emetic, 4 drachms (15 ml.).

Fluid extract of ipecacuanha 7, glycerin 10, syrup to 100.

Tinctura Ipecacuanhæ (B.P.).

Dose.—10 to 30 minims (0.6 to 2 ml.); emetic dose, $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 30 minims contains about $\frac{3}{7}$ gr. of alkaloids.

Prepared with 5% *v/v* of liquid extract in a glycerin-alcohol-water medium and contains 0.1% *w/v* of alkaloids. *B.P. Add. I* requires the addition of 1.65% *v/v* (1 m. per dr.) of acetic acid. It is the same strength as Vinum Ipecacuanhæ (*B.P.* '14), which was prepared with sherry. The *B.P.* requires the tincture to be dispensed when the Vinum is prescribed.

Fr. Cx., *P.G. VI*, *P. Belg. IV*, *P. Hung.* and *I.A.* include a tincture (10%) made by percolation of the root with alcohol 70%. *P.G. VI* is standardised to contain 0.194% of emetine.

Trochisci Ipecacuanhæ (B.P.C.) contain $\frac{1}{2}$ gr. (0.015 g.) in each, with simple basis.

[P1] **Trochisci Morphine et Emetini** (TROCHISCI TUSSIS) contain morphine $\frac{1}{10}$ gr. with emetine $\frac{1}{10}$ gr. In bronchial asthma.

[P1] **Unguentum Ipecacuanhæ et Crotonis.** Pulvis Ipecacuanha 1, Linimentum Crotonis 1, Adeps Benzoinatus 2. A powerful counter-irritant, rubbed on the skin of epigastrium relieves gastralgia.

[P1] **Alcresta Tablets of Ipecac** (*Lilly, London*). Uncoated tablets representing an adsorption compound of ipecac alkaloids with a form of aluminium silicate. The compound passes through the stomach unchanged and liberates the alkaloids in the intestinal tract. Each tablet contains the alkaloids from 10 gr. of ipecacuanha (*U.S.P. XI*).

[P1] **Ipecopan** (*Sandoz, London*). Malted tablets, each containing 2.5 mg. of the hydrochlorides of the total alkaloids of opium, and 0.5 mg. of emetine hydrobromide. *Dose.*—1 to 2 tablets thrice daily. For treatment of coughs.

[P1-S1] **Emetina.** *Syn.* IPECINE, METHYLCEPHAËLINE.

$C_{29}H_{46}O_4N_2 = 480.3$. *Dose.*— $\frac{1}{2}$ to 1 grain (0.005 to 0.06 g.).

A white powder darkening on exposure. In the stable neutral salts the bases are combined with *two* equivalents of acid. Basic salts also exist.

Soluble in water 1 in 600 at 15·5°, 1 in 900 at 40°. Soluble also in ether, alcohol, chloroform and fixed oils. Insoluble in essential oils.

1 gr. in 6 dr. of olive oil has been given as an enema for amœbic dysentery.

[P1] **Emetol** (*Martindale, London*). A solution of emetine base 1 gr. in 2 dr. (8 ml.) of olive oil, for rectal use in amœbic dysentery. *Dose*.—2 drachms are added to 4 or 6 dr. of ether and 8 oz. (230 ml.) of olive oil for use.

[P1-S1] **Emetine Hydrobromide**. $C_{20}H_{40}O_4N_2 \cdot 2HBr \cdot 4H_2O = 714 \cdot 2$.

Dose.—As for hydrochloride, *q.v.* for details.

White crystalline salt. Soluble about 1 in 70 only of water, hence the hydrochloride should be prescribed in preference. The addition of a little hydrobromic acid does not affect solubility.

[P1-S1] **Emetinæ Hydrochloridum** (*B.P., P. Jap. V, P.G. VI*). $C_{20}H_{40}O_4N_2 \cdot 2HCl \cdot 7H_2O = 679 \cdot 4$.

P. Ned. V has "varying quantity" of water. *P. Helv. V* has "about 4H₂O." *Fr. Cx.* 5H₂O. *P. Ital. V* allows 20% and *F.E. VIII* 19% of moisture. *P. Belg. IV* is anhydrous.

Dose.— $\frac{1}{2}$ to 1 grain (0·03 to 0·06 g.) by injection, $\frac{1}{100}$ to $\frac{1}{2}$ grain (0·0006 to 0·0025 g.) *per os* as an expectorant, but larger doses, e.g., $\frac{1}{2}$, 1 grain are given in enteric coated tablets or pills in amœbic dysentery. As an emetic *per os* $\frac{1}{12}$ to $\frac{1}{2}$ grain (0·005 to 0·01 g.) has been given. Intravenously $\frac{1}{2}$ to $\frac{3}{4}$ grain in 5 ml. of normal saline has been given, but its use by this route is not recommended.

P. Helv. V has max. single dose 0·1 g. and max. daily dose 0·2 g.

Soluble about 1 in 9 in water, but this is not permanent at 15·5°—it is safer to use 20 parts of water at least. The addition of hydrochloric acid throws out the acid salt which is less soluble. Also soluble in alcohol 90% and chloroform, but insoluble in ether.

Injections made with distilled water are less irritant than those made with normal saline. Solutions in ampoules stand sterilising.

Toxic Effects. Emetine is a protoplasmic poison acting on all tissues, but appearing to have a selective action on the heart muscle. The effective dosage of emetine seriously overlaps the toxic range and excessive dosage is followed by diarrhoea, nausea, vomiting, depression, peripheral neuritis and cardiac irregularity. It should be used with caution in all cases where the myocardium is damaged, and it is advisable that the patient remain in bed during a course of emetine treatment, and that a careful watch be kept on the pulse-rate, the drug being withheld if this shows a definite increase. According to Chopra, its use is not contraindicated in pregnancy.

Emetine is only slowly excreted and continuous use leads to *cumulative action*. The consensus is that under no circumstances should more than twelve injections of 1 gr. each be given in one course, which may be repeated after an interval of three or four months.

CUMULATIVE POISONING. The premonitory signs of poisoning, for which a most careful daily examination is urged to avoid disaster, are:—(1) alimentary; persisting nausea, return of diarrhoea; (2) urinary; oliguria, azotæmia, slight albuminuria; (3) circulatory; grave hypotension, increased cardiac response to effort. The appearance of any one of this triad calls for immediate suspension of

emetine. Established poisoning, which terminates fatally in 25% of cases in which it appears (16 deaths among 66 cases reported in the literature), is manifested by sensory and motor indications of a polyneuritis of the lower or of all four limbs and grave cardiac insufficiency. 0.8 g. is the maximum total dose to be taken in a month, followed by six weeks' suspension of emetine treatment. In adults it is best to give either an intensive course of 0.08 g. of emetine hydrochloride daily for 5 days, followed after 4 days intermission by 0.06 g. daily for 4 days, or a modified course of 0.06 g. daily for 5 to 7 days. Both courses to be followed by six weeks' suspension of emetine treatment, arsenicals being administered meanwhile. In the acute stage of amœbiasis subcutaneous injection is advised; in chronic cases the double iodide of bismuth and emetine, or Auremetine, are given in capsules.—C. Mattei, per *Trop. dis. Bull.*, 1939, 301.

Antidotes. Treat as for poisoning by ipecacuanha, see p. 655.

Uses. The most important use of emetine is in the treatment of amœbic dysentery, especially in the early acute stage. When actual symptoms of dysentery are present the amœbæ are numerous and in full activity and are amenable to the action of emetine. The reason is that the gut in these conditions is hyperæmic, and emetine circulating in the blood will have ready access to the amœbæ. The cases most resistant to treatment are the indeterminate group which get relapse after relapse and fail to react to any drug. In these patients there is superficial ulceration or even considerable thickening and fibrosis of the gut, the amœbæ are walled in, and it becomes difficult for emetine to reach them. It is for this reason that emetine therapy is so frequently a failure in the carrier condition. The respective merits of emetine and surgery in amœbic liver abscess have been widely discussed; according to Chopra, the only indication for surgical interference in this condition is in the presence of bacteria in the aspirated fluid.

Emetine has also been used successfully in a variety of other conditions, e.g., bilharziasis, Guinea worm, and oriental sore. In bilharziasis it is especially indicated in patients who are intolerant to antimony and in young children in whom it is difficult to find a vein. Six daily intramuscular injections of 1 gr. each are given, followed by an interval of six days, and then a second series of six injections. In children, doses of $\frac{1}{2}$ gr. are often sufficient. In the treatment of oriental sore injections of $\frac{1}{2}$ gr. are given locally.

Injections of $\frac{1}{2}$ to 1 gr. of emetine hydrochloride are often effective in arresting hæmoptysis.

A solution of the hydrochloride, $\frac{1}{2}$ gr. in 8 oz. of water, has been advocated as a mouth-wash in pyorrhœa.

Treatment of Amœbic Dysentery. Treatment usually consists of a combination of hypodermic or intramuscular injections of emetine hydrochloride with oral administration of one of the less irritant compounds such as emetine bismuth iodide or the periodide. The injections are made twice daily, an average dose being $\frac{1}{2}$ gr. each time until 10 to 12 gr. has been given. Intramuscular injections are preferable to hypodermic, as they are less painful and irritant. The treatment is only successful in about one third of the cases treated. Re-treatment with equal or larger amounts is rarely successful.

From observations on the use of emetine in 554 cases of amoebiasis over a period of 15 years at the Mayo Clinic, it seems hardly justifiable to discard its use, though it should be re-emphasised that in the total dose of 0.65 g. in two weeks, it is employed only to control acute manifestations of the disease and to give the patient prompt relief, but not with the idea of continuing the drug to bring about a cure.—P. W. Brown, *J. Amer. med. Ass.*, ii/1935, 1321.

It is now recognised that emetine possesses so great a therapeutic hazard in dosage required for effectiveness in amoebiasis that its routine clinical use in this disease is no longer justified. It has recently been demonstrated *in vitro* that amounts of emetine which are directly lethal for amoebae are much greater than the body tissues can tolerate. It is a fact that clinically safe doses are not always sufficient to rid the patient of this infection, and that amounts in excess of 10 gr. total may produce permanent cardiac damage. The use of this alkaloid should be confined to amoebic hepatitis or abscess and to complicated amoebiasis requiring surgical intervention, since other less harmful drugs are now available for the average uncomplicated case.—H. A. Anderson, *J. trop. Med. (Hyg.)*, 1935, 271.

Emetine is effective only in acute and subacute amoebic dysentery and should be used only in these conditions. It is of practically no use in chronic cases and in carriers, and in bacillary dysentery its use is a confession of ignorance.—A. Viswanathan, *Indian med. J.*, 1939, 304.

In acute amoebic dysentery emetine is given in one grain doses intramuscularly up to a maximum of 9 to 12 gr. over a period of 10 days, by which time all the acute symptoms will have disappeared. When the acute symptoms have subsided E.B.I. is given by the mouth in a maximum dose of 3 gr. daily for 10 to 12 days. This line of combined treatment rarely gives rise to relapses.—K. N. Murthi, *Indian med. J.*, 1939, 298.

AMOEBC LIVER ABSCESS. Aspiration and emetine injection are the methods of choice in the treatment of liver abscess, but it is further advisable to clear up the infection in the bowels with 20 to 30 gr. of ipecacuanha or with E.B.I. internally, so as to prevent relapses.—K. N. Murthi, *Indian med. J.*, 1939, 310.

EMETINE INJECTIONS IN CONJUNCTION WITH ARSENIC ORALLY.

Acetarsol 4 gr. twice daily is given for a week or 10 days in conjunction with daily injections of emetine hydrochloride 1 gr.

At the Mayo Clinic, if the patient has not received anti-amoebic treatment recently he is given 0.065 g. of emetine hydrochloride subcutaneously, twice daily for three days. After an interval of a week 0.043 g. of emetine is given twice daily for three more days. With the institution of the emetine, Treparsol 0.25 g. is administered orally with each meal for four days. If there is no intolerance to arsenic, two more such courses are prescribed, with intervals of ten days between the courses. If the patient is quite ill he is kept in bed for the first few days. Obviously, the diet may need to be bland and simple if there is much dysentery, but within 24 to 48 hours a full and generous diet is begun. A rich, high-vitamin diet has a profound influence on the healing of amoebic ulceration. Hepatic involvement may subside, but if there is a large collection of broken-down material, aspiration preferably, or occasionally open drainage, may be required. If stool tests are positive following this regimen, three courses of chiniofon are prescribed: 3 g. orally per day for a week, and repeated for two more such courses with a week's interval between courses. If diarrhoea is increased, the daily dose is decreased, thereby prolonging each course. Failure after this would indicate a course of 1 injection of arspheamine weekly for 6 weeks, and 1 dr. (3.88 g.) of bismuth subnitrate from 3 to 6 times daily during the period. A "cure" should not be regarded as having been attained until three faecal specimens monthly, obtained preferably after a saline purge, are negative over a period of six months.—P. W. Brown, *J. Amer. med. Ass.*, ii/1935, 1319.

EMETINE INJECTIONS IN CONJUNCTION WITH BISMUTH ORALLY (JAMES AND DEEKS).

Emetine hydrochloride is injected hypodermically in doses of $\frac{1}{2}$ to 3 gr. to the limit of tolerance and bismuth subnitrate ("Panama bismuth") is given orally, a heaped teaspoonful (180 gr.) in a tumbler of water every 3 hours night and day in severe cases.

In chronic cases continue for 2 to 3 months after convalescence with 3 or 4 doses daily. Cyanosis and tachycardia may occur but have been stated to be due to impurities in the bismuth subnitrate.

References to the use of Emetine in other conditions.

BRONCHOPNEUMONIA in children. Though not a specific, it is of value, the febrile period is shortened and the stomach is left free from irritation by expectorants. *Daily hypodermic injection*—up to 4 years, $\frac{1}{4}$ grain; 4 to 10 years $\frac{1}{2}$ grain; 10 to 15, $\frac{3}{4}$ grain. Discontinue if no definite results after 6 injections.—C. R. Wilson, *Brit. med. J.*, i/1928, 845.

GASTRIC ULCER. Over 400 cases of gastric and duodenal ulceration treated by intravenous injections; relief complete in each case in periods ranging from 3 days to a week. 1 grain of the salt is dissolved in 6 ml. of treble distilled water and 1 injection into the median basilic or cephalic vein is given on alternate days until 6 have been administered, followed by an interval of a week, when the injections can be repeated. Injections given on an empty stomach and the patient should be kept on a bland salt-free diet during treatment, alcohol in any form being strictly prohibited.—A. E. Olpp, *Med. Rec.*, 1934, 472.

PULMONARY SUPPURATION. Emetine 1 gr. daily for 8 to 12 days, preferably combined with strychnine, of benefit. In some cases dramatic results, in others of no value, but never known to do harm.—A. J. Scott Pinchin and H. V. Morlock, *Lancet*, ii/1930, 842, *Practitioner*, ii/1931, 345.

[P1-81] Emetinæ et Bismuthi Iodidum (B.P.). Syn. E.B.I.

Dose.—1 to 3 grains (0.06 to 0.2 g.) (= approximately 1 gr. of emetine, or about 60 gr. of ipecacuanha) constitutes the average daily dose, given in cachets, tablets, pills or capsules on an empty stomach last thing at night. Twelve doses are given in succession to make up the course. A total of 60 to 70 gr. (4 to 4.6 g.) may be necessary in some cases. If nausea and vomiting are produced, a sedative such as phenobarbitone $\frac{1}{2}$ to 1 gr., or tincture of opium 10 to 20 m., should be given previously.

A brick-red powder containing 25 to 28% of emetine and 18 to 21% of Bi (1 g. of emetine and bismuth iodide is equivalent to approximately 0.4 g. of emetine hydrochloride).

Soluble in acetone, insoluble in water and alcohol. In contact with dilute acids it is slightly decomposed but not dissolved. Is dissolved with decomposition in alkalis and strong acids.

Uses. Introduced in the belief that it would not be acted upon by the stomach and that the emetine would be liberated in the intestine. Is considered effective in the treatment of chronic cases and of carriers. The treatment is drastic, but it is claimed to result in a cure in 70 to 80% of cases. Its administration is sometimes combined with injections of emetine. When once a patient has resisted three courses of emetine bismuth iodide it is no use persisting with it.

It is important to observe certain precautions while giving this drug. It is given at bed-time, 4 hours after the last meal of the day, and nothing must be taken after. Any saliva flowing from the mouth should not be allowed to be swallowed. During treatment the patient should remain in bed on a milk diet. Alcohol should be avoided.—K. N. Murthi, *Indian med. J.*, 1939, 298.

[P1-81] Emetinæ Periodidum. Syn. E.P.I.

$C_{29}H_{40}O_4N_2I_6 = 1241.9$.

Dose.—The average dose is 2 grains (0.12 g.) thrice daily for 15 days in capsules. Doses as high as 5 grains of the periodide, i.e., $1\frac{1}{2}$ grains of emetine, have been given.

A dark purple crystalline powder containing about 38.7% of emetine and 61.3% of iodine. It is obtained by precipitation of an emetine salt with a solution of iodine.

Soluble readily in acetone, slightly soluble in alcohol and chloroform, insoluble in water. Practically insoluble in dilute acids.

Uses. This drug is the least toxic of the emetine preparations, and as much as 120 gr. has been given over 20 days without toxic symptoms. It causes less vomiting and nausea than emetine and bismuth iodide. In amœbic dysentery it is given in 2 gr. doses thrice daily for 15 days in capsules, one capsule of ox bile, 5 gr., being given simultaneously together with emetine hydrochloride 1 gr. by injection or emetine in oil *per rectum* daily for 6 days. It is also valuable in schistosomiasis, and for other indications for treatment with emetine.

SCHISTOSOMIASIS. The oral use clears up the urine of children intensely infected with *S. hamatobium* as quickly and with almost as great certainty as emetine hydrochloride subcutaneously, and without risk. 1 grain of the periodide thrice daily for 15 days was given.—R. M. Gordon, *Brit. med. J. Epit.*, ii/1926, 76.

For tropical use, it is suggested, a preparation of emetine periodide in dried milk (1 grain in 2 drachms, i.e., 8 g.) will be of value. **Directions.**—Two heaped teaspoonfuls in 3 ounces ($\frac{1}{4}$ cupful) of warm water. The majority of the children apparently successfully treated in 1926 were found to be passing live ova in 1930, but owing to the high degree of infection in the district it was impossible to say whether these were cases of relapse or reinfection.—R. M. Gordon and E. P. Hicks, *Ann. trop. Med. Parasit.*, Oct. 22, 1930.

Relatively safe, but may cause vomiting unless patients are kept in bed on strict diet.—F. G. Cawston, *Brit. med. J.*, i/1929, 890.

[P1-S1] **Auremetine** (*Martindale, London*). A combination of the periodides of emetine and auramine, containing 28% of emetine, 16% of auramine and 56% of iodine, for the treatment of amœbic dysentery. It occurs as a maroon-coloured insoluble powder. Does not cause nausea, vomiting or purging. It is administered in capsules containing 1 gr., 4 times daily for 10 or 15 days, and the administration may be combined with that of acetarsol and bismuth subnitrate as for emetine hydrochloride.

92% of cases treated by the method "responded," i.e., the patient regained his health, lost all clinical signs and symptoms of his disease (including sigmoidoscopic findings), his stools were negative on repeated examination. It is impossible to guarantee permanent cure of chronic amœbic dysentery. Auremetine has given some gratifying and more hopeful immediate results than any other essayed.—J. Graham Willmore, *Proc. R. Soc. Med.*, Nov., 1928.

Combined treatment with Auremetine, bismuth, and acetarsol, has stood the hardest tests and stands first in general usefulness among all the remedies at hand, being the least toxic and the most widely applicable of them all.—Otto Wilner, *J. trop. Med. (Hyg.)*, 1928, 207.

SCHISTOSOMIASIS in a child of 16 successfully treated with Auremetine. Live ova disappeared from urine in 24 days. Total dose 47 grains. No vomiting or ill-effects.—R. M. Gordon and E. P. Hicks, *Ann. trop. Med. (Hyg.)*, Oct. 22, 1930.

Cephaeline. $C_{29}H_{35}O_4N_2 = 466.3$.

Dose.— $\frac{1}{12}$ to $\frac{1}{8}$ grain (0.005 to 0.01 g.).

White silky needles becoming yellow on exposure to light.

Soluble in alcohol, chloroform, benzene, caustic alkali solutions. Is a more powerful emetic than emetine. Its action is exerted slowly, and it should be given orally.

By methylation it is converted into emetine.

Cephaeline Hydrochloride. $C_{28}H_{35}O_4N_3 \cdot 2HCl = 539.2$.

Dose.—As for the base. Has been given as an emetic.

Sedatussin (*Lilly, London*). Cephaeline hydrochloride $\frac{1}{10}$ gr., sodium benzoate 4 gr., tincture of sanguinaria 40 m., syrup of squill 48 m., syrup of tolu 60 m., menthol *q.s.* Cough syrup.

Acalypha (*B.P.C.*). *Syn.* INDIAN ACALYPHA, MUKTA-JHURI. The fresh or dried entire plant, *Acalypha indica* (Euphorbiaceæ). A gastro-intestinal irritant. Has been used as a substitute for ipecacuanha.

Adhatoda (*B.P.C.*). *Syn.* MALABAR NUT LEAVES, VASAKA. The leaves of *Adhatoda Vasica* (Acanthaceæ). Used as an expectorant in the form of liquid extract, syrup, or tincture, also smoked for asthma.

Angelice Radix (*B.P.C.*).

Dose.—10 to 30 grains (0.6 to 2 g.).

The dried rhizome and roots of *Angelica Archangelica* (Umbelliferae). Contains 0.3 to 1% of volatile oil. The powder and an infusion (1 in 20) have been administered for their stimulant, diaphoretic and expectorant properties. The seeds (*Angelice Fructus B.P.C.*) have similar properties. *Fr. Cx.* includes leaf and root.

Calotropis (*B.P.C.*). *Syn.* MUDAR. *Dose.*—Expectorant, 3 to 10 grains (0.2 to 0.6 g.); emetic, $\frac{1}{2}$ to 1 drachm (2 to 4 g.). Dried root-bark of *C. procera* and *C. gigantea* (Asclepiadaceæ). Used in the East instead of ipecacuanha. *Tinctura Calotropis, dose.*— $\frac{1}{2}$ to 1 drachm, 1 in 10.

Eriodictyon (*B.P.C.*). *Syn.* YERBA SANTA.

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 g.). The dried leaves of *Eriodictyon glutinosum* (Hydrophyllaceæ). Expectorant and bitter tonic. Has been used in asthma, chronic bronchitis and phthisis. Is administered as a liquid extract, 1 in 1, prepared with alcohol 25%, *dose.*—15 minims. The liquid extract greatly reduces the bitterness of mixtures containing quinine or other bitter drugs.

Eriodictyon (*U.S.P. XI*) is from *E. Californicum*.

Fluidextractum Eriodictyi (*U.S.P. XI*). *Average dose.*—15 minims (1 ml.). 1 in 1, prepared with a mixture of alcohol 95% 4 parts and water 1 part.

The action of liquid extract of eriodictyon in removing the bitter taste of solutions of quinine or strychnine is due to the presence of resinous matter which adsorbs the alkaloid.—Fantus, Dyniewicz and Dyniewicz, *J. Amer. pharm. Ass.*, 1933, 323.

Grindelia (*B.P.C., Fr. Cx.*).

The dried leaves and flowering tops of the "Gum Plant," *Grindelia camporum* (Compositæ). The involucre, and often the leaves, are coated with resin, 20% or more, to which the medicinal action is due.

Uses. For the spasmodic attacks which occur in asthma, whooping-cough and bronchitis, and given in heart disease to slow and regulate the pulse.

Extractum Grindeliæ Liquidum (*B.P.C.*). 1 in 1.

Dose.—10 to 20 minims (0.6 to 1.2 ml.) at the onset of a paroxysm of asthma, repeated every hour, in sweetened water or milk.

A 1 in 10 dilution has been used in dermatitis due to the poison ivy, *Rhus toxicodendron*.

Extractum Grindeliæ.

Dose.—2 to 3 grains (0.12 to 0.2 g.) 3 times a day.

Prepared by evaporating the alcoholic percolate.

[*P.*] **Grindeline** (*Oppenheimer, London*). *Dose.*—1 to 2 drachms in water every 2 to 4 hours. Containing liquid extract of grindelia 15 m., potassium iodide 2 gr., glyceryl trinitrate $\frac{1}{10}$ gr., liquid extract of euphorbia 20 m. in each drachm.

[P1] *Mist. Grindeliæ* (N.I.F.). Liquid extract of grindelia 10 m., ethereal tincture of lobelia 7½ m., tincture of belladonna 5 m., liquid extract of liquorice 10 m., mucilage of acacia 30 m., chloroform water to ½ oz.

[P1] *Spiritus Grindeliæ Compositus*.

Dose.—1 to 2 drachms (4 to 8 ml.) in water every 2 to 4 hours while attack of asthma lasts.

Liquid extract of grindelia 15 m., sodium iodide 2 gr., solution of glyceryl trinitrate 1 m., tincture of euphorbia pilulifera 20 m., spirit of chloroform to 1 drachm.

Holarrhena (B.P.C.). *Syn.* CONESSI BARK, TELICHERRY BARK, KURCHI OR COORCHI. The bark of the stem and root of *H. antidysenterica* (Apocynaceæ), a small deciduous tree found throughout India. The plant, as also *H. Congolensis* from the Congo, contains conessine, $C_{12}H_{20}N$. This alkaloid has strong inhibitory action on amœbæ—equal to that of emetine. It is 50% less toxic than the latter. Conessine salts can be given *per os* and intravenously, but subcutaneously they produce necrosis at site of injection. The bark has remarkable effect in amœbic dysentery. Suggested dose of powdered bark 2 to 5 grains. A liquid extract 1 = 1 has been used with good result in daily doses of 6 to 8 drachms.

Antidysenteric value compares favourably with any other remedy in vogue and depends on use of entire seed or bark. Recommended daily dose of 60 to 120 grains of powdered bark in 3 or 4 portions.—*Lancet*, i/1928, 39; see also T. A. Henry and H. C. Brown, *ibid.*, 108.

Comparative treatment of 154 cases of amœbic dysentery with Alcresta Ipecac, emetine injections, emetine injections plus bismuth *per os*, emetine and bismuth iodide, Yatren, Stovarsol and kurchi bark, showed that the last two gave the best results, the ratio of probable cures to failures in each of these cases being 1 : 1.1.—R. Knowles, *per Lancet*, ii/1928, 714. Total kurchi bark alkaloids used with success in amœbiasis—2 grain doses intramuscularly or liquid extract orally.—*Per Med. Annu.*, 1931, 17.

Compared with emetine, kurchi is rather slow in action and does not produce that dramatic effect often experienced with emetine in acute cases. But in other respects it is superior to emetine. It is non-toxic, non-emetic, and is capable of oral administration, and a daily dose of the liquid extract totalling 2 to 4 gr. of the alkaloid per day continued for a fortnight, is an efficient and dependable amœbicide.—A. Viswanathan, *Indian med. J.*, 1939, 304.

Kurchi Bismuth Iodide. *Dose*.—4 grains twice daily for 10 days in amœbiasis. In acute amœbic infections nine ½- to 1-grain doses of the total kurchi bark advised.—H. W. Acton and N. R. Chopra, *Med. Annu.*, 1931, 17.

Intramuscular injections of 2 gr. of kurchi alkaloid as effective as emetine, but painful. Kurchi-bismuth-iodide compares favourably with corresponding emetine compound in 10 gr. doses twice daily, preceded half an hour beforehand by 60 gr. of sodium bicarbonate and 40 gr. of sodium citrate, for 10 days or longer. Second course not recommended.—H. W. Acton and R. N. Chopra, *Indian med. Gaz.*, 1932, 8.

Phytolacca (B.P.C.). *Syn.* POKE ROOT.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

The root of *Phytolacca decandra* (Phytolaccaceæ) containing a bitter resin. Is emetic, purgative and mildly sternutatory. Has been given in chronic rheumatism, and used as a local application in mammitis and mumps.

Phytolaccin, *dose*—1 to 5 grains, is the dried extractive.

Antidotes. Empty stomach by emetic or stomach tube. Give stimulants, *e.g.*, aromatic spirit of ammonia, ½ dr. in water. Digitalis may be necessary, and morphine, ½ gr. hypodermically, for pain.

Sanguinaria (B.P.C.). *Syn.* BLOOD ROOT. *Dose.*—1 to 5 grains (0.06 to 0.3 g.). The dried rhizome of *S. Canadensis* (Papaveraceæ). Expectorant in chronic bronchitis. Has been given as a 10% tincture, *dose.*—15 minims.

A resinoid extractive, sanguinarin, *dose.*— $\frac{1}{4}$ to 1 grain, is made.

Simaruba (B.P.C.). *Dose.*— $\frac{1}{4}$ to $\frac{1}{2}$ drachm (1 to 2 g.). The dried root-bark of *S. amara* (Simarubaceæ). Used as a bitter, and as an astringent in dysentery. Administered as a decoction (1 in 20).

Decoctum Simarubæ et Punice Granati. Add simaruba bark, pomegranate fruit rind and gum arabic of each 15 g. to a litre of water, and boil down to $\frac{1}{2}$ litre. *Dose.*—30 ml. 3 or 4 times daily. For the treatment of dysentery. The quantities and the ingredients have been varied from time to time.

JALAPA

(with IPOMŒA, etc.)

B.P., Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

Syn. BRYONE NOIRE, MECOACAN NOIR, VERA CRUZ JALAP.

The dried tubercles of *Ipomœa purga* (*syn. Exogonium purga*) (Convolvulaceæ). A powerful purgative producing watery stools; it is apt to gripe, and must be avoided if the bowels are inflamed. Used to reduce dropsy of Bright's disease, and to relieve uræmia. When Jalapa is prescribed Jalapa Pulverata is to be dispensed.

Jalapa Pulverata (B.P.).

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Jalap in fine powder adjusted with exhausted jalap or lactose to contain 10% of resin.

Pulvis Jalapæ Compositus (B.P.).

Dose.—10 to 60 grains (0.6 to 4 g.).

Powdered jalap 30% with ginger 10% and potassium acid tartrate.

Tinctura Jalapæ (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). Contains 1.5% of resin.

Tinctura Jalapæ Composita (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). Contains 1 $\frac{1}{2}$ in 12 $\frac{1}{2}$ of jalap with scammony resin and turpeth.

Tinctura Jalapæ Composita (*Fr. Cx.*). *Syn.* EAU-DE-VIE ALLEMANDE. Prepared by macerating jalap 8 g., turpeth 1 g., scammony 2 g., in alcohol 60% for 10 days.

Jalapæ Resina (B.P.C., *Fr. Cx., P. Jap. V, P.G. VI, P. Ital. V, F.E. VIII, P. Belg. IV, P. Helv. V and P. Dan.*).

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Contains two glucosidal resins, about 90% convolvulin (*syn. JALAPURGIN*), soluble in alcohol, but insoluble in ether, together with about 10% soluble in ether and in alcohol. The latter, orizabin or jalapin (Mayer), the principal constituent of spurious jalap (*Ipomœa simulans*), is identical with scammonin from ipomœa. It is cheaper and less active. B.P.C. requires not less than 85% of ether-insoluble resins.

A jalap resin, known as *Regina de Batata de Purga*, and extracted from the tubercle of *Convolvulus Operculatus*, is extensively used in Brazil. It possesses the same properties as the official jalap, but is practically devoid of any subsequent constipating action. Dose.—0.25 to 2 g.—*Chem. & Drugg.*, i/1925, 854.

Jalapinum (B.P.C.).

Dose.—1 to 5 grains (0.06 to 0.3 g.).

The ether-insoluble portion of the resin obtained from jalap, occurring as a white odourless powder with acrid taste, m.p. about 155°. **Soluble** in alcohol, glacial acetic acid and ethyl acetate, insoluble in ether and water, slightly soluble in chloroform. Is considered less active than jalap resin.

It should be distinguished from the substance known in Germany as jalapin, which is the ether-soluble portion of jalap resin.

Ipomœa (B.P.). *Syn.* ORIZABA JALAP ROOT, MEXICAN SCAMMONY ROOT.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

The dried root of *I. orizabensis* (Convolvulaceæ). A powerful purgative very similar in its action to jalap and containing up to about 20% of resin.

Scammonia Resina (B.P.). *Syn.* RESINA IPOMŒÆ (U.S.P. X), RESINA SCAMMONIÆ MEXICANÆ (Fr. Cx.).

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.).

Soluble in alcohol 90%, insoluble in water, wholly or partly soluble in ether. The ether-soluble portion of scammony resin is known as scammonin. Purgative in obstinate constipation, producing copious watery evacuation in a few hours. Does not act until reaching the duodenum.

Pulvis Scammonia Compositus (B.P.C.).

Dose.—10 to 20 grains (0.6 to 1.2 g.). Scammony resin 50% with jalap and ginger.

Pilula Scammonia Composita (B.P.C.).

Dose.—1 or 2 pills. Contain 1 gr. each of scammony resin, jalap resin and curd soap, and $\frac{1}{2}$ gr. of ginger.

Scammonium (B.P.C.), *syn.* RESINA SCAMMONIÆ (Fr. Cx.), VIRGIN SCAMMONY, dose.—5 to 10 grains (0.3 to 0.6 g.), is the gum-resin obtained from Levant scammony root (*Convolvulus Scammonia*). It occurs in blackish pieces giving an emulsion with water. It resembles scammony resin in its action.

Cambogia (B.P.C., P. Helv. V, P. Austr., Fr. Cx.). *Syn.* GOMME GUTTE.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.). *P. Helv. V* max. single dose 3 grains approx., max. in 24 hours 10 grains. Yellow gum-resin from *Garcinia Hanburyi* (Guttifera) growing in Siam. A powerful purgative, and may cause severe griping. Will expel tapeworm. Is rarely now given alone. Indian gamboge, from *G. Morella*, is similar.

Kaladana (B.P.C.). *Syn.* PHARBITIS SEEDS.

Dose.—30 to 45 grains (2 to 3 g.). The dried seeds of *Ipomœa hederacea* (Convolvulaceæ). Purgative and anthelmintic.

Pulvis Kaladana Compositus and Tinctura Kaladana are prepared in the same way as the corresponding preparations of jalap, and are used instead of them in India and the East.

Kaladana Resina. Dose.—2 to 8 grains (0.12 to 0.5 g.).

Useful hydragogue, used as a substitute for jalap resin in India and the East.

Leptandra (*B.P.C.*). *Syn.* BLACK ROOT, CULVERS ROOT.

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 g.).

The dried rhizome and roots of *Veronica virginica* (Scrophulariaceæ). Cholagogue, reputed to act without irritating the bowels. Often combined with podophyllin or euonymin.

Extractum Leptandræ (*B.P.C.*). *Syn.* LEPTANDRIN.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.). A dry extract.

[P1] **Tabellæ Leptandræ Compositæ** (*B.P.C.*). *Syn.* TABELLÆ LAXATIVÆ COMPOSITÆ, VEGETABLE LAXATIVE TABLETS. *Dose.*—1 to 3 tablets.

Contain compound extract of colocynth 1 gr., $\frac{1}{2}$ gr. each of leptandra, jalap resin, resin of podophyllum, dry extract of hyoscyamus and extract of taraxacum, and oil of peppermint.

Turpethum (*B.P.C., Fr. Cx.*). *Syn.* INDIAN JALAP. *Dose.*—5 to 20 grains (0.3 to 1.2 g.). The dried root and stem of *Ipomœa Turpethum* (Convolvulacææ). Contains 5 to 10% of resin and is used in the East in place of jalap.

KRAMERIA

(with KINO, CATECHU, etc.)

B.P., Fr. Cx., P. Helv. V, P. Dan.

Syn. RHATANY ROOT, PERUVIAN RHATANY.

The dried root of *Krameria triandra* (Polygalacææ). Contains about 8% of a tannin. Astringent in relaxed throat. Also used in tooth powders when gums are liable to bleed, and in mouth-washes, also for bleeding from nose and bowels, and for diarrhœa.

The root of *K. argentea*, known as Pará Rhatany, is not official.

Extractum Kramerizæ Siccum (*B.P., Fr. Cx.*).

Dose.—5 to 15 grains (0.3 to 1 g.). The aqueous percolate evaporated to dryness under reduced pressure.

Infusum Kramerizæ Concentratum (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 2 $\frac{1}{2}$.

Infusum Kramerizæ Recens (*B.P.C.*). *Syn.* INFUSION OF RHATANY.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

Tinctura Kramerizæ (*B.P.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5 of 60% alcohol by percolation.

Garg. Kramer. Co. (*N.I.F.*). Tincture of krameria 3 dr., liquefied phenol 3 dr., glycerin 4 dr., peppermint water to 8 oz. For use dilute one tablespoonful with $\frac{1}{2}$ pint of warm water.

Trochiscus Kramerizæ (*B.P.*) contains 1 gr. of the dry extract.

[D-P1-81] **Trochiscus Kramerizæ et Cocainæ** (*B.P.*) contains 1 gr. of the dry extract with $\frac{1}{10}$ gr. of cocaine hydrochloride.

Kino (*B.P.C., U.S.P. XI, P. Helv. V*).

Dose.—5 to 20 grains (0.3 to 1.2 g.). *U.S.P. XI* average dose 8 grains.

The dried juice from the trunk of *Pterocarpus Marsupium* (Leguminosæ). Genuine kino is sometimes difficult to obtain,

and frequently the commercial article is inferior, and undoubtedly derived from a different source.

Partly *soluble* in cold water, more soluble in hot water and alcohol 90%, nearly insoluble in ether. Contains 70 to 80% of kinotannic acid. Astringent for diarrhoea, and as Trochisci for relaxed condition of the throat. The powder is also insufflated to check epistaxis.

[P1-81] **Pulvis Kino Compositus (B.P.C.).**

Dose.—5 to 20 grains (0.3 to 1.2 g.).

Kino 75%, powdered opium 5%, and cinnamon 20% (*exempt* [D]).

Tinctura Kino (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10.

The tincture may gelatinise, due to enzymes, on storage.

Incompatible with mineral acids and alkalis and with substances precipitable by the tannin it contains.

Tinctura Kino (U.S.P. XI). *Average dose.*—30 minims (2 ml.).

1 in 5; double the strength of the U.S.P. X tincture.

Kino Eucalypti (B.P.C.). *Syn.* RED GUM, GUMMI EUCALYPTI.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

An exudation from *Eucalyptus rostrata* (Myrtaceæ), and other species. About 80% of it is soluble in cold water, and about 90% in alcohol 90%. Used in diarrhoea, and relaxed throats, and as astringent in dentistry, cuts, etc. As astringent in hæmorrhage and in relaxed conditions of the larynx and trachea, it is used mixed with an equal weight of starch. As a suppository, 5 gr. in oil of theobroma may be used.

To be distinguished from the common Australian or Botany Bay kino, said to be from *E. resinifera*.

Extractum Kino Eucalypti Liquidum (B.P.C.). *Syn.* EXTRACTUM GUMMI RUBRI LIQUIDUM.

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1 in 4.

Gargarisma Kino Eucalypti (B.P.C.). Liquid extract of kino eucalyptus 6.25% v/v.

Tinctura Kino Eucalypti (B.P.C.). *Syn.* TINCTURA GUMMI RUBRI.

Dose.—15 to 40 minims (1 to 2.6 ml.). 1 in 4.

Trochisci Kino Eucalypti (B.P.C.). *Syn.* RED GUM LOZENGES; EUCALYPTUS GUM LOZENGES. Contain 1 grain.

Bela (B.P.C.). *Syn.* BAEL FRUIT. The fresh or dried half-ripe fruit of *Aegle Marmelos* (Rutaceæ). Mild astringent. The fresh fruit is useful in dysentery and in dyspepsia.

Extractum Belæ Liquidum (B.P.C.). *Dose.*—1 to 2 drachms (4 to 8 ml.). 1 in 1.

Buteæ Gummi (B.P.C.). *Syn.* BENGAL KINO. Obtained from incisions in the stem of *Butea frondosa* (Leguminosæ). Used in the East in place of kino.

Catechu (B.P., P. Helv. V). *Syn.* CATECHU PALLIDUM, GAMBIR.

Dose.—5 to 15 grains (0.3 to 1 g.).

A dried aqueous extract of the leaves and young shoots of *Uncaria gambir* (Rubiaceæ). Soluble in water to the extent of about 50%. Astringent in diarrhoea.

Mist. Catechu Co. (N.I.F.). Powdered catechu 10 gr., aromatic powder of chalk 15 gr., chalk 15 gr., chloroform water to $\frac{1}{2}$ oz.

Pulvis Catechu Compositus (B.P.C.). *Dose.*—10 to 60 grains (0.6 to 4 g.). 1 in 2 $\frac{1}{2}$, with kino, krameria, cinnamon and nutmeg.

Tinctura Catechu (B.P.). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

1 in 5 of alcohol 45% with cinnamon 1 in 20.

Trochiscus Catechu (B.P.C.) contains 1 grain. For relaxed throat.

Catechu Nigrum (B.P.C.). *Syn.* CUTCH, CACHOU DE PÉGU (*Fr. Cx.*), CATECHU (*Fr. Cx.*).

Dose.—5 to 15 grains (0.3 to 1 g.).

An extract prepared from the heartwood of *Acacia Catechu* (*Leguminosæ*) used for the same purposes as catechu.

Rhus (B.P.C.). *Syn.* RHUS FRUCTUS, SUMACH, SUMAC BERRIES.

Dose.—10 to 30 grains (0.6 to 2 g.).

The dried fruits of *R. Glabra* (*Anacardiaceæ*). Astringent and reputed diuretic. The liquid extract (1 in 1) and decoction (1 in 20) have been used in gargles.

Rhus Toxicodendron (Anacardiaceæ). *Syn.* POISON OAK, POISON IVY LEAVES. *Tincture.* *Dose.*—2 to 15 minims. Imported from North America, prepared from fresh leaves 1, alcohol 2. It is much employed in homeopathic medicine in the treatment of subacute and chronic rheumatism, chronic skin affections, and other conditions. It may irritate the stomach and bowels. The poisoning by the "Toxicodendrol" contained takes the form of an itching, burning, erythematous and herpetiform rash. Swab skin with 5% potassium permanganate—recovery rapid. A 1 in 10 dilution of liquid extract of grindelia is also effective. A 5% ferric chloride solution in 50% glycerin, washed freely on skin will act as a preventive.

A vanishing cream base (potassium stearate) containing 10% of sodium perborate or potassium periodate was found to be an effective preventive against poison ivy dermatitis. It is recommended that it be rubbed well into the skin of the arms and face before exposure. After a few hours it should be washed off and a fresh portion applied before further exposure. The cream must be freshly prepared and not used after 2 to 3 weeks, since it deteriorates rapidly.—L. Schwartz, L. H. Warren and F. H. Goldman, *Publ. Hlth Rep., Wash.*, 1940, 55, 1327.

Coto (B.P.C.). *Syn.* PARACOTO.

Dose.—1 to 8 grains (0.06 to 0.5 g.), in powder, 4 to 6 times a day.

A bark of unknown botanical origin imported from Bolivia; probably from a species of *Nectandra*. Has been used in cholera, and the diarrhoea of phthisis, for night sweats, and for gout and rheumatism.

Extractum Coto Liquidum (B.P.C.). 1 = 1 of bark.

Dose.—5 to 15 minims (0.2 to 1 ml.).

Tinctura Coto (B.P.C.). *Dose.*—10 to 30 minims (0.6 to 2 ml.). 1 in 10.

Mistura Anti-choleraica (Royal Coll. Phys., Form II).

Aromatic sulphuric acid 15 minims, compound tincture of camphor 30 minims, compound tincture of chloroform, tincture of coto, of each 20 minims, syrup of orange flower 1 drachm, peppermint water to 1 ounce. *Dose.*—1 ounce every 3 or 4 hours.

Rosæ Petalum (B.P.C.). *Syn.* RED-ROSE PETALS (*Fr. Cx.*). The petals of the red or French rose, *Rosa gallica*. *Flos Rosæ* (*P. Helv. V*) is from *R. gallica* or *R. centifolia*. Mildly astringent.

Confectio Rosæ Gallicæ (B.P.C.), *syn.* CONFECTION OF ROSES, consists of the fresh petals beaten to a paste with sucrose.

Infusum Rosæ Acidum Concentratum (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

About 1 in 5. Approximately 8 times the strength of the fresh infusion.

Infusum Rosæ Acidum Recens (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 40, with 1 in 80 of dilute sulphuric acid.

Syrupus Rosæ (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). A solution of sucrose in an acidified aqueous infusion of the petals.

Rosæ Centifoliæ Petalum, syn. PALE-ROSE PETAL (Fr. Cx.), is obtained from the cabbage or Provence rose, *Rosa centifolia*.

Rosæ Fructus (B.P.C.). Syn. HIPS. The fresh ripe fruits of the dog rose, *Rosa canina* (Rosaceæ) and other closely allied species.

Confectio Rosæ Caninæ (B.P.C.), syn. CONFECTION OF HIPS, consists of the hips deprived of their achenes and beaten to a pulp with sucrose. Occasionally used as a pill excipient.

Salix (B.P.C.). Syn. WILLOW BARK. The bark of *S. alba* and other species. Contains tannin and salicin. Has been employed as a bitter and astringent.

Extractum Salicis Nigræ Liquidum (B.P.C.). Dose.— $\frac{1}{2}$ to 1 drachm (1 to 4 ml.). 1 in 1.

LIGATURES AND SUTURES

Surgical ligatures and sutures are materials used in surgery for tying and stitching respectively. They fall into two main divisions, those which are absorbed by the body and become replaced by a ring of living tissue, and those which are not absorbed. The absorbable, non-irritating type are few in number, catgut and kangaroo tendon being the only ones in common use. The non-absorbable type act as foreign bodies when introduced into living tissue, and set up irritation leading to their isolation by the formation of a fibrous capsule, or their ejection through a stitch-abscess. This class includes horsehair, silk, silkworm gut and Japanese synthetic gut.

The properties essential to a satisfactory surgical ligature or suture are sterility, tensile strength commensurate with gauge, and good keeping qualities. It is in the attempts to fulfil these requirements that very considerable difficulties are met with, the prolonged heating or chemical action to which it is necessary to expose some materials to ensure sterility often having a detrimental effect on the tensile strength. Because of this difficulty of ensuring a satisfactory sterile substance, surgical ligatures and sutures were brought within the scope of the Therapeutic Substances Act, 1925, by the Therapeutic Substances Regulations 1931 (amended by S.R. and O. 1937, No. 767). The regulations control the manufacture and importation for sale of any ligature or form of binding material prepared from the gut or any tissue of an animal, and offered for sale for use in surgical operations on the human body. The substances to which the Regulations apply are catgut, kangaroo tendon and horsehair, and the chief requirements include a licence to manufacture granted by the Ministry of Health for England and Wales, the Department for Health for Scotland, or the Ministry of Home Affairs for Northern Ireland, use of approved processes for manufacture and sterilisation and subjection to prescribed bacteriological tests of not less than one per cent. of material from every batch manufactured.

Every container must bear on it, or on a label enclosed within it, the name of the substance and its source, for example, "surgical

ligature (catgut)," the manufacturer's licence number and a distinctive batch number. The Regulations also control the labelling of non-sterile surgical ligatures and sutures, not offered or intended to be offered for sale as sterile, the containers of which must bear the following words written or printed in indelible red ink:—"non-sterile surgical ligature (suture)—not to be used for operations upon the human body unless efficiently sterilised." Otherwise non-sterile material is outside the scope of the Regulations. The control exercised under the Act has raised considerably the standard of sterility of ligatures and sutures on sale in this country, and it is unfortunate that the preparation of sterile ligatures and sutures in hospitals for use in the operating theatre is outside this control. Hospitals are recommended to use only materials manufactured under a licence issued under the Therapeutic Substances Act, unless they are certain that the same precautions are observed in the preparation of and the same tests applied to their own product as are required under the Act and Regulations.

Catgut is almost exclusively prepared from the small intestine of lambs, preferably that of young lambs, and consists of the submucous cellular coat, the other layers being scraped away during the course of manufacture. The raw material for catgut manufacture is heavily infected with a variety of micro-organisms, among which there may occur pathogenic anærobcs, so that sterilisation becomes a matter of primary importance.

The intestines, after removal, are stroked free from fæces and immediately salted or frozen. In the factory the blocks of frozen gut are thawed out, thoroughly washed, soaked in weak alkali to make them soft and supple, and then split longitudinally into ribbons. The ribbons are scraped to free them from the unwanted layers, leaving the *submucosa* only. Sometimes a preliminary sterilising or inhibiting process is carried out at this stage by soaking the ribbons in a disinfectant solution. Gut treated in this way but not subjected to a sterilising process after spinning, is often sold as "internally sterilised" catgut, and is purchased by hospitals and similar institutions, who subject it to a final sterilising action before use. As this material is not sold as sterile and ready for use, it falls outside the scope of the Therapeutic Substances Regulations, and great care should be taken when buying "internally sterilised" catgut to ascertain that the material has been through an efficient sterilisation process, as the final treatment that it will receive in the hospital often effects very little more than surface sterilisation, and the use of infected material of this type has undoubtedly led to wound infection.

After splitting, the ribbons are fastened together in twos, threes, or fours with string loops, the number used depending upon the gauge of the catgut desired, and with the aid of a mechanical device a definite number of twists is given. The "spun" string is stretched and dried under tension, the product being "raw" catgut. The dried raw catgut is polished with glass paper or similar material and graded according to thickness.

There is, unfortunately, no recognised gauging standard for surgical catgut in U.K., and each manufacturer sets his own, often with varying results. A typical scale is given below, in which the gauge number is compared with the diameter of the gut and the standard wire gauge.

Catgut No.	Diameter	Standard Wire Gauge No.	Catgut No.	Diameter	Standard Wire Gauge No.
	<i>In.</i>			<i>In.</i>	
8/0	0.010	33	0	0.018	26
6/0	0.0116	31	1	0.020	25
4/0	0.0136	29	2	0.022	24
3/0	0.0149	28	3	0.024	23
2/0	0.0164	27	4	0.028	22

At this stage the gut is sometimes submitted to a chemical process for the purpose of hardening the gut and so delaying its absorption by the body. Various substances have been used for this purpose, including potassium dichromate and tannic acid. For example, *Lister's sulphochrome catgut* is prepared by soaking raw catgut for 24 hours in twenty times its weight of "preparing fluid" made by dissolving chromic acid 4, in water 240, adding sufficient sulphurous acid to produce the green colour of chromium sulphate, making up to 480 (by weight) with water, and finally adding a solution of mercuric chloride 2, in water 320. The catgut is dried under tension. Lister considered that sulphochrome catgut does not begin to be absorbed for about ten days, and is then only gradually eroded, retaining considerable firmness to the last. By variations in the treatment to which the gut is submitted, it is claimed that the time of absorption can be controlled, and so-called 10, 20, 30 day catguts are supplied. Such times can only be approximate, since the rate of absorption varies with the type of tissue in which it is embedded, and with the individual.

Sterilisation. Production of sterile catgut must from the very nature of its origin and method of manufacture prove difficult. The presence of such pathogenic organisms as tetanus and anthrax is almost certain, and as during the manufacture they become embedded in the strands by the twisting of the ribbons, it becomes a matter of great importance to find a process which will penetrate the tissue and kill any spores present without affecting the physical characters of the material, including its suppleness and tensile strength. It is essential that the tensile strength shall be good on both the length and the knot, and it may readily be lost during the sterilisation process.

Many processes have been used for producing sterility, including treatment with phenol in oil, mercuric chloride, mercuric biniodide, silver compounds, essential oils, iodine and heat. All

have objectionable properties in some degree or another, some are not sporicidal, others do not penetrate, whilst a number affect the tissue of the gut and render it practically useless. The most effective chemical sterilising agents are hydrogen peroxide and iodine. The former, owing to its swelling effect on "spun" gut, is seldom employed by itself, but is generally used for treating the wet gut as a preliminary to the action of iodine.

Iodine Treatment. Iodine is the most practical sterilising agent, as it possesses great penetrating power and may be relied upon to produce a sterile gut with good physical properties. The process consists of immersing the catgut under tension in an aqueous solution containing iodine 1%, potassium iodide 2%, potassium iodate 0.25%, glycerin 5 to 10%, for eight to nine days, until it has absorbed 12% of its weight of iodine. The process is said to depend upon the formation of nascent hydriodic acid, which is of great sporicidal value, from the reaction of iodine and organic matter. The potassium iodate is added to prevent damage to the catgut by the excessive formation of acid, while the glycerin maintains its suppleness and increases the tensile strength on the knot. The next step is to remove the excess of free iodine by replacing the iodine solution with a sterile bleach containing sodium thiosulphate. The strings are then thoroughly washed and dried by dehydration with spirit or other means. Under aseptic conditions, the gut is cut to the required lengths, coiled, tubed, and the tubes filled with an alcoholic solution of iodine diluted with just enough water to allow the iodine to exert a germicidal effect without waterlogging the catgut. This removes any slight contamination picked up during the bleaching, washing, drying and tubing processes. After an appropriate time, the iodine solution is replaced by the final alcoholic tubing fluid, and the tubes are sealed.

Heat Treatment. Heat is probably the most efficient and reliable agent provided the physical properties of the catgut remain unimpaired. Heating catgut in air renders it hard and brittle, whilst heating it in a moist atmosphere ruins it immediately. Accordingly the raw catgut is first thoroughly dried by placing it already cut to the required length, coiled and tubed, in warm ovens. Immediately after drying the tubes are placed in an autoclave containing an organic fluid such as toluene or xylene, and gradually heated. The temperature is usually maintained somewhere between 150° and 165° for several hours, and at the end of this time the autoclave is allowed to cool slowly. The tubes are removed, the final tubing fluid added under aseptic conditions, and the tubes sealed.

Tubing fluids vary in their composition, but are usually alcoholic solutions of different chemicals containing, if necessary, the correct amount of water to recondition heat-treated catgut. It may be emphasised here that alcohol used in any process should be sterilised by filtration before use, since spores can remain unharmed by immersion in it for long periods.

Tests for Sterility. All ligatures and sutures manufactured under licence must be subjected to prescribed tests for sterility. The Regulations specify that not less than one per cent. of each batch shall be examined by the following procedure. The container is opened and the sample removed aseptically. It is drained and placed in sterile water and incubated at 37° for 24 hours. The sample is then transferred aseptically to a sterile aqueous solution of sodium thiosulphate 1%, and sodium carbonate 1%, and again incubated at 37° for 24 hours. This solution is intended to remove iodine used in the manufacture of the ligature or suture. If any other substance has been used instead of iodine, the manufacturer must obtain the approval of the licensing authority to substitute an alternative procedure. This part of the test is of great importance, and its neglect in the past has undoubtedly led to the reliance which is wrongly placed on such disinfectants as mercuric chloride, mercuric biniodide, essential oils, etc., which, while

having insufficient penetrating power to ensure the internal sterility of catgut are bacteriostatic enough to prevent growth of organisms in culture media.

After the second incubation the sample, without further washing, is divided into two portions and tested for the presence of aerobic and anaerobic organisms by incubating in suitable media for twelve days at 37°. Only if negative results are obtained from the test may the ligatures or sutures be passed for sale.

The tests prescribed in the *U.S.P. XI Supp. II* for the sterility of surgical gut are similar except that the material is also tested for moulds and yeast, and all cultures showing no growth at the end of the tests are themselves tested for absence of bacteriostatic agents which may have been accidentally transferred.

The terms "boilable" and "non-boilable", which are often applied to catgut, indicate those tubes of material which can and cannot be boiled before opening for the purpose of sterilising the outside of the tube. Such a process can have no effect on the sterility of the gut and may damage its physical properties. It is preferable, therefore, to wash the tube with a germicidal solution.

Chorda Chirurgicalis (*U.S.P. XI Supp. II*). *Syn.* SURGICAL GUT, SURGICAL "CATGUT," "CATGUT" SUTURE.

It consists of sterile gut prepared from the submucous connective tissue of the small intestine of the sheep. The monograph includes the following four types depending upon the treatment they have undergone to increase their resistance to digestion. Type A, plain or untreated; Type B, mild treatment; Type C, medium treatment; Type D, prolonged treatment. Each type may be supplied as "boilable" or "non-boilable." The monograph controls length, diameter, tensile strength on the straight pull and over a surgeon's knot, sterility, labelling, etc.

Pharm. J., ii/1936, 254.

Kangaroo tendon consists of the tendons dissected out from kangaroo tails. They form very stout material about 10 inches in length and, like catgut, are absorbable in a wound. They are used for suturing large wounds in heavy muscle. Sterilisation is difficult but can be carried out as for catgut.

Non-absorbable Ligatures. The greatest use for this type of material is for suturing skin, but some surgeons prefer silk to catgut for internal operations although the silk will probably remain *in situ*. This preference is, in many cases, due to the fact that silk can be readily sterilised in the operating theatre.

Non-absorbable sutures should preferably have a smooth surface, be impermeable to water, resilient, and easy to remove after the healing of the wound. They are often coloured to contrast with the skin.

Black horsehair occurs in hanks, the threads being up to 28 inches in length. It is smooth and impermeable. It is occasionally used for small skin wounds, but is generally not very satisfactory as it is inclined to be brittle, particularly on the knots, whilst the gauge gradually decreases from the base to the tip. It may be sterilised by thoroughly washing in neutral soap solution and boiling or autoclaving.

Silkworm gut. *Syn.* CRINA (*Fr. Cx.*). It has the same composition as ordinary silk, but a much wider gauge. Instead of being spun by the living silkworm it is extracted by the fingers from worms which have been killed. It is manufactured chiefly in Spain for this special purpose.

Silkworm gut occurs in hanks of 50 threads, the threads having an effective length of 10 to 14 inches. The gauges may be very fine, fine, medium, and stout, but being hand-prepared, the gauge may vary in the same thread. Silkworm gut is often supplied dyed in different colours, each colour representing a particular gauge, so that the surgeon can distinguish a mixture of threads of different gauges on the sterilising tray. Sterilisation may be carried out as for horsehair. It is employed as a substitute for catgut in deep-seated operations.

Japanese synthetic gut consists of silk thread specially surfaced and hardened by treatment with agar or some similar substance. It is a very stout material, very supple and smooth, and is supplied in a large variety of gauges. It occurs in lengths up to 40 yards. It may be sterilised as for horsehair and silkworm gut.

Silk. Ordinary silk thread slightly waxed is employed for long skin suturing, and very fine silk for suturing blood vessels, divided nerves and fascia. It is not advisable to use it where definite sepsis occurs, as it is liable to absorb contamination. It may be sterilised as for horsehair.

Nylon, a synthetic super polymer, is marketed by *I.C.I. (Plastics) Ltd., Welwyn*, as non-absorbable surgical sutures. It forms into filaments of great strength, toughness and elasticity, which are uniformly even and smooth. The sutures are more easily withdrawn than natural silkworm gut sutures. They are of solid section and consequently non-capillary. Nylon does not soften in water or steam at the highest temperatures normally used for sterilising, and it is unharmed by any of the usual sterilising agents or antiseptic solutions, except phenols and strong mineral acids. Available in 14-inch lengths.

LINUM

(with PSYLLIUM, etc.)

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V.

The dried ripe seeds of *Linum usitatissimum* (Linacæ). The seeds contain mucilage and about 30% of fixed oil. Preparations are administered for their demulcent action in the treatment of cough. The seeds, 1 or 2 teaspoonfuls in a tumbler of water, may be taken to increase the bulk of the intestinal contents in the treatment of constipation.

TOXICOLOGY OF LINSEED PLANT. Cattle poisoning by linseed flowers is fairly common in Bengal. The results of an investigation into the amount of hydrocyanic acid liberated by the enzyme linase from different parts of the plant showed that flowers after fertilisation (*i.e.*, with immature seeds) were the most potent, as much as 0.69% of HCN being liberated in water and 0.6% in acid. A strong solution of an alkali (sodium carbonate) has been suggested as an antidote in linseed flower poisoning.—K. N. Bagchi and H. D. Ganguli, *Indian J. vet. Sci.*, 1939, 9, 61, per *Analyst*, 1939, 680.

Infusum Lini (B.P.C.). *Syn.* LINSEED TEA.

Dose.—1 to 4 ounces (30 to 120 ml.). About 1 in 30.

Linum Contusum (B.P.). *Syn.* CRUSHED LINSEED, LINSEED MEAL. Coarsely powdered linseed, freshly prepared. Contains not less than 30% of oil.

Mucilago Lini (B.P.C.). 1 in 8.

Oleum Lini (B.P., U.S.P. XI, P. Helv. V, P. Dan.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

A yellowish-brown drying oil expressed from linseed. It thickens on exposure to air. **Soluble** 1 in 40 of dehydrated alcohol, slightly soluble in alcohol 90%; miscible with turpentine, ether, chloroform, carbon disulphide and light petroleum.

Boiled linseed oil is linseed oil heated with litharge, magnesium resinate or other "driers" causing the oil to dry more rapidly. It must not be used for linseed oil.

Fœnum-græcum (B.P.C., *P. Helv. V*). *Syn.* FœNUGREEK. The seeds of *Trigonella Fœnum-græcum* (Leguminosæ), a herb largely grown in India and Egypt. The seeds contain a large proportion of mucilage and about 5% of oil, and are used chiefly in veterinary medicine.

An Egyptian preparation, *Helba*, is made from fœnugreek—when soaked the seeds swell into a pasty condition and are used for fever, also for diabetes. Seeds which have been allowed to sprout for 3 or 4 days are sometimes preferred and are taken raw, together with unsprouted seeds. A decoction of fœnugreek, an egg-cupful to a pint of water, boiled down to 5 oz., strained and taken cold on an empty stomach, has been used in diabetes.

Ispaghula (B.P.C.).

Dose.—45 to 150 grains. Pinkish-brown, boat-shaped seeds of *Plantago ovata* (Plantaginaceæ), containing mucilage and swelling in contact with moisture. Administered internally in intestinal atony, also in chronic diarrhoea, either dry, or as Decoctum Ispaghulæ (1½%) in doses of ½ to 2 ounces.

It has been suggested as a war-time substitute for agar and psyllium.

Ispaghulæ Testa, *syn.* ISPAGHULA HUSK, consists of the separated epidermis of the seeds. It is used in the same way as the whole seeds, but is more powerful in its action.

Psyllium (B.P.C., *Fr. Cx.*). *Syn. and Prop. Names.* FLEA SEED, ARCOLAX (Roberts, London), PSYLLA (Battle Creek Food Co., Michigan; Coates & Cooper, London).

The dried ripe seeds of *Plantago Psyllium* and of *P. arenaria* (Plantaginaceæ), from Southern Europe. Contain mucilage and are used in constipation, 1 to 4 teaspoonfuls or more being allowed to soak in half a cupful of water until a jelly is produced, the whole then being taken. The 1½% decoction is used in France as a demulcent drink.

Coréine (Daniel-Brunet, Boulogne-sur-Seine; Wilcox, JozEAU, London). Pure vegetable mucilage in flakes or granules. **Dose.**—2 teaspoonfuls thrice daily. For constipation.

I-so-gel (Allen & Hanburys, London). The dried mucilage of certain tropical seeds in granular form. Aperient.

Sylnasol (G. P. Searle, Chicago; A. Tate, London). A 5% solution of the fatty acids of a vegetable oil extracted from a seed of the psyllium group for the injection treatment of hernia.

Of 109 cases of inguinal hernia treated and followed up, 32 (29%) had recurrences. The longest time any patient was observed to remain cured was 42 months and the shortest two months, the average period being 14 months. The advantages of injection treatment are its safety, lack of complications, and the fact that the patient remains ambulatory; the chief disadvantages are that it is prolonged and that the recurrence rate is higher than would be expected from expert surgery.—H. K. Sowles and W. H. Shedden, *New Engl. J. Med.*, 1/1940, 753.

Salep. *Syn.* TUBERA SALEP (*P. Helv. V, P. Jap. V, P.G. VI, P. Ned. V, P. Belg. IV*).

The dried tubers of *Orchis mascula* and other species of *Orchis* (Orchidaceæ). They are immersed in boiling water on collection and dried. They contain mucilage, and have nutritious and demulcent properties, allaying gastro-intestinal irritation. Mucilage Salep (*P.G. VI, P. Jap. V*) is 1% freshly made. Salep is much sold in the Indian bazaars as an article of diet.

Ulmus Fulva (*B.P.C.*). *Syn.* SLIPPERY ELM. The dried inner bark of *U. fulva* (Ulmaceæ). It contains much mucilage and in powder is used as a demulcent in catarrhal affections and in diarrhœa and dysentery. It should be free from starch. Ten grains shaken with an ounce of water should form a thick, jelly-like, fawn-coloured mass. Mixed with hot water, the powder is used as a poultice in abscesses and whitlows. Decoction.—1 in 8. *Dose.*—2 to 4 ounces. Glycogelatin pastilles are prepared containing 2 grains.

It is recommended that steps should be taken to prohibit the sale by retail of sticks of slippery elm bark, owing to its popularity as an instrumental means of criminally terminating pregnancy.—*Report of the Inter-Departmental Committee on Abortion, H.M.S.O., 1939.*

LITHIUM

Li = 6.94.

Lithium salts have long had a reputation for assisting in the elimination of uric acid, but their effect is probably analogous to that of the corresponding potassium salts. Their introduction into medicine was due to a misconception. Lithium urate being relatively soluble, the lithium salts were introduced as solvents for uric acid, but since the soluble urate cannot exist in the body or in the urine in the presence of sodium or potassium ions, there is no rational foundation for the use of these salts. When given they should be freely diluted.

Lithii Benzoas (*B.P.C., Fr. Cx.*). $C_6H_5COOLi = 128.0$.

Dose.—5 to 15 grains (0.3 to 1 g.).

A light, white, crystalline powder or in scales. Antiseptic and diuretic.

Soluble about 1 in 3 of water, about 1 in 15 of alcohol 90%.

Incompatible with acids and sodium bicarbonate.

Lithii Carbonas (*B.P.C., P. Helv. V, Fr. Cx.*).

$Li_2CO_3 = 73.88$.

Dose.—2 to 5 grains (0.12 to 0.3 g.). Tablets, 5 grains. A white amorphous or minutely crystalline powder.

Soluble 1 in 75 of water, 1 in 140 of boiling water, more soluble in water containing carbon dioxide; insoluble in alcohol. Diuretic, thought to increase the alkalinity of the blood.

Lithii Chloridum (B.P.C.). $\text{LiCl} = 42.40$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

White deliquescent crystals or crystalline powder, with salty taste.

Soluble 1 in $1\frac{1}{2}$ of water, 1 in 30 of alcohol.

Lithii Citras (B.P.C.). $\text{C}_2\text{H}_4\text{OH}(\text{COOLi})_3 \cdot 4\text{H}_2\text{O} = 281.9$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

White crystalline powder. Diuretic.

Soluble 1 in 2 of water, insoluble in alcohol 90%.

Lithii Citras Effervescens (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 g.). Contains 1 in 20.

Lithii Guaiacas.

Dose.—5 grains (0.3 g.) in pill twice a day.

Prepared by digesting guaiacum resin in solution of lithium oxide, decanting the solution, evaporating, and scaling it. Contains lithium oxide 1, guaiacum resin 3. For gout and rheumatism.

Lithii Hippuras. $\text{C}_6\text{H}_5 \cdot \text{CO} \cdot \text{NH} \cdot \text{CH}_2 \cdot \text{COOLi} \cdot 2\text{H}_2\text{O} = 221.0$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

In light, white, minute crystals, soluble 1 in 3 of water. Has been used in gout and rheumatism. Effervescent lithium hippurate contains 5 grains in 1 drachm.

Lithii Sulphas. $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O} = 109.9$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

White crystals soluble in water and alcohol.

Lithii Tartras Acidus. $\text{CHOH} \cdot \text{COOLi} \cdot \text{CHOH} \cdot \text{COOH} \cdot 1\frac{1}{2}\text{H}_2\text{O} = 183.0$.

Dose.—5 to 20 grains (0.3 to 1.2 g.).

White crystalline powder, used in gouty cases with gum affections.

LOBELIA

B.P., Fr. Cx., P. Belg. IV, F.E. VIII, P. Dan., P. Helv. V.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Lobelia, alkaloids of.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Lobelia, alkaloids of, except substances containing less than 0.5 per cent. of the alkaloids of lobelia.*"

[S3] "*Alkaloids—Lobelia, alkaloids of—in preparations for the relief of asthma in the form of cigarettes, smoking mixtures or fumigants; substances containing less than 0.1 per cent. of the alkaloids of lobelia.*"

[S6] "*Alkaloids—Lobelia, alkaloids of—specify proportion as the proportion of any one alkaloid of lobelia that the preparation would be calculated to contain on the assumption that all the alkaloids of lobelia in the preparation were that alkaloid.*"

Dose.—1 to 3 grains (0.06 to 0.2 g.).

The dried aerial parts of *Lobelia inflata* (Campanulacæ). Has purgative and emetic properties in large doses, but its chief use is to relax spasm of the bronchi in asthma and bronchitis. It is contained in many anti-asthmatic powders (*vide Pulvis Lobeliæ Compositus*). Large doses are diuretic, cathartic and emetic, and

may cause collapse through medullary paralysis. It should not be employed in the presence of cardiac disease.

Antidotes. Treat as for poisoning by nicotine, *see* p. 867.

[P1] **Mistura Lobeliæ et Stramonii Composita (B.P.C.).**

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains potassium iodide 5 gr., and ethereal tincture of lobelia 10 m., with ammonium carbonate and tincture of stramonium in chloroform water to 1 oz.

[P1] **Mist. Lobel. Co. (N.I.F.).** Ethereal tincture of lobelia 10 m., potassium iodide 3 gr., mucilage of tragacanth 30 m., tincture of stramonium 20 m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mist. Lobel. Co. (P.M.H.).** Potassium iodide 10 gr., ammonium carbonate 5 gr., ethereal tincture of lobelia 20 m., tincture of ipecacuanha 20 m., spirit of chloroform 5 m., concentrated infusion of senega 60 m., water to 1 oz.

[P1] **Nebula Lobeliæ Composita.** Tinctures of lobelia, belladonna and stramonium, of each 10 m., tincture of ipecacuanha 5 m., sodium nitrite 10 gr., glycerin and rose water to 1 oz.

Pulvis Lobeliæ Compositus (B.P.C.) contains equal parts of lobelia, stramonium and tea impregnated with potassium nitrate and oil of anise.

Pulvis Stramonii Compositus (B.P.C.) contains stramonium 50%, with lobelia, anise and tea impregnated with potassium nitrate.

The fumes of half a teaspoonful or more to be inhaled six or eight times a day. Himrod's and Potter's Asthma cures and proprietary asthma cigarettes are preparations of similar type (*see* Vol. II).

[P1] **Tinctura Lobeliæ Ætherea (B.P.).**

Dose.—5 to 15 minims until nausea occurs.

1 in 5, prepared by percolation with spirit of ether.

ASTHMA. The following antispasmodic mixture may be taken at first thrice daily and then, as the attacks diminish in frequency, reduced to morning and evening doses, and finally taken in the evening only: ethereal tincture of lobelia 15 m., tincture of stramonium 15 m., potassium iodide 5 gr., arsenical solution 3 m., camphor water $\frac{1}{2}$ oz.—Whitla, 8th Edn., 1938.

[P1] **Tinctura Lobeliæ Simplex (B.P.C.).** *Syn.* TINCTURA LOBELIÆ. **Dose.**—10 to 30 minims (0.6 to 2 ml.).

1 in 8 in alcohol 60%. I.A. agreed 10% w/w in alcohol 70%.

[P1-S1] **Lobelinum Hydrochloricum (P.G. VI, P. Belg. IV, P. Helv. V).** $C_{22}H_{27}O_2N \cdot HCl = 373.7$.

Max. dose.— $\frac{1}{2}$ grain (0.02 g.): *per diem* $1\frac{1}{2}$ grains (0.1 g.). *P. Helv. V* has $\frac{1}{8}$ and $\frac{1}{4}$ grain respectively.

Intravenously $\frac{1}{8}$ grain (10 mg.) in 1% solution.

A white crystalline powder, **soluble** 1 in 50 of water, 1 in 10 of alcohol; easily soluble in chloroform. *Solutions must not be heated.*

Used as respiratory stimulant in emergencies, also in coal gas poisoning and in acute morphine poisoning, but it has only a transient action and repeated injections are necessary.

[P1-81] **Lobeline.** $C_{15}H_{17}O_3N = 337.2$.

A crystalline alkaloid obtained from lobelia. A powerful respiratory stimulant, but should be used cautiously in patients with enfeebled myocardium. Probably more effective combined with a cardiac stimulant. Is usually used as the hydrochloride.

[P1] **Lobelin Ingelheim** (*Boehringer, Hamburg; Zimmermann, London*). Solution of lobeline hydrochloride in 1 ml. ampoules containing $\frac{1}{10}$ grain (0.01 g.) or $\frac{1}{100}$ grain (0.003 g.). *Dose*.—Subcutaneously for adults and for older children, $\frac{1}{10}$ grain; for new-born infants, $\frac{1}{100}$ grain intramuscularly. The effect sets in after $\frac{1}{2}$ to 1 minute, but is of short duration. Injections may be repeated every 2 to 4 hours. In particularly urgent cases $\frac{1}{10}$ gr. may be given by slow intravenous injection, and is effective in 3 to 6 seconds.

MAGNESIUM

Mg = 24.32.

Magnesii Carbonas Levis (*B.P., Fr. Cx., P. Helv. V, P. Dan.*).

Dose.—10 to 60 grains (0.6 to 4 g.).

Prepared by boiling together dilute solutions of magnesium sulphate and sodium carbonate. The composition corresponds approximately to $3MgCO_3 \cdot Mg(OH)_2 \cdot 3H_2O$.

Uses. During their passage through the intestinal tract the magnesium salts are mainly changed to the soluble bicarbonate. Their effects are therefore largely identical, *i.e.*, antacid and mildly laxative, except in the case of the sulphate, which has a cathartic action. The carbonates are less effective as antacids than the oxides, and have the disadvantage of liberating carbon dioxide. The light carbonate is more suitable for mixtures and the heavy variety for powders. The neutralising value of the oxides is more than twice that of the carbonates. For a description of mixtures of carbonates used for the treatment of gastric and duodenal ulcer, see under *Pulvis Bismuthi Compositus*, p. 301.

A paper on the preparation, composition, impurities and uses of magnesium oxides and carbonates.—J. S. F. Gard, *Quart. J. Pharm.*, 1938, 572.

Mist. Mag. Carb. (*N.I.F.*).

Sodium bicarbonate 15 gr., light magnesium carbonate 10 gr., chloroform $\frac{1}{2}$ m., peppermint water to $\frac{1}{2}$ oz.

Magnesii Carbonas Ponderosus (*B.P.*).

Dose.—10 to 60 grains (0.6 to 4 g.).

Prepared by mixing boiling concentrated solutions of magnesium sulphate and sodium carbonate, evaporating to dryness and washing out the sulphate. The composition corresponds approximately to $3MgCO_3 \cdot Mg(OH)_2 \cdot 4H_2O$.

Magnesii Carbonas (*U.S.P. XI*).

Average dose.—As antacid 10 grains, as laxative 2 drachms.

Described as a bulky white powder or as light white friable masses. Contains the equivalent of about 41% of MgO .

Sippy's Powder.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 g.) in water.

No. 1—Magnesium carbonate and sodium bicarbonate equal parts.

No. 2—Calcium carbonate and sodium bicarbonate equal parts.

Sippy's treatment of gastric ulcer (introduced in 1915) consisted in giving large doses of alkalis after, and of belladonna before, the feeds, and by using as the basis of the diet milk and cream. The feeds are given at two or two and half

hourly intervals, an alkaline powder is taken one hour after, and olive oil or belladonna before the feeds. The treatment is now little used in this country.—*Cf. Maclean's Powder, p. 302.*

Liquor Magnesii Bicarbonatis (B.P.). *Syn.* FLUID MAGNESIA. *Dose.*—1 to 2 ounces (30 to 60 ml.).

A colourless liquid saturated with carbon dioxide and containing not less than 2.5% *w/v* of $\text{Mg}(\text{HCO}_3)_2$, equivalent to about 7½ grains of magnesium carbonate in 1 oz.

It can be made in a Sparklet syphon as follows:—Add a boiling solution of magnesium sulphate 40 g. in water 200 ml. to a cold solution of sodium carbonate 50 g. in water 200 ml.; boil until carbon dioxide is removed, collect the precipitate on a calico strainer, wash until free from sulphate, suspend in 400 ml. of water and transfer to a "C" size Sparklet syphon. Discharge a bulb of gas into the liquid, shake and allow to stand for 6 hours. Discharge a second bulb, shake and allow to stand for 18 hours.—*G. R. Gibbon, Pharm. J., ii/1934, 403.*

Magnesii Citras.

A white, odourless, crystalline substance obtained by the interaction of citric acid and a magnesium salt.

Soluble in water. It is best used in the form of effervescent magnesium citrate, or as solution of magnesium citrate as a purgative or cooling drink.

Magnesium Citricum Siccum (Fr. Cx.) is prepared by dissolving citric acid 100, in water 30, and adding the solution to magnesium carbonate 60, in a porcelain dish. The mixture is well stirred, slowly dried and powdered.

Liquor Magnesii Citratis (B.P.C.). LIMONADE CITRO-MAGNESIENNE (Fr. Cx.).

Dose.—3½ to 10 ounces (100 to 500 ml.), or more.

A solution containing magnesium citrate, saturated with carbon dioxide and flavoured with lemon.

Liquor Magnesii Citratis (U.S.P. XI). *Average dose.*—7 ounces (200 ml.).

Prepared by dissolving magnesium carbonate in a hot solution of citric acid, adding syrup and heating to boiling point, adding oil of lemon mixed with talc and filtering while hot into a strong bottle; after diluting to the required volume and cooling, potassium or sodium bicarbonate is added, the bottle securely stoppered, and kept on its side in a cool place, preferably in a refrigerator. It must be dispensed in bottles holding 200 or 350 ml.

[P1] **Mistura Magnesii et Belladonnæ (C.X.H.).** *Syn.* MISTURA GASTRICA. Light magnesium carbonate 10 gr., bismuth carbonate 10 gr., tincture of belladonna 7½ m., sodium citrate 15 gr., peppermint water to 1 oz. For hyperacidity and peptic ulcer. To be taken 3 or 4 times a day, the last dose being increased to 1½ or 2 oz.

Magnesii Hydroxidum (B.P.C.). *Syn.* MAGNÉSIE HYDRATÉE (Fr. Cx.). $\text{Mg}(\text{OH})_2 = 58.3$.

Dose.—10 to 60 grains (0.6 to 4 g.), or more. Usually administered as Mistura Magnesii Hydroxidi (*vide infra*).

Prepared by decomposition of magnesium sulphate 24½ with sodium hydroxide 8 in solution, the precipitate being washed free from sulphate and dried at a low heat.

According to the *Fr. Cx.*, calcined magnesia is boiled with 20 to 30 times its weight of distilled water 20 minutes. Dry as much as possible by collecting on calico and finally at 50° until it no longer loses weight. Thus prepared, magnesium hydroxide contains 31% of water.

It dissolves more freely in dilute acids than calcined magnesia and is preferred to the carbonates as an antacid since no carbon dioxide is liberated. It is a recognised antidote in arsenical poisoning.

[P2] *Lotio Magnesii Hydroxidi et Phenolis* (*St. Mark's H.*).

Phenol 15 gr., zinc oxide 30 gr., calamine 15 gr., glycerin 30 m., rose water 60 m., mixture of magnesium hydroxide to 1 oz.

Mistura Magnesii Hydroxidi (B.P.). *Syn.* CREAM OF MAGNESIA, CREMOR MAGNESIÆ.

Dose.—1 to 4 drachms (4 to 16 ml.). Four drachms contains the equivalent of about $12\frac{1}{2}$ gr. of magnesium oxide.

An aqueous suspension of hydrated magnesium oxide containing the equivalent of about 8.25% of $Mg(OH)_2$. Antacid without evolving carbon dioxide.

On standing in contact with ordinary glass bottles magnesium hydroxide suspensions increase in alkalinity and develop a bitter taste. This can be prevented by using hard glass bottles or by adding 0.1% of citric acid.—E. C. Billheimer and F. W. Nitardy, *J. Amer. pharm. Ass.*, 1936, 36.

Uses. In indigestion, dyspepsia, acidity, rheumatism, and as an alkaline mouth-wash. A useful antidote in case of poisoning by mineral acids.

Magma Magnesiae (U.S.P. XI). Contains 7 to 8.5% of $Mg(OH)_2$. No method of preparation is given, and the solution may contain 0.1% of citric acid to minimise its action on glass, and 0.05% of volatile oil for flavouring purposes.

Alkagen Tablets (Allen & Hanbury, London). Contain magnesium hydroxide 5 gr. and peppermint oil $\frac{1}{4}$ m. *Dose.*—1 to 3 with water. For acidity, flatulence, etc. Lozenges and granules containing glucose are also available.

Lactomagnesia (Crookes Laboratories, London). An antacid and laxative containing 10% colloidal magnesium hydroxide.

[P1] **Sedogastriue (Bengal, London).** Magnesium hydroxide, calcium carbonate, sodium and calcium phosphates, and conium, in granules and tablets for hyperacidity, dyspepsia, etc.

Magnesii Lactas. $(C_2H_5OH \cdot COO)_2Mg \cdot 3H_2O = 256.4$.

Dose.—15 to 60 grains (1 to 4 g.). White crystalline powder. Soluble 1 in 30 of water; insoluble in alcohol 90%.

A mild laxative. Useful in some cases as a hæmostatic where calcium salts do not seem to act. A dose of 30 grains usually reduces time of coagulation of the blood 30%, e.g., from 2 to $1\frac{1}{2}$ minutes. The salt can be made extemporaneously by the dispenser, if prescribed in a mixture, from magnesia 1, with lactic acid about 5. The large dose of the bulky powder, if ordered in that form, is inconvenient to take.

Magnesii Oxidum Leve (B.P., Fr. Cx.), syn. MAGNESIA LEVIS, MAGNESII OXIDUM (U.S.P. XI), and Magnesii Oxidum Ponderosum (B.P.), syn. MAGNESIA PONDEROSA. $MgO = 40.32$.

Doses.—As for the carbonates. *U.S.P. XI* has average dose as antacid 4 grains, as laxative 45 grains.

These are prepared from the respective carbonates by exposure to a dull red heat. Antacid, antilithic, diuretic, laxative.

Magnesia should never be prescribed as compressed tablets since these do not dissolve and may form the nucleus of calculi.

Magnesii Phosphas (B.P.C.). *Syn.* TRIBASIC MAGNESIUM PHOSPHATE (*U.S.P. XI Supp. II*). *Dose.*— $\frac{1}{4}$ to 1 drachm (1 to 4 g.).

A white, slightly gritty powder consisting of a hydrated tribasic

phosphate containing about 30% of combined water. Products containing more water are liable to become fungoid.

Used as an antacid. Does not produce systemic alkalisation. Has laxative action.

Magnesii Sulphas (*B.P.*, *U.S.P.* XI, *Fr. Cx.*, *P. Jap. V*). *Syn.* EPSOM SALTS, SEL ANGLAIS (*P. Belg. IV*), SEL D'ANGLETERRE, SEL DE SEDLITZ (*P. Helv. V*, *P. Dan.*). $\text{MgSO}_4 \cdot 7\text{H}_2\text{O} = 246.5$.

Dose.— $\frac{1}{2}$ to 4 drachms (2 to 16 g.).

Death following ingestion of 57 g. Care should be exercised as toxicity may result without death—idiosyncrasy may exist and the average dose may be toxic. If toxicity does occur use calcium salts subcutaneously or intravenously.—H. S. Thatcher, *J. Amer. med. Ass.*, ii/1928, 1185.

In colourless crystals with a saline bitter taste.

Soluble 10 in 13 of water—measuring 18.5 (*B.P.* gives 1 in 1 $\frac{1}{2}$); also soluble 1 in 1.1 of glycerin, solution taking place very slowly. For extemporaneous preparation dissolve 70 g. in 15 ml. of boiling water and add glycerin to 120 ml. Sparingly soluble in alcohol.

Incompatible with Soda Tartarata, alkali carbonates and bicarbonates unless in dilute solution. With potassium or ammonium bromide concentrated solutions give a precipitate of the double sulphate.

Uses. Taken internally, magnesium sulphate is a very efficient evacuant, producing watery stools with little or no griping. Its use as a purgative is indicated whenever prompt action is called for, when it is desired to cleanse the bowel of poisonous material, to relieve cerebral congestion or œdema, or to obtain watery evacuations in ascites or other forms of dropsy. An injection directly into the duodenum, by means of a duodenal tube, of an ounce of a 24% solution causes relaxation of the sphincter of the gall-bladder and permits of the collection of the bile for study, or, when this does not appear, indicates obstruction of the gut (Meltzer-Lyon Test); this procedure has also been employed for evacuation of the gall-bladder in cholecystitis. In cases of injury to the brain dehydration by the use of magnesium sulphate *per rectum*, 3 ounces in 6 fluid ounces of warm water, repeated four-hourly, gives marked relief.

Because of its osmotic and anæsthetic action it is widely employed as a local dressing, in the form of a saturated solution, in various inflammatory conditions, such as sprains, bruises, arthritis, orchitis, cellulitis, insect bites, epididymitis, erysipelas, etc., or as a paste in carbuncles, boils, etc. (*see* Morison's Paste).

When introduced into the circulation it acts as a depressant to the central nervous system and intravenous injections of 10 to 25 ml. of a 10% solution are used to control eclamptic convulsions. Intraspinal injections of 2 to 6 ml. of a 25% solution have given good results in tetanus, and in chorea hypodermic or intramuscular injections of 5 ml. of a 20 to 25% solution have been found of value.

ANGIOSPASM. Cases of intermittent claudication, endarteritis obliterans, Buerger's disease, migraine, spasm of the brachial artery, acute pulmonary œdema, angina pectoris, coronary thrombosis and cerebral angiospasm have all been treated with varying success by magnesium sulphate intravenously. The

patient lies on a couch with head and shoulders slightly raised and a solution of magnesium sulphate and glucose is slowly injected. The dose is 5 to 10 ml. of a 20% solution and an equal volume of 10% to 40% glucose. About half a minute after commencement of injection the patient feels intense heat all over the body. Treatment usually given twice weekly. Magnesium sulphate probably relaxes vascular spasm by direct action on the vasomotor centre of the brain.—N. Pines, *Lancet*, i/1933, 577.

DEAFNESS. Hot baths containing 1 lb. of magnesium sulphate are sometimes effective in a minority of chronic cases. To be used with caution in elderly people. 10 minutes' immersion enough. Exhausting.—J. Adam, *Brit. med. J.*, i/1931, 621.

ECLAMPSIA. 5 to 10 ml. of 25% solution intramuscularly after each convulsion until controlled. It is not used in coma. Give colonic irrigation, wash out stomach, and leave 60 ml. of saturated magnesium sulphate in it. Then inject 1000 ml. of 20% dextrose solution during 30 to 50 minutes 2, 3 or 4 times daily. When stomach has emptied itself, inject 5% syrup water, beginning with 50 ml. and increasing hourly up to patient's tolerance, possibly up to 300 ml. an hour, until patient is conscious.—O. H. Schwarz, *J. Amer. med. Ass.*, ii/1929, 1679.

Of 201 cases treated, attacks were terminated in 136 after one injection; 69 patients went on to spontaneous delivery, while 132 were operated on; six died. The treatment was carried out as follows: The patient was placed in a darkened room and kept at absolute rest. Soon after an eclamptic fit or after admission, the patient was given from 0.015 to 0.02 g. of morphine hydrochloride and examination made under light chloroform anaesthesia. Thirty minutes later 40 ml. of a 15% solution of magnesium sulphate (6 g.) was given subcutaneously. Morphine was repeated one and a half hours later and magnesium sulphate 3½ hours later in a dose of 6 g., if there was another attack, or 4 g. when no further attack took place. If labour did not terminate, 4 g. of magnesium sulphate was injected at an interval of 6 and then of 8 hours later. If the fits did not cease, the full dose, i.e., 6 g., was given (but not to exceed 24 g. in 24 hours). Among the disadvantages of the drug are its toxicity, the tendency to development of abscesses at the site of injection, and a tendency to the development of psychoses (in some 2% of cases). In rare cases the injections of magnesium sulphate caused alarming symptoms, such as acute cyanosis, dyspnoea, and feeble pulse. Should this happen, 10 g. of a 5% solution of calcium chloride should be given intravenously.—W. Stroganoff and O. Davidovitch, *J. Obstet. Gynec.*, 1937, 44, 289.

ENCEPHALOPATHY, HYPERTENSIVE. Excellent results in children by slow intravenous injections of 10 to 15 ml. of 1% magnesium sulphate solution per kilo body weight, repeated at 12 to 24 hour intervals, and supplemented by giving the salt also by mouth or rectally. Alternatively, 40 ml. of a 30% sodium chloride solution intravenously.—Clifford Hoyle, *Practitioner*, ii/1933, 430.

ERYSIPELAS. A cold saturated aqueous solution of magnesium sulphate, containing 10 to 20% of glycerin, favoured.—W. T. Benson, *Lancet*, ii/1930, 1286.

HEADACHE, e.g., post-concussional, 4 to 8 oz. of 50% magnesium sulphate solution per rectum.—A. Feiling, *Brit. med. J.*, ii/1930, 907.

MIGRAINE. Of 74 cases, 45 obtained relief and 4 were cured by intravenous injections of a 50% solution of magnesium sulphate. A course of 12 injections was given, the first two of 2 ml., subsequently increased to 5 ml. The injection is given slowly with the patient lying down.—A. Schick, *Wien. klin. Wschr.*, 1937, 1205.

OTORRHOEA. Cleanse the meatus. Half fill the meatus with powdered magnesium sulphate (cryst.) and cover with a large piece of wool. Where discharge is free, four-hourly treatment is needed, otherwise once or twice a day suffices. As a rule the ear is dry in three weeks or less and hearing is greatly improved.—E. Watson-Williams, *Brit. med. J.*, ii/1933, 49.

SYDENHAM'S CHOREA. Intramuscular injections of a 25% aqueous solution most effective. In children of 1 to 5 an injection of 5 ml. is given deeply into the gluteal muscles every 2 days, and in older children 10 ml. In most cases improvement occurs after the second to the fifth injection, with cure after the tenth. Severe cases were often cured more rapidly than milder ones. No secondary effects and no renal or cardiac complications.—M. R. Couterras, *Pr. méd.*, i/1936, 228.

TETANUS. Treatment of tetanus recommended by means of serum and subcutaneous injections of 40 ml. of 2.5% magnesium sulphate solution every four hours, the injections being continued for a varying period.—P. Paterson, per *Prescriber*, 1939, 305.

TROPICAL ULCER treated with wet dressings of magnesium sulphate 25% solution.—J. F. James, *Indian med. Gaz.*, June, 1925, 274.

ULCERS of the leg treated by soaks of 5 to 10% magnesium sulphate solution.—J. H. Young, *Lancet*, i/1925, 976.

URÆMIA successfully treated by slow intravenous infusion of a 1% solution (2 g. $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ in 100 ml. of distilled water). Indicated when blood pressure rises above 130 mm.—C. B. Watson, *Brit. med. J.*, ii/1931, 1086.

Balneum Magnesii Sulphatis (B.P.C.). Contains 1 lb. of magnesium sulphate per 30 gallons.

Enema Magnesii Sulphatis (B.P.C.). *Dose.*—20 ounces (600 ml.). 5% w/v in mucilage of starch with olive oil 10% v/v. A solution containing 50% w/v in hot water is also used, in doses of 2 to 6 oz.

Liquor Magnesii Sulphatis (R.I. Edin.). *Syn.* HENRY'S SOLUTION.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Magnesium sulphate $\frac{1}{2}$ oz., dilute sulphuric acid 20 m., water to 1 oz. An occasional purge.

Eau Saline Purgative (Fr. Cx.). Magnesium sulphate 25, sodium sulphate 25, water to 650.

Eau Saline Purgative Gazeuse (Fr. Cx.). Magnesium sulphate 30, sodium bicarbonate 4, tartaric acid 4, water to 650.

Magnesii Sulphas Effervescens (B.P.C.). *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 g.), or 1 to 3 drachms (4 to 12 g.) repeated.

Contains about 50% of magnesium sulphate which, in this form, is frequently more effective, and more palatable.

Mistura Alba (B.P.C., N.I.F.). *Dose.*— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Magnesium sulphate 120 gr. and light magnesium carbonate 20 gr. in peppermint water to 1 ounce. A mild aperient.

BLOOD PRESSURE, TO REDUCE. In uncomplicated hypertony give Mistura Alba as routine treatment. Drinking large quantities of water often beneficial.—I. Harris, *Lancet*, ii/1931, 1045.

[P1] **Mistura Salina Laxans (St. T. H.).** Magnesium sulphate 30 gr., potassium citrate 20 gr., tincture of hyoscyamus 15 m., chloroform water to 1 oz.

Magnesii Sulphas Exsiccatus (B.P.C., P. Helv. V, P. Dan.).

Dose.— $\frac{1}{2}$ to 3 drachms (2 to 12 g.).

Prepared by heating magnesium sulphate at 100° until it has lost 25% of its weight. A white powder *soluble* 1 in 2 of water. Contains 62 to 70% of MgSO_4 .

Pasta Magnesii Sulphatis (B.P.C.). *Syn.* MORISON'S PASTE.

Prepared with magnesium sulphate dried to constant weight at 100°, when the loss in weight is about 37%, by mixing 4 $\frac{1}{2}$ parts with 5 $\frac{1}{2}$ parts, by weight, of glycerin and incorporating 0.5% of phenol.

Morison's original paste was prepared by mixing 1 $\frac{1}{2}$ lb. of exsiccated magnesium sulphate with 11 ounces of glycerin of phenol (the phenol may be omitted). The exsiccated magnesium sulphate used was "in the form of a fine white powder containing

12% less water than the ordinary."—(See A. E. Morison, *Brit. med. J.*, i/1924, 703; also *ibid.*, i/1918, 342.)

Was originally advocated for the treatment of wounds, later for boils and carbuncles. For wounds the dressing of gauze and wool is left unchanged for 6 to 8 days unless more wool is required, and after a few such dressings a magnesium sulphate solution is applied. The paste is applied to boils, carbuncles, etc., until a slough has separated.

Pasta Mag. Sulph. (*N.I.F.*). Exsiccated magnesium sulphate 432 gr., glycerin 528 gr.

Magnesium Sulphate and Ethylene Glycol Paste. Magnesium sulphate 60% and ethylene glycol 40% "by volume." Heat the ethylene glycol to boiling and slowly add the magnesium sulphate, stirring thoroughly until the solution becomes adherent to the stirring rod. Then mix in an electric mixer for 20 to 25 minutes. Allow to stand for 10 days before use, stirring daily for five minutes. The paste is changed every eight hours in severe cellulitis. Furuncles should be dressed repeatedly, but the application need not be covered.—J. W. Hinton, *Arch. Surg.*, ii/1936, 210.

MALTUM

Syn. CEBADA GERMINADA (*F.E. VIII*).

Grain of barley, *Hordeum distichon* (Gramineæ), partially germinated artificially and then dried. The source of pharmaceutical, veterinary and baker's malt extract and of malt flours for bread making and infants' foods.

Malt flour or entire malt powdered, is added to baked wheaten flour in various proportions to form the popular infants' foods, and is given to assist digestion. When these are mixed with hot water or a mixture of hot milk and water, the starch contained in the wheaten flour becomes soluble and digested into dextrin and malt sugar. The diastasic property of malt is most active in aqueous solution at 104°F.—a boiling heat destroys it. A small teaspoonful of malt flour may be sprinkled over or mixed with cooked farinaceous foods, etc.

Extractum Malti (*B.P.*). *Syn.* EXTRACTUM BYNES, EXTRAIT D'ORGES. DIAMALT (*British Diamalt Co., London*), KEPLER (*Burroughs Wellcome, London*), and MALTINE (*Glaxo Laboratories, London*) are proprietary brands of extract of malt. (*Note.*—Maltine in France is a synonym for diastase.)

Dose.—1 to 4 drachms (4 to 16 ml.).

A brownish, semi-liquid substance, sp. gr. 1.40 to 1.42, with pleasant sweet taste, consisting principally of maltose (about 50%), with dextrin, dextrose, diastase, protein, phosphates and aromatic principles. The *B.P.* requires a nitrogen content equivalent to 4.5% w/w of protein. It is made by mixing malt with tepid water (55°), pressing, filtering, and evaporating *in vacuo* at below 55°. Extract of malt and its preparations are prescribed in cases of debility of all kinds, as a restorative, but particularly where digestion is weak. Commercially, malt extracts are assayed for their

diastasic power (Lintner value) but since diastase is inactive *per os* no such assay is required by the B.P.

Maltosan (*A. Wander, London*) is malt extract in granular form.

Extractum Malti (*U.S.P. XI*). *Average dose*.— $\frac{1}{2}$ oz. (15 g.).

It can convert not less than five times its weight of starch into water-soluble sugars, and unlike the product of the British Pharmacopœia its diastasic activity is regarded as the factor of primary importance.

F.E. VIII incorporates 10% of glycerin and the finished product must digest five times its weight of potato starch at 40°.

Extractum Malti cum Oleo Morrhue (*B.P.*).

Dose.—1 to 4 drachms (4 to 16 ml.).

Contains 10% *w/w* of cod-liver oil, equivalent to approximately 15% *v/v*.

Extractum Malti cum Oleo Vitaminato (*B.P. Add. II*).

Dose.—1 to 4 drachms (4 to 16 ml.), approximately equivalent to 650 to 2500 units of vitamin A, and 65 to 250 units of vitamin D.

Contains 10% *w/w* of vitaminised oil, equivalent to approximately 15% *v/v*. It is an efficient substitute for extract of malt with cod-liver oil.

Ext. Malt. c. Ol. Hippoglossi (*D.T.F.*). Halibut-liver oil 16 m., arachis oil 180 m., extract of malt to 1 lb.

Extractum Malti cum Oleo Olivæ (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 ml.).

Olive oil 15% *v/v* in extract of malt.

Extractum Malti Ferratum (*B.P.C.*).

Soluble iron pyrophosphate $\frac{1}{2}$ dissolved in water and mixed with extract of malt.

Dose.—1 to 4 drachms (4 to 16 ml.).

Ext. Malt. c. Syr. Ferri Phos. Co. (*D.T.F.*). Compound syrup of ferrous phosphate 25% *w/w* in extract of malt.

Extractum Malti Liquidum (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 ml.).

In place of evaporating malt infusion to the viscosity of the soft extract, it is concentrated *in vacuo* until it has sp. gr. 1.375, and about 10% of alcohol added, making the finished product of sp. gr. about 1.23. It may also be prepared by diluting the soft extract (67½% *v/v*) with alcohol and water.

Extractum Malti Liquidum cum Cascara.

Dose.—1 to 4 drachms (4 to 16 ml.). Liquid extract of cascara 1, liquid extract of malt 7. This is palatable. Mix and mark "Shake."

Extractum Malti Liquidum cum Glycerophosphatibus (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 ml.).

Contains 2 gr. each of sodium and potassium glycerophosphates in 4 dr.

Extractum Malti Liquidum cum Hæmoglobino (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 ml.). Contains 30 gr. of hæmoglobin in 4 dr.

Extractum Malti Liquidum cum Hypophosphitibus (*B.P.C.*). *Dose*.—1 to 4 drachms (4 to 16 ml.).

Contains 1 gr. each of calcium and sodium hypophosphites in 4 dr.

Extractum Malti Liquidum cum Pancreatina. *Dose*.—1 to 4 drachms (4 to 16 ml.).

Liquid extract of malt 2, solution of pancreatin 1.

[P] **Extractum Malti Liquidum cum Quinina et Strychnina** (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 ml.).

Contains quinine hydrochloride $\frac{1}{2}$ gr. and strychnine hydrochloride $\frac{1}{8}$ gr. in 4 dr.

Extractum Malti cum Vitaminis (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 ounce (8 to 30 ml.)

Contains solution of vitamin A and solution of irradiated ergosterol and is about three times as potent as extract of malt and cod-liver oil. 1 dr. contains about 3000 units of vitamin A and 225 units of vitamin D.

Extractum Malti Liquidum et Medullæ Rubræ (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Equal parts of liquid extract of malt and extract of red bone marrow.

Mistura Ferri cum Malto (B.P.C.).

Dose.—1 to 2 dr. (4 to 8 ml.).

Contains 3 gr. of soluble iron pyrophosphate per dr.

Bronamalt (*Fletcher, Fletcher & Co., London*). A combination of a hydrobromic extract of cinchona with a liquid malt. *Dose.*—1 to 2 drachms with or immediately after meals. In cases of impaired nutrition and loss of appetite, especially in children.

Bynin (*Allen & Hanburys, London*). A brand of liquid extract of malt. Also available in numerous combinations including liquid paraffin, glycerophosphates, hæmoglobin, liver extract, stomach extract, hypophosphites, lecithin, pancreatin and phosphates. [P1] **Bynin Amara** contains in 1 oz. quinine phosphate $1\frac{1}{2}$ gr., iron phosphate 2 gr., strychnine phosphate $\frac{1}{2}$ gr., in liquid extract of malt.

Jecomalt (*Wander, London*). A dry extract of malt with cod-liver oil, in yellow granular powder.

Ostomalt (*Glaxo Laboratories, London*). Standardised concentrated malt preparation of vitamins A, B complex, C and D, with calcium glycerophosphate.

Radio-Malt (*British Drug Houses, London*). A malt extract preparation containing vitamins A, B₁, B₂ and D.

Vimaltol (*Wander, London*). A preparation of malt extract with vitamins A and D as a concentrate of cod-liver oil and vitamin C from orange juice.

Diastasum (B.P.C., Fr. Cx., P. Jap. V). Syn. AMYLASE.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

An enzyme obtained from an infusion of malt, prepared at below 60°, by precipitation with alcohol. Occurs as a yellowish or whitish amorphous powder, almost entirely soluble in water. Converts starch into sugars and dextrin, and is used in amylaceous dyspepsia in conjunction with pepsin.

Incompatible with acids, alkalis, alum, iron salts and tannin.

Taka-Diastase (*Parke, Davis, London*). Amyolytic enzyme derived from species of *Eurotium oryzae* cultivated on wheat bran. *Dose.*—5 grains. For the treatment of amylaceous dyspepsia.

Takazyma (*Parke, Davis, London*). Powder containing magnesium carbonate, bismuth carbonate, Taka-Diastase, calcium carbonate and ginger. *Dose.*—1 to 2 teaspoonfuls in water. For hyperchlorhydria.

Maltosum (B.P.C.). $C_{12}H_{22}O_{11}, H_2O = 360.2$.

Consists of β -maltose obtained from starch by hydrolysis with diastase. Crystallises from water as the monohydrate, from alcohol as the anhydrous substance. Used in bacteriological culture media.

Dextri-Maltose. (*Mead, Johnson & Co., Evansville; Brooks & Warburton, London*). A powder containing 51% of maltose, 42% of dextrin and 5% of water and, at choice, salt free, or containing sodium chloride 2%, potassium bicarbonate 3%, or with vitamin B. No. 1 (with salt) is for infant feeding, No. 3 (with potassium bicarbonate) for infants who suffer from constipation.

No. 2 (salt free) for use by practitioners who prefer to make their own salt additions.

Malto-Dextrin (*Glaxo Laboratories, London*). A mixture of dextrins, malto-dextrins and maltose for modifying milk mixtures; it contains no unaltered starch. Composition approx. 50% of maltose and 50% of dextrin and malto-dextrin.

MANGANUM

Mn = 54.93.

Traces of manganese occur naturally in all organs of man and animals. When administered by the mouth the salts of manganese (with the exception of the permanganates) produce no noticeable effect and they are little employed in this manner, except in conjunction with iron in the treatment of microcytic anæmia.

Chronic manganese poisoning, resulting from exposure to the dust produced in certain grinding processes, is an industrial hazard. The condition is not observed in the uses of manganese not involving the production of dust.

POISONING. Manganese poisoning has been added to the list of diseases acquired in a factory or workshop that must be notified by the practitioner attending a case. The signs and symptoms are a stolid mask-like face, a low monotonous voice, and cramp in the legs, with muscular twitchings and increased tendon reflexes, ankle and patellar clonus. The patient shows retropulsion and propulsion and has a peculiar "slapping" gait. There are also emotional disturbances and occasionally uncontrolled laughing or crying.—*Lancet*, ii/1936, 412.

A report of 4 cases of chronic manganese poisoning in men working in the same manganese works, the symptoms appearing in one case after only 8 months' work and in the other three after 2½, 6½, and 8 years respectively. Clinical picture indistinguishable from chronic post-encephalitic parkinsonism; signs and symptoms of hepatic cirrhosis not found.—D. Owen, *Brit. med. J.*, ii/1934, 833.

Mangani Butyras. $(C_3H_7\cdot COO)_2Mn = 229.0$.

Dose.—1 to 1.5 ml. of 1% solution intramuscularly—not more than 3 injections should be given with 3 or 4 days' clear interval between them.

A pale pink powder having only a slight odour of butyric acid. Is precipitated as a heavy oily liquid by interaction of solutions of sodium butyrate and manganese chloride. This oil is washed with water, dried over sulphuric acid, and then washed with ether to remove free butyric acid. The product is again dried over sulphuric acid for some days, and powdered.

Soluble 1 in about 6 of water. The substance is hydrolysed by boiling water with deposition of manganese hydroxide.

Uses. Boils, carbuncles and other staphylococcal skin infections have been treated by intramuscular injections of a 1% solution of manganese butyrate, injections of 1 to 2 ml. being given at intervals of five days, with a maximum of three injections. The addition of sodium thiosulphate ½ gr. to the solution has been stated to reduce the pain of the injection.

The therapeutic claims made for any or all of the manganese salts (including manganese butyrate) in the treatment of cutaneous diseases and coccigenic infections are unsubstantiated. The evidence as to their scientific value is inconclusive and inadequate, and they are unacceptable for inclusion in N.N.R.—*J. Amer. med. Ass.*, i/1940, 248.

BOILS. The most satisfactory treatment for boils, recurring or non-recurring, is intramuscular injections of manganese butyrate. Moist dressings are unnecessary.—H. L. McCormick, *Brit. med. J.*, ii/1932, 780. Value confirmed.—A. P. Bertwistle, *ibid.*, 904.

MINERS' BOILS AND CARBUNCLES. Manganese injections recommended.—S. W. Fisher, *Lancet*, i/1931, 750.

Mangani Carbonas (*Fr. Cx.*). $\text{MnCO}_3 \cdot \text{H}_2\text{O} = 132.9$.

A white powder with a faint pink tinge. Insoluble in water, but slightly soluble in the presence of carbon dioxide.

Mangani Chloridum. $\text{MnCl}_2 \cdot 4\text{H}_2\text{O} = 197.9$.

Dose.—5 grains (0.3 g.); $\frac{1}{2}$ to $\frac{1}{4}$ grain by injection (0.016 to 0.03 g.).

Rose coloured deliquescent crystals, soluble about 1 in 1 of water, and in alcohol 90%.

DEMENTIA PRÆCOX (but not cases with active organic disease) treated by 30 half-weekly injections intravenously of from 2 to 8 ml. of a 0.02% solution: then 0.3 g. manganese chloride *per os* twice daily for a month. Improves physical condition, but optimum intravenous dose should not be exceeded.—G. E. Reed, *per Med. Annu.*, 1931, 316.

Mangani Citras, "Soluble."

Dose.—3 to 5 grains (0.2 to 0.3 g.).

This, a double salt with sodium citrate, and Ferro-Mangani Phosphas—*dose.*—3 to 10 grains (0.2 to 0.6 g.)—are scale preparations.

Mangani Hypophosphis. $\text{Mn}(\text{H}_2\text{PO}_3)_2 \cdot \text{H}_2\text{O} = 203.0$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

A white or slightly rose-tinted powder, soluble 1 in 7 of water. A nerve stimulant.

Mangani Dioxidum Præcipitatum (*B.P.C.*). *Syn.* MANGANI PEROXIDUM PRÆCIPITATUM. $\text{MnO}_2 = 86.93$.

Dose.—2 to 8 grains (0.12 to 0.5 g.) or more, in pills with syrup. Tablets, 2 grains (0.12 g.).

A bulky blackish brown powder, free from grittiness and entirely soluble in cold hydrochloric acid. In gastrodynia, pyrosis, and in amenorrhœa taken 3 or 4 times a day before expected period. In microcytic anæmia it assists the action of iron salts, and is less irritant than the permanganates.

Mangani Sulphas (*Fr. Cx.*). *Syn.* SULFATO DE MANGANESO (*F.E. VIII*). $\text{MnSO}_4 \cdot 4\text{H}_2\text{O} = 223.1$. *Dose.*—2 to 10 grains (0.12 to 0.6 g.).

A white powder with a faint pink tint, due to a little manganic sulphate, or in pink crystals. Soluble about 1 in $1\frac{1}{2}$ of water.

Given in conjunction with iron in anæmia.

Potassii Permanganas (*B.P., U.S.P. XI, Fr. Cx., etc.*). $\text{KMnO}_4 = 158.0$.

Dose.—1 to 3 grains (0.06 to 0.2 g.) in well-diluted solution, or in pill. *U.S.P. XI* average dose 1 grain.

In purple crystals with astringent taste, soluble about 1 in 20 of water.

Incompatible with all vegetable oxidisable matter, *e.g.*, glycerin, alcohol, sugar, fats and oils, with ammonia, ammonium salts and alkaloids.

Antidotes. Empty stomach by stomach tube. Give medicinal charcoal, stirred up in water. Keep patient lying down and warm. Strychnine, $\frac{1}{4}$ gr., hypodermically. Calcium bromide intravenously or calcium gluconate intramuscularly has been recommended.

A fatal case of poisoning in a young man following injection into the urethra of a solution of 25 g. of the crystals in a teacupful of water. Other fatalities have been recorded following ingestion of 15 to 20 g. of the crystals.—S. G. Willimott and M. Freiman, *Brit. med. J.*, i/1936, 58.

The brown stain caused by solutions can be removed from the skin by oxalic or sulphurous acid.

Uses. Potassium permanganate possesses oxidising, deodorising and astringent properties. Although it is markedly bactericidal *in vitro* its clinical value as a bactericide is minimised by its rapid reduction in the presence of body fluids.

Because of its oxidising action it is a valuable cleansing agent for wounds and mucous membranes, especially in suppurating and fetid conditions such as cancerous ulcers. In dilute solution, e.g., 1 in 10,000 to 1 in 2000, it is extensively employed for washing out internal cavities such as the vagina and bladder; in the former strength it is widely used as an irrigation in the treatment of gonorrhœa in the male, not less than a quart of warmed solution being introduced into the meatus, employing either a syringe or douche-can with nozzle. The application of a 1 in 1000 solution is stated to prevent the occurrence of venereal disease if employed immediately after exposure to infection. As a gargle or mouth-wash a 1 in 5000 solution is of value as an antiseptic deodorant, though its nauseous taste is a disadvantage. A 1% solution is also said to be useful in bromidrosis and in various types of mycotic infection such as athlete's foot. Poison ivy dermatitis is well treated by application of this solution, and potassium permanganate baths (5 to 6 g. to a bathful of water) have been employed in the treatment of smallpox, especially in confluent cases, to reduce the smell and sloughing.

The crystals are widely used as an antidote to snake-bite poisoning. The venom is squeezed out, the area round incised, and the crystals rubbed in. The action is purely a chemical one and the treatment is only effective if used immediately.

It is little used internally, since owing to its oxidising action on the gastric mucosa it is liable to produce vomiting, but it has been recommended in cholera, in 2 gr. doses, to destroy the bacterial toxins, and in the treatment of asylum dysentery a solution of 1 gr. in 20 ounces has been employed in a dose of $\frac{1}{2}$ to 1 ounce several times a day. Potassium permanganate is reputed to have emmenagogue properties and it has been used for this purpose in the treatment of amenorrhœa in doses of 1 to 2 gr. three or four times daily, but it is of doubtful value and is not recommended.

ANTIDOTAL ACTION is distinct but limited: even fairly dilute solutions are irritant, and a large dose may cause death. Potassium permanganate may be given orally in concentrations varying from 1 : 5000 to 1 : 2000, and 1 : 5000 may be used for washing the stomach, in poisoning by aconitine, amidopyrine, morphine, phenazone, picROTOXIN, and strychnine. It will not destroy all the poison, and its use should be followed by evacuation of the stomach. It is useless as an antidote in poisoning by atropine, cocaine, phosphorus, and by most of the synthetic hypnotics. There is no justification for the intravenous, subcutaneous, or intramuscular injection of potassium permanganate for the destruction of any poison in the circulation.—R. A. Hatcher, *J. Amer. med. Ass.*, ii/1935, 502.

TROPICAL ULCER. Soak a pledget of cotton wool in a saturated (5%) solution of potassium permanganate and apply to the sloughing floor of the ulcer. Small sloughs seem to be burnt away by this and larger sloughs are removed with scissors. The "cauterising" process is continued in each part of the ulcer until the patient feels the burning. The ulcer is finally filled with 1 in 5 iodoform-boric dusting powder covered with absorbent wool and bandaged till the next day, when it will show a large granulating surface with a few patches of phagedena

and a fine layer of iodoform over the whole area. Cases needing more than two such treatments are rare.—K. W. Todd, *Brit. med. J.*, ii/1939, 688.

Thyroid and Manganese Treatment. Acute infections, joint diseases, heart disease, abnormal blood pressure, diseases of pregnancy, disorders of metabolism, digestive troubles, nerve complaints, pulmonary diseases, diseases of the skin, goitre and myxoedema, disease of the breast, etc., treated by rectal injections of potassium permanganate 1 gr. in 1½ pints of sterile warm water. The amount is varied according to case, e.g., 2 doses of ½ pint may be found more effective than 1 dose of ½ pint. Warn patients they may feel some pain in the epigastrium within a few minutes, also they may pass long white skins or strings of mucus in the stools. Thyroid is given simultaneously—1 gr. twice daily, but doses of 6½ gr. or 5 or 10 gr. are in some cases desirable. Sometimes the permanganate may be used *per os*, in cachet, followed by a large draught of water, but this is not so good.—H. W. Nott, *Brit. med. J.*, i/1925, 443; ii/1925, 1209.

PNEUMONIA. Remarkable results. It is suggested that permanganate may be a specific. Treatment consists in rectal injections of 3 to 10 ounces of a potassium permanganate solution (4 grains in 3 pints) every 2 or 4 hours.—H. W. Nott, *Brit. med. J.*, ii/1926, 109. Basic principles underlying the treatment.—H. W. Nott, *Brit. med. J.*, i/1928, 94. See also *Brit. med. J. Epit.*, ii/1929, 43.

Value of treatment confirmed in 5 consecutive cases of acute pneumonia.—N. J. Roche, *Brit. med. J.*, i/1927, 459. See also *Brit. med. J.*, i/1927, 539.

A 1 in 7000 solution per rectum 4-hourly of value, even in debilitated children almost moribund; in conjunction with antipneumococcus vaccine a good armamentarium.—A. A. Hearne, *Brit. med. J.*, i/1928, 159. H. L. McCormick, *ibid.*, 377.

Manganese and Thyroid. "The most sure, the most scientific, the easiest treatment of all forms of cold or influenza."—F. A. Hort, *Brit. med. J.*, i/1933, 250.

Gargarisma Potassii Permanganatis (B.P.C.). 0.025% w/v.

Injectio Potassii Permanganatis (L.H.) has 5 grains in 1 pint, i.e. about 1 in 1600. C.H.W. has 1 in 1000 solution 4 dr., water to 2 pints, i.e. about 1 in 80,000.

Liquor Potassii Permanganatis (B.P.C.). Dose.—2 to 4 drachms (8 to 15 ml.). 1% w/v.

Pilula Potassii Permanganatis. 1, 2, 3, 4 or 5 grains with kaolin ointment, q.s.

Caution! Avoid mixing with any easily oxidised substance, like sugar, glycerin, etc. The pills may be coated with sandarac solution.

Solvellæ Potassii Permanganatis contain 5 gr. (0.3 g.).

Calcii Permanganas (B.P.C.). $\text{Ca}(\text{MnO}_4)_2 \cdot 5\text{H}_2\text{O} = 368.0$.

Dose.—½ to 1½ grains (0.03 to 0.1 g.) in pills or capsules (with liquid paraffin as vehicle) thrice daily one hour before meals.

Deliquescent crimson crystals preferred for making mouth lotions, as it has less taste than the potassium salt. 1 in 100,000 sterilises water in 5 minutes; more powerful than the latter.

Uses. Similar to the potassium salt. Has been given in gastric ulcer and gastritis, and employed as a local application in rodent ulcer.

Sodii Permanganas. $\text{Na}_2\text{Mn}_2\text{O}_8 = 283.9$.

In solution, red in colour, is used as a cheap disinfectant. **Condy's Red Fluid** (Condy & Mitchell, London; *Pharmaceutical Products, London*) is stated to be a mixture of the sulphate and permanganate of soda.—H. R. Kenwood, *Lancet*, i/1926, 1055. **Condy's Green Fluid** has sodium manganate, $\text{Na}_2\text{MnO}_4 = 164.9$, in solution.

Zinci Permanganas (B.P.C.). $\text{ZnMn}_2\text{O}_8 \cdot 6\text{H}_2\text{O} = 411.3$.

Brownish-black deliquescent crystals soluble 1 in 3 of water (usually leaving some residue).

It possesses the oxidising properties of the potassium salt but

is more astringent. It is more readily reduced than the potassium compound. For lotions and injections, especially in urethritis, 1 gr. in 8 oz. (1 in 4000), where the astringent action of the zinc is indicated. As an eye wash 1 in 2000 to 1 in 1000. For pyorrhœa alveolaris and oral sepsis it is very useful as a mouth wash.

Caution. Is liable to explode spontaneously and if the stopper of a bottle containing it becomes stuck, the bottle should be wrapped in a cloth before removal is attempted.

Zinc permanganate bougies, 4 inches long, containing $\frac{1}{2}$ grain (0.03 g.) in oil of theobroma basis, are prepared.

Inject. Zinc. Permang. (N.I.F.). Zinc permanganate 4 gr., water to 12 oz. To be diluted with an equal quantity of hot water (1 in 2625 when diluted).

Colloidal Manganese. A colloidal solution of manganese hydroxide may be prepared by double decomposition of manganese chloride and sodium hydroxide, using dextrose as protective.

Uses. Gonorrhœa and sequelæ, also eczema, acne, psoriasis, quinsy and furunculosis have been treated by it, either *per os* or by intramuscular injections of $\frac{1}{2}$ to 1 ml.

In a carefully observed group of 43 patients with pustular acne, acne vulgaris, furunculosis, rosacea, and sycosis vulgaris, and also in a group of 9 patients with psoriasis, the results of treatment with a well-known brand of colloidal manganese hydroxide were unsatisfactory. There is no sound experimental basis for the claims made in respect of manganese and its compounds in the treatment of dermatoses.—M. Sullivan, *J. Amer. med. Ass.*, i/1940, 246.

MENTHOL

B.P., U.S.P. XI, Fr. Cx., P. Jap. V, P. Helv. V, P. Dan.

$\text{CH}_3\cdot\text{C}_6\text{H}_4\cdot(\text{OH})\text{C}_3\text{H}_7 = 156.16.$

Syn. *l-p*-MENTHAN-3-OL, METHYL-PROPYL-PHENOLHEXAHYDRIDE.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.), or more, in a pill with powdered soap, or in solution in olive oil.

A white crystalline substance obtained from the volatile oils of various species of *Mentha*. B.P. Add. I and U.S.P. XI recognise also lævorotatory synthetic menthol. M.p. 42° to 44°.

Soluble 5 in 1 of alcohol 90%, 2 in 1 of ether, approximately 4 in 1 of chloroform, 1 in 4 of olive oil, 10 in 7 of light petroleum, and 1 in 6 of liquid paraffin. Freely soluble in essential oils, sparingly soluble in water, insoluble in glycerin. Soluble on warming in a strong solution of sodium salicylate, but thrown out again.

Caution. It is dangerous to apply an ointment containing menthol to the nostrils of infants, e.g., for treatment of catarrh—it may cause instant collapse. Cf. Camphor.

Uses. Given internally, it is carminative and is occasionally given in vomiting but is liable to upset digestion. Applied to the skin, it dilates the vessels, causing a sensation of coldness, and is useful for headache, rheumatic pains and neuralgia. For these purposes menthol cones are employed. It has antiseptic and anæsthetic properties, and gives great relief in prurigo, urticaria

and pruritus ani. An excellent mixture for pruritus ani consists of menthol 1 part, eucalyptol 2 parts, sodium baborate, sodium bicarbonate and powdered alum, each 8 parts.

As an antineuralgic in toothache and for sciatica 1 in 60 of alcohol with a little clove oil is employed as an external application. The crystals on cotton wool may be placed in the hollow of an aching tooth.

Menthol liquefies with an equal amount of either phenol, chloral hydrate or thymol, also 3 parts of menthol and 2 parts of camphor, 2 parts of menthol and 1 part of butylchloral hydrate, and 2 parts of menthol, with 1 each of phenol and butylchloral hydrate. These will relieve toothache. Its camphor and phenol combinations are used to medicate dry inhalers, and are most beneficial for arresting and curing colds, and relieving influenza and chest affections. Preparations of menthol are valuable for medicating hot moist air inhalations.

Menthol, camphor and other combinations, diluted with a heavy mineral oil, for spraying into the nares or in spirituous solution, inhaled as above, relieve swelling and irritability of nasal catarrh, contract capillary blood-vessels of mucous membrane, reduce swelling, relieve pain and fullness of head, arrest sneezing, and check excessive discharge.

INFLUENZA. In doses of $7\frac{1}{2}$ grains, dissolved in olive oil in gelatin capsules, every 2 hours of value early in influenza. Reduces temperature in 18 to 24 hours, relieves pain, prevents post-influenzal debility, and lessens incidence of complications.—F. Schnapek, per *Brit. med. J. Epit.*, ii/1933, 61.

TUBERCULOUS LARYNGITIS. In the simpler non-ulcerative forms, 5 to 10% menthol in olive oil dropped on to the cords during phonation from a laryngeal syringe gives appreciable relief, the menthol acting as a decongestive and anesthetic.—R. C. Cohen, *Brit. med. J.*, i/1940, 322.

Aqua Mentholis (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). A saturated aqueous solution (about 1 in 1000).

Emplastrum Mentholis (B.P.C.). 15% in a basis of yellow wax and colophony. Useful for rheumatism and intercostal neuralgia.

Injectio Mentholis.

Menthol 0.5, liquid paraffin 100. For use with a eustachian catheter to the middle ear.

Insufflatio Mentholis (B.P.C.). *Syn.* INSUFFLATIO MENTHOLIS COMPOSITA, MENTHOL SNUFF. Menthol 5% in ammonium chloride, boric acid and lycopodium. Relieves nasal catarrh.

[D-P1-S1] **Insufflatio Mentholis et Cocainæ (B.P.C.).** Menthol $2\frac{1}{2}\%$, and cocaine hydrochloride 0.14% ($\frac{1}{8}$ gr. per oz.) with ammonium chloride, camphor and lycopodium.

[P1] Linimentum Mentholis.

Menthol 3, chloroform 4, olive oil q.s. to 16. Useful in lumbago, neuralgia, sciatica, and ringworm.

[P2] **Menthophenol.** Menthol 3, phenol 1. Useful as gargle; 15 drops to the tumbler of water.

Nebula Mentholis. 0.5 to 2% in light liquid paraffin or olive oil is used for spray or pigment for throat. Relieves acute laryngitis,

Nebula Mentholis Composita. Menthol and camphor, 20 gr. each, cinnamon oil 5 m., light liquid paraffin to 1 oz.

Nebula Mentholis et Thymolis Composita (B.P.C.). Menthol, camphor and phenol, of each 2% *w/v*, with thymol, in light liquid paraffin.

Narist. Menthol. et Thymol. (N.I.F.). Menthol 2 gr., thymol 1 gr., eucalyptol 1 m., liquid paraffin to 1 oz.

[P1] **Neb. Menthol. c. Benzamin. (N.I.F.).** Menthol 10 gr., benzamine 5 gr., oleic acid 10 m., light liquid paraffin to 1 oz.

Pastilli Mentholis (B.P.C.) contain $\frac{1}{10}$ gr. (0.003 g.).

[P1] **Pastilli Mentholis et Cocainæ (B.P.C.)** contain menthol $\frac{1}{10}$ gr. and cocaine hydrochloride $\frac{1}{10}$ gr.

Pigmentum Mentholis. Menthol 1, olive oil 4. Painted or injected into the larynx, or even the trachea, is useful in phthisis and laryngeal disease. Also applied on wool for ear affections.

A solution of menthol 60 gr. in liquid paraffin or olive oil to 1 oz. is known in some clinics as "Pigmentum Melbæ," and is a great favourite with professional singers.—D. McKenzie, *Practitioner*, ii/1935, 663.

Pigmentum Mentholis cum Guaiacol. Menthol 1 gr., guaiacol in crystals 1 gr., oil of almond to 1 oz. Is often of value in acute tonsillitis.

Pigmentum Mentholis et Tolueni (B.P.C.). *Syn.* LÖFFLER'S PAINT. Menthol 10% *w/v*, with dehydrated alcohol, strong solution of ferric chloride and toluene. For diphtheria; to be applied on wadding every 3 hours. Painful in use; dilute hydrogen peroxide is preferable.

Pilula Mentholis. $\frac{1}{2}$ to 2 grains. Mass with powdered soap or half its weight of white wax previously just melted.

[D-P1-81] **Pulvis Mentholis et Cocainæ Compositus.** *Syn.* POUDRE CONTRE LE CORYZA (*Fr. Cx.*).

Menthol 1, cocaine hydrochloride 0.5, bismuth salicylate 45, boric acid 53.5.

Spiritus Mentholis (B.P.C.). 1 in 20.

Spiritus Mentholis Compositus (B.P.C.).

Dose.—10 drops, by inhalation. Camphor, menthol, terebene and eucalyptol, of each 1 in 10, in alcohol 90%.

[P1] **Tinctura Mentholis Ætherea.**

Menthol 1, ether 4 and chloroform 4. For local application in neuralgia.

Unguentum Mentholis et Camphoræ. Menthol 3% and camphor 2% in white soft paraffin. To be applied to the nasal passages in small quantity for hay fever.

Ung. Menthol. et Eucalypt. (N.I.F.). Menthol 5 gr., oil of eucalyptus 20 m., white soft paraffin to 480 gr.

Vapor Mentholis Citriodoratus.

Menthol, oil of *Eucalyptus Citriodora*, Cologne spirit and alcohol 90%, of each, equal parts. A little inhaled, *e.g.*, from an oro-nasal inhaler or the handkerchief, is valuable for nasal catarrh and influenza.

Vapor. Menthol. et Eucalypt. (N.I.F.). Menthol 20 gr., oil of eucalyptus 2 dr., liquid paraffin to 1 oz.

Menthylis Valerianas.

Dose.—10 to 15 minims (0.6 to 1 ml.).

A colourless liquid with agreeable odour and free from the burning taste of menthol. Nerve sedative. Used in sea-sickness.

Validol (*Boehringer, Mannheim; Coates & Cooper, London*) is a mixture of menthol and menthyl valerianate. Available as liquid or in perles.

MORPHINA

B.P.C., Fr. Cx., F.E. VIII.

[D] "*Morphine and its salts, the esters of morphine and their respective salts.*"

"Any solution or dilution of morphine or its salts in an inert substance, whether liquid or solid, containing any proportion of morphine, and any preparation, admixture, extract or other substance (not being such a solution or dilution as aforesaid) containing not less than one-fifth per cent. of morphine."

"All preparations of esters of morphine."

[P1] "*Alkaloids, the following; their salts, simple or complex:—Morphine.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Morphine except substances containing less than 0.2% of morphine calculated as anhydrous morphine.*"

NOTE.—The esters do not include and should not be confused with the ethers of morphine, e.g., methyl-morphine (codeine) and ethyl-morphine (dionin).

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.02 g.).

MORPHINE FOR CHILDREN. The dose of morphine for children (in pre-operative medication) is often estimated in a haphazard fashion; it should be calculated according to body weight. If $\frac{1}{2}$ gr. is taken as the standard dose for a 10-stone man a child of 1 stone should be given gr. $\frac{1}{2} \times \frac{1}{10} = \frac{1}{20}$ gr., whilst a child of 7 lb. would receive $\frac{1}{20}$ gr.—R. R. Macintosh, *Practitioner*, ii/1939, 544.

This, the principal alkaloid of opium, occurs as a white powder, or white, shining crystals. 3 parts of morphine are reckoned approximately equal to 4 parts of the acetate, hydrochloride or sulphate.

Soluble about 1 in 5000 of water, 1 in 100 of alcohol 90%, 1 in 4000 of chloroform, 1 in 3250 of benzene, 1 in 16 of aniline, 1 in 6 of pyridine; almost insoluble in ether. 1 in 125 of glycerin, 1 in 10 of oleic acid; solutions of its salts are precipitated by ammonia and by potassium hydroxide (but redissolve in the latter).

Solubility at 20° is 1 in 6700 of water, 1 in 410 of alcohol 60%, 1 in 300 of alcohol 90%, 1 in 38 of dehydrated alcohol, 1 in 900 of alcohol-free pure chloroform or 1 in 500 of commercial chloroform containing alcohol.—H. Baggesgaard-Rasmussen and F. Reimers, *Dansk Tidsskr. Farm.*, 1931, 5, 145.

Incompatibility. Morphine salts are decomposed by alkalis, and solutions are precipitated by vegetable compounds containing tannin. Also incompatible with iron, lead, manganese, silver, copper, and zinc salts and potassium permanganate.

The alkalinity of glass bottles may throw out a very appreciable amount of morphine from a solution of a salt.

Antidotes. Emetics would probably not act, so empty stomach by stomach tube, using 60 gr. of potassium permanganate in 2 gallons of water and repeating the lavage frequently for a period

of some hours. Stomach washing should be carried out even if the morphine has been taken hypodermically, because it seems to be excreted partly into the stomach. Keep the patient warm; rouse him by constant attention, flap him with a wet towel but do not walk him about. Give hot black coffee by mouth and by rectum, and medicinal charcoal, stirred up in water, freely. Atropine is the physiological antidote, and may be given hypodermically, $\frac{1}{100}$ gr., or as tincture of belladonna. Strychnine, $\frac{1}{8}$ gr., or caffeine sodium benzoate, 2 gr., hypodermically; nikethamide, 5 to 15 ml. of 25% solution, intravenously. Artificial respiration and inhalations of oxygen with 7% carbon dioxide may be necessary. Urine must be drawn off with a catheter frequently.

(According to Sollmann, atropine, although the physiological antidote, may in some circumstances actually be a dangerous remedy, since the effects of morphine and atropine on circulation, respiration and metabolism are antagonistic only with certain stages; in the more severe grades of poisoning they are actually synergistic. Atropine is only useful therefore if given in moderate doses, *i.e.*, not exceeding $\frac{1}{10}$ gr., in moderate morphine poisoning.)

Morphine poisoning in a baby of 10 days (due to pre-anæsthetic injection of $\frac{1}{8}$ gr. morphine) combated by a mixture of 10% carbon dioxide and 90% oxygen. This mixture is known in the U.S.A. as 10-90.—J. R. McCurdy, *J. Amer. med. Ass.*, 1/1929, 1927.

Treatment of Drug Addiction. Morphine addicts are defined as persons who, not requiring the continued use of a drug for relief of symptoms of organic disease, have acquired, as a result of repeated administration, an overpowering desire for its continuance, and in whom withdrawal of the drug leads to definite symptoms of mental or physical distress or disorder. The withdrawal symptoms vary in intensity with the individual, the degree of addiction, and the rapidity with which the drug is withdrawn. They begin within 24 hours, become severe within 48 hours, reach their acme within 72 hours, and then gradually subside. They include violent pains and muscular twitchings, headache, weakness, insomnia, irritability, severe digestive disturbances, nausea, vomiting, loss of weight, diarrhoea, and vasomotor disturbances.

Withdrawal of the drug may be effected rapidly or gradually. The latter method, which is safer and causes less pain, and which requires from three to six weeks, is the method of choice in most cases. Whichever method is employed institutional treatment is essential, and the patient must be kept under continual surveillance.

The following are brief summaries of some of the more widely used methods:—

Gradual Reduction Treatment lasts about two months:—

During the first 20 days the amount of morphine hypodermically is decreased gradually, and the decrease made up either by giving the deficit, plus 25%, by the mouth, or by exactly replacing the amount of morphine stopped with codeine sulphate. A gradually increasing dose of strychnine, either with the injection or *per os*, should be given.

The next 6 to 12 days should see the codeine entirely replace the morphine hypodermically, the strychnine as previously should be given and the morphine

per os should be gradually diminished, though, of course, the volumes of all solutions given must remain the same. The daily amount of codeine must now be lessened, a period of about 10 to 20 days being occupied (according to the honesty and disposition of the patient) in reducing the amount to zero. During these last stages a bitter tonic should be given and a daily dose of hyoscine hydrobromide of $\frac{1}{16}$ gr. is required.

Acidosis should be treated with magnesia, and cascara is useful for the frequently attendant constipation.

The Lambert-Towns Rapid Withdrawal Method is one in which enormous quantities of blue pill are given, together with decreasing amounts of morphine and increasing quantities of belladonna, xanthoxylum and hyoscyamus mixture (*vide infra*). The treatment appears to culminate in the administration of 2 ounces of castor oil, the nervousness of the patient being controlled with codeine.

The Pettey Method (George E. Pettey) includes the administration of hyoscine in $\frac{1}{16}$ gr. doses, sparteine sulphate in 2 gr. doses and sodium thiosulphate in doses of 20 gr. every 2 hours for 24 hours. Cathartic capsules containing calomel, cascara, ipecacuanha, strychnine and atropine are also given.

In these more rapid methods ethylmorphine is stated to be more efficacious than codeine; as it is about twice as powerful it is argued that half the dosage will suffice. This is taken advantage of in the following—

Sceleth's Method, in which ethylmorphine $\frac{1}{4}$ gr. is combined with hyoscine, pilocarpine and cascara, and an amount varying with the amount of morphine taken is administered daily for 10 days. Then strychnine $\frac{1}{16}$ gr., 3 times a day for 1 day, and on the following day the dose is halved and continued for a week. In about 4% of the cases hyoscine delirium has been observed. In such cases it should be omitted for a few doses.

Hyoscine and pilocarpine constitute the bases of **Bishop's Method** with sometimes the addition of heroin during the active stage.

Gradual and cautious withdrawal covered by two successive waves of overdosage by "Special Mixture" (consisting of equal parts of tincture of belladonna and the fluid extracts of hyoscyamus and xanthoxylum, and Luminal respectively). When the total dose is reduced to $\frac{1}{4}$ grain in 24 hours, without discomfort, for two days saline is given in place of the drug. No distress at any stage and no crisis. Treatment lasts ten to fourteen days.—G. Laughton Scott, *Practitioner*, 1/1927, 56.

A 0.1% solution of quinine hydrochloride gives the same bitter taste as a 0.5% solution of morphine, and may be substituted for it without the patient's knowledge.—H. Alpers, *Munch. med. Wschr.*, 1935, 1327.

Intensive Treatments of Morphine Addiction. Rapid relief from the craving for the drug in a simplified, painless and non-hazardous manner without the usual discomfort of withdrawal. The patient is first assured that permanent relief from the habit is possible, and that he will receive absolutely no more morphine when the treatment is started. Owing to the increased psychomotor activity during the intensive phase of the treatment, constant nursing service is required. Saline catharsis 5 drachms (19 g.) of Karlsbad salt for one or two doses precedes treatment. Scopolamine and pilocarpine are given hypodermically as follows:—(1) Scopolamine hydrobromide $\frac{1}{160}$ gr., 1 dose; (2) scopolamine hydrobromide $\frac{1}{160}$ gr., 5 doses, 1 every hour; (3) scopolamine hydrobromide $\frac{1}{160}$ gr., 21 doses, every 2 hours; (4) pilocarpine nitrate $\frac{1}{4}$ gr. 2 hours after the last dose of scopolamine and continued for a total of 5 doses, 1 every hour. Every patient treated has stated that he did not recall what had taken place during the treatment, had not experienced any physical or mental distress whatever, and had no desire for morphine. After the intensive treatment (48 hours) the following powder is given and continued for 6 to 8 weeks to restore the blood calcium level, which falls during the administration of sedatives and hypnotic drugs:—Scopolamine hydrobromide $\frac{1}{4}$ gr., calcium phosphate compound (magnesium phosphate 2, dibasic calcium phosphate 8, calcium glycerophosphate 8, potassium bicarbonate 32, sodium bicarbonate to 100) 2 drachms, divided into 24 doses, 1 capsule being taken 3 times a day before meals. Of 57 patients treated 55% were permanently relieved and 12% relapsed.—T. Klingmann and W. H. Everts, *J. Amer. med. Ass.*, 1/1936, 18.

The opium is suddenly withdrawn (with the patient's consent) and a dose of 1 to 3 gr. of calomel given at bedtime followed by a dose of salts next morning.

The salts are repeated every morning for the next few days to eliminate opium from the system and to stimulate liver function. On the day of withdrawal, or as soon as symptoms appear, lecithin is given by mouth in doses of 15 to 20 gr. thrice daily in form of pills (or by intramuscular injection, 2 ml. of 1% solution twice daily). The lecithin is continued till most of the major symptoms completely disappear (in 2 to 4 days). Plenty of fluids and dextrose are given by the mouth, and 25 ml. of 25% dextrose with 10 ml. of 10% calcium gluconate is given intravenously during the first five days of the treatment. The duration of the treatment varies from 7 to 12 days. This treatment has been employed with success on several thousand opium addicts who were taking doses of opium ranging from 45 to 250 gr. daily in Assam.—R. N. Chopra and G. S. Chopra, *Indian J. med. Res.*, 1940, 28, 225. See also *ibid.*, *Indian med. Gaz.*, 1937, 265; and R. N. Chopra and S. C. Gonguly, *Indian J. med. Res.*, 1939, 26, 699.

Auto-serotherapy. Blistering the patient and reinjecting the blister fluid, from two to five injections being given. The patient no longer needs or desires the drug. Remarkably good results in Egypt.—M. Vivian, *Lancet*, ii/1934, 273.

Successfully used in every one of eight cases. In obtaining the fluid, two, or even three or four, small blisters—e.g., 1½ inch square—are preferable to one large one, because they heal more easily. The fluid is withdrawn before the plaster is removed and is reinjected immediately, the amount injected being from 5 to 10 ml. hypodermically; it causes no pain or reaction of any kind. The treatment obviates the usual distressing withdrawal symptoms and removes the physical need for the drug within two or three weeks.—M. Vivian, *Lancet*, i/1937, 1221.

THE TREATMENT OF DRUG ADDICTION: an exhaustive review of modern withdrawal methods—"abrupt," "rapid," and "gradual"—with a bibliography of 57 references.—E. W. Adams, *Practitioner*, ii/1932, 234, 390.

Contraindications. Morphine and opium are contraindicated in children under one year of age, and in respiratory depression, especially in the presence of cyanosis and excessive bronchial secretion, also in asthenic bronchitis and after operations on the biliary tract. In the presence of marked hepatic deficiency only small doses should be given.

Uses. The chief uses of morphine, in the order of their importance, are the relief of pain, the procuring of sleep, the arrest of hæmorrhage, the checking of peristalsis, the suppression of cough, the relief of dyspnoea, and the quietening of muscular spasm. Morphine is the most valuable of all analgesics especially for persistent pain, though it is apt to give rise to indigestion and constipation.

It is invaluable in the treatment of shock, for relieving the pain (if present) and allaying the anxiety and restlessness; it may be given in a dose of ½ gr. either by the mouth, or by subcutaneous, intramuscular or intravenous injection. A second dose should not be given until at least four hours later; excessive dosage may increase the symptoms of shock.

In addition to its use in pathological conditions it is of value as a sedative for the relief of pain during the first stage of labour, but it should not be used in the later stages. Morphine is invaluable for the relief of insomnia due to pain, but it should be avoided if possible in nervous insomnia and in excitable conditions. As a pre-operative sedative it has now been largely replaced by the basal narcotics.

Morphine favours the arrest of hæmorrhage by soothing the patient, thus keeping the blood pressure low and permitting the formation of the clot; hypodermic injections of ½ gr. are especially

valuable in internal hæmorrhage, as from gastric or duodenal ulcer or the less severe forms of hæmoptysis. Shock due to hæmorrhage is also well treated by morphine.

Owing to its anti-peristaltic action, morphine is very effective in the treatment of diarrhœa and for the relief of pain in biliary and renal colic and the colic of lead poisoning; in peritonitis it is invaluable for alleviating the pain, but should not be given until a diagnosis has been made.

Its depressant action on the respiratory centre renders it valuable in the suppression of cough, especially of the irritative type, but its use is contraindicated where there is much expectoration, and if employed in phthisical cough it should be employed with expectorants. Injections of $\frac{1}{2}$ gr. are useful in acute asthma and dyspnœa and for the relief of the respiratory distress and pain in acute respiratory diseases such as pneumonia and pleurisy.

Although morphine cannot compare with the anti-convulsants in the treatment of conditions such as tetanus, injections of $\frac{1}{2}$ to $\frac{1}{2}$ gr. are of undoubted value in the suppression of the convulsions of eclampsia.

Morphine acts only on certain pain centres in the brain, and is therefore wasted in lead and opium lotion and laudanum fomentations. Rectal morphine suppositories are efficacious only so far as morphine is absorbed and carried to the brain. We are apt to fear the secondary effects of morphine too much, rather than too little, and to forget that large doses of the synthetic products may cause sweating, rashes, and sometimes cyanosis.—E. B. Leach, *Lancet*, i/1924, 915.

May be given without fear of renal complications secondary to its use.—R. S. Ackley, *J. Amer. med. Ass.*, i/1930, 79; *Lancet*, i/1930, 364.

MORPHINE AS A PRE-ANÆSTHETIC. Morphine sulphate intravenously is used extensively at the Mayo Clinic as an adjunct to regional anæsthesia and in peroral endoscopy. The method may also be used in any case in which rapid action is desired, e.g., as a pre-anæsthetic medication, in emergencies. The amount used has varied from $\frac{1}{8}$ to $\frac{1}{2}$ gr. After about $\frac{1}{8}$ gr. has been injected a pause of thirty seconds allows one to judge the response and to note possible idiosyncrasy. The injection is then slowly continued until the desired result is obtained. The advantages of the intravenous route are that full effect is at once attained, while the dose may be accurately controlled. The duration of effect is about the same as with hypodermic injection.—C. J. Betlach, *Proc. Mayo Clin.*, 1937, 733.

When average doses of Pentothal sodium given intravenously do not produce adequate anaesthesia, morphine sulphate in suitable doses may be injected through the same needle; subsequent doses of Pentothal sodium will usually result in adequate anaesthesia without use of excessive amounts of the drug. When local anaesthesia, particularly cervical block anaesthesia, is used for an extensive operation, morphine sulphate intravenously produces rapid sedation and relieves the patient of much discomfort so that the operation may frequently be completed without administration of a supplementary anaesthetic agent. It is also of value as an adjuvant to spinal anaesthesia, if towards the end of the operation the patient is beginning to experience some discomfort; also for tranquilising the patient prior to an operation under local or regional anaesthesia or before such procedures as œsophagoscopy or bronchoscopy. A sufficiently dilute solution of morphine should be used for intravenous administration so that a very small initial dose may be given—in this way any untoward effects may be noted and an overdose prevented; administration should be discontinued as soon as the patient feels the first effects, regardless of the amount of the dose. This may vary between $\frac{1}{8}$ and $\frac{1}{2}$ gr. (this latter amount should be diluted so as to make a total volume of 2 to 3 ml.).—J. S. Lundy *et al.*, *Proc. Mayo Clin.*, 1939, 278.

[D-P1-S1] Oleatum Morphinae. Morphine 1, oleic acid 60. Dissolve.

Oleic acid will dissolve as much as one-tenth of its weight of pure morphine. Morphine is added to oleate of mercury to relieve pain.

[D-P1-81] Morphinæ Acetas (B.P.C.).

$C_{17}H_{19}O_3N, C_2H_4O_2, 3H_2O = 399.2$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.02 g.), which may be increased.

A white powder with faintly acetous odour. Soluble 1 in $2\frac{1}{2}$ of water, about 1 in 100 of alcohol 90%, and 1 in 5 of glycerin.

[P1] Linctus Morphinæ Hydrocyanicus (Ogle's Drops) (St. G. H.).

Dilute hydrocyanic acid 1 m., solution of morphine acetate 3 m., oxymel of squill to 1 dr.

[D-P1-81] Liquor Morphinæ Acetatis (B.P.C.).

Dose.—5 to 30 minims (0.3 to 2 ml.). 1%.

[D-P1-81] Morphinæ Hydrobromidum. $C_{17}H_{19}O_3N, HBr, 2H_2O = 402.1$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.03 g.).

A white powder, soluble 1 in 22 of water and about 1 in 50 of alcohol 90%. Given with hydrobromic acid as sedative.

[D-P1-81] Morphinæ Hydrochloridum (B.P., Fr. Cx., P.G. VI, P. Helv. V, P. Dan., P. Ital. V, F.E. VIII, P. Belg. IV). $C_{17}H_{19}O_3N, HCl, 3H_2O = 375.7$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.02 g.), which may be increased.

In silky white crystals or in powder. **Soluble** 1 in 25 of water, about 1 in 50 of alcohol 90%, and about 1 in 8 of glycerin; insoluble in ether or chloroform.

[D-P1-81] Hypodermic Tablets contain $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$ and 1 grain.**[D-P1-81] Guttæ Morphinæ et Cocainæ (Aural). Morphine hydrochloride 4 gr., cocaine hydrochloride 24 gr., glycerin 1 drachm, distilled water to $\frac{1}{4}$ oz.****[D-P1-81] Injectio Morphinæ (B.P.C.).**

Dose.—5 to 10 minims (0.3 to 0.6 g.).

Contains 2½% of morphine hydrochloride (about $\frac{1}{4}$ gr. in 10 m.).

[D-P1-81] Soluté Injectable de Chlorhydrate de Morphine (Fr. Cx.) is 1%. Solutio Morphini Hydrochloridi (P. Svec. X) is 3%.**[P1] Linctus Morphinæ (U.C.H.).**

Solution of morphine hydrochloride 3 m., emulsion of chloroform 3 m., treacle 60 gr., water to 1 dr. May be more agreeably flavoured with syrup of lemon.

Dose.—A teaspoonful 3 or 4 times a day; repeated frequently when cough is troublesome. Taken undiluted, swallowed very slowly. *For children* of 8 to 14 years, dose 10 to 20 drops. Not suitable for very young children or in difficulty of expectoration in bronchitis.

[P1] St. M. H. has solution of morphine hydrochloride 10 m., honey $\frac{1}{2}$ dr., water to 1 dr.**[P1] Linct. Morph. (N.I.F.).** Solution of morphine hydrochloride 5 m., syrup of tolu 30 m., water to 1 dr.**[P1] Linct. Morph. (P.M.H.).** Solution of morphine hydrochloride 15 m., syrup of tolu 30 m., water to 1 dr.**[P1] Linct. Morph. Rub. (N.I.F.).** Solution of morphine hydrochloride 5 m., vinegar of ipecacuanha 10 m., syrup of squill 30 m., solution of bordeaux B $\frac{1}{2}$ m., glycerin to 1 dr.**[D-P1-81] Liquor Morphinæ Hydrochloridi (B.P.).**

Dose.—5 to 30 minims (0.3 to 2 ml.). 30 m. contains about $\frac{1}{4}$ gr. of morphine hydrochloride.

Morphine hydrochloride 1, dilute hydrochloric acid 2, alcohol 90% 25, distilled water to 100.

[P1] Mistura Morphinae et Phenazoni Composita.

Dose.—1 ounce (30 ml.).

Solution of morphine hydrochloride 10 m., phenazone 10 gr., tincture of castor 20 m., spirit of chloroform 10 m., mucilage *q.s.*, water to 1 oz.

This is virtually a specific for spasmodic dysmenorrhœa.

[P1] Mist. Tuss. Hydrocyan. (N.I.F.). Syn. BROMPTON MIXTURE.

Solution of morphine hydrochloride $7\frac{1}{2}$ m., dilute hydrocyanic acid 2 m., syrup of tolu 30 m., acid infusion of roses to $\frac{1}{2}$ oz.

[P1] Mist. Tuss. Rub. (N.I.F.). Syn. MIST. TUSS. ACID.

Solution of morphine hydrochloride 5 m., vinegar of ipecacuanha 10 m., syrup of squill 30 m., solution of bordeaux B $2\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

[D·P1·S1] Suppositorium Morphinae (B.P.). Unless otherwise stated contains $\frac{1}{2}$ grain (0·015 g.) of morphine hydrochloride in oil of theobroma *q.s.* to 15 grains.

[P1] Syrupus Morphina (Fr. Cx.) contains morphine hydrochloride 0·05%, water 0·95%, cold-prepared syrup to 100%.

[P1] Trochisci Chlorodyni (B.P.C.) contain $\frac{1}{80}$ gr. of morphine hydrochloride (equivalent to about 8 m. of tincture of chloroform and morphine).

[P1] Trochisci Morphinae (B.P.C.) contain $\frac{1}{30}$ gr. of morphine hydrochloride.

[P1] Trochiscus Morphinae et Ipecacuanhae (B.P.).

Contains $\frac{1}{32}$ grain (0·002 g.) of morphine hydrochloride, with $\frac{1}{10}$ grain (0·006 g.) of powdered ipecacuanha. Useful to allay cough.

[D·P1·S1] Morphinae Meconas. Syn. MORPHINE BIMECONATE.

$(C_{17}H_{19}O_3N)_2 \cdot C_7H_5O_2 \cdot 5H_2O = 860·4$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0·008 to 0·03 g.).

This, one of the natural salts of morphine in opium, is in white minute acicular crystals, soluble 1 in 34 of water.

[D·P1·S1] Liquor Morphinae Bimeconatis.

Dose.—5 to 40 minims (0·3 to 2·4 ml.).

Morphine $14\frac{1}{2}$ gr., meconic acid 12 gr., alcohol (90%) 1 oz., mix and add distilled water to 4 oz. Filter. 1 ounce contains about 6·3 gr. or 1·45% (*w/v*) of morphine meconate. It is about the same strength as tincture of opium.

Acidum Meconicum. $C_7H_5O_2 \cdot 3H_2O = 254·1$. White crystals slightly soluble in water. A dicarboxylic hydroxy acid forming soluble salts with opium alkaloids. It occurs in good opium to extent of 5 to 8%. Has little physiological action.

[D·P1·S1] Morphinae Sulphas (B.P.C., U.S.P. XI).

$(C_{17}H_{19}O_3N)_2 \cdot H_2SO_4 \cdot 5H_2O = 758·5$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0·008 to 0·02 g.).

In white, silky acicular crystals. Soluble 1 in 21 of water, very slightly in alcohol 90% (about 1 in 700).

[D·P1·S1] Hypodermic Tablets contain $\frac{1}{8}$, $\frac{1}{6}$, $\frac{1}{4}$, $\frac{1}{2}$ and 1 grain; also combined with hyoscine hydrobromide for scopolamine-morphine narcosis, and with atropine as follows:—

{ Morphine sulphate $\frac{1}{8}$, $\frac{1}{6}$, $\frac{1}{4}$, $\frac{1}{2}$, $\frac{1}{2}$ gr. }
{ Atropine sulphate $\frac{1}{200}$, $\frac{1}{125}$, $\frac{1}{60}$, $\frac{1}{25}$, $\frac{1}{10}$ gr. }

Morphine and atropine are given before anaesthesia, effected by gas and ether, to lessen the amount required and to minimise the secretion from the mouth and lungs.

[D-P1-81] Morphinae Tartras (B.P.). $(C_{17}H_{19}O_3N)_2 \cdot C_4H_6O_8 \cdot 3H_2O = 774.4$.*Dose.*— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.008 to 0.02 g.).

In small white nodular tufts of acicular crystals, readily *soluble* 1 in 11 of water, slightly in alcohol 90%; insoluble in ether or chloroform.

[D-P1-81] Liquor Morphinae Tartratis (B.P.C.).*Dose.*—5 to 30 minims (0.3 to 2 ml.). 1%.

[P1-81] Æthylmorphinae Hydrochloridum (B.P.C., P. Hung., P. Svec., P. Jap. V, Fr. Cx., U.S.P. XI, P.G. VI, P. Ned. V, P. Belg. IV, P. Helv. V, P. Dan., P. Ital. V). Prop. Name. DIONIN (Merck, Darmstadt; Savory & Moore, London).
 $C_{19}H_{23}O_3N \cdot HCl \cdot 2H_2O = 385.7$.

[P1] "Alkaloids, the following; their salts, simple or complex:—*Ethylmorphine.*"

[81] "Alkaloids, the following; their salts, simple or complex:—*Ethylmorphine*, except substances containing less than 0.2% of *ethylmorphine.*"

NOTE.—Although ethylmorphine and its salts are controlled by the *Methylmorphine and Ethylmorphine Regulations, 1933*, these regulations do not affect any sale or distribution of the drugs by any person other than a wholesaler or any sale or distribution by an authorised seller of poisons in the course of any retail business (see p. 1145).

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.006 to 0.03 g.), by the mouth; $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.0025 to 0.008 g.), by hypodermic injection. *Fr. Cx.* has max. dose in 24 hours 3 grains (0.2 g.); *P.G. VI* 5 grains (0.3 g.).

A white crystalline powder, m.p. about 123°, obtained by the action of diethyl sulphate on morphine in alkaline alcoholic solution and recrystallisation from hydrochloric acid. Morphine contains one phenolic and one alcoholic group. In ethylmorphine the H of the phenolic group is replaced by C_2H_5 .

Soluble about 1 in 10 of water, 1 in 25 of alcohol 90%; insoluble in ether and chloroform.

Uses. To replace codeine and morphine in bronchitis, pulmonary emphysema and bronchial asthma, and for whooping-cough.

A useful anodyne in glaucoma, iritis, corneal ulcers, etc., and is of service in interstitial keratitis with potassium iodide internally and yellow precipitate ointment in the conjunctival sac. Solutions may be from 1 to 5% strength or more, but it may cause "ophthalmic fireworks," pain, chemosis, swelling and sneezing. The 5% solution is of value in clearing up corneal opacities.

[P1-81] Elixir Æthylmorphinae et Terpini (B.P.C.).*Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{4}$ gr. of ethylmorphine hydrochloride and $\frac{5}{18}$ gr. of

terpin hydrate in alcohol 90%, glycerin and syrup of wild cherry to 1 drachm.

[P1-S1] **Gutt. Ethylmorphin.** (N.I.F.). Ethylmorphine hydrochloride 3 gr., distilled water to 2 fl. dr.

[P1-S1] **Guttæ Ethylmorphinæ Hydrochloridi** (R.L.O.H.). *Syn.* GUTTÆ DIONINÆ.

Contain 4, 8, 20 or 40 gr. of ethylmorphine hydrochloride in 1 oz. of sterilised water.

Diamorphinæ Hydrochloridum (B.P.). *Syn.* DIACETYLMORPHINE HYDROCHLORIDE (P.G. VI, P. *Helv.* V, P. *Dan.*, Fr. *Cx.*, P. *Jap.* V), HEROIN HYDROCHLORIDE.
 $C_{21}H_{23}O_5N \cdot HCl \cdot H_2O = 423.7$.

[D] "*Diacetylmorphine and its salts, any preparation, admixture, extract or other substance containing any proportion of diacetylmorphine.*"

[P1] and [S1] "*Alkaloids, the following; their salts, simple or complex:—Diacetylmorphine.*"

The manufacture and importation of heroin are prohibited in the United States and its use is actively discouraged in many other countries.

Dose.— $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.0025 to 0.008 g.). P.G. VI, P. *Helv.* V and P. *Dan.* have max. in 24 hours approx. $\frac{1}{4}$ grain. Fr. *Cx.*, $\frac{1}{8}$ grain.

A colourless crystalline powder, m.p. 229° to 233°, obtained by the action of acetic anhydride on morphine. The hydrogen atoms of both the alcoholic and phenolic OH groups are replaced by the $CH_3 \cdot CO$ group.

Soluble about 1 in 2 of water and about 1 in 11 of alcohol 90%.

Incompatibles. Both alkalis and acids and other chemicals as morphine.

Antidotes. Treat as for poisoning by morphine, *see* p. 697. Recovery after 9 grains is on record.

Heroin and Morphine Addiction. Heroin is used sometimes by injection and sometimes as a snuff like cocaine. The addict prefers it to morphine. The morphine addict has only one or two stools a week, whereas the bowels of the diamorphine addict are almost normal. There is not so much pallor or emaciation.

Of 200 addicts in Egypt, 138 used heroin, 20 opium, 14 hashish, 12 morphine, 8 manzûl (a mixture of hashish, dry spices and herbs), 6 mixtures and 2 cocaine. Owing to the transmission of malaria in 1929 the intravenous route fell into disrepute, and heroin is now usually taken by snuffing, the average dose being 1 to 2 gr. daily. Description of a 7-day special substitution treatment employing morphine, phenobarbitone, intramuscular magnesium sulphate and paraldehyde.—A. G. Biggam and co-workers, *Lancet*, i/1932, 923.

Whereas in 1932 the number of heroin, cocaine, opium and hashish addicts in Egypt were 5695, 714, 7141 and 18,871 respectively, in 1934, as a result of the work of the Egyptian Central Narcotics Intelligence Bureau, the figures were reduced to 1605, 279, 5237, and 11,552 respectively, or a reduction of from 0.23% of the total population to 0.133%.—E. W. Adams, *Bull. Hyg.*, 1936, 341.

Uses. Often more effectual than morphine in relief of severe nerve pain but is more dangerous. It does not constipate. The danger of addiction from its continual use must never be forgotten. Sedative for cough without much expectoration, *e.g.*, in phthisis,

bronchitis, and laryngitis, also in asthma. Has been given in hæmoptysis.

Although diamorphine (hypodermically) is preferable to morphine for relief of pain after abdominal operations, care should be taken to see that the patient is *fully round from the anæsthetic before administering*, and only $\frac{1}{8}$ gr. should be given, repeated if necessary, as the effect of larger doses may be very dangerous to the respiratory centre. Artificial respiration necessary in two cases.—A. E. M. Woolf, *Brit. med. J.*, i/1929, 499; see also *ibid.*, 975.

[D-P1-81] **Elixir Diamorphinæ et Pini Compositum** (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains about $\frac{3}{8}$ gr. of diamorphine hydrochloride, $\frac{5}{8}$ gr. of terpin hydrate and $\frac{1}{2}$ m. of oil of pumilio pine in 1 dr.

[D-P1-81] **Elixir Diamorphinæ et Terpini** (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm.

Contains about $\frac{1}{8}$ gr. of diamorphine hydrochloride and $\frac{1}{8}$ gr. of terpin hydrate in a syrup of wild cherry menstruum.

[P1-81] **Elixir Diamorphinæ et Terpini cum Apomorphina** (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.) diluted.

Contains $\frac{1}{10}$ gr. of diamorphine hydrochloride and $\frac{3}{8}$ gr. of apomorphine hydrochloride, with $\frac{5}{8}$ gr. of terpin hydrate in 1 dr. (*exempt* [D]). For preparations of similar composition also *exempt* [D] see p. 1141.

This elixir keeps badly; it should be freshly prepared and stored in full bottles protected from light.

[D-P1-81] **Glycerinum Diamorphinæ** (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains about $\frac{3}{8}$ gr. of diamorphine hydrochloride in 1 drachm with acid infusion of roses in a water-alcohol-glycerin menstruum.

[D-P1-81] **Linctus Diamorphinæ** (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains about $\frac{1}{8}$ gr. of diamorphine hydrochloride in 1 dr., with tincture of hyoscyamus, syrup of wild cherry, syrup of tolu and glycerin.

[D-P1-81] **Linct. Diamorph. Hydrochlor.** (N.I.F.).

Dose.—1 drachm (4 ml.).

Diamorphine hydrochloride $\frac{1}{10}$ gr., glycerin 15 m., compound solution of tartrazine $\frac{1}{2}$ m., chloroform water to 1 dr.

[P1-81] **Linctus Diamorphinæ Camphoratus** (B.P.C.). *Syn.* ELIXIR CAMPHORÆ COMPOSITUM.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{10}$ gr. of diamorphine hydrochloride in 1 dr., with small doses of squill and ipecacuanha (*exempt* [D]).

[P1-81] **Linctus Diamorphinæ cum Ipecacuanha** (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{10}$ gr. of diamorphine hydrochloride in 1 dr., with a little ipecacuanha, hyoscyamus and tolu (*exempt* [D]).

[P1-81] **Linctus Diamorphinæ et Scillæ** (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{10}$ gr. of diamorphine hydrochloride in 1 dr., with $\frac{1}{10}$ gr. of sodium antimonyltartrate and a little squill and senega (*exempt* [D]). For a preparation of similar composition also *exempt* [D] see p. 1141.

[P1-81] **Linctus Diamorphinæ et Thymi** (B.P.C.). *Syn.* LINCTUS THYMI COMPOSITUS.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains $\frac{1}{16}$ gr. of diamorphine hydrochloride in 1 dr. and $\frac{1}{32}$ gr. of apomorphine hydrochloride, with liquid extract of thyme, tolu and glycerin (*exempt* [D]).

[D-P1-81] **Pastilli Diamorphinæ Hydrochloridi** contain $\frac{1}{16}$ gr. (0.0016 g.).

[D-P1-81] **Pastilli Diamorphinæ et Pini Compositi** (B.P.C.) contain $\frac{1}{16}$ gr. of diamorphine hydrochloride, $\frac{1}{2}$ m. of oil of pumilio pine and $\frac{1}{4}$ gr. of terpihydrate.

[D-P1-81] **Morphine Methylbromide.** *Syn.* MORPHOSAN.

$C_{17}H_{19}O_3NBr \cdot H_2O = 398.1$.

Dose.—*Hypodermically*, $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.008 to 0.016 g.).

White needles soluble 1 in 20. Compared with morphine it is non-poisonous—it is thought to be 10 times less potent.

Uses. In epilepsy, also for use with hyoscine as anæsthetic.

[D-P1-81] **Morphine Methylchloride**, $C_{17}H_{19}O_3NCl \cdot 2H_2O = 389.7$, is a similar compound, soluble 1 in 10 of water.

The hydrochloride of this base is readily soluble 1 in 200; the sulphate 1 in 170.

[D-P1-81] **Benzylmorphinæ Hydrochloridum.**

$C_{21}H_{25}O_3N(OCH_2C_6H_5) \cdot HCl = 411.7$

[D] "Benzylmorphine and its salts; any preparation, admixture, extract or other substance containing any proportion of benzylmorphine or its salts."

[P1] and [81] "Alkaloids, the following; their salts, simple or complex:—Benzylmorphine."

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.008 to 0.03 g.).

Colourless microcrystalline powder with bitter taste. Soluble 1 in 200 of water, 1 in 160 of alcohol 90%; insoluble in chloroform and ether. Similar in therapeutic properties to codeine and ethylmorphine and administered with expectorants for local irritation of respiratory organs.

Narcotina (B.P.C.). $C_{18}H_{21}O_3N(OCH_3) = 413.2$.

Dose.—1 to 3 grains (0.06 to 0.2 g.) or more in a pill.

An alkaloid from opium (sometimes as much as 15% is present), in white crystals, insoluble in water, soluble 1 in 3 of chloroform, 1 in 100 of 90% alcohol, 1 in 125 of ether, soluble also in benzene. An anti-periodic analogous to quinine. Has been used in malaria, but there is no clinical evidence of its therapeutic value.

Narcotine Hydrochloride (P. Ned. V, P. Helv. V, P. Dan.).

Dose.—1 to 3 grains (0.06 to 0.2 g.). White crystals soluble about 1 in 4 of water.

Narceina. $C_{23}H_{27}NO_3 \cdot 3H_2O = 499.3$.

Dose.— $\frac{1}{4}$ to 1 grain. An opium alkaloid soluble in alcohol, almost insoluble in water. Hypnotic sedative of doubtful utility. **Narceine Hydrochloride** (P. Ned. V, P. Helv. V). Action is similar to morphine, but it is rarely used in medicine.

[P1-81] **Papaverina** (B.P.C., F.E. VIII). $C_{20}H_{21}O_4N = 339.2$.

[P1] "Alkaloids, the following; their salts, simple or complex:—Papaverine."

[81] "Alkaloids, the following; their salts, simple or complex:—Papaverine, except substances containing less than 1% of papaverine."

Dose.—2 to 4 grains (0.12 to 0.25 g.). An alkaloid of opium (0.5 to 1%). M.p. 147°. Easily soluble in hot alcohol, but with difficulty in cold.

Z*

[P1-31] **Papaverinæ Hydrochloridum** (*P. Helv. V, Fr. Cx., P.G. VI, P. Ned. V, P. Svec. X, P. Belg. IV, F.E. VIII, P. Ital. V*). $C_{20}H_{21}O_4N \cdot HCl = 375.6$.

Dose.—2 to 4 grains (0.12 to 0.25 g.). *P. Helv. V* has max. single dose approx. 3 grains; max. in 24 hours 10 grains; by hypodermic injection $\frac{1}{2}$ and $2\frac{1}{2}$ grains respectively.

A white crystalline powder slowly soluble 1 in 40 of water, giving an acid solution; also soluble 1 in 9 of chloroform and slightly soluble in alcohol. Is used for the same purposes as the sulphate.

ARTERIAL OCCLUSION. Slow intravenous injection of $\frac{1}{4}$ to $\frac{1}{2}$ gr. of papaverine hydrochloride in 1 ml. of normal saline, administered within 6 hours of the occlusion, may tide a limb over the critical period or enable operation to be performed at a time when, without the injection, the limb would be gangrenous.—G. de Takats, *per Brit. med. J. Epit.*, ii/1936, 10.

RAYNAUD'S DISEASE. Five patients successfully treated by means of histamine iontophoresis followed by papaverine intravenously. Histamine iontophoresis releases the spasm of the minute vessels of the skin but increases the spasm of the larger arteries. This may be counteracted by giving papaverine hydrochloride three times weekly in doses of 60 to 120 mg., usually before and after histamine iontophoresis. The treatments are continued for 8 to 12 weeks.—M. G. Mulinos *et al.*, *Amer. J. med. Sci.*, 1939, 197, 793.

[P1-31] **Papaverinæ Sulphas.** $(C_{20}H_{21}O_4N)_2 \cdot H_2SO_4 = 776.4$.

Dose.—2 to 4 grains (0.12 to 0.25 g.) *per os* or hypodermically; up to 8 grains (0.5 g.) in a day.

A white crystalline powder soluble 1 in 2 of water. It is said to be non-toxic in single doses of even 1 g.

A rather feeble central analgesic and a local anæsthetic. Does not induce a habit like morphine. In all kinds of gastric and intestinal spasms (also for the diagnosis of pyloric spasm), in biliary colic and in bronchial spasm and other forms of excitability of the involuntary muscles. Of more doubtful value in pertussis, hyperemesis and vascular spasm—angina pectoris, acute uræmia and eclampsia. Ureteral calculi have been treated by instillation through a catheter of 5 ml. of 2% solution.

CALCULUS. A most valuable drug for introducing into the ureter in cases of calculus. It has a local analgesic effect and its property of lowering the tonus of smooth muscle, combined with its low toxicity, warrants its more extended use.—S. F. Wildman, *per Med. Annu.*, 1938, 544.

[D-P1-31] **Spasmalgin** (*Roche Products, Welwyn Garden City*). Combination of papaverine 0.02 g., Omnopon 0.01 g. and Atrinal (a sulphonic derivative of atropine) 0.001 g. in tablet form, or in solution in ampoules. For pathological conditions due to spasm of plain muscle, e.g., gastric pain, cardiac asthma, dysmenorrhœa, hiccup, renal colic and sea-sickness. **Dose.**—1 to 2 ampoules or tablets a day, increased to 4 in severe cases.

Perparine. A synthetic derivative of papaverine in which the four methoxy groups are replaced by four ethoxy groups. The action is stated to be similar to that of papaverine, but to be two or three times more intense with only one third the toxicity. Suggested as a morphine substitute in the treatment of conditions in which pain is produced by spasm of plain muscle. Biliary colic, cholecystitis, vesical spasm, renal calculus, asthma and dysmenorrhœa successfully treated. **Surparine**, a combination of Perparine and Novatropine (brom-methyl-homatropine), particularly efficacious.—M. G. Pouchet, *per Brit. med. J.*, i/1934, 812.

Perparine Hydrochloride, $C_{24}H_{29}ON \cdot HCl$, is a microcrystalline powder, of faintly yellow colour, tasteless, and slightly soluble in hot water, alcohol, and

very soluble in chloroform and ether. It caused diminution in motility and tonicity of the small intestine in rabbits, and the spasm caused by pilocarpine and barium hydrochloride was quickly calmed by a dose half that required by papaverine, and the relaxing effect lasted much longer. It is much less toxic than papaverine and better tolerated. It may be given clinically in a dose of 0.12 to 0.4 g. either by mouth or injection in spasmodic conditions.—H. Goldstein, per *Practitioner*, i/1937, 546.

Eupaverin (*Merck, Darmstadt; Savory & Moore, London*). A synthetic compound, $C_{15}H_{15}O_4N$, with action similar to papaverine, but stated to be less toxic.

[P1-81-84] **Eupaco** (*Merck, Darmstadt; Savory & Moore, London*). Combination of Eupaverin, atropine methylbromide, amidopyrine and phenobarbitone, in tablets or suppositories. For spastic conditions of smooth muscle and for obstetric cases when long and difficult labour is expected.

Octon (*Knoll, London*). Methyloctenylamine, an unsaturated aliphatic base, supplied in the forms of its bitartrate (in tablets containing $2\frac{1}{2}$ gr.) and hydrochloride (in 10% solution). In its paralysing effect on the smooth musculature it is 5 to 10 times more active than papaverine and its effect is of longer duration; its toxicity is from $1\frac{1}{2}$ to 2 times that of papaverine. *Dose*.—1 tablet or 15 to 20 drops of solution 3 times daily. Antispasmodic and anodyne in pain due to spasms. It is also supplied in ampoules of 1.1 ml. (1 ml. contains $1\frac{1}{2}$ gr. of Octon hydrochloride) for subcutaneous or intramuscular injection.

[D-P1-81] **Thebaine Hydrochloride** (*P. Ned. V, P. Helv. V*). $C_{15}H_{21}O_2N.HCl, \frac{1}{2}H_2O = 356.6$.

[D] "*Thebaine and its salts; any preparation, admixture, extract or other substance containing any proportion of thebaine or its salts.*"

[P1] "*Alkaloids, the following; their salts, simple or complex:—Thebaine.*"

[81] "*Alkaloids, the following; their salts, simple or complex:—Thebaine, except substances containing less than 1% of thebaine.*"

Dose.— $\frac{1}{10}$ to 1 grain *per os* increased with care; hypodermically $\frac{1}{10}$ grain.

The salt of an alkaloid of opium, soluble about 1 in 15 of water. Has been used in neuralgic affections.

NITROGLYCERINUM

Syn. TRINITROGLYCERIN, GLONON, TRINITRIN (*Fr. Cx.*), GLYCERYLIS TRINITRAS.

[P1] "*Glyceryl trinitrate.*"

Dose.— $\frac{1}{200}$ to $\frac{1}{50}$ grain (0.0003 to 0.0013 g.) increased to $\frac{1}{10}$ grain.

Tolerance may develop to a marked degree but is of exceeding short duration. A case recorded failing to respond after 6 months' use to 500 times the initial dose.—H. B. Myers and V. T. Austin, *J. Pharmacol.*, June, 1929, 227.

Nitroglycerin is a dense, opaque, white, oily liquid, transparent when dehydrated, and of sp. gr. 1.600. It has no odour, is slightly volatile, and has a sweet, aromatic and pungent taste.

Slightly *soluble* in water, freely soluble in ether, 1 in 6 of almond oil, freely soluble in absolute alcohol, and 1 in 15 of 90% alcohol. Nitroglycerin in fatty or oily solution is perfectly safe and stable, but in alcoholic solution the substance must be handled with the utmost caution, *vide infra*.

Incompatibility. Nitroglycerin is decomposed by caustic alkalis. The alcoholic solution is also precipitated by water in excess.

Antidotes. Keep patient lying down and warm; apply ice to the head. Give 30 m. of liquid extract of ergot by mouth, repeating the dose if necessary. Ephedrine hydrochloride, $\frac{1}{4}$ gr. hypodermically, has been recommended. Artificial respiration may be necessary.

Strychnine, ergot and belladonna are recommended to counteract the headache produced by large doses.

Uses. Physiologically it has the action of the nitrites and is especially valuable in angina pectoris and in asthmatic paroxysms, also generally to relieve dyspnoea of cardiac, pulmonary or renal origin. Repeated doses can be given with perfect safety but habituation quickly develops, necessitating increased dosage. Suspension of administration for a few days may restore susceptibility. It acts more quickly if taken on an empty stomach, and good results are claimed by sub-lingual administration, $\frac{1}{10}$ gr. three to four times daily.

Nitroglycerin, within 2 minutes of taking, accelerates the pulse, dilates the arteries, produces a feeling of fullness all over the body, but particularly in the head by a throbbing at the sides of the temples. It also causes headache, which lasts from 15 minutes to several hours, according to the quantity taken; but to patients accustomed to its use the headache is not felt. In treating angina pectoris, neuralgia, asthma, migraine, sea-sickness and Bright's disease, its action is like that of amyl nitrite and the other nitrites, but its effects last much longer. For the weak heart of fatty degeneration and of old persons, this lessened tension proves valuable. It has been given in hæmoptysis but is of doubtful value. In tinnitus aurium it has been found useful. In arteriosclerosis patients are made more comfortable by small doses for a week or two.

ANGINA PECTORIS. From a study of 87 patients it was observed that 97% of attacks are of less than three minutes in duration. Since the attacks are of short duration the cessation of pain frequently coincides with the solution of the nitroglycerin tablet, and this may explain in part the frequency of apparently beneficial results. The tablet triturate is slow in dissolving and the nitroglycerin content does not become available until the pain has disappeared or is subsiding. The hypodermic tablet, which is more rapidly soluble, is the preparation of choice, and for all practical purposes $\frac{1}{100}$ gr. is as effective as $\frac{1}{10}$ gr. Nitroglycerin (or amyl nitrite) was found of no value in many patients and increased the duration of pain in a few individuals. In about one-half the patients these drugs decreased the duration of pain by about one-third.—J. E. F. Riseman and M. G. Brown, *New Engl. J. Med.*, ii/1937, 470.

VOMITING OF PREGNANCY. Twelve severe consecutive cases in whom all the common methods had failed were treated with uniformly good results by means of glyceryl trinitrate $\frac{1}{10}$ gr. under the tongue 10 minutes before meals.

All of them ceased vomiting within two days of the onset of treatment. No untoward effects except transient headache.—J. M. McGowan *et al.*, *J. Amer. med. Ass.*, i/1938, 498.

[P1] Haustus Nitroglycerini.

Solution of glyceryl trinitrate 1 m., sodium bicarbonate 10 gr., compound tincture of cardamom 1 dr., spirit of chloroform 20 m., water to 1½ oz. To be slowly sipped at first symptoms of an attack as restorative in angina pectoris.

[P1] Gowers' Migraine Mixture. Sodium bromide 5 to 10 gr., solution of glyceryl trinitrate 2 m., dilute hydrobromic acid 5 m., tincture of nux vomica 5 m., tincture of gelsemium 5 to 10 m., syrup of lemon 1 dr., water to ½ oz. To be taken three times a day after food. Tincture of belladonna 5 to 10 m. can usefully be included either in addition to, or in place of, the nux vomica. This mixture must be taken for long periods in severe cases, but not during an attack. It should be supplemented by phenobarbitone ½ gr. every night and when an attack threatens.—D. Brinton, *Practitioner*, i/1936, 528.

[P1] Injectio Nitroglycerini Hypodermica.

Dose.—1 to 4 minims (0.06 to 0.25 ml.).

Solution of glyceryl trinitrate 5, alcohol (90%) 2, distilled water to 12.

Contains about $\frac{1}{250}$ gr. in 1 m. Acts promptly and is useful in collapse, etc., when the patient cannot swallow.

P1] Liquor Glycerylis Trinitratis (*B.P.*, *F.E. VIII*, *P. Hung.*, *P.G. VI*, *P. Belg. IV*, *P. Helv. V*, *P. Ned. V*). *Syn.* SOLUTIO NITROGLYCERINI SPIRITUOSA (*I.A.*), LIQUOR TRINITRINI (*Fr. Cx.*), LIQUOR NITROGLYCERINI, SPIRITUS GLYCERYLIS NITRATIS.

Dose.—½ to 2 minims (0.03 to 0.12 ml.). The dose may be increased gradually to 10 minims, if necessary, every 3 or 4 hours, in any aqueous vehicle. 2 minims contains about $\frac{1}{80}$ gr. of glyceryl trinitrate.

A 1% *w/v* solution of glyceryl trinitrate in alcohol 90%. *P. Ned. V* gives directions for making direct from glycerin by nitration with a mixture of nitric and sulphuric acids.

A colourless neutral liquid; 10 ml. with an equal volume of water keeps clear, but diluted further, the glyceryl trinitrate separates in oily drops, which explode when struck with a hammer. Should be kept from sunlight. A 5% and a 10% solution in absolute alcohol are also prepared commercially but are not safe for use in dispensing. A little caustic potash solution should be poured over it to decompose should it be accidentally spilled.

[P1] Spiritus Glycerylis Trinitratis (*U.S.P. XI*).

Average dose.—1 minim (0.06 ml.).

An alcoholic solution containing about 1% *w/v* of glyceryl trinitrate, and of the same strength therefore as the Liquor of the *B.P.*

[P1] Tabella Glycerylis Trinitratis (*B.P.*). *Syn.* TABELLÆ TRINITRINI, TABLETS OF NITROGLYCERIN.

Tablets of chocolate, each weighing 0.3 g. (5 grains), and containing 0.0005 g. ($\frac{1}{2000}$ grain).

Dose.—1 or 2 tablets.

Tablets are also available containing $\frac{1}{400}$, $\frac{1}{300}$, $\frac{1}{200}$, $\frac{1}{100}$ and $\frac{1}{50}$ grain. Also made with lactose instead of chocolate.

[P1] Tabellæ Glycerylis Trinitratis (*U.S.P. XI*).

Average dose.— $\frac{1}{2000}$ grain (0.0005 g.) of glyceryl trinitrate.

No definite weight or strength is prescribed for these tablets, but they are required to contain from 80 to 112.5% of the amount of glyceryl trinitrate stated on the label.

[P1] *Tabellæ Nitroglycerini Compositæ.*Nitroglycerin $\frac{1}{10}$ gr., amyl nitrite $\frac{1}{2}$ gr., menthol $\frac{1}{10}$ gr., capsicum 100 gr.[P1] *Tabellæ Anti-Asthmaticæ (Hare).**Dose.*—1 to 4 thrice daily.Nitroglycerin $\frac{1}{10}$ gr., sodium iodide 2 gr., potassium bromide 2 gr., liquid extract of euphorbia 3 m., tincture of lobelia 4 m.

Very useful in asthma; the nitroglycerin depresses the peripheral ends of the vagus nerve and stimulates the heart by removing the inhibitory action of the vagus and relieving blood vessels elsewhere.

[P1-S1] *Tabellæ Nitroglycerini* $\frac{1}{10}$ gr. (0.0065 g.) *et Strychninæ* $\frac{1}{10}$ gr. (0.0013 g.).

In migraine, nitroglycerin, especially in combination with strychnine, is of value. It relieves headache almost immediately. Its vasodilator effect lowers blood pressure in the peripheral vessels, and so reduces cerebral and arterial pressure. In high arterial tension where the heart is beginning to fail and such symptoms as irregularity of pulse, giddiness, shortness of breath, or even œdema of ankles begin to appear, Brunton advised to combine cardiac tonics with vasodilators.

[P1] *Hypotensive Tablets (Parke, Davis, London)* contain lithium hippurate 2 gr., sodium nitrite 1 gr., nitroglycerin $\frac{1}{100}$ gr. *Dose.*—1 to 2 tablets. For the treatment of high blood pressure.

NUX VOMICA

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, F.E. VIII, P. Belg. IV, P. Ital. V.

Syn. STRYCHNI SEMEN I.A.[P1] "*Nux Vomica.*"*"Alkaloids, the following; their salts, simple or complex:—Brucine; Strychnine."*[S1] "*Nux Vomica, except substances containing less than 0.2% of strychnine.*"*"Alkaloids, the following; their salts, simple or complex:—Brucine, except substances containing less than 0.2% of brucine; strychnine, except substances containing less than 0.2% of strychnine."*[S8] "*Nux Vomica—specify the proportion of strychnine contained in the preparation.*"*Dose.*—U.S.P. XI has average dose $1\frac{1}{2}$ grains (0.1 g.). The B.P. requires that when *Nux Vomica* is prescribed, *Nux Vomica Pulverata* shall be dispensed.The dried ripe seeds of *Strychnos Nux-Vomica* (Loganiaceæ), imported from India and Ceylon, containing not less than 1.2% of strychnine.*Antidotes.* Treat as for poisoning by strychnine, see p. 929.*Uses.* A bitter stomachic and tonic. Stimulates the bowels, hence added to aperients. Increases nervous energy. Is employed in dyspepsia and as a general tonic in all conditions of debility and neurasthenia. For the aged, this and strychnine have been described as the only suitable bitter tonics.In phosphaturia, small doses of *nux-vomica* and dilute hydrochloric acid are said to be of service.

[P1-81] **Extractum Nucis Vomicae Siccum (B.P.).** *Syn.* EXTRACTUM NUCIS VOMICÆ.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

Contains 5% of strychnine, adjusted with calcium phosphate; 1 grain contains about $\frac{1}{20}$ grain of strychnine.

Fr. Cx. conforms with *I.A.* (*Second*) making the preparation 16% of total alkaloids, with *max. single dose* $\frac{3}{4}$ grain and *max.* in 24 hours $1\frac{1}{2}$ grains approx. Elsewhere abroad the extract is called Extractum Strychni. *P.G. VI, P. Ital. V, F.E. VIII* and *P. Belg. IV* also agree with *I.A.* (*Second*).

[P1-81] **Extractum Nucis Vomicae (U.S.P. XI).**

Average dose.— $\frac{1}{4}$ grain (0.015 g.).

Contains 7.4% of strychnine, and is therefore 50% stronger than the dry extract of the *B.P.*

[P1-81] **Extractum Nucis Vomicae Liquidum (B.P.).**

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Prepared by percolating the seeds in powder with alcohol 70%, defatting with hard paraffin, and adjusting the strength so that the extract contains 1.5% *w/v* of strychnine. 3 minims contains about $\frac{1}{20}$ grain. *P. Ital. V* has 2.5% of alkaloids.

[P1] **Mist. Gent. Acid. c. Nuc. Vom. (N.I.F.).** Dilute hydrochloric acid 10 m., liquid extract of nux vomica $1\frac{1}{2}$ m., concentrated compound infusion of gentian 15 m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mist. Nuc. Vom. Alk. (N.I.F.).** Sodium bicarbonate 10 gr., liquid extract of nux vomica $1\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

[P1] **Mist. Nuc. Vom. c. Gent. (N.I.F.).** Sodium bicarbonate 10 gr., liquid extract of nux vomica $1\frac{1}{2}$ m., concentrated compound infusion of gentian 15 m., chloroform water to $\frac{1}{2}$ oz.

[P1-81] **Nux Vomica Pulverata (B.P.).** *Syn.* PULVIS NUCIS VOMICÆ.

Dose.—1 to 4 grains (0.06 to 0.25 g.). 4 grains contains about $\frac{1}{10}$ grain of strychnine.

Nux vomica in fine powder adjusted by admixture with stronger or weaker nux vomica, or with lactose, to contain 1.2% of strychnine.

[P1] **Tinctura Nucis Vomicae (B.P.).**

Dose.—10 to 30 minims (0.6 to 2 ml.), often less.

Liquid extract of nux vomica 8.34% *v/v*, with alcohol 90% and distilled water. It contains 0.125% *w/v* of strychnine; 30 minims contains about $\frac{1}{10}$ grain.

I.A. (*Second*) recommended 0.25% of total alkaloids. *P. Belg. IV, F.E. VIII* and *P. Ital. V* conform to this standard.

Fr. Cx. prepares by dissolving 1.562 g. of extract (*Fr. Cx.*) in alcohol 70% *q.s.* to produce 100 g. This contains 0.25% of combined alkaloids (*I.A.*). *Max. single dose*, 1 g.; *max.* during 24 hours, 5 g.

PSYCHONEUROSIS. Most sufferers from functional nervous illness are considerably benefited by a mixture such as the following, which is best styled a sedative tonic: sodium bromide 5 gr., tincture of nux vomica 5 to 10 m., spirit of chloroform 10 m., compound infusion of gentian to $\frac{1}{2}$ oz. *Dose.*— $\frac{1}{2}$ oz. thrice daily, after meals.—D. Brinton, *Fractitioner*, i/1936, 524.

[P1] Tinctura Nucis Vomice (U.S.P. XI).

Average dose.—15 minims (1 ml.).

Prepared by maceration with a mixture of hydrochloric acid, alcohol and water, followed by percolation with a diluted alcohol and adjusting the volume to contain 0.115% w/v of strychnine; the tincture is then cooled to 5° for $\frac{1}{2}$ hour and filtered.

[P1-81] Ignatia (B.P.C.). Syn. ST. IGNATIUS BEAN (Fr. Cx.).

Dose.— $\frac{1}{4}$ to 2 grains (0.03 to 0.12 g.).

The dried ripe seeds of *Strychnos Ignatii* (Loganiaceæ), containing strychnine and brucine, the alkaloidal content being 2.5 to 3%, of which rather more than half is strychnine. A nerve tonic similar in action to nux vomica.

Antidotes. Treat as for poisoning by strychnine, see p. 929.

[P1] Tinctura Ignatiæ (B.P.C.).

Dose.—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10.

[P1-81] Teinture de Fève de Saint-Ignace Composée (Fr. Cx.). Syn. GOUTTES AMERES DE BAUMÉ.

Dose.—Max. single 4 minims; max. during 24 hours 30 m., approximately.

Prepared by macerating 1 of ignatia and 0.025 of potassium carbonate in 5 of alcohol 70%.

[P1-81] Cabalonga de Tabasco (P. Mex. V). Mata-perros, Veneno del diablo. The seeds of *Strychnos triplinervia*. According to Professor Graham, they contain 1.83% of strychnine and brucine. Used in place of ignatia.

Damiana (B.P.C.). Syn. TURNEA, HYSTERIONICA, BAYLAHUEN.

The dried leaves of *Turnera diffusa* var. *aphrodisiaca* (Turneraceæ) and probably other species. Contains a bitter principle, damianin, resins and $\frac{1}{2}$ to 1% of volatile oil. Is laxative and tonic, and is reputed to have aphrodisiac properties.

Extractum Damianæ (B.P.C.).

Dose.—5 to 10 grains (0.3 to 0.6 g.). A soft extract.

Extractum Damianæ Liquidum (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (2 to 4 ml.). 1 in 1.

[P1] Mistura Damianæ Compositum (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains $\frac{1}{2}$ dr. of liquid extract of damiana, 2 m. of liquid extract of nux vomica and calcium and sodium hypophosphites in chloroform water to 2 dr.

[P1-81] Pilulæ Damianæ Compositæ (B.P.C.).

Dose.—1 pill.

Contain extract of damiana 2 gr., phosphorated suet $\frac{1}{16}$ gr., and dry extract of nux vomica $\frac{1}{16}$ gr.

ŒSTRADIOL

(with other ŒSTROGENS, PROGESTERONE and the ANDROGENS)

Sex hormones are closely related to each other in their chemical structure, which resembles that of the steroids of the suprarenal cortex and other tissues of the body. They possess, likewise, physiological properties common to each other which forbid any sharp differentiation. They may, however, be broadly classified as œstrogens (the œstrus-provoking hormones), progesterone (the hormone of the corpus luteum), and androgens (the male sex hormones).

Before the isolation of the œstrogens and progesterone, desiccated preparations of the ovaries were used in the treatment of various

diseases of menstruation, disturbances of the climacteric and in hæmophilia. The preparations which were used included "Ovarian Substance," consisting of the whole ovary, "Corpora Lutea," prepared from the yellow bodies formed in the ovaries after ovulation, and "Ovarian Residue," the substance of the ovaries remaining after removal of the corpora lutea, all of which were supplied in a dried and powdered form. These preparations, being unstandardised and of doubtful value, should be replaced by the standardised preparations of the respective hormones, which are now available.

In 1923 Allen and Doisy showed that an alcoholic extract of the ovary was capable of producing œstrus in rats and mice after their ovaries had been removed. The active principle of this substance was called "œstrin," indicating that it was a substance capable of producing œstrus or heat in animals. Owing, however, to the complex nature of the fatty substances extracted from the ovaries, purification and identification of the active materials could not be achieved, and no real progress was made until Aschheim and Zondek in 1927 demonstrated the presence of œstrogenic substances in large quantities in human pregnancy urine in what was probably a purer condition than that obtained from ovaries. Pregnant mares' urine was then found to contain very large quantities and to be a convenient source of supply. In 1929 Doisy in America and Butenandt in Germany isolated from pregnancy urine a pure crystalline sex hormone which was called œstrone, and this was followed shortly after by the isolation, by Marrian, of a second hormone, œstriol. It was then found that hydrogenation of œstrone resulted in the formation of a dihydro derivative five times as active as œstrone. This substance was termed "œstradiol." Two years later, in 1935, œstradiol was separated from sow ovaries and from pregnant mares' urine, and it is this substance which is believed to be the naturally-occurring œstrus principle, œstrone and œstriol being degradation products. Estradiol is developed in both the Graafian follicles and in the non-follicular cells of the ovary, possibly by the corpus luteum. The substances œstradiol and œstrone, together with other substances of known œstrogenic activity such as equiline and equilenine, also obtained from pregnant mares' urine, probably represent the active principles of the material formerly known as "œstrin," a term which, since it does not imply any definite chemical substance, has now fallen into disuse. Criticism has also been directed against the term "œstrogenic" in that it implies a limitation of the biological activity of these substances, which in addition to provoking œstrus, also possess actions which are not related to the œstrus cycle, such as the feminisation of the plumage of birds. The alternative word "gynæcogen" has been suggested as a more suitable generic term for the members of this group.

Esters. Various esters of œstradiol and its derivatives have been biologically tested in an endeavour to find a product which

would be absorbed more slowly than the hormones themselves. Among those which have been prepared are the acetates, benzoates, and propionates, of which the benzoates, particularly that of œstradiol have proved to be very suitable for the purpose, giving a much more prolonged action than the free hormone and resembling more closely the continuous secretion of the natural substance as it takes place in the body. Other derivatives have also been investigated, including ethinyl œstradiol which is stated to possess great activity when given by mouth. Preparations of œstrogenic hormones for injection are usually prepared from œstradiol benzoate, whilst tablets for oral use generally consist of œstrone which is active when given by mouth.

Standardisation. The œstrogens are standardised on their œstrus-provoking property. When they are administered to rats or mice from which the ovaries have been removed they bring about easily recognised changes in the vaginal epithelium, and by comparison with the effect produced by the international standard preparations the strength of the test preparation can be expressed in international units. Two international standards have been set up. They consist of crystalline samples of œstrone and œstradiol benzoate. The *international unit of œstrone* is defined as the specific œstrus-producing activity of 0.0001 mg. of the standard preparation of œstrone, whilst the *international benzoate unit* is defined as the specific œstrus-producing activity of 0.0001 mg. of the standard preparation of œstradiol monobenzoate. It may be noted that the benzoate unit represents a considerably greater activity than the œstrone unit.

Synthetic Œstrogenic Substances. Although extensive attempts have been made to synthesise œstradiol and its derivatives, little success has been met with owing to the complexities of their chemical structure and to the stereo-isomerism which a number of them exhibit. Œstradiol, for example, exists in two stereo-isomeric forms, α and β , only the former of which has œstrogenic activity to any degree. It was shown, however, that œstrogenic activity was not dependent upon the presence of the phenanthrene ring structure possessed by the hormones, and the search for synthetic compounds turned to relatively simple substances. It culminated in the synthesis of a derivative of stilbene, 4:4'-dihydroxy- α : β -diethylstilbene, which was found to be very highly active. This substance, generally known as diethylstilbœstrol or stilbœstrol, is three or four times as potent as œstrone when injected subcutaneously and nearly as active orally as when given by the subcutaneous route, thus differing from the natural products which are relatively inactive when given by mouth. Stilbœstrol has been tested both experimentally and clinically, and appears to be capable of replacing all the known functions of the naturally occurring œstrogenic substances. Further work on synthetic œstrogenic substances has led to the discovery of the dihydro derivative of stilbœstrol called hexœstrol,

which has been obtained as a crystalline substance capable of producing oestrus in animals. Its effects resemble those of stilboestrol, but while clinical trials indicate that it is slightly less active, it has the advantage of being more readily tolerated.

Comparisons of Activity of Oestrogens. Although all the follicle-stimulating preparations possess similar therapeutic properties they vary considerably in the intensity and duration of their action. Generally speaking, it may be said that the oestrogenic activity is less marked and less prolonged with oral therapy than with parenteral therapy, and that oral use necessitates the administration of amounts from five to thirty times as great as would be required to produce the same effect by injection. Thus, when given by the oral route, *oestrone* is rapidly absorbed and excreted and therefore has a low specific action. Nevertheless, owing to the convenience of oral therapy it is widely employed in this manner, and is undoubtedly effective provided it is given in adequate amounts in two or three divided doses daily. *Oestriol*, which is more effectively absorbed by the oral route, is claimed to give better results than *oestrone*.

For more intensive treatment than can conveniently be achieved by oral administration *oestrone* may be given by injection, since it is stated to be five times as active by this route. Even by injection, however, it is no more active than *oestradiol* by mouth and is much less active and has a less prolonged action than *oestradiol benzoate* by injection. In view of the fact that the esterification of an oestrogen prolongs the duration of its activity, it might be anticipated that *oestrone benzoate* would have a similarly prolonged action to *oestradiol benzoate*, but its effect is delayed until it has undergone hydrolysis in the body and *oestrone* is more effective than its benzoate. By virtue of its greater oil-solubility and slower absorption-rate, however, *oestradiol benzoate* is more suited to intensive parenteral therapy than *oestrone*, its effectiveness lasting at least three days, so that twice weekly injections may be expected to produce a continuous effect. *Oestradiol propionate* by parenteral injection is said to have an even more prolonged effect than *oestradiol benzoate*.

It has been shown that the administration of an oestrogen (crystalline *oestrone*) in the form of a tablet implanted subcutaneously leads to a prolongation of the period of effectiveness of some months; this method of administration is, however, at present only in the experimental stage.

As a general guide, it may be said that the bulk of clinical evidence favours the use of *oestrone* (or, more recently, one of the synthetic equivalents, *q.v.*) by the mouth for low intensive therapy and of *oestradiol benzoate* by injection for high intensive therapy.

Uses. The follicular hormone can be employed to increase the growth of the secondary sex characters and to condition the genital tract, and particularly to produce the changes in the

endometrium characteristic of the post-menstrual phase (*i.e.*, those changes which facilitate the fertilisation of the ovum) and to influence the growth of the uterus and increase its contractility. Its main indications, therefore, may be summarised as:—(1) arrest or retardation of puberty, *e.g.*, primary amenorrhœa; (2) disturbances of menstruation, *e.g.*, secondary amenorrhœa, menorrhagia and spasmodic dysmenorrhœa; (3) disturbances of the menopause and post-menopausal disorders.

The most satisfactory response is seen in the menopausal syndrome, for which it is claimed to be the ideal method of treatment. Relatively small doses of œstrone given daily by mouth control the flushing, palpitation, headaches and giddiness, and induce a general feeling of well-being. Some of the later results of the climacteric ovarian deficiency, *e.g.*, disorders of the vagina and vulva, such as pruritus, kraurosis, atrophic vulvitis, and senile vaginitis and ulceration, require higher doses of the hormone by injection. Thus, in the first two weeks of treatment doses of 100,000 i.b.u. of œstradiol benzoate are given weekly, subsequently reduced to 20,000 units weekly. Good results are also obtained, both by oral and parenteral administration, in the psychological disorders associated with the menopause, *e.g.*, in involutional melancholia, in the migraine which frequently occurs at this period, and in what is known as climacteric arthritis.

Primary amenorrhœa (delayed puberty), as also the milder forms of menstrual irregularity such as hypomenorrhœa or oligomenorrhœa, may often be completely cured by the oral administration of œstrone, and a certain percentage of cases of secondary amenorrhœa may be permanently benefited by injection therapy, but primary amenorrhœa in patients over 20 and secondary amenorrhœa of long-standing rarely, if ever, respond permanently to this therapy, the amenorrhœa returning when the treatment is suspended.

By virtue of the fact that it is responsible for the growth of the uterus and for maintaining the tone of the uterine muscle, the œstrogenic hormone may be employed with a considerable measure of success in the treatment of uterine hypoplasia, uterine inertia, and missed abortion. For these purposes it is necessary to give adequate injections of œstradiol benzoate.

œstrone is also concerned in the growth of the mammary gland and may be successfully employed for the development of under-sized breasts, being especially effective when administered by inunction, an amount of ointment containing a total of 2500 i.u. of œstrone, or 10,000 i.b.u. of œstradiol benzoate, being rubbed well into the breasts twice daily. In the treatment of persistently painful and lumpy breasts, a relatively high dosage by injection of œstrone or œstradiol benzoate has been found of value, and may often bring about sufficient improvement to avoid the necessity for operation.

œstrogenic substances, by inhibiting the secretion of the lactogenic hormone of the pituitary, suppress lactation, and large

amounts of œstradiol benzoate injected daily during the puerperium inhibit lactation and breast engorgement.

In the treatment of gonococcal vulvovaginitis in children, œstrogenic therapy now holds an established place, and is considered by many to be the most effective treatment discovered to date. Treatment would appear to be equally effective whether given by the mouth (œstrone), by injection (œstrone or œstradiol benzoate), or *per vaginam* (œstrone, in the form of suppositories), though the latter is the most favoured method. The use of œstrone suppositories has also been found of value in the treatment of leucorrhœa.

Owing to the similarity in chemical structure between the œstrogens and the carcinogenic hydrocarbons, and to the demonstration that the prolonged administration of œstrogens in high doses is capable of causing mammary cancer in susceptible strains of mice, the possibility that the therapeutic application of œstrogens might give rise to cancer in human beings was for a time seriously entertained. Subsequent work, however, has largely disposed of this fear, since it was shown that the enormous doses and the prolonged periods of administration necessary to produce cancer in mice were greatly in excess of those required to produce therapeutic effects in human beings. The use of œstrogens should, however, be avoided when a carcinoma of the breast or cervix is already present. In this connection it is of interest to note that recent work suggests that both progesterone and testosterone propionate (*q.v.*) exert an antitumorigenic action.

œstradiol. *Syn.* DIHYDROTHEELIN, DIHYDROXYCESTRIN, DIHYDROFOLLICULINUM (*Fr. Cx.*). $C_{18}H_{24}O_2 = 272.37$.

Dose.—0.1 to 0.2 mg. (5000 to 10,000 i.u.) daily *per os* in divided doses.

œstradiol, $\Delta^{1,3,5}$ -œstratriene-3,17-*trans*-diol is obtained from ovaries and from the urine of pregnancy. It is a white, crystalline substance with a melting point of 174° to 175°.

Sparingly **soluble** in water; soluble about 1 in 4 of alcohol.

œstradiol reduces the number, severity and duration of "hot flushes" after a radium menopause. In nearly all of 51 cases the hormone when given by the mouth in very low dosage (not more than 0.2 mg. of œstradiol daily) the number

and severity of the flushes were reduced, and most of the less severe cases were cured. After withdrawal of the tablets there was seldom any recurrence of symptoms within the next six months.—B. C. Murless, *Lancet*, i/1939, 1205.

Implantation of Tablets. Under a local anæsthetic an incision 2 or 3 inches in length is made through the skin of the right or left hypogastric region; the fatty tissue is drawn apart, and each tablet (which has been previously sterilised in boiling water for 3 to 5 minutes) is embedded separately in the subcutaneous tissue. The tablets should not be in contact with one another, and should not lie directly beneath the skin, as otherwise they act too much as foreign bodies and are expelled again too easily. The deeper the tablet lies the better it will be retained; the larger the tablet the less certain the chances of healing up. A tablet one-third of an inch in diameter is most suitable for implantation, although the absorption proceeds more rapidly when the surface is larger. The skin, and on occasion the fatty tissue, is closed with a few stitches of catgut.

Estradiol was implanted subcutaneously to allow a small infantile uterus to develop and to make it ready for conception, and this was done successfully. Five tablets, each of 15 mg. were implanted deeply in the subcutaneous fat of the right hypogastric region.—A. A. Loeser, *Brit. med. J.*, i/1940, 479.

Uterine and extra-uterine tumours can be produced in the guinea-pig by introducing a tablet of estradiol beneath the skin. These tumours are similar to the uterine and extra-uterine fibroids or fibromyomas produced previously by a long course of injections of follicular hormones. The uterine tumours begin to appear as early as 2½ to 3 weeks after the introduction of the tablet, and the degree of tumorigenesis is much greater with the tablets than with injections of free estradiol when equal quantities are compared. The treatment with tablets is comparable, as regards the danger of tumorigenesis, to a treatment with esters of estradiol administered by injection without intervals free from treatment.—A. Lipschutz and L. Vargas, *Lancet*, i/1939, 1313.

Estradiol Benzoate. *Syn.* DIHYDROFOLLICULINUM BENZOICUM (*Fr. Cx.*). $C_{25}H_{28}O_3$ = 376.22.

Dose.—1 to 5 mg. (10,000 to 50,000 i.b.u.) daily by intramuscular injection.

Estradiol benzoate is prepared by the esterification of the phenolic hydroxy group of estradiol with benzoic acid. It is a white, crystalline substance melting at 194°.

Insoluble in water; soluble in organic solvents and oils.

AMENORRŒIA. The rubbing of alcoholic tincture of oestrogenic hormone into the skin is almost as effective clinically as injections of the hormone, but some patients who do not react to percutaneous treatment will nevertheless react to injections. Application of oestrogenic hormone to the skin, followed by the injection of progesterone, will produce uterine bleeding in primary and secondary amenorrhœa.—B. Zondek, *Lancet*, i/1938, 1107.

KRAUROSIS VULVÆ. The effects of the oestrogens on senile vaginitis and kraurosis vulvæ are so great that a cure is possible without any local treatment. 5 mg. of estradiol benzoate should be injected twice weekly, and the patient is usually free from symptoms in from one to three weeks, though small doses by mouth should be continued for two or three months afterwards.—T. N. A. Jeffcoate, *Brit. med. J.*, ii/1939, 673.

TEMPORARY POSTPONEMENT OF MENSTRUATION. Injections of estradiol benzoate may be used to effect the temporary postponement of menstruation in order to avoid coincidence of menstrual bleeding with special events in a woman's life, such as athletic championships or marriage. Deep intramuscular injections of 50,000 i.b.u. are given every 3 to 4 days throughout the cycle, or if treatment is not begun until after ovulation may be expected to have occurred, the dosage must be increased to 100,000 i.b.u. at shorter intervals. No harmful effects are produced, and menstruation occurs 2 to 8 days after the last injection.—G. L. Foss, *Brit. med. J.*, ii/1937, 10.

The normal ovarian cycle in women can be inhibited by oestrogen (estradiol benzoate). Menstruation can be postponed for from 7 to 70 days and artificial amenorrhœa produced in this way. The dose necessary to bring about this effect is at least 70,000 i.u. Still larger doses, e.g., more than 600,000 i.u., are able to cause the uterine mucosa to react with glandular cystic hyperplasia, and pro-

tracted administration of immense doses (6,000,000 i.u. over 60 days) prevents the ripening of the follicle as well as corpus luteum formation, so that the ovaries appear to be those of an old woman. Estrogen is thus able to produce functional castration. These extremely large doses do not appear to give rise to carcinomatous changes of the uterus.—B. Zondek, *J. Amer. med. Ass.*, i/1940, 1850.

Oestradiol Dipropionate. $C_{24}H_{32}O_4$ = 384.5.

Oestradiol dipropionate is the double ester of oestradiol and propionic acid.

Benzo-Gynöestryl (*Roussel Laboratories, London*). Ampoules containing 1000, 10,000 or 50,000 i.b.u. of oestradiol benzoate per ml.

Di-Menformon (*Organon Laboratories, London*). Ampoules and solution of oestradiol benzoate for injection, containing 10,000 or 50,000 i.b.u. per ml. Also available as an ointment containing 20,000 i.b.u. per g.

Ecto-Gynöestrol (*Roussel Laboratories, London*). A solution of oestradiol 0.5 mg., in a mixture of equal parts of oleic alcohol and 95% ethyl alcohol. For local application only. Also available as an ointment containing 2.5 mg. of oestradiol per oz.

Gynöestrol (*Roussel Laboratories, London*). Tablets containing 0.025 or 0.2 mg. of oestradiol (equivalent to 1250 or 10,000 i.u.).

Estroform Ampoules (*British Drug Houses, London*). 1 ml. ampoules of a solution of oestradiol benzoate containing 1000, 10,000, 20,000 or 50,000 i.b.u. per ml.

Ovocyclin (*Ciba, Horsham*). Tablets of oestradiol containing 0.02 mg. or 0.2 mg. Also issued in an ointment containing 0.1 mg. per g.

Ovocyclin P (*Ciba, Horsham*). Ampoules of oestradiol dipropionate containing 1 or 5 mg. per ml.

Progynon B Oleosum (*Schering, London*). 1 ml. ampoules containing 10,000 i.b.u. of oestradiol benzoate in sesame oil. **Progynon B Oleosum Forte** contains 50,000 i.b.u. per ml.

Progynon Capsules and Suppositories (*Schering, London*), contain 0.25 mg. or 0.36 mg. of oestradiol respectively. **Progynon Ointment** contains 0.1 mg. of oestradiol per g.

Progynon D-P (*Schering, London*). A solution of oestradiol dipropionate for intramuscular injection.

[P1] **Sedo-Gynöestryl** (*Roussel Laboratories, London*). Solution for oral administration containing per ml. 1000 i.u. of oestradiol, 0.5 g. of sodium bromide, and 0.02 g. of extract of hyoscyamus. For menopausal disturbances and ovarian hypofunction complicated with nervous symptoms. *Dose*.—50 drops daily in 4 doses for 12 to 15 days after the last period.

Unden Ampoules (Oily) (*Bayer Products, London*). Ampoules of an oily solution of oestradiol benzoate, containing 10,000 or 50,000 i.b.u. Also supplied in 10 ml. bottles containing 10,000 i.b.u. per ml.

Oestriol. *Syn.* ESTRIOL, THEEOL, TRIHYDROXYOESTRIN.

$C_{18}H_{24}O_3$ = 288.37.

Dose.—0.05 to 0.5 mg. (500 to 5000 i.u.) daily *per os* in divided doses.

Œstriol, $\Delta^{1,4,5}$ -œstratriene-3,16,17-triol, is obtained from placental tissue and pregnancy urine. It is a white, odourless, micro-crystalline powder with a melting point of 282° , and exhibits a reddish fluorescence under filtered ultra-violet light.

Practically *insoluble* in water; soluble in alcohol, dioxane and oils.

Face cream, stated to contain œstradiol, sold commercially and recommended for the removal of wrinkles from normal women, has decided internal effects when applied daily on the skin of experimental animals. Such treatments (a) stimulate mammary development on normal male guinea-pigs, (b) induce cornified vaginal œstrus smears in spayed female rats, (c) maintain or increase normal growth of the uterus in young or mature spayed rats, and (d) reduce the weight of testes by 80% and the weight of seminal vesicles by 90% in young male rats in comparison with normal litter mates.—C. R. Moore *et al.*, *J. Amer. med. Ass.*, ii/1938, 11.

Theelol Capsules (Parke, Davis, London). Capsules for oral administration containing 200 or 400 i.u. of œstriol.

Tridestrin (Paines & Byrne, London). Tablets containing 500, 1000, or 5000 mouse units of œstriol.

Œstrone. *Syn.* ESTRONE, THEELIN, KETOHYDROXYCESTRIN, FOLLICULIN (*Fr. Cx.*). $C_{18}H_{22}O_2 = 270.17$.

Dose.—0.1 to 5 mg. (1000 to 50,000 i.u.) daily *per os* in divided doses or from 0.5 to 1 mg. (5000 to 10,000 i.u.) by intramuscular injection.

Œstrone, $\Delta^{1,4,5}$ -œstratriene-3-ol-17-one, is obtained from the urine of pregnant mares. It is a white, odourless, crystalline powder which exhibits a strong bluish-white fluorescence under ultra-violet light.

Practically *insoluble* in water; slightly soluble in alcohol, benzene and other organic solvents; soluble about 1 in 4 of dioxane and in oils.

If œstrone is administered to men or to castrate women, from 3 to 12% of it is excreted in the urine shortly after administration. The proportion excreted is somewhat greater after oral than after parenteral administration. When given by the mouth the quantity excreted is proportional to the dose administered. Œstrone administered orally is very rapidly absorbed and excreted by the body, and has, therefore, a comparatively low specific biological action. It ought, therefore, to be given in such a form that it can be absorbed slowly and given divided into three or more daily doses.—T. Kemp and K. Pedersen-Bjergaard, *Lancet*, ii/1937, 842.

ANXIETY STATES. In anxiety occurring in connection with the menopause, the administration of Theelin (œstrone) intramuscularly, in doses of 1000 international rat units in oil twice weekly, gives almost uniformly good results. Where the anxiety arises apart from the menopause the effects are doubtful and may even be undesirable.—G. A. Little and D. E. Cameron, *Canad. med. Ass. J.*, ii/1937, 144.

ATROPHIC RHINITIS. In 31 women suffering from eczema and atrophic rhinitis, 1000 i.u. of œstrone in 0.025 ml. of olive oil was sprayed twice daily into the nose, and crusts which formed were removed by forceps twice a week. Improvement usually occurred in from 2 to 6 weeks and continued until in 20 cases there was complete disappearance of unpleasant odour, absence of crusts, disappearance of purulent secretions, and restoration of an almost normal pink mucosa.—H. Mortimer, P. R. Wright and J. B. Collip, *Canad. med. Ass. J.*, ii/1937, 445.

BREAST ENGORGEMENT. It is claimed that even small doses of œstrone, 2 to 6 mg. taken by mouth during the course of 3 to 6 days, are sufficient to prevent the discomfort of engorged breasts when breast feeding is contraindicated; more usually daily injections of 1 to 2 mg. of œstradiol benzoate are required.—T. N. A. Jeffcoate, *Brit. med. J.*, ii/1939, 675.

CUSHING'S SYNDROME. The alleged inhibitory effect of large doses of œstrone on the secretion of the anterior pituitary, suggested trial in Cushing's syndrome. Three cases received daily injections of 100,000 or 200,000 i.b.u. for periods of 40 to 50 days. No effect was obtained on the obesity, hypertrichosis, abdominal striae or hypertension, but subjective improvement occurred in all three cases, and the severe headaches were either abolished or greatly improved.—A. M. Gill, *Lancet*, ii/1937, 70.

GONOCOCCAL VAGINITIS. Twenty-four cases successfully treated in girls aged 2 to 9 years by nightly insertions into the vagina of capsules containing 75 rat units of Amniotin (œstrone).—R. M. Lewis and L. Weinstein, *Surg. Gynec. Obstet.*, ii/1936, 640.

All of 169 patients were cured by the use of Amniotin (œstrone) vaginal suppositories (1000 international units), one suppository being introduced daily at bedtime. There was no clinical evidence of harm due to the treatment.—R. W. Le Linde, *J. Amer. med. Ass.*, i/1938, 1633.

INVOLUTIONAL MELANCHOLIA. Theelin (œstrone) seems to be specific in involutional melancholia, the apparent recovery rate being 92% in a series of 14 cases. Massive doses of from 30,000 to 40,000 i.u. for the first month of treatment accelerate the recovery rate, the hospitalisation being reduced to an average period of three months.—C. C. Ault *et al.*, *J. Amer. med. Ass.*, ii/1937, 1786.

MASTITIS. Hormone therapy in chronic cystitic mastitis is a convenient form of palliative treatment preventing needless mutilating operations, and, if properly used, speeding regression of the disease. The results are most satisfactory in persistent painful breasts and in early adenosis. Relatively high doses of œstrogen are needed. 10,000 i.u. is injected intramuscularly twice weekly for a period of three weeks (between two menstrual periods), a total of approximately 60,000 i.u. being given. This is followed by similar doses injected once a week for another month, then twice the following month. After this, a single injection is given in the premenstruum, or capsules are taken by mouth every other day to complete six months of treatment. The oral preparation used was Amniotin in capsules containing 2000 i.u. of œstrogen each. The œstrogen is never given during menstruation and treatment is usually confined to a period of six months.—D. Lewis and C. F. Geschickter, *J. Amer. med. Ass.*, ii/1937, 1894.

MENOPAUSAL SYMPTOMS. In the treatment of menopausal symptoms—hot flushes, headaches, nausea and vomiting, epigastric pain, exhaustion and nervous instability—all of 76 patients were relieved and the effect in 75% of the cases was "miraculous." Theelin in oil, 2000 units, was given three times a week till symptoms were relieved, then once weekly for a varying length of time. For acute cases 4000 units may be the initial dose. It may also be necessary to increase the dosage the week before the patients would ordinarily expect their periods. The headaches and flushes disappear rapidly and the patients experience a general feeling of well-being.—M. Hilliard, *Canad. med. Ass. J.*, ii/1937, 223.

There is no doubt that in a large percentage of cases menopausal symptoms can be eliminated by the administration of estrogens. The dose required varies

considerably and can only be determined by therapeutic trial. Daily doses of 0.6 mg. of œstrone by mouth are usually sufficient, but in difficult cases intramuscular injections of 1 to 5 mg. of œstradiol benzoate every few days may also be required. Once the symptoms have been controlled, the dosage should be reduced very gradually over a period of months until the patient can manage with only 0.1 mg. once or twice weekly.—T. N. A. Jeffcoate, *Brit. med. J.*, ii/1939, 671.

PREMATURE INFANTS. Œstrone given orally appears definitely helpful to premature infants. The babies cause less anxiety, feeds are taken better, the initial loss of weight appears less and is usually made up sooner. The preparation used in a series of 11 premature babies was Progynon, the dose being half a dragée twice daily (i.e., 500 i.u. twice daily). One dragée was dissolved in two drachms of hot water and one drachm given as a dose. None of the babies died.—M. F. Potter, *Brit. med. J.*, i/1937, 1201.

PRURITUS VULVÆ. This condition can be entirely relieved by Theelin. The dose should be large and frequent (e.g., 2000 units bi-weekly), depending on the duration of the pruritus and the condition of the skin and mucous membrane of the vulva. Treatment must not be discontinued too soon, especially in older women.—M. Hilliard, *Canad. med. Ass. J.*, ii/1937, 223.

VULVO-VAGINITIS. In a series of 25 cases of vulvo-vaginitis of children, symptomatic and bacteriological cures were obtained in a period averaging 45 days. Recurrence of discharge occurred in 28% of cases. The method of treatment found most satisfactory was doses of 1000 international units tri-weekly.—J. V. Berry, *Canad. med. Ass. J.*, i/1937, 396.

Implantation of Tablets. Experimental work shows that the crystalline gonadal hormones are effective when administered by the subcutaneous implantation of solid tablets. It is concluded that the technique is particularly useful where a large-continued steady effect is required, as for instance in the depression of the gonad-stimulating and growth-promoting activity of the pituitary by estrogens, and in the masculinisation of the female by androgens. It appears that treatment of very long duration, following one administration of hormone, will be possible by implantation of tablets.—R. Deanesly and A. S. Parkes, *Lancet*, ii/1938, 606.

Female rats received tablets of œstrone implanted into the subcutaneous tissue. The tablets varied from 1 to 7 mg. in weight. Following this method of treatment, tumours were found in the mammary glands of 28 out of 49 rats. The first tumour to appear was palpable after 226 days of treatment. The tumours were frequently multiple, slowly growing, and were not near the site of the œstrone tablet.—R. L. Noble *et al.*, *Canad. med. Ass. J.*, i/1940, 413.

Œstrone Benzoate. *Syn.* FOLLICULINUM BENZOICUM (*Fr. Cx.*). $C_{25}H_{36}O_2 = 374.46$.

Dose.—1 to 5 mg. (10,000 to 50,000 i.b.u.) by intramuscular injection.

Œstrone benzoate is prepared by the esterification of the phenolic hydroxy group of œstrone with benzoic acid. It is a white, crystalline substance melting at about 220°.

Practically *insoluble* in water; less soluble in alcohol, but more soluble in benzene than œstrone; soluble in oils.

Amniotin (*Squibb, New York; Savory & Moore, London*). Preparations of œstrone available in 1 ml. ampoules each containing 2000 or 10,000 i.u. in oil, and in capsules containing 1000 or 2000 i.u. Pessaries containing 1000 i.u. are also prepared for the treatment of vulvovaginal infections in children.

Benztone (*Paines & Byrne, London*). 1 ml. ampoules of œstrone benzoate containing 10,000, 20,000, or 50,000 i.b.u.

Glandubolin (*Richter, London*). Preparations of œstrone available in ampoules containing 100, 1000, 10,000 or 50,000 i.u., and in tablets containing 100 or 1000 i.u.

Hormotone T (*Carnrick, Newark, N.J.; Brooks & Warburton, London*). Each tablet contains ovarian follicular hormone equivalent to 200 i.u., with thyroid $\frac{1}{10}$ gr., and dried suprarenal and whole pituitary gland $\frac{1}{10}$ gr. each.

Ketodestrin (*Paines & Byrne, London*). 1 ml. ampoules of oestrone containing 500, 1000, 5000 or 10,000 i.u.

Kolpon (*Organon Laboratories, London*). Soluble tablets and bougies for local application to the vagina, containing respectively 1000 i.u. and 500 i.u. of oestrone. The tablets have a buffered glucose base giving a pH of 4.0 to 4.5 on solution.

Menformon (*Organon Laboratories, London*). Preparations of oestrone available as an aqueous solution in 1 ml. ampoules (100 or 1000 i.u. per ml.), an oily solution in 1 ml. ampoules and 5 ml. vials (10,000 i.u. per ml.), an ointment (5000 i.u. per g.), tablets (100, 500, 1000, 3000 or 10,000 i.u. per tablet), and as drops for oral use (10,000 i.u. per ml. in oil).

Oestroform Tablets (*British Drug Houses, London*). Tablets of oestrone containing 1000, 5000 or 10,000 i.u. per tablet. **Oestroform Pessaries** contain in each 1000 i.u.

Oestroglandol (*Roche Products, Welwyn Garden City*). Preparations of oestrone, available as tablets containing 1000 i.u., ampoules containing 1000 i.u., and ointment containing 10,000 i.u. per g.

Ovarnon (*Organon Laboratories, London*). Tablets containing 2.5 gr. of ovarian powder, representing 10 i.u. of oestrone.

Ovostab Tablets (*Boots, Nottingham*). Tablets contain 1000 or 10,000 i.u. of oestrone.

Perlitan (*Boehringer, Mannheim; Coates & Cooper, London*). Preparations of oestrone available for injection in 1 ml. ampoules containing 500, 1000 or 10,000 i.u., and in 10 ml. vials containing 400 i.u. per ml. Tablets containing 500 i.u., and vaginal suppositories containing 1000 i.u. are also prepared.

Progynon Dragées (*Schering, London*). Dragées of oestrone containing 1000, 3000 or 10,000 i.u.

Sistomensin (*Ciba, Harsham*). Preparations of lipo-soluble ovarian hormones, available in tablets containing $\frac{1}{2}$ gr., and in 1 ml. ampoules containing $\frac{1}{2}$ gr., equivalent to 10 i.u. of oestrone. *Dose*.—1 to 3 tablets three times a day, or 1 to 2 ampoules a day subcutaneously or intramuscularly.

Solestrin (*Paines & Byrne, London*). Alcoholic solution of oestrone for percutaneous administration. *Dose*.—10 to 20 drops (1 to 2 ml.) once or twice daily. (One drop contains 750 units of oestrone.)

Theelin (*Parke, Davis, London*). Ampoules of oestrone containing 200 i.u. per ml., and pessaries containing 2000 i.u. in a glycoelatin base. **Theelin in Oil**. Ampoules of oestrone containing 1000, 2000, 5000 or 10,000 i.u. per ml.

Theelin in oil stimulates development of the sex-related structures in women, producing changes in the breast, gross appearance of the vagina, with increased mucous secretion, and growth of the endometrium and vaginal mucosa in dosages as low as 5000 i.u. Relief of symptoms of castration was obtained with this dosage, but this will at the same time stimulate development of the endometrium sufficiently to cause uterine bleeding when discontinued. The large doses of theelin advocated by some (from 30,000 to 50,000 rat units) as necessary to produce the interval phase of the endometrium, are grossly excessive. Theelin in oil is much more effective than in aqueous solution. When administered intramuscularly in the human being, smaller dosages and less frequent intervals produce more rapid and more marked effect on the endometrium and vaginal mucosa.—A. A. Werner *et al.*, *J. Amer. med. Ass.*, ii/1937, 1027.

Thelestrin (*Carwick, Newark, N.J.; Brooks & Warburton, London*). Ampoules of oestrone containing 2000 i.u. per ml.

Unden (*Bayer Products, London*). Ampoules of oestrone containing 1000 i.u. per ml., or tablets for oral administration containing 1000 i.u. An ointment for local application containing 1000 i.u. per g. is also prepared.

Stilbœstrol. *Syn.* DIETHYL-STILBÆSTROL.
 $\text{HO} \cdot \text{C}_6\text{H}_4 \cdot (\text{C}_2\text{H}_5) \cdot \text{C} : \text{C}(\text{C}_2\text{H}_5) \cdot \text{C}_6\text{H}_4 \cdot \text{OH} = 268.3.$

Dose.—1 to 5 mg. *per os* or intramuscularly. (1 mg. is equivalent to 40,000 i.u. or 800 i.b.u.).

Stilbœstrol is 4 : 4'-dihydroxy- α : β -diethylstilbene, a derivative of the unsaturated aromatic hydrocarbon stilbene or *trans*-1 : 2-diphenylethylene. It is prepared synthetically and consists of a white, crystalline substance melting at 167° to 168°.

Insoluble in water, but soluble in alcohol, most organic solvents and fixed alkali hydroxides; also soluble in oils.

Uses. Stilbœstrol acts similarly to the naturally occurring œstrogens. It is highly active by mouth and its duration of action is approximately the same as that of œstradiol. By injection it is said to be about two and a half times as active as œstrone, but is less active than œstradiol benzoate and its action is of shorter duration. It may be employed in all conditions in which the natural hormones are used, and is especially indicated for the relief of the subjective symptoms of the menopause, in atrophic vaginitis, kraurosis vulvæ, pruritus vulvæ and for vulvovaginitis in children. It has also been employed with success for inhibiting lactation. It may occasionally give rise to secondary effects such as nausea and vomiting, but is usually well tolerated.

Stilbœstrol is a comparatively simple substance to synthesise. It imitates the natural œstrogens faithfully and is highly active by mouth.—*Pharm. J.*, i/1939, 31. (For original work see paper by E. C. Dodds, L. Golberg, W. Lawson and L. Robinson, *Nature, Lond.*, i/1938, 247; ii/1938, 34.)

Has an action similar to œstrone on the uterus of ovariectomised rats, on the mating reaction, vagina, and uterus of immature rats, on the uterus of immature rabbits, and on the feathers of capons. By vaginal-smear assay on ovariectomised rats it was found to be approximately 2½ times as active as œstrone.—E. C. Dodds, W. Lawson and R. L. Noble, *Lancet*, i/1938, 1389.

The duration of action of stilbœstrol is short compared to that of œstradiol benzoate, triphenyl-chlor-ethylene, or œstradiol benzoate butyrate when given subcutaneously. Orally, œstradiol and stilbœstrol act for approximately the same time, and their period of action is a little longer than that of triphenyl-chlor-ethylene.—J. M. Robson, A. Schönberg and Hussein Ahmed Fahim, *Nature, Lond.*, ii/1938, 293.

Diethylstilbœstrol has been found (1) partially to inhibit the response of the pigeon crop-gland to prolactin, (2) to inhibit lactation in the rat, and (3) to produce a temporary increase in the phosphatase content of cows' milk, accompanied by more prolonged increases in both fat and non-fatty solids content. In all these respects its action qualitatively resembles that of natural œstrogens.—S. J. Folley and H. M. S. Watson, *Lancet*, ii/1938, 423.

As active as any known œstrogen, and can be made cheaply. It seems likely to play an important part in therapeutics.—J. H. Gaddum, *Pharm. J.*, i/1939, 28.

In contrast to œstrone, stilbœstrol is only rendered inactive in the organism to a small extent, resembling, in this respect, the hormone esters. Similarly to the hormone esters, stilbœstrol remains deposited at the site of injection for a considerable time (depot formation) and from there it is slowly absorbed. Stilbœstrol is distinguished from the hormone esters by the fact that large amounts are eliminated in the excreta, particularly in the urine.—B. Zondek and F. Sulman, *Nature, Lond.*, ii/1939, 597.

Stilbœstrol, even when given by the mouth, has been shown to produce good results in all the conditions for which œstradiol and œstrone have proved their value, and it has been used with success to induce labour in cases of intra-uterine death of the fetus. The dosage laid down for œstradiol should form the basis of stilbœstrol therapy, but when administered by mouth it is advisable to give it more frequently and in slightly larger quantities. The same principles of treatment should be followed, and it is rarely necessary to give more than 5 mg. daily.—T. N. A. Jeffcoate, *Brit. med. J.*, ii/1939, 676.

LACTATION. Lactation was either prevented or inhibited in 20 women by the administration of stilbœstrol 5 to 15 mg. by mouth. In most cases 5 mg. was sufficient.—R. Wenner and K. Joel, *Lancet*, ii/1939, 688.

VULVOVAGINITIS. Of 25 cases of gonorrhoeal vulvovaginitis in children ranging from 20 months to 12 years, all were cured by the administration three times daily of a 1 mg. tablet crushed and dissolved in 2 ounces of milk, until a total of 12 tablets had been taken. The rapidity of cure, the absence of toxic or deleterious effects, and the ease of administration renders it an ideal drug for the treatment of vulvovaginitis.—J. D. Russ and C. G. Collins, *J. Amer. med. Ass.*, i/1940, 2446.

Implantation of Tablets. Subcutaneous implantation of hard pellets weighing about 100 mg. will give slow absorption with continuous mild oestrus effect. The material seems to be more effective per milligramme absorbed by implantation than by injection or mouth. These small "artificial ovaries" may be left in place for weeks or months, in cases of hypo-ovarianism, without any untoward local effects.—C. M. MacBryde, *J. Amer. med. Ass.*, i/1940, 686.

Toxic Effects. Headache and retching in two cases following administration of 1 mg. twice daily.—F. Sanders, *Brit. med. J.*, i/1939, 693.

Though less active than oestradiol benzoate parenterally, stilboestrol is more efficient than the natural oestrogens by mouth, though it is less active than ethinyl oestradiol by mouth. The oral oestrogenic unit for the human being lies between 2 and 4 mg. It is capable of relieving the subjective symptoms of the menopause. In a series of 44 cases treated, its use was associated in 35 with toxic symptoms, including nausea, vomiting, abdominal distress, anorexia, diarrhoea, lassitude, paraesthesia, vertigo, thirst, an acute psychotic reaction and cutaneous rashes. Until the nature of the side-effects of stilboestrol are understood, its use in the human being should be confined to experimental studies.—E. Shorr *et al.*, *J. Amer. med. Ass.*, ii/1939, 2312. (These conclusions as to toxic symptoms were not substantiated by C. L. Buxton and E. T. Engle, *ibid.*, 2318, or by C. M. MacBryde *et al.*, *ibid.*, 2320.)

The tumorigenic action of stilboestrol is much greater than that of the natural hormones (oestradiol and oestrone) when equal quantities are compared. The tumorigenic action of small doses is less than that of similar doses of esterified oestradiol, but with greater doses it equals that of similar doses of certain esters of oestradiol (monobenzoate and dipropionate). The guinea-pig uterus increases beyond the normal weight more rapidly with stilboestrol than with free natural hormones. Loss of blood from the genital tract in the guinea-pig treated with stilboestrol is commoner than with the natural hormones, but as common as with similar quantities of the esterified hormones. This is considered to be a sign of greater toxicity of stilboestrol as compared with the natural hormones.—A. Lipschütz and Luis Vargas, *Lancet*, i/1940, 541.

Stilboestrol Dipropionate.

$C_2H_5 \cdot COOC_6H_4(C_2H_5)C : C(C_2H_5)C_6H_4OOC \cdot C_2H_5 = 380.5$.

Dose.—1 to 5 mg. intramuscularly.

A colourless, crystalline substance obtained by the action of propionic anhydride on stilboestrol. M.p. 104° .

Uses. Used for parenteral therapy in preference to stilboestrol itself, since it is believed to liberate stilboestrol slowly, thus giving a prolonged action.

Esterification reduces the activity of diethylstilboestrol, but prolongs the effect. It would appear that the maximum prolongation without undue reduction resides in the dipropionate.—E. C. Dodds, L. Golberg, W. Lawson and R. Robinson, *Nature, Lond.*, ii/1938, 211.

Stilboestrol dipropionate and hexoestrol have oestrogenic properties similar to those of stilboestrol in so far as they are capable of the following actions: (1) inducing uterine haemorrhage in cases of amenorrhoea; (2) relieving the symptoms of the menopausal syndrome; (3) leading to the appearance of cornified cells in the vaginal smear in menopausal cases; (4) restoring the normal conditions of the vulva and vagina in senile atrophic vaginitis; (5) relieving the pain of dysmenorrhoea; (6) inhibiting lactation. Toxic effects, though not severe, developed in 21.6% of cases treated with stilboestrol dipropionate, and in 4.5% of cases treated with hexoestrol.—P. M. F. Bishop *et al.* (Clinical report to the Therapeutic Trials Committee of the M.R.C.), *Lancet*, i/1940, 630.

Climestrol (*Glaxo Laboratories, London*). Tablets containing 0.5, 1 or 5 mg. of stilbœstrol; ampoules containing 1 or 5 mg. of the dipropionate.

Neo-Estranol I (*Crookes Laboratories, London*). Tablets containing 1 or 5 mg. of stilbœstrol; ampoules containing 1 or 5 mg. of the dipropionate.

Ovodosyn (*Menley & James, London*). Tablets each containing stilbœstrol 0.5 mg., calcium phosphate 227 mg.

Pabestrol (*Paines & Byrne, London*). Stilbœstrol supplied in tablets containing 0.1, 0.5, 1 or 5 mg.; ampoules contain 1 or 5 mg. in solution. Pabestrol D is stilbœstrol dipropionate supplied in the same forms.

Stilbœstroform (*British Drug Houses, London*). Brand of diethylstilbœstrol available in ampoules containing 1 or 5 mg. per ml. of oily solution for intramuscular injection and in tablets of 0.5, 1 and 5 mg. for oral administration.

Syntestrin (*Richter, London*). Tablets containing 0.5, 1 or 5 mg. of stilbœstrol; ampoules containing 1 or 5 mg. of the dipropionate. Also supplied as an ointment containing 15 mg. of stilbœstrol per oz.

Hexœstrol. *Prop. Name.* SYNTHOVO (*Boots, Nottingham*). $\text{HO}\cdot\text{C}_6\text{H}_4(\text{C}_2\text{H}_5)\text{CH}\cdot\text{CH}(\text{C}_2\text{H}_5)\text{C}_6\text{H}_4\cdot\text{OH} = 270.3$.

Dose.—1 to 5 mg. *per os* three times daily or the same dose intramuscularly.

Hexœstrol is *p*:*p'*-dihydroxy-3:4-diphenyl-*n*-hexane, obtained by the hydrogenation of stilbœstrol in the presence of palladium, or from anethole. It is a white powder melting at 185°.

Soluble in alcohol.

Uses. Hexœstrol may be used in all conditions in which the natural or synthetic œstrogenic hormones have been employed, and in particular in the symptomatic treatment of the menopausal syndrome, in atrophic conditions of the vagina, for inducing uterine hæmorrhage in amenorrhœa, for the relief of pain in dysmenorrhœa, and for inhibiting lactation. It is slightly less active than stilbœstrol or stilbœstrol dipropionate when given by the mouth, but is more active by injection. It is stated, however, to be less toxic than either of these, and toxic symptoms are rare in dosage up to 2 mg.

Triphenylchlorethylene.

$(\text{C}_6\text{H}_5)_2\text{C}:\text{C}(\text{C}_6\text{H}_5)\text{Cl} = 290.8$.

A synthetic substance which simulates the action of œstrogenic hormones. It can be safely administered by mouth, by injection or by local application. It causes the same effects as the naturally occurring œstrogens—namely, uterine growth, proliferation of the endometrium, withdrawal bleeding, transition of menopausal to œstrous vaginal smear, relief of menopausal symptoms and inhibition of lactation.

Its action is not sudden or dramatic; it has no definite toxic effects and it can be administered in large doses or over a long period of time; under these conditions adequate dosage is easy to maintain and gives remarkable certainty of action. The duration of action by mouth closely approximates to that of stilbœstrol. By injection, however, the duration is singularly prolonged. The substance is prepared for oral use in tablet form, each tablet containing 200 mg., in ampoules containing 250 mg. dissolved in 5 ml. of sesame oil, for injection, and in vaginal suppositories containing 100 mg. Tablets are given after meals and as many as 9 a day may be given. Two injections are given a week apart to begin with, followed by a third injection three weeks after the second and subsequent injections at intervals of three or four weeks. The suppositories are used

nightly for the first 14 days, and then on every second or third night.—A. I. S. Macpherson and E. M. Robertson, *Lancet*, ii/1939, 1362.

Progesterone. *Syn.* HORMONUM LUTEALE (*Fr. Cx.*), PROGESTIN, PREGNENEDIONE. $C_{21}H_{30}O_2 = 314.45$.

Dose.—1 to 10 mg. (1 to 10 i.u.) daily by intramuscular injection.

Progesterone, pregnene-3,20-dione, is the hormone of the corpus luteum. It can exist in two isomeric forms, α -progesterone which forms rhombic crystals melting at 128° and β -progesterone which forms mono-clinic needles melting at about 121° .

Progesterone is usually obtained artificially from stigmasterol, a sterol found in soya beans, by chemical degradation, since the supply of corpora lutea is strictly limited. It is excreted in the urine of pregnant women in the inactive form of pregnanediol.

Very **soluble** in alcohol, ether and chloroform, slightly soluble in light petroleum.

Progesterone is standardised biologically according to its effect in causing proliferation of the lining membrane of the uterus in immature rabbits previously sensitised by injections of oestrone. The *international unit* is defined as the amount of progestational activity present in 1 mg. of the standard sample of progesterone.

Uses. Progesterone is the hormone which is responsible for transforming the endometrium from the proliferative phase to the pre-gravid phase essential to prepare the uterus for the reception of the fertilised ovum, and it plays an important role in the formation of the placenta and the nutrition of the embryo. It is also stated to inhibit the contractility of the uterus and to be responsible for the further development of the breasts initiated by the follicular hormone. Progesterone only acts on tissues which have been previously subjected to the action of the follicular hormone. Preparations of progesterone are administered by intramuscular injection in the form of an oily solution. Orally, they are without effect.

The principal application of progesterone is in threatened and habitual abortion. In the former, intensive treatment of 5 to 10 mg. daily is advisable until all threatening symptoms have abated;

Pregneninolone. *Syn.* PREGNENINONOL, ANHYDRO-HYDROXY-PROGESTERONE, ETHINYL TESTOSTERONE. $C_{21}H_{28}O_2 = 312.4$.

Dose.—10 to 60 mg. by the mouth.

A white, crystalline substance melting at 269° to 272° .

Insoluble in water, but soluble in dioxane.

A modification of progesterone synthesised by Inhoffen and Hohlweg, and possessing marked progestational activity when administered by the mouth, the effective dose being six times the effective dose of progesterone given by intramuscular injection.

It has been successfully employed in amenorrhœa, dysmenorrhœa, menorrhagia, metropathia hæmorrhagica, and in threatened and habitual abortion.

In normally menstruating women, uterine hæmorrhage has been induced during the intermenstrual stage by giving pregneninolone *per os* in the postmenstruum. In secondary amenorrhœa, hæmorrhage has been induced by oral administration of pregneninolone without preliminary treatment with oestrogenic hormone. The effective dose of pregneninolone given by mouth is about six times greater than the effective dose of progesterone given by intramuscular injection.—B. Zondek and S. Rozin, *Lancet*, 1/1939, 504; see also *ibid*, 519.

Lutocyclin Oral (*Ciba, Horsham*). Tablets each containing 5 mg. of pregneninolone.

Lutogyl Tablets (*Roussel Laboratories, London*). Each tablet contains 5 mg. of pregneninolone.

Proluton C (*Schering, London*). Dragées each containing 5 or 10 mg. of pregneninolone.

Progestoral (*Organon Laboratories, London*). Tablets each containing 5 or 10 mg. of pregneninolone.

PROPRIETARY OVARIAN GLAND PRODUCTS

Agomensin (*Ciba, Horsham*). Water-soluble ovarian substance. *Dose.*—1 to 3 tablets three times a day or 1 to 4 ampoules, subcutaneously or intramuscularly, 2 or 3 times a week. In functional amenorrhœa.

[P1] **Climatone** (*Paines & Byrne, London*). Tablets containing the full hormone complement of ovary whole gland, with theobromine-calcium, calcium lactate, nitroglycerin and menthyl valerianate. *Dose.*—1 or 2 three times daily before meals for 4 weeks, repeated after an interval of one week. Menopausal hypertension, flushing, etc.

Crinex (*Continental Laboratories, London*). Standardised ovarian extract. Supplied as ampoules, tablets and drops.

Glanduovin (*Richter, London*). Extract of whole ovarian gland. In ampoules of two strengths for intramuscular or subcutaneous administration.

Gynocalcion M (*Anglo-French Drug Co., London*). A combination of calcium acetate, with manganese, phosphorus, and ovarian and orchitic extracts, in the form of dragées. *Dose*.—12 to 16 dragées daily for two periods of 10 days a month separated by an interval of 8 days. In menopausal disorders.

Hormofort Ovarian (*Richter, London*). Ovarian gland $1\frac{1}{2}$ gr., ovarian follicular hormone 100 i.u. *Dose*.—3 tablets daily.

Lipamensin (*Paines & Byrne, London*). Fractionated extract of ovarian residue. Tablets or ampoules.

[P1-87] **Matronax** (*Knoll, London*). Ovarian substance $\frac{1}{2}$ gr., Thyraden $\frac{1}{10}$ gr., Bromural $2\frac{1}{2}$ gr., calcium diuretin $2\frac{1}{2}$ gr. For menopausal disorders.

[P1-87] **Menocrin Tablets** (*Endocrines-Spicer, Watford*). Tablets containing whole ovary with follicular fluid, thyroid, total pituitary, magnesium phosphate, calcium phosphate (dibasic) and glycerophosphate, potassium and sodium bicarbonates. Also supplied in ampoules for injection.

Ovacliman (*Richter, London*). Bromised ovary (80% ovary, 20% bromine) 0.05 g., theobromine 0.05 g., calcium lactate 0.2 g., benzyl succinate 0.03 g. *Dose*.—1 or 2 tablets thrice daily.

[P1-87] **Ovacoids** (*Reed & Carnrick, Jersey City; Coates & Cooper, London*). Fresh ovary 5 gr., fresh anterior pituitary $\frac{1}{2}$ gr. *Dose*.—2 tablets thrice daily.

Ovamammoid Compound Capsules (*British Organotherapy Co., London*). contain 1 gr. each of ovarian extract and mammary gland extract. *Dose*.—1 thrice daily $\frac{1}{2}$ hour before meals and one at bedtime.

Ovobrol (*Roche Products, Welwyn Garden City*). Ovarian-bromide preparation in the form of soup cubes, each corresponding to 1 g. of fresh gland and 1 Sedobrol cube (= 17 gr. of sodium bromide).

[P1-87] **Panatoe** (*Paines & Byrne, London*). Tablets contain ovary (w.g.) $\frac{1}{2}$ gr., testis $\frac{1}{2}$ gr., thyroid $\frac{1}{10}$ gr., pituitary (w.g.) $\frac{1}{10}$ gr., suprarenal (w.g.) $\frac{1}{10}$ gr. *Dose*.—1 to 4 tablets thrice daily. Also supplied as elixir.

[P1-87] **Polyglandin** (*Allen & Hanburys, London*). 5-gr. capsules each containing fresh mixed glands, pituitary $\frac{1}{2}$ gr., thyroid $\frac{1}{2}$ gr., ovary $2\frac{1}{2}$ gr., testes $2\frac{1}{2}$ gr. *Dose*.—1 or 2 capsules two or three times daily. Also available as an elixir and as a solution for injection.

Prokliman (*Ciba, Horsham*). Tablets containing ovarian hormones 0.02 g., Peristaltin 0.015 g., caffeine sodium salicylate 0.05 g., Kryofine 0.2 g. For the treatment of all forms of climacteric disturbances. Kryofine is described as methoxyacet-*p*-phenetidin, a non-toxic phenacetin derivative with antipyretic and antineuralgic properties.

[P1-87] **Thyrovarian Compound Tablets** (*Parke, Davis, London*). Desiccated ovarian substance 3 gr., desiccated suprarenal gland 1 gr., desiccated thyroid gland $\frac{1}{2}$ gr. *Dose*.—1 tablet twice daily.

Varium (*Burroughs Wellcome, London*) is a brand of ovarian substance in 5-gr. tablets.

The Bi-sexual Properties of the Sex Hormones.

Although the terms "male" and "female" sex hormones are still retained as a legacy of the early work on these substances, recent researches have shown that there is no justification for differentiation such as these terms would imply. It is now known, in fact, that all oestrogens have some androgenic activity and all androgens have some oestrogenic activity; in other words, with few exceptions, bi-sexual property must be considered the common attribute of nearly all the sex hormones. A great deal of work has been conducted on this subject, mostly by Korenchevsky and his associates, and these workers have suggested the following new classification (*Brit. med. J.*, ii/1937, 896) in place of the old classification of "male" and "female" hormones: (i) *Purely male*

or female hormones. So far as is shown by rat experiments, progesterone is the only member of this group, and may be defined as a pure female hormone. (ii) *Partially bi-sexual hormones*:—(a) *Hormones with chiefly male characters*: androsterone, testosterone propionate, androstenediol, and probably Δ^4 -androstenedione. (b) *Hormones with chiefly female properties*: oestrone and oestradiol belong to this group. (iii) *True bi-sexual hormones*: to this group seem to belong *trans*dehydroandrosterone, testosterone and Δ^4 -androstenediol, since in prolonged experiments they bring about a return to or towards the normal of all the atrophied sexual organs to approximately the same degree in males and females. Broadly speaking it may be said in respect of this last group that the male benefits by direct action as a result of androgen therapy, and the female benefits indirectly by a counteracting effect on ovarian hyperfunction. While successful results have been reported by numerous workers in the conditions referred to, the methods would appear to be somewhat unreliable, and there is the possibility that the administration of large doses of androgens to females may give rise to unpleasant masculinising side-effects.

The matter is further complicated by the fact that certain of the sex hormones exert a co-operative action when given in the form of combined injections, while in other cases there may be antagonistic action. Thus, as an example of co-operative action, it has been shown that the simultaneous administration of androsterone and oestrone to rats causes a greater increase in the weight of the prostate and seminal vesicles than is caused by androsterone alone; and, as an example of antagonistic action, it is found that when castrated mice are maintained in continuous oestrus by daily injections of oestrone the simultaneous administration of testosterone propionate inhibits oestrus. It is obvious that the complex inter-relationships of the sex hormones are at present but inadequately appreciated, and it is probable that their therapeutic applications will be subject to continuous modification for some time to come.

In female rats testosterone suppresses the appearance of normal oestrus and causes an increase in the size of uterus, vagina and preputial glands, the histological changes produced being reminiscent of those seen in pregnancy. With few exceptions, bi-sexual activity, though weak in some hormones, must be considered to be one of the common properties of nearly all the sexual hormones.—V. Korenchevsky, M. Dennison and K. Hall, *Biochem. J.*, 1937, 780.

A comparison of the efficiency of various preparations of androgens given by different routes in maintaining sexual function in a male post-puberal eunuch. The minimum effective dose of testosterone propionate given by subcutaneous injection was 40 mg. per week; to obtain an equivalent effect it was found necessary to give 2 to 3 times this dose rubbed in as ointment, 6 times the dose rubbed in as tincture, or 20 times the dose by mouth. Progesterone was found to prolong the action of testosterone propionate when given in conjunction with it.—G. L. Foss, *Lancet*, i/1939, 502.

OTOSCLEROSIS. Sex hormones have been administered with beneficial results in otosclerosis. Of 18 males treated 7 were improved and 11 not improved, and of 38 females 24 were improved and 14 not improved. The males generally showed most improvement following the use of the female hormones (oestrone, stilboestrol, etc.), and the females following the use of male hormones (e.g., Perandren—the propionic ester of synthetic androsterone). There is some

intimate connection between the gonadal internal secretions and otosclerosis—it may be that there is an imbalance between the male and female hormones, which can be rectified by administration of the deficient hormone.—J. Bernstein and L. Gillis, *Lancet*, ii/1939, 1368.

ANDROGENS

The essential action of the hormones of this group, which consists of testosterone and its derivatives, is the promotion of the growth and the maintenance of the size and function of the accessory sexual organs in the male. The first crystalline androgens isolated were androsterone and dehydroandrosterone, which were crystallised from male urine. Soon after they were produced by the synthetic degradation of cholesterol, and considered to be the active testicular secretion although their potency in producing comb-growth in the capon and enlargement of the seminal vesicles and external genitalia of the castrated rat proved to be very low. Subsequently, however, another androgenic substance, testosterone, was separated from bull testis-tissue, and soon after it was prepared artificially from cholesterol and established as the natural hormone of the testes. Androsterone is now considered to be an excretion product of testosterone, and dehydroandrosterone an intermediary product of the synthesis of testosterone within the body. To date, six naturally occurring androgens have been isolated, four of them from human urine, and some sixty androgenic substances have been prepared artificially. Study of the formulæ of androgens, all of which are derivatives of androstane, reveals that the critical points in their formulæ are represented by the carbon atoms 3 and 17, and by the position of the unsaturated linkage.

Esters. When testosterone was isolated from the testes by E. Laquens and his collaborators, they pointed out that there was present in testis-tissue an "X" substance which was itself inactive, but had the power of increasing the effectiveness of testosterone. Investigation of this substance suggested that it was not a hormone, but a mixture of fatty acids including palmitic acid, which was found to be present in testis-tissue, and it was shown that an even greater effect could be produced by the esterification of testosterone. Numerous esters were prepared and tested by their actions on the rat prostate and seminal vesicles, and on the capon comb. Of these, testosterone propionate was found to have a particularly favourable effect both in intensity and duration of action.

Standardisation. Two methods of standardisation of androgenic activity are in common use, each of them depending on the counteraction of castration effects by the administration of the substance to be tested. The capon-comb test depends upon the increase in size of the capon's comb which the substance causes, and the seminal vesicle test upon the growth of the seminal vesicles and prostate of young castrated rats. In both tests the effects produced are compared with those of the international

standard preparation of androsterone. The international unit of male hormone activity is defined as the activity of 0.1 mg. of the international standard preparation of androsterone, as measured by a specific biological reaction. It was agreed that all comparisons should be made by the capon-comb method which, although it does not reveal the effects of esterification of testosterone, gives a more exact response weight by weight for androgens, and seems to be a better medium than the seminal vesicle test for a purely quantitative test of total activity.

Comparisons of activity of the androgens. On the basis of the effects produced on the seminal vesicles and prostate, Korenchevsky and Dennison (*Biochem. J.*, 1936, **30**, 1514) found one rat unit of male hormone activity to be present in 8 gamma of testosterone, 21 gamma of androstanediol, 170 gamma of androsterone and 940 gamma of dehydroandrosterone, and they also found that in addition to its greater activity testosterone, unlike androsterone, appears to bring about a qualitatively normal development of the male sex organs. These findings are not surprising when it is recalled that testosterone is the actual male sex hormone present in testicular tissue, whereas the other androgens are merely excretion products occurring in male urine.

Subsequently it was found that an even greater effect could be produced by the esterification of testosterone, the increase in the weight of the seminal vesicles of the rat following a single injection of testosterone propionate amounting to 12 times that produced by the same amount of free testosterone. By reason, therefore, of its greater activity and more prolonged action, testosterone propionate is the androgen most frequently employed in clinical practice.

Testosterone. $C_{19}H_{28}O_2 = 288.41$.

Testosterone, Δ^4 -androstene-17-*trans*-ol-3-one, the true testicular hormone, is a crystalline substance melting at 154° . It is

obtained from testicular tissue and, artificially, by chemical degradation of the cholesterol molecule.

Insoluble in water but soluble in organic solvents.

Testosterone has been successfully employed by inunction in the treatment of hypogonadism, but it is now more usual to employ the propionate owing to its greater activity.

Testosterone or testosterone propionate applied on the skin as an ointment is readily absorbed and either maintains the accessory reproductive organs of castrate males in a normal reproductive state or stimulates their development precociously in the young or decidedly above the normal level in adults. These androgens, so administered, exert effects similar to those following subcutaneous injections.—C. R. Moore *et al.*, *J. Amer. med. Ass.*, ii/1938, 11.

In castrated patients and in those with hypogonadism due to cryptorchidism the administration of testosterone brings about an effective substitution. Beneficial results have been obtained through the intramuscular injection of testosterone propionate and equally good results through the inunction method with free testosterone in a greaseless base.—W. M. Kearns, *J. Amer. med. Ass.*, i/1939, 2255.

Testosterone Propionate. $C_{19}H_{27}O_2 \cdot CO \cdot C_2H_5 = 344.5$.

Dose.—5 to 25 mg. daily by intramuscular injection or by inunction.

Testosterone propionate is the ester of testosterone and propionic acid. It is a crystalline substance melting at 123° and soluble in oils.

Uses. The androgens are chiefly employed in males as substitution therapy whenever the organism is incapable of secreting an adequate amount of the testicular hormone, and they are responsible for the development of the male secondary sex characters. Their employment is therefore indicated in conditions resulting from the arrest or retardation of puberty, as in eunuchoidism and hypogonadism, in impotence especially when associated with endocrine insufficiency, in cryptorchidism, in surgical castration and in prostatic hypertrophy. In all cases it should be borne in mind that androgen therapy is pure substitution therapy and that to obtain a permanent result a maintenance dose will be required.

The androgens may also be employed in the treatment of certain conditions in the female such as menorrhagia, dysmenorrhœa, mastodynia and chronic mastitis.

Owing to its much greater activity, testosterone propionate is now employed almost to the exclusion of the other androgens. It is usually given by intramuscular injection in oil, in a dose of from 10 to 25 mg. daily or every other day, and in a dose of 5 mg. every other day in females. It is also effective when employed by percutaneous administration in the form of ointment. According to Foss (*Lancet*, ii/1939, 502), a comparison of the efficacy of testosterone propionate by various routes shows that, as compared with subcutaneous injection, the dose by inunction of ointment must be two to three times as great, by inunction of solution in spirit six times as great, and by mouth twenty times as great. More recently it has been successfully employed by the subcutaneous implantation of tablets, the amounts implanted varying from 300 to 1600 mg. Testosterone propionate should not be given in high doses in the presence of hypertension.

The effects of testosterone on castrated rats are increased by the addition of fatty acids, the increase being very great with normal saturated acids having sixteen C atoms. The testosterone esters most effective in promoting growth of

the capon's comb are those of the lower fatty acids. In rats maximum intensity and duration is obtained, among the lower fatty acids, with the esters of propionic acid.—K. Miescher, A. Wettstein and E. Tschopp, *Biochem. J.*, 1936, 1970.

The administration of 25 mg. of testosterone propionate twice weekly to normal mature female rhesus monkeys stopped the menstrual cycle during the period of injections. The internal reproductive organs are not injured by the treatment. Follicular growth and luteinisation are both inhibited. It is suggested that testosterone propionate may be of clinical value for the induction of temporary sterility and the control of uterine bleeding.—S. Zuckerman, *Lancet*, ii/1937, 676.

Antitumorigenic action. When the monobenzoate ester of cestradiol was given to castrated guinea-pigs simultaneously with testosterone propionate, up to the proportion of 1 : 13, uterine and extra-uterine fibroids developed in the usual manner, as with similar quantities of the ester of cestradiol alone. When the proportion of cestradiol to testosterone was raised to 1 : 22 or more, no fibroids of appreciable size developed.—A. Lipschütz, L. Vargas and O. Ruz, *Lancet*, ii/1939, 867.

EUNUCHOIDISM. Percutaneous application in a fatty vehicle effective in the treatment of eunuchoidism, though a larger dose is required than when the hormone is given by injection. An ointment containing 25 mg. of testosterone propionate per gramme in a 2 gramme collapsible tube is recommended for practical use.—G. L. Foss, *Lancet*, ii/1938, 1284.

INHIBITION OF LACTATION. Excellent results in 19 out of 21 cases from deep intramuscular injection of 25 mg. twice daily for one or more days. Complete relief of all symptoms was usually obtained within a few hours after the second dose (eight hours after the first dose). There was no tendency to recurrence of symptoms after injections were stopped and there were no unpleasant side effects.—R. Kurzrok and C. P. O'Connell, *Endocrinology*, 1938, 23, 478.

Favourable results in 49 out of 56 patients. The results were uniformly good with a total dosage of 125 or 150 mg. given in divided doses of 25 to 50 mg. intramuscularly at 12 hour intervals. Lactation, engorgement and pains in the breasts did not recur after treatment was stopped. Single doses of 100 and 125 mg. were generally ineffective regardless of the time of administration.—C. H. Birnberg, *Amer. J. Obstet. Gynec.*, 1940, 107.

50 patients treated with total doses varying from 25 to 125 mg. in three or four divided doses every 12 hours with successful results in 47. As little as 10 mg. doses appeared to be as effective as larger doses.—S. L. Siegler and L. M. Silverstein, *ibid*, 109.

MASTITIS. Mammary pain was relieved in every one of 8 patients with chronic mastitis by the daily inunction of the breast with an ointment of testosterone propionate containing 3 to 10 mg. of active substance. No undesirable side-effects were observed.—A. W. Spence, *Lancet*, ii/1940, 387.

Androgens can alleviate the symptoms of most cases of chronic mastitis, but the beneficial effect is not permanent, and undesirable effects may rob the treatment of its value. In one case carcinoma of the breast developed ten months after a course of testosterone propionate injections. The histological changes produced by androgens up to the limit of tolerance are insignificant.—H. J. B. Atkins, *Lancet*, ii/1940, 412.

MENTAL DISORDERS. Four cases of severe mental disorder in men successfully treated with testosterone propionate (Testoviron) or androsterone benzoate (Proviron).—A. Guirham, *Brit. med. J.*, i/1940, 10.

METRRORRHAGIA and menorrhagia can as a rule be controlled by injection of testosterone propionate in adequate doses. The amounts required depend on the clinical findings and the pathology of the condition. A temporary therapeutic menopause with its associated symptoms can be induced with large doses. Menstruation may be postponed for several months after treatment; ovulation and luteinisation can be inhibited, and the endometrium is usually found to be in the resting stage. The breasts become smaller. No harmful effect has been noticed in 16 patients treated during 9 months, with total doses up to 2200 mg.—G. L. Foss, *Lancet*, i/1938, 992.

Male hormone was implanted subcutaneously to control serious menorrhagia caused by fibroids. Good results were obtained in the case of women near the menopause. The dose employed varied from 300 to 1600 mg. in tablets, each containing 50 mg. All the patients experienced an increased sexual drive and a great feeling of general well-being.—A. A. Loeser, *Brit. med. J.*, i/1940, 481.

PROSTATIC HYPERTROPHY. Twenty-seven out of 34 cases of prostatic hypertrophy treated with testosterone propionate in oily solution responded well—frequency of micturition decreased, emission of urine was easier, and urgency and the burning sensation disappeared. Decrease of vesical residuum was obtained in some patients suffering from partial retention, and in some the symptom completely disappeared. One notable effect was the reduction in blood pressure. No definite decrease in the volume of the prostate was noted, although the swelling was arrested. The dosage used was 5 to 10 mg. (250 i.u.) daily by intramuscular injection, or 20 mg. every four days. On an average, some diminution of symptoms was obtained in 10 to 12 days; a decided improvement must be recorded before cessation of the injections, and they may then be suspended until recurrence is noted—an average of from three to six months, or even one year.—A. Aberholtzer, *Brit. J. Urol.*, 1938, 10, 237.

Methyl Testosterone. Methyl testosterone is very efficacious by mouth, being about twice as active as testosterone by this route. Potency was fully maintained in a eunuch with 100 mg. daily and a lower dosage of 50 mg. is effective. All the signs of puberty can be rapidly produced in cases of genital hypoplasia affecting not only sexual but physical development, and for such patients it is probable that much smaller doses would be adequate. Oral therapy with this androgen may ultimately replace all other methods of using testosterone or its propionate.—G. L. Foss, *Brit. med. J.*, ii/1939, 11.

Neo-Hombreol (*Organon Laboratories, London*). 1 ml. ampoules of testosterone propionate in oil containing 5, 10 or 25 mg. Also available as an ointment containing 2 or 25 mg. per g.

Perandren (*Ciba, Horsham*). 1 ml. ampoules of testosterone propionate containing 5, 10 or 25 mg. Also available as an ointment containing 2 mg. per g.

Sterandryl (*Roussel Laboratories, London*). 1 ml. ampoules of testosterone propionate in oil containing 5, 10 or 25 mg. **Ecto-Sterandryl** is a solution of testosterone in oleic alcohol containing 50 mg. per 10 ml. For percutaneous administration.

Testoviron (*Schering, London*). 1 ml. ampoules of testosterone propionate in oil containing 5, 10 or 25 mg. Also supplied as an ointment containing 10 mg. of testosterone per g.

Virormone (*Paines & Byrne, London*). 1 ml. ampoules of testosterone in oil containing 2 or 5 mg.

Androsterone. $C_{19}H_{30}O_2 = 290.4$.

Androsterone, androstane-3-*cis*-ol-17-one, is an excretion product of testosterone obtained from male urine and, artificially, by chemical degradation of the cholesterol molecule. It is a crystalline substance melting at 178° .

Insoluble in water but soluble in organic solvents and oils.

Androsterone.

Dehydroandrosterone.

Dehydroandrosterone. *Syn.* TRANSDEHYDROANDROSTERONE. $C_{19}H_{28}O_2 = 288.4$.

Dehydroandrosterone, Δ^4 -androsterene-3-*trans*-ol-17-one, is a

crystalline substance obtained from male urine and, artificially, by the chemical degradation of the cholesterol molecule. It melts at 148° and is soluble in oil.

Androfort (*Richter, London*). A preparation for intramuscular injection containing 2 i.u. androsterone per ml. in oily solution. For sexual debility, impotence, prostatic enlargement.

Hombreol (*Organon Laboratories, London*). 1 ml. ampoules containing 4 or 20 i.u. of androsterone.

Proviron (*Schering, London*). 1 ml. ampoules containing 5 mg. of androsterone benzoate in oil solution for intramuscular injection.

PROPRIETARY MALE GLAND PRODUCTS.

Androstin (*Ciba, Horsham*). Ampoules A and B containing respectively the hydrosoluble and liposoluble principles of the gland. One ampoule A and one ampoule B together represent 16 g. of fresh gland. Tablets are also available equivalent to 8 g. of fresh gland.

Erugon (*Bayer Products, London*). Whole testicular extract in oily solution for intramuscular injection. Each ampoule contains 2 cock's comb growth units. Also available in pellets containing $\frac{1}{2}$ unit.

Gynofort (*Richter, London*). Tablets containing testis 0.2 g. and seminal vesicle 0.02 g. *Dose*.—1 to 3 tablets thrice daily. In frigidity.

[P1-S1-S7] **Homovir** (*Anglo-French Drug Co., London*). Tablets containing thyroid 0.005 g., suprarenal 0.016 g., pituitary (whole) 0.03 g., prostate 0.03 g., orchis 0.06 g., yohimbine 0.002 g. Also available in ampoules for injection.

[P1-S1] **Orkitone** (*Anglo-French Drug Co., London*). An elixir containing fresh orchitic gland 21.25 g., nucleinic acid 0.326 g., disodium methylarsenate 0.05 g., sodium glycerophosphate 50% 0.5 g., saccharated hydro-alcoholic solution to 100 g. *Dose*.—1 tablespoonful thrice daily.

[P1-S1] **Prostatin** (*Paines & Byrne, London*). Prostate, testis, and cerebrin, of each 15 gr. of fresh gland, yohimbine hydrochloride $\frac{1}{8}$ gr., in ampoules of 1 ml.

[P1-S1] **Protestin** (*Richter, London*). Brain, prostate, testis and yohimbine. Tablets and ampoules.

Testacoids (*Reed & Carnrick, Jersey City; Coates & Cooper, London*). Tablets representing fresh testicle 25 gr., fresh prostate 5 gr. *Dose*.—3 tablets thrice daily. Male hypofunction.

Testanon (*Organon Laboratories, London*). Dried total testes in tablets.

[P1-S7] **Thyorchic Compound Tablets** (*Parke, Davis, London*). Desiccated orchitic substance 3 gr., desiccated suprarenal gland 1 gr., and desiccated thyroid gland $\frac{1}{2}$ gr. *Dose*.—1 tablet before meals.

[P1] **Tonicine** (*Reed & Carnrick, Jersey City; Coates & Cooper, London*). Liquid gonadal tonic. 1 dr. = fresh testicle 25 gr., strychnine sulphate $\frac{1}{100}$ gr., sodium glycerophosphate 1 gr.

OLEA ESSENTIALIA

Taken internally, the volatile oils exert a mild irritant action on the mucous membrane of the mouth and the digestive tract, which induces a feeling of warmth and increases salivation, and for this purpose they are included in stomachic mixtures to stimulate appetite and aid digestion. During excretion they stimulate the secretions of the bronchial glands and act as mild expectorants. The irritant action also causes some acceleration of respiration, stimulation of the heart's action and a transient rise of blood pressure, and they are therefore employed as reflex restoratives in syncope, though usually in conjunction with more potent

irritants, *e.g.*, aromatic spirit of ammonia. Taken after meals they are carminative and are employed for the relief of gastric discomfort and of flatulent colic, as also to counteract the griping tendencies of purgatives.

All the volatile oils are antiseptics, and when taken internally they check the growth of fermentative organisms in the stomach; their antiseptic properties are also made use of in the preparation of tooth pastes and powders, their stimulant and rubefacient action on the gums being a further advantage in this connection. Owing to their irritation of the renal epithelium, many of the volatile oils promote diuresis, and after excretion they act as urinary antiseptics, *e.g.*, oil of sandalwood and oil of copaiba.

When applied to the intact skin they have an irritant and rubefacient action, causing first a sensation of warmth and smarting, which is later replaced by a mild local anæsthesia. For this reason they are much used as counter-irritants and cutaneous stimulants in the treatment of chronic inflammatory conditions, to relieve neuralgia and rheumatic pains, and for application to the chest wall in bronchitis, pleurisy, etc.

When inhaled they arrest profuse secretion and relieve congestion of the bronchioles, and they may be employed for this purpose, and for their mild antiseptic action, in conditions such as chronic bronchitis.

Notes on essential oils and their preparations not included in the following group are given under the drugs from which they are manufactured (*see* Index).

Solutions of essential oils containing no alcohol may be made by the use of soaps, the solutions remaining transparent on dilution with water to any extent. As an example, oil of citronella 25 ml., is mixed with strong solution of ammonia 8.5 ml., and ammonium "ricinoleosulphate" soap solution added to produce 100 ml., care being taken that no globule of oil escapes the action of the soap. The solution of ammonium ricinoleo-sulphate is made by the action of sulphuric acid on castor oil below 30° and, after purification, it is diluted so as to contain 50% of solids. A table of essential oils, auxiliary and soaps is given.—A. Albert, *J. Soc. chem. Ind., Lond.*, 1939, 58, 196.

Oleum Bergamottæ (B.P.C., *Fr. Cx.*, *P. Jap. V*). *Syn.* ESSENCE OF BERGAMOT. Expressed from the fresh peel of the fruit of *Citrus Aurantium* subsp. *bergamia*, and largely employed in perfumery, especially in preparations for the hair.

Spiritus Coloniensis (B.P.C.). *Syn.* AQUA COLONIENSIS. A form of eau de Cologne containing oil of bergamot for use in hair lotions, etc.

Eau de Cologne (*Fr. Cx.*). *Syn.* TEINTURE D'ESSENCE CITRON COMPOSÉE. One litre contains oils of bergamot, orange and lemon 10 g., oils of orange-flower and rosemary 2 g., in alcohol 90%.

Oleum Cajuputi (B.P., *P. Helv. V*).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Distilled from the fresh leaves and twigs of *Melaleuca Leucadendron* and other species of *Melaleuca* (Myrtaceæ) and redistilled in steam. Contains 50 to 65% of cineole, $C_{10}H_{18}O$.

It has the typical actions of a volatile oil, and is employed internally as a carminative, and externally as a counter-irritant in rheumatism.

Spiritus Cajuputi (B.P.).

Dose.—5 to 30 minims (0.3 to 2 ml.). 1 in 10.

Leucadol. A redistilled oil of cajuput boiling below 235°, fractionated from the high-boiling constituents. A yellow liquid, sp. gr. 0.922, cineole content 78%. Has been employed in chest affections by injecting into the bronchi. It is miscible with iodised oil in all proportions, with which it has been used for diagnosis. Mix with olive oil up to 5% for oleothorax, or weaker for intratracheal injection.

Oleum Cedri (B.P.C.). *Syn.* OIL OF RED CEDAR, CEDRI LIGNI OLEUM. Chiefly from *Juniperus virginiana* (Pinaceæ), also from chip shavings and sawdust of pencil cedar (*J. americana* and *J. bermudiana*). It yields a stearoptene, cedrene camphor (cedrol), $C_{15}H_{26}O$, and the sesquiterpene cedrene, $C_{15}H_{24}$, the odour of which is distinct and stronger than the camphor, and taste finally peppery. Oil largely used in perfumery, also, in a thickened form by concentration *in vacuo* and admixture with other substances, in microscopical work with oil immersion lenses. It has also been used internally in the treatment of gonorrhœa, but is of doubtful value.

The oil from *Cedrus atlantica*, *Syn.* LIBANOL, has been given in 8-m. capsules, in doses of up to 6 per diem, in phthisis, bronchitis and skin affections. A 25% ointment in soft paraffin has also been used in skin affections.

Urocedrol (Anglo-French Drug Co., London). Essential oil of *Cedrus atlantica*, with hexamine camphorate and salol. *Dose.*—6 to 10 capsules daily. Gonorrhœa, cystitis, pyelitis, etc.

Oleum Citronellæ (B.P.C., P. Helv. V). Obtained from *Cymbopogon Nardus*. Ceylon oil contains not more than 10% of citronellal; Java oil (including oil from Burma and the Straits Settlements) contains from 30 to 40%. Used as a perfume for soap and as an insect repellent.

The old "Bamber Oil" used in India has now been replaced in the Army by an anti-mosquito cream with the following formula: oil of citronella 18.25%, camphor 1%, cedarwood oil 1%, hard paraffin 17.25%, soft white paraffin 45%. Applied to hands, face, neck and ears it will keep off mosquitoes for 6 hours, and is an excellent protection against sandflies. It is now used in India, Egypt and Palestine.—J. A. Manifold, *Trans. R. Soc. trop. Med. Hyg.*, 1939, 33, 298.

Oleum Eucalypti (B.P., U.S.P. XI, Fr. Cx., P. Helv. V).

Dose.—1 to 3 minims (0.06 to 0.2 ml.) on sugar, emulsified, or mixed with olive oil. U.S.P. XI average dose 8 minims.

Eucalyptus oil is distilled from the leaves of numerous species of *Eucalyptus*. The oils which contain a large percentage of eucalyptol and little phellandrene are used chiefly for pharmaceutical purposes. The most important species now being distilled for oils of this class are *E. polybractea* and *E. dumosa*. Unmixed oil of *E. globulus* is no longer an article of commerce. As the yield of oil varies greatly with the several species this is a controlling factor. The rectified oils of *E. polybractea* and *E. Australiana* are water white; some oils are tinged slightly yellow when freshly distilled. The oil from *E. citriodora* has an odour resembling that of lemon-grass.

Soluble in oils, fats, paraffins, about 3 in 1 of alcohol 90%, in about 3 to 5 vols. of alcohol 70% and in all proportions in absolute alcohol.

Toxic Effects. Poisoning effects from 1 to 6 drachms are recorded. Effects were gastro-intestinal irritation and cerebral paresis with vomiting and diarrhoea. Treatment by external stimulation, as on the lines of opium poisoning.

Eucalyptus and castor oil taken in error for plain castor oil. Three doses of camphor given hypodermically. Recovery.—L. M. Chesney, *Lancet*, i/1926, 131.

Poisoning caused by about $\frac{1}{2}$ oz. Cyanosis. Strychnine $\frac{1}{10}$ gr. hypodermically and mustard 2 dr. by the mouth: after vomiting, stomach lavage.—P. Gibbin, *Brit. med. J.*, i/1927, 1005. See also *ibid.*, 1133, and A. Neale, *Brit. med. J.*, ii/1927, 520.

Uses. Antiseptic and deodorant. Oily spray solutions and ointments for use in catarrh are prepared with eucalyptus, pine oils and other ingredients such as menthol and camphor. It is also used for colds as a steam inhalation and given internally on sugar. Useful mixed with an equal quantity of olive oil as a rubefacient for rheumatism, and as an ointment for the treatment of burns.

Nebula Eucalypti (B.P.C.). Oil of eucalyptus 5% v/v in light liquid paraffin.

Nebula Eucalypti Composita.

Form A. Eucalyptus oil 5 m., cinnamon oil 2 m., menthol 12 gr., liquid paraffin containing 2% thymol iodide to 1 oz.

Form B. Eucalyptus oil 5 m., methyl salicylate 5 m., menthol 5 gr., liquid paraffin to 1 ounce for a common cold.

Pigmentum Olei Eucalypti et Acidi Salicylici.

Eucalyptus oil 8, salicylic acid 1, olive oil to 64.

Eczema capitis treated by rubbing into the scalp twice a week.

Unguentum Eucalypti (B.P.C.). 10% in a paraffin basis.

Unguentum Eucalypti et Acidi Borici.

Eucalyptus oil 40, boric acid 120, soft paraffin to 500. Lessens secretions of rhinitis.

Unguentum pro Ustionibus. *Syn.* TRINITY OINTMENT.

Eucalyptus oil 40 m., zinc ointment 120 gr., hydrous wool fat 120 gr., soft white paraffin to 1 oz.

BURNS. In second degree burns and scalds one expects to find the underlying skin soundly healed on removal of the (tannic acid) coagulum. Clean raw surfaces are treated with Trinity Ointment.—W. M. Dennison, *Lancet*, ii/1939, 1109.

Vapor Eucalypti (T.H.).

Oil of eucalyptus 20 m., light magnesium carbonate 10 gr., water to 1 ounce. A teaspoonful in a pint of hot water.

[P2] **Vapor Eucalypti Compositus (B.P.C.).** *Syn.* ANTICATARRHAL SALTS.

Contains phenol, oil of eucalyptus, camphor, oil of Siberian fir, strong solution of iodine and ammoniated alcohol. Pine sawdust saturated with the mixture may be used as "smelling salts."

Vap. Eucalypt. et Pini (N.I.F.). Oil of eucalyptus 15 m., oil of Siberian fir 15 m., light magnesium carbonate 15 gr., camphor water to 1 oz.

Eucalyptol (B.P., U.S.P. XI, P. Helv. V, Fr. Cx., F.E. VIII). *Syn.* CINEOLE, CAJUPUTOL, MENTHAN-1:8-DIOL ANHYDRIDE. $C_{10}H_{18}O = 154.1$.

Dose.—1 to 3 minims (0.06 to 0.2 ml.). *U.S.P. XI* average dose 5 minims.

The principal constituent of oil of eucalyptus, which contains not less than 70%.

Insoluble in water; miscible with organic solvents and fixed oils.

It is preferred to the crude oil for use in oro-nasal inhalers owing to the fact that it is less irritating to the mucous membrane.

Nebula Eucalyptolis Composita (B.P.C.). *Syn.* NEBULA THYMOLIS COMPOSITA.

Eucalyptol 8% v/v, with camphor, menthol and thymol in light liquid paraffin.

Pastilli Eucalyptolis (B.P.C.) contain $\frac{1}{2}$ m. (0.03 ml.).

Pastilli Mentholis et Eucalyptolis (B.P.C.) contain $\frac{1}{20}$ gr. of menthol and $\frac{1}{2}$ m. of eucalyptol.

Eucalyptus (B.P.C.). *Syn.* EUCALYPTI FOLIUM.

The dried leaves of *E. globulus* (Myrtaceae). Used in the form of the tincture in asthma, phthisis and chronic bronchitis.

Tinctura Eucalypti (B.P.C.). *Dose.*— $\frac{1}{2}$ to 2 drachms (1 to 8 ml.). 1 in 5. Haemorrhage from superficial wounds is stated to be capable of arrest by internal use of calcium chloride combined with local application of this tincture.

Oleum Geranii (B.P.C.). *Syn.* OIL OF ROSE GERANIUM, OIL OF PELARGONIUM. Obtained from the leaves of *Pelargonium odoratissimum*, *P. capitatum* and *P. Radula*. Used for perfuming dusting powders and other preparations.

Oleum Graminis Citrati (B.P.C.). *Syn.* INDIAN OIL OF VERBENA, OIL OF LEMON GRASS, INDIAN MELISSA OIL. Distilled oil from entire herb of *Cymbopogon citratus* and *C. flexuosus*. Carminative, with agreeable odour. Contains citral, citronellal, etc. True oil of verbena is from *Lippia citriodora* and has a more delicate odour.

Herba Melissae (Fr. Cx., P. Dan.) is from *Melissa officinalis* (Labiatae).

Alcoolat de Mélisse Composé (Fr. Cx.) is prepared from fresh flowering melissa, fresh lemon peel, cinnamon, clove, nutmeg, coriander and angelica root with alcohol 80%.

20 to 25 drops twice a day is also used as an application in rheumatism, etc.

Oleum Juniperi (B.P.C.). *Syn.* ESSENCE DE GENIÈVRE (Fr. Cx.).

Dose.— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.). Oil distilled from juniper fruits, *J. communis*. Sp. gr. 0.862 to 0.890, increasing with age. Soluble (when freshly distilled) 1 in 4 of alcohol 95%, becoming less soluble with age. A diuretic and urinary antiseptic, but should not be used in the presence of renal disease.

Spiritus Juniperi (B.P.C.). *Dose.*—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10.

Spiritus Juniperi Compositus. *Dose.*—2 $\frac{1}{2}$ drachms. Oil of juniper 8, oil of caraway 1, oil of fennel 1, alcohol (99%) 1400, water to 2000.

Vinum Diureticum (P. Helv. V.). *Dose.*— $\frac{1}{2}$ to 1 ounce (8 to 30 ml.). Juniper 15, squill 10, orange peel 10, absinthe 5, angelica root 5, sweet flag 5, dry southern wine 1000.

Juniperus (B.P.C., P. Dan.). *Syn.* JUNIPER BERRY. The ripe fruits of *Juniperus communis* (Pinaceae) containing about 0.5 to 2% of volatile oil. Used principally in veterinary practice.

Oleum Juniperi Lignl. A trade name for fictitious juniper oil supposed to be made from the wood, but generally a mixture of juniper berry oil and oil of turpentine.

Oleum Lavandulae (B.P., Fr. Cx.).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

The oil distilled from the fresh flowering tops of *Lavandula officinalis* (Labiatae). English and French oils are available, the former being considered to have the finer odour. English oil

contains (*B.P. Add. I*) 7 to 12% *w/w* of esters, and French oil not less than 35% *w/w*, both calculated as linalyl acetate, $C_{12}H_{20}O_2$. English oil contains cineole which confers a distinctive odour.

Has carminative properties, and may be given internally (on sugar) in flatulence and colic. It is also used externally as an insect repellent.

Spiritus Lavandulæ (*B.P.C.*). *Dose.*—5 to 20 minims (0.3 to 1.2 ml.).
1 in 10.

Spiritus Lavandulæ (*U.S.P. XI*). *Average dose.*—30 minims (2 ml.).
1 in 20.

Spiritus Lavandulæ Compositus (*B.P.C.*). *Syn.* AQUA LAVANDULÆ. A form of lavender water for use in lotions, etc.

Tinctura Lavandulæ Composita (*B.P.C.*). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Oil of lavender 1 in 200, oil of rosemary, cinnamon, nutmeg and red sanders wood in alcohol 90%.

Tinctura Lavandulæ Composita (*U.S.P. XI*). *Average dose.*—30 minims (2 ml.).

Cinnamon 2, clove 0.5, nutmeg 1, red sanders 1, with oils of lavender and rosemary in diluted alcohol to 100.

Oleum Lavandulæ Spicatæ (*B.P.C.*). *Syn.* OIL OF SPIKE LAVENDER. From *L. latifolia* and other species. Has a harsher and more terebinthinate odour than oil of lavender, and is used for similar purposes.

Oleum Melaleuca Alternifolia. *Syn. and Prop. Names.* TI-TREE OIL, TEA-TREE OIL, AMBOL (*Australia Medical Products, Sydney*; *R. Ferber, London*), TI-TROL (*Australian Essential Oils Ltd., Sydney*; *Fassett & Johnson, London*).

The oil distilled from the Australian ti-tree, *M. alternifolia*, and containing about 50 to 60% of terpenes, including cineole (up to 8%) and terpineol, to which the odour is largely due. It is antiseptic and has been advocated as a non-irritant germicide for general and surgical use.

The Rideal-Walker coefficient is about 10.—A. R. Penfold, *Perfum. essent. Oil Rec.*, 1929, 155; also *Mfg. Chem.*, 1936, 332.

Although Penfold and Morrison have claimed that ti-tree oil has a R-W coefficient of 11 to 13, commercial brands available on the market have a coefficient of about 2 only.—W. C. Reynolds, *Chem. & Drugg.*, ii/1937, 615 and 697.

Oleum Menthæ Piperitæ (*B.P., Fr. Cx.*).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Distilled from the fresh flowering tops of *Mentha piperita* (*Labiata*). Contains (*B.P. Add. I*) 4.0 to 9% *w/w* of esters calculated as menthyl acetate, $C_{12}H_{22}O_2$ and not less than 46% of free menthol.

Soluble 1 in 4 of alcohol 70% and 2 in 1 of alcohol 90%; with some samples of oil the solution becomes turbid on addition of more alcohol 90%.

Uses. Internally it has a sedative effect on the stomach and a mild stimulating effect on the intestines. It relieves gastric and intestinal flatulence and colic and is employed with purgatives to prevent griping. It may be employed by inhalation in coryza in place of menthol. Applied externally it has a mild anæsthetic action, and has been employed in neuralgia.

Oil of peppermint, given by mouth to man, decreased the gastric secretion even if there was stimulation of the flow of gastric juice by an alcohol test meal or by histamine. The mode of action of the essential oil is obscure, but patients with peptic ulceration benefit from its administration.—J. Meyer and co-workers, *Arch. intern. Med.*, 1935, 56, 88.

Aqua Menthae Piperitæ Concentrata (B.P.). Dose.—5 to 15 minims (0.3 to 1 ml.).

Contains 2% v/v of oil and is approximately 40 times the strength of the distilled water.

Aqua Menthae Piperitæ Destillata (B.P.). Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). Oil of peppermint 1, water 1500; distil 1000.

Aqua. Menth. Pip. (D.T.F.). Triturate oil of peppermint 60 m., with talc 1 oz., and water sufficient to produce 160 oz.; filter.

Emulsio Menthae Piperitæ (B.P.C.). Dose.—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10 of oil of peppermint emulsified in water with tincture of quillaia.

Spiritus Menthae Piperitæ (B.P.). Dose.—5 to 30 minims (0.3 to 2 ml.). 1 in 10 of alcohol 90%.

Spiritus Menthae Piperitæ (U.S.P. XI). Average dose.—15 minims (1 ml.). Oil of peppermint 10% in alcohol in which 1% of washed dried peppermint leaf has been macerated for 6 hours.

Syrupus Menthae Piperitæ (B.P.C.). Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Concentrated peppermint water 1, syrup to 8.

Mentha Piperita (B.P.C., U.S.P. XI, Fr. Cx.). Syn. PEPPERMINT. Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 g.). The dried leaves and flowering tops of *Mentha piperita* (Labiatae).

Oleum Menthae Viridis (B.P.C., U.S.P. XI).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Distilled from fresh flowering spearmint, *Mentha viridis*, and *M. crispata*. Contains 42 to 60% of carvone.

Forms a clear solution with an equal volume of 85% alcohol, the solution becoming turbid on further dilution.

Aqua Menthae Viridis Concentrata (B.P.C.). Dose.—5 to 15 minims (0.3 to 1 ml.). 2% v/v of oil. Is approximately 40 times the strength of the distilled water.

Aqua Menthae Destillata (B.P.C.). Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 1000.

Spiritus Menthae Viridis (U.S.P. XI). Average dose.—15 minims (1 ml.). Oil of spearmint 10%, in alcohol in which 1% of washed dried spearmint leaf has been macerated for 6 hours.

Mentha Viridis (U.S.P. XI). Syn. SPEARMINT, MINT. Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 g.). The dried leaves and flowering tops of *M. viridis*.

Oleum Niaouli (Fr. Cx., P. Helv. V). Syn. ESSENTIA EX NIAULI (F.E. VIII).

The oil obtained from the fresh leaves of *Melaleuca viridiflora* by distillation in steam. It contains 35 to 60% of cineole, and gives a clear solution with an equal volume of alcohol 80%, and with four times its volume of alcohol 70%.

Oleum Niaouli Depuratum (Fr. Cx.). Prop. Name. GOMENOL (*Laboratoire du Gomenol, Paris; Coates & Cooper, London*). Prepared by heating Oleum Niaouli with sodium plumbate on a water-bath for three hours, and distilling.

It is given in rhinitis, laryngitis and other diseases of the respiratory tract, and is used in various forms as a general antiseptic. For injection purposes dilutions in olive oil are used, in strengths varying from 2 to 20%.

Oleum Pulegii (B.P.C.). *Syn.* OIL OF PENNYROYAL.

Dose.—1 to 3 minims (0.06 to 0.2 ml.), on sugar or in water.

Distilled from fresh pennyroyal herb, *Mentha Pulegium*. A yellow or greenish-yellow oil containing not less than 80% v/v of pulegone. Mildly irritant to the kidneys and bladder and reflexly excites uterine contractions; is used as an emmenagogue. Is reputed to produce abortion. **Oleum Hedeomæ** from *Hedeoma Pulegioides* has similar properties and is similar in composition.

Antidotes. Empty stomach by emetic or stomach tube. Give purgative dose of magnesium sulphate. Demulcent drinks freely. Keep patient warm; hot applications to abdomen. Stimulants, e.g., hot black coffee. Morphine, $\frac{1}{2}$ gr. hypodermically, for pain. Saline infusion if necessary.

The inclusion of oil of pennyroyal in the Fourth Schedule to the Poisons Rules is recommended.—Report of the Inter-Departmental Committee on Abortion, H.M.S.O., 1939.

Spiritus Pulegii (B.P.C.). *Syn.* ESSENCE OF PENNYROYAL. *Dose.*—10 to 20 minims (0.6 to 1.2 ml.). 1 in 10.

Mentha Pulegium. *Syn.* PULEGIUM, PENNYROYAL. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 g.). The dried leaves and flowering tops of *M. Pulegium*.

Oleum Rosæ (B.P.C., U.S.P. XI, P. Helv. V, Fr. Cx., P. Jap. V). *Syn.* OTTO OR ATTAR OF ROSE. Distilled from the fresh flowers of *Rosa damascena*, cultivated in Bulgaria (3000 yield 1). A pale yellow, semi-solid crystalline mass.

Rosettol. An artificial otto, probably more penetrating than the natural oil. It is entirely free from stearoptene, i.e., is fluid at ordinary temperatures.

Aqua Rosæ (B.P.C.). Triple rose water diluted, immediately before use, with twice its volume of distilled water.

Aqua Rosæ Triplex (B.P.C.). The undiluted rose water of commerce.

Aqua Rosæ Concentrata (B.P.C.). Contains 1% of oil of rose, and is approximately 40 times the strength of rose water.

Unguentum Aquæ Rosæ (B.P.C.). Contains oil of rose, rose water, white beeswax, borax and almond oil.

Unguentum Aquæ Rosæ (U.S.P. XI). Spermaceti 12.5, white wax 12, almond oil 56, borax 0.5, rose water 5, water 14, otto of rose 0.02. It must be free from rancidity and is required to be stored in pure tin collapsible tubes.

Unguentum Rosæ Album (B.P.C.). *Syn.* CERATUM GALENI. Contains oil of rose, triple rose water, spermaceti, white beeswax and almond oil.

Oleum Rosmarini (B.P., Fr. Cx., P. Jap. V).

Dose.—1 to 3 minims (0.06 to 0.2 ml.).

Obtained by distillation from the flowering tops of *Rosmarinus officinalis*. Contains not less than 2% of esters calculated as bornyl acetate, $C_{19}H_{30}O_2$, and not less than 9% of free alcohols calculated as borneol, $C_{10}H_{18}O$. Is used, mainly in hair lotions, as **Spiritus Rosmarini**.

Spiritus Rosmarini (B.P.C.). *Dose.*—5 to 20 minims (0.3 to 1.2 ml.). 1 in 10. Occasionally used in hair lotions as a mild stimulant.

Oleum Rūtæ (B.P.C.).

Dose.—2 to 5 minims (0.12 to 0.3 ml.), in hot water or on sugar.

A pale yellow oil with unpleasant odour becoming pleasant in great dilution. Contains about 90% of methylnonylketone. An emmenagogue and antispasmodic. Has been given as an enema in mucilage of starch for paralytic ileus.

Ruta (B.P.C., *P. Helv. V*). *Syn.* RUE (*Fr. Cx.*), HERBYGRASS. *Dose.*—10 to 30 grains (0.6 to 2 g.). The dried herb *Ruta graveolens* (Rutaceæ). The infusion has been used as an emmenagogue.

Confectio Rutæ. *Dose.*—1 to 2 drachms (4 to 8 g.). Fresh rue, caraway, bay berries, of each 1½, sagapenum ½, black pepper ½, honey 16. Add the first three in powder by degrees to the sagapenum melted in the honey with water q.s. Carminative and antispasmodic. Sometimes used as enema in infantile convulsions.

[P1-81] **Oleum Sabinæ** (B.P.C.).

[P1] and [81] "*Savin, oil of*"

Dose.—1 to 4 minims (0.06 to 0.24 ml.). A violent irritant; has emmenagogue and abortifacient properties. May cause hæmaturia and gastro-intestinal irritation.

The inclusion of oil of savin in the Fourth Schedule to the Poisons Rules is recommended. Oil of savin has no legitimate use of any importance.—Report of the Inter-Departmental Committee on Abortion, H.M.S.O., 1939.

[P1-81] **Unguentum Sabinæ** (B.P. '85). Melt lard 16 and wax 3 on a water-bath, add bruised fresh savin tops 8, digest 20 minutes and express through calico. Freshly made has been used in conjunction with blisters in rheumatoid arthritis.

[P1-81] **Sabina** (B.P.C., *P. Helv. V, Fr. Cx.*). *Syn.* SAVIN, SABINÆ CACUMINA. *Dose.*—5 to 10 grains (0.3 to 0.6 g.). *P. Helv. V* and *Fr. Cx.* have max. single dose 7½ gr.; max. during 24 hours 15 gr. The fresh or dried young shoots of *Juniperus Sabina* (Pinaceæ). Properties are due to the oil.

The tops of *Juniperus sabina*, when taken orally in large doses, sometimes produce abortion, followed by fairly serious poisoning. Two fatal cases of such poisoning are discussed, in both of which death occurred without abortion having taken place. The oil of sabina is fixed in the lungs, liver, uterus and kidneys, especially in the lungs and kidneys.—M. J. Papavassiliou, per *J. Amer. pharm. Ass.*, 1935, A-342.

OLEA EXPRESSA

Notes on fixed oils not included in the following sections are given under the drugs from which they are manufactured (*see* Index).

Oleum Arachis (B.P., *P. Helv. V, P. Dan.*). *Syn.* OLEUM NUCIS, GROUND-NUT OIL, PEA-NUT OIL.

Dose.—½ to 1 ounce (15 to 30 ml.).

The oil expressed from the seeds of *Arachis hypogæa* (*syn.* GOOBER NUT, MANILLA GRAIN, CHINESE ALMOND). Slightly soluble in alcohol 90%, miscible with ether, chloroform and light petroleum. Resembles olive oil in properties and uses, and B.P. *Add. II* and *III* authorise its use, if desired, in place of olive oil, in a number of official preparations.

Emulsio Olei Arachis (B.P.C.). *Syn.* MARYLEBONE CREAM (IMPROVED). *Dose.*—1 to 2 drachms (4 to 8 ml.). A 50% emulsion of arachis oil containing 300 units of vitamin D per drachm.

Emulsio Olei Arachis cum Glucose (*Gt. Orm. H.*). Arachis oil 15 m., saccharated lime solution 4 m., acacia 7½ gr., oil of cassia ½ m., oil of clove ½ m., chloroform ½ m., liquid glucose 30 m., water to 1 dr.

Oleum Gossypii Seminis (B.P.).

Dose.—½ to 1 ounce (15 to 30 ml.).

The purified semi-drying oil expressed from the seeds of *Gossypium herbaceum* and other species of *Gossypium* (Malvaceæ).

It is a yellow, almost odourless liquid with a bland nutty taste. At temperatures below 12° solid fat separates, and if this has occurred the oil should be remelted and mixed before use. It is used for the same purposes as olive oil, especially externally, and *B.P. Add. II* authorises its use, if desired, in place of olive oil, in liniment of camphor, hydrous ointment, and compound ointment of mercury.

Wesson Oil is a high grade of cottonseed oil, largely used in America as salad oil, said to be superior to olive oil for making mayonnaise.

Oleum Palmæ (B.P.C.). A fat obtained from the fleshy portion of the ripe fruits of the palm tree, *Elæis guineensis*, being expressed after allowing the fruits to ferment. It is an orange to dark red fat with a somewhat violet-like odour. Is used in the manufacture of soap. It is also a valuable potential source of vitamin A, 1 lb. of palm oil containing roughly 0.6 of the vitamin A activity of a similar quantity of cod-liver oil.

Oleum Rapæ (B.P.C., P. Dan.). *Syn.* RAPE OIL, COLZA OIL.

The refined oil expressed from the seeds of *Brassica campestris* and other species. A pale yellow, slightly viscous oil with unpleasant taste unless highly refined. Used occasionally in liniments in place of olive oil; largely used for burning and as a lubricant. Is used as an edible oil in India.

Ravison Oil is from a wild variety of *B. campestris* found near the Black Sea. It resembles rape oil but differs in chemical constants.

Oleum Sesami (B.P., P. Helv. V). *Syn.* BENNÉ OIL, GINGELLY OIL, TEEL OIL.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). Expressed from the seeds of *Sesame indicum* (Pedaliaceæ). A pale yellow oil not solidifying at 0°. Slightly soluble in alcohol 90%; miscible with ether, chloroform and light petroleum.

It does not readily turn rancid, is easily saponified even by cold process, is a semi-drying oil, neither gummy nor sticky, readily absorbed. It is thinner than cottonseed oil.

It may be used instead of olive oil in various parts of the Empire, and *B.P. Add. II* authorises its use, if desired, in place of olive oil in liniment of camphor, hydrous ointment and compound ointment of mercury.

Oleum Sojæ (B.P.C.). *Syn.* SOYA OIL, SOYA BEAN OIL, SOJA BEAN OIL, SOY OIL.

Obtained by expression from soya seeds, the yield being 10 to 12%. A yellowish or brownish oil, used for soap-making and for burning. It is also used as an edible oil.

Soja (B.P.C.). *Syn.* SOYA BEANS. The seeds of *Glycine Soja* (Leguminosæ), cultivated in China and Japan for human use and latterly in America and Europe, chiefly for forage. A method of use in the East is to boil until soft and then ferment in a warm cellar—the resulting “cheese” being known as “Natto.”

It contains 38.5% of protein (on dry) and 20% of fat. It contains practically no starch—said to be due to presence of a diastase. Has been used as an addition to diabetic dietary. Soy flour is even more serviceable, containing almost $\frac{1}{2}$ more protein than the bean, this being due to the removal of the fibrous hulls, which contain but little protein. The seeds also contain the enzyme urease, which

converts urea into ammonium carbonate. It can be extracted by dilute alcohol or acetone and used in the determination of urea in blood or urine.

In 1898 only 8 varieties of soy beans were grown in U.S.A.; now there are 60 different varieties, the acreage having mounted from 500,000 in 1917 to 2,500,000 in 1934. The soy bean itself and soy bean flour are used in the preparation of a wide variety of foods for human consumption, including medicinal foods for infants, diabetic and obese individuals. Soy bean oil is used in many industrial products. Soy bean meal is used chiefly for animal feed and fertiliser. In 1934 Duke stated there were more than 250 different uses for soy beans (a list of 49 uses is given).—A. M. Olsen and L. E. Prickman, *Proc. Mayo Clin.*, 1936, 467.

Soya Bean Milk. The shells are removed after baking the beans overnight in 3 times their weight of water, then ground and boiled for 5 minutes and filtered through a sieve. To every 1000 g. of filtrate add 20 g. of starch previously made into a paste with some of the filtrate, 60 g. of sugar, 1.5 g. of calcium lactate, and 1 g. of salt. The addition of cod-liver oil is essential.—*Brit. med. J. Epit.*, i/1931, 93.

Beans of the mammoth yellow variety are cleansed, treated to remove unpleasant flavour and converted into a milky liquid. Malt syrup, lactose, cotton seed oil, mineral salts (Nemssalz), and calcium lactate are added and the mixture homogenised and spray-dried, being re-liquefied in the proportion of 35 gr. to 8 oz. of boiled water, providing a greyish-white "milk", in fine suspension, with about the same body as cows' milk. One ounce contains 28 Steenbock units of vitamin D. The "milk" was well tolerated and babies fed on it showed gain of weight and resistance to infection equal to that of milk-fed babies.—F. R. Rittinger and L. H. Dembo, *per Brit. med. J.*, i/1933, 378.

Owing to its relative cheapness the soya bean flour-milk mixture merits an extended trial in countries where for economic reasons a satisfactory substitute for breast milk has hitherto been unobtainable. It should be possible to market a milk-plus-flour powder at a price much lower than that of full-cream dried milk.—*Brit. med. J.*, i/1940, 982.

Soyolk (*Soya Flour Manufacturing Co., Rickmansworth*). A flour made from the soya containing 20% of fat, which does not turn rancid. It has 42% of protein, 25% of carbohydrates, principally sucrose and dextrin, no starch, and vitamins A, B, D, and E. Suggested as a basic food for infants, *i.e.*, to blend with other ingredients and reduce the protein and increase the sugar, *e.g.*, with lactose.

Sobee. A mixture of soya bean flour 67.5% and barley flour 9.5%, with olive oil 19%, sodium chloride 1.3%, and calcium 2.7%. Used as a milk substitute for infants with milk idiosyncrasy. Infants take it well, digest it, and thrive on it.—L. W. Hill and H. C. Stuart, *J. Amer. med. Ass.*, ii/1929, 986; *See also ibid.*, 989.

OLEUM HYDNOCARPI

B.P.

Dose.—5 to 15 minims (0.3 to 1 ml.) gradually increased to 1 drachm (4 ml.); by subcutaneous or intramuscular injection, $\frac{1}{2}$ drachm (2 ml.) gradually increased to 75 minims (5 ml.).

Obtained by cold expression from the seeds of *Hydnocarpus Wightiana*, and occurs as a yellowish or brownish-yellow oil or soft cream-coloured fat. Contains glycerides of hydnocarpic and chaulmoogric acids. Oleum Hydnocarpi (*P. Helv. V*) is from *Hydnocarpus Kurzii* (*see* Oleum Chaulmoogræ). For further information regarding the sources and characters of various commercial *Hydnocarpus* and *Chaulmoogra* oils, *see* under Oleum Chaulmoogræ, p. 751, and in Vol. II.

Soluble almost completely in hot 90% alcohol, partly insoluble in cold; miscible in ether, chloroform and carbon disulphide.

Uses. Is given *per os*, or by subcutaneous or intramuscular injection in the treatment of leprosy. It is well tolerated if injections are made into healthy subcutaneous tissues, and rarely causes any reactions. Hydnocarpus oil is not suitable for intradermal infiltration over a large area. For this purpose the esters are preferable.

Hydnocarpus oil with 4% of creosote the cheapest and most effective remedy, and the one which did the maximum amount of good in all stages.—R. G. Cochrane, R.S.M. Discussion, *Brit. med. J.*, i/1927, 285.

Vaccines intravenously are useful in certain cases and in the third stage of the disease: hydnocarpus oil is the most efficient treatment in the first and second stages.—E. Muir, R.S.M. Discussion, *Brit. med. J.*, i/1927, 284; *Lancet*, i/1927, 339.

Hydnocreol (*Smith, Stanistreet, Calcutta*). Hydnocarpus oil with the addition of 4% of double distilled creosote.

Sodii Hydnocarpas. *Prop. Name.* ALEPOL (*Burroughs Wellcome, London*).

Dose.—1 ml. of a 3% solution (increased to 5 ml. or more) intramuscularly or subcutaneously; intravenously 1 ml. of 1% solution increased by 1 ml., up to 5 or 10 ml.

A mixture of the sodium salts obtained from the low-melting fraction of the acids of *H. Wightiana* oil.

Sodium hydnocarpate is specially convenient, but apt to cause endophlebitis and block the veins when given intravenously.—E. Muir, per *Brit. med. J.*, ii/1930, 1095.

Pain of subcutaneous injections markedly reduced by addition of glycerin—2.5 ml. of pure glycerin to 100 ml. of 3% sodium hydnocarpate solution containing 0.5% of phenol.—J. T. Jackson, per *Brit. med. J. Epit.*, ii/1932, 98.

A preparation worthy of more than passing attention is sodium hydnocarpate (Alepol) which, in many countries, is used as the drug for routine treatment.—E. Muir, *Int. J. Leprosy*, 1933, 441.

Intravenous injections up to 10 ml. of 5% solution the method of choice in "mass" treatment in the Yambio District of the Belgian Congo. Locally, trichloroacetic acid is used and ulcers dressed with hydnocarpus oil.—A. Cruickshank, *Leprosy Rev.*, 1932, 6.

Ionisation of the nasal mucous membrane, using Alepol, potassium iodide, and sodium chloride, in 1% solution, produces in many cases apparently complete cure of leprotic lesions in this site, an electrode being placed in each nostril and kept in position by bandages, and a current of 20 to 30 ma. passed for 20 to 30 minutes.—F. G. Rose, *Brit. med. J.*, i/1929, 148.

20 out of 152 cases of leprosy cured by Alepol and no symptoms of disease have recurred after lapses of 4, 5, or 6 years.—S. Lagoudaky, *J. trop. Med. (Hyg.)*, 1937, 77.

[P2-81] **Avenyl** (*Burroughs Wellcome, London*). 2-Myristoxy-mercuri-3-hydroxybenzaldehyde, a mercury preparation for the treatment of leprosy complicated by syphilis. Is soluble in hydnocarpus oil and in the ethyl esters of hydnocarpus oil, and may be administered as a 0.25% solution in hydnocarpus oil, or as a 0.5% solution in the ethyl esters in doses of 1 ml., increased to 4 ml. or more, in courses of 12 to 15 injections.

Oleum Hydnocarpi Æthylicum (B.P.). *Syn. and Prop. Name.* ETHYL ESTERS OF HYDNOCARPUS OIL, ETHYL HYDNOCARPATE, HYDNESTYLE (*Smith, Stanistreet, Calcutta*).

Dose.—5 to 15 minims (0.3 to 1 ml.), increasing gradually to 1 drachm (4 ml.). By subcutaneous or intramuscular injection, $\frac{1}{2}$ drachm (2 ml.) gradually increased to 75 minims (5 ml.).

A colourless or faintly yellow oil with acrid taste. Prepared by saponifying the oil and precipitating the acids, dissolving them

in ethyl alcohol and esterifying by passing in hydrogen chloride.

Is used for the same purpose as hydnocarpus oil, either alone or mixed with an equal volume of olive oil with or without creosote 4%.

Intradermal injections of chaulmoogra and hydnocarpus esters should be accompanied by intramuscular to produce maximum effect. Big doses should be pushed where resistance is high—but doses above 10 ml. harmful.—R. Cochrane, *Trans. R. Soc. trop. Med. Hyg.*, 1931, 98.

The action of hydnocarpus oil and its preparations, injected intradermally, is largely due to the local irritation, which continues for some time, the esters remaining absorbed inside the local cells, causing breaking down and phagocytosis of the lepromatous material. There might also be some antigenic action.—E. Muir, *Trans. R. Soc. trop. Med. Hyg.*, 1931, 92.

No proprietary preparation of hydnocarpus oil or esters at present on the market is more effective than the pure oil and esters prepared in institutions. For this reason, and because of their greater cost, the preferential use of such preparations is not recommended. Hydnocarpus oil and its esters intramuscularly, subcutaneously and intradermally remain, so far as our present knowledge goes, the most efficacious drugs for the special treatment of leprosy (Report of the Sub-committee on Treatment to the International Congress of Leprosy, Cairo, March, 1938).—*Leprosy Rev.*, 1938, 150.

Eulykol (*Burroughs Wellcome, London*). Phenyl-ethyl esters of a selected fraction of the acids of hydnocarpus oil, or "phenylethyl hydnocarpate." *Dose*.—Commence with 0.1 ml. intradermally and a week later infiltrate the whole patch with 1 ml., repeating at weekly intervals until the nodules have disappeared. *Lupus vulgaris*.

LUPUS VULGARIS. Phenylethyl hydnocarpate of value by intradermal injection in the treatment of lupus vulgaris. Of 11 cases treated, clinical cure of affected patches was obtained in 7 and the other 4 showed satisfactory progress. The injections cause comparatively little pain and after treatment very little scarring is present.—N. Burgess, *Brit. med. J.*, ii/1935, 835.

Extremely encouraging results in 15 cases of lupus vulgaris.—J. E. Wallace, *Brit. med. J.*, i/1937, 1151.

Oleum Chaulmoogræ (B.P.C., U.S.P. XI, *Fr. Cx.*, *P. Ned-V*, *P. Helv. V*, *P. Belg. IV*, *F.E. VIII*).

Dosa.—5 to 15 minims (0.3 to 1 ml.), increased to 1 drachm (4 ml.) orally, in capsules, cod-liver oil, or milk; 30 minims (2 ml.), increased gradually to 75 minims (5 ml.) by subcutaneous or intramuscular injection. *F.E.* max. single dose 1 g.; max. in 24 hours 5 g. *U.S.P. XI* average dose 15 minims.

The oil (about 33%) expressed from the seeds of *Hydnocarpus Kurzii* (formerly *Taraktogenos Kurzii*). This is an evergreen shrub growing in Chittagong, Burma, and other parts. *U.S.P. XI* and *Fr. Cx.* include the oils of *Taraktogenos Kurzii*, *Hydnocarpus Wightiana*, *H. anthelmintica* and other species of *Hydnocarpus*, provided the oil agrees with specification. *P. Helv. V* calls this oil "Oleum Hydnocarpi," with *syn.* OLEUM CHAULMOOGRÆ.

The kalaw tree, frequently stated to be the historic origin of chaulmoogra oil, is apparently the Burmese name for *Taraktogenos Kurzii*.

Gynocardia oil is from *G. odorata*. It has a brown colour and odour resembling painter's varnish, and remains liquid down to 4.5°. It does not contain chaulmoogric acid but consists chiefly of the glyceryl esters of linolic and linolinic acids. It is stated to have no therapeutic value in leprosy. The fruits yielding genuine chaulmoogra oil are distinguished from those of gynocardia by

containing many seeds (average 21) packed closely together and faceted by mutual pressure, hence no two are the same identical shape, and having no pulp. The embryo of the seed is vertical and cordate, while that of gynocardia is lateral and reniform.

The name chaulmoogra has been sometimes misapplied to a smaller seed derived from *Hydnocarpus anthelmintica*, a native of Siam, where it is known as Lukrabao. This is exported to China and used there for leprosy in place of the true chaulmoogra, which may be regarded as the East Indian remedy. The oil is used by natives of Siam for cutaneous infections and contains 67.8% of hydnocarpic acid and 8.7% of chaulmoogric acid.

The oil from *Hydnocarpus Kurzii* is cold-drawn. It is a yellow fat, or at tropical temperatures a brownish-yellow oil with an odour of rancid butter and m.p. of 22° to 23°. It consists chiefly of the glycerides of chaulmoogric acid, $C_{18}H_{32}O_2$, and hydnocarpic acid, $C_{16}H_{28}O_2$. The residual cake is valuable for cattle feeding.

The oil from *Taraktogenos Kurzii* is often adulterated and other hydnocarpus oils are frequently sold as chaulmoogra oil. Because of these disadvantages its use in leprosy treatment has been largely superseded by *H. Wightiana* and *H. anthelmintica* oils which are cheaper and of better quality. Statements that the oil does not keep are untrue, but the oil is practically never expressed from fresh dried seeds, and oil from old seeds is always irritating.—H. I. Cole and H. T. Cardoso, *J. Amer. chem. Soc.*, 1939, 3442.

Soluble in ether and in chloroform.

Uses. Chaulmoogra oil is employed almost exclusively for the treatment of leprosy. It is not a specific, but with prolonged treatment (extending over several years) it results in so complete an arrest of the disease as to produce an apparent cure in a very considerable proportion of cases. It may be given by mouth (in capsules after meals), by intramuscular injection or by intradermal infiltration, or by a combination of these procedures. It has also been employed in pulmonary tuberculosis, but there is no convincing evidence of its clinical value, though successful results are claimed for its use by local application in tuberculous pharyngitis.

Externally, the oil is a potent rubefacient and may cause great pain when applied to raw surfaces, though a 30% ointment in lanolin has been used in chronic psoriasis.

INTRADERMAL INFILTRATION undoubtedly gives better results than intramuscular and subcutaneous injections in leprosy. In patients in whom the skin areas involved are too small to permit giving the desired doses by the intradermal route, supplementary intramuscular or subcutaneous injections may be given. The relative efficacy of the oil and esters given intradermally has not yet been fully tested, but experience shows that both are effective, and that if either is better than the other the difference is not great.

Technique. A small syringe is used with a short guarded needle. If oil is used the temperature must be at least 55°. The area to be injected is marked off with grease pencil and sterilised. Infiltration is made through multiple punctures 6 to 10 mm. apart, 0.5 to 1 minims being injected at each puncture, so that to give the maximum 5 ml. dose some 80 to 100 punctures are required. The needle should be sloped at an acute angle with the skin surface and should not enter more than 2 or 3 mm. except for deeper lesions. In patients with marked fibrous nodules, begin treatment by infiltrating them (2 to 4 drops slowly injected into the middle of the nodule), treating the more diffuse lesions later. The dose varies according to tolerance, from 0.5 to 5 ml. once or twice a week.

Almost all skin areas showing either visible lesions or deep analgesia due to local invasion by *M. lepræ* are suitable for infiltration (this does not apply to analgesia of the extremities due to affection of the nerve trunks supplying them). When the lesions are widespread it is well to begin with the back of the trunk, as it is less sensitive. As a rule lesions should not be infiltrated a second time within a month. The induration caused by the previous infiltration must first be absorbed, lest much pain and even ulceration occur. Spots of hyperpigmentation remain at old sites of puncture and the new punctures should be made between them. Recommendation of the infiltration method does not exclude other supplementary methods of special treatment, e.g., hot baths, cauterisation, etc. In a patient who can tolerate maximum treatment and maintain a sedimentation index below 10, a good prognosis can generally be given.—E. Muir, *Int. J. Leprosy*, 1933, 442.

Treatment of leprosy—a valuable review with extensive bibliography.—E. Muir, *Int. J. Leprosy*, 1933, 407.

TUBERCULOUS LARYNGITIS. Local applications of chaulmoogra oil (Burmese), either diluted 10 to 20% in mineral oil, or full strength, dropped into the larynx or applied by a swab, in ulcerative tuberculous laryngitis, and superficial infiltrations, have been praised by R. M. Lukens, of Philadelphia. R. Scott Stevenson found it soothing but not of any curative benefit.—*Brit. med. J.*, ii/1933, 964.

Use of Indian chaulmoogra oil disappointing, but good results from Burmese oil (which contains a larger proportion of chaulmoogric acid). 65% of cases were improved and 25% greatly improved or cured.—R. Scott Stevenson, *Practitioner*, ii/1937, 565.

Chaulmoogra oil is the most effective local application, but the Burmese oil must be employed. Of 40 cases so treated, 2 were healed, 11 much improved, 15 improved, 6 remained stationary, and 6 became worse.—R. S. Stevenson and F. R. G. Heaf, *Brit. med. J.*, i/1940, 164.

Emulsio Olei Chaulmoogræ.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Chaulmoogra oil 1 oz., poppy seed oil 2 oz., powdered acacia $\frac{1}{2}$ oz., cinnamon oil 6 m., saccharin elixir 45 m., with water to make 6 oz.

Injectio Olei Chaulmoogræ Intramuscularis.

Dose.— $\frac{1}{2}$ to 1 ml., increased to tolerance.

Chaulmoogra oil and almond oil equal parts, sterilised.

This and other formulæ have been given intramuscularly, but the injection of oily preparations of chaulmoogra is often badly tolerated—causing abscess, heart failure, etc.

The following is said to be *painless*. Chaulmoogra oil 90, olive oil 10, benzocaine 3, 5 ml. injected at body temperature in deltoid region, alternating semi-weekly with 8 ml. in buttocks.

Unguentum Chaulmoogræ (B.P.C.).

10% in a paraffin basis.

Sodii Chaulmoogras (B.P.C.). *Syn.* SODIUM GYNOCARDATE.

Dose.—1 to 3 grains (0.06 to 0.2 g.) in 3% solution by intramuscular or intravenous injection.

A mixture of the sodium salts of the fatty acids, or of a selected fraction of the fatty acids, of chaulmoogra oil. Occurs as a granular yellow or buff-coloured powder.

Good results in long-standing infection from the use of sodium chaulmoograte in sufficient quantity to saturate the system to the limit of toleration, treatment extending over months. Intravenously 0.04 g. given every second day, followed by an interval of 25 days after each 12 injections. In some cases a 1% or 1.5% solution was better tolerated than the 3% solution. Found to be one of the best anti-leprosy remedies, intense and rapid in action.—E. Balbi, *Brit. med. J. Epit.*, i/1927.

Æthylis Chaulmoogras (U.S.P. XI).

Average dose.—By mouth or by intramuscular injection, 15 minims (1 ml.).

A pale yellow oil prepared from chaulmoogra or hydnocarpus oil, or from the oil of *H. Anthelmintica* by the same method as *Oleum Hydnocarpi Æthylicum*, which it closely resembles.

When given by the mouth it is tolerated much better than the oil and for longer periods, since its taste and odour are not disagreeable and it does not give rise to gastric upset. The injections also are better tolerated than those of the oil and are less painful.

Chaulmoogri et Hydnocarpi Æthylicum (*Fr. Cx.*) resembles the *U.S.P.* preparation. It is insoluble in water, but soluble in alcohol and miscible with organic solvents.

Iodised Ethyl Chaulmoograte containing 2% Iodine.

Dose.—1 ml. intramuscularly has been reported on.—*See H. W. Wade and C. B. Lara, Lancet, i/1927, 599.*

Antileprol (*Bayer Products, London*). Ethyl esters of the fatty acid of chaulmoogra oil.

Moogrol (*Burroughs Wellcome, London*). A mixture of esters of the acids of the chaulmoogric series for intramuscular injection in the treatment of leprosy, and also, in combination with 4% of creosote, in lupus vulgaris. **Iodised Moogrol** is Moogrol with 0.5% of iodine, which markedly reduces the irritation produced. Injections are made intradermally and intramuscularly at weekly intervals. Intradermally, 5 ml. is given each time, 0.1 ml. at each point. If total 5 ml. cannot be given in this way, the balance is given intramuscularly.

OLEUM MORRHUÆ

(with OLEUM HIPPOGLOSSI)

B.P. Add. I, U.S.P. XI.

Syn. OLEUM JECORIS ASELLI (*P.G. VI, P. Ital. V, P. Belg. IV, F.E. VIII, Fr. Cx., P. Dan.*), OLEUM JECORIS (*P. Helv. V*).

Dose.—Prophylactic, 15 to 30 minims (1 to 2 ml.) 3 times daily; therapeutic, 45 to 90 minims (3 to 6 ml.) 3 times daily. *U.S.P. XI* average daily dose 2 drachms (8 ml.).

The oil expressed from the fresh liver of the cod, *Gadus morrhua*, and freed from solid fat by filtration at 0°. *B.P. Add. I* and *Fr. Cx.* require the oil to contain per g. not less than 600 units of vitamin A activity, and not less than 85 units of antirachitic activity. These limits are much lower than the proportions of the two vitamins usually occurring in commercial samples of the oil (*see Vol. II*).

U.S.P. XI states "and other species of the family *Gadida*." The oil may be flavoured with 1% of recognised flavouring agent. It contains at least 850 i.u. of vitamin A per g., and at least 85 i.u. of vitamin D.

Soluble slightly in alcohol 90%, miscible with ether, chloroform, and light petroleum.

Uses. Cod-liver oil is a valuable nutritive and is the most easily assimilated of all oils. It increases weight and improves the general condition of the patient. Its medicinal value is largely due to its high content of vitamins A and D. It is especially valuable in tuberculosis and other forms of wasting disease and is a specific in rickets. Externally the oil is sometimes applied by inunction with good results, especially to young infants. It is also applied externally in the treatment of burns, wounds, varicose ulcers, bed-sores, and inflammatory conditions of the eyes and

eyelids. Thus employed, the oil has a soothing action and stimulates epithelial growth. Ulcerative colitis has been successfully treated by rectal instillations of the oil.

BURNS, VARICOSE ULCERS AND BED SORES. 120 cases treated. A noticeable feature was the absence of pain when dressings were changed.—K. Strauss, *Dtsch. med. Wschr.*, 1935, 50.

Very popular with the patients, who experience great relief on its first application. A dressing of lint well soaked in crude cod-liver oil preferred to ointment. The dressing is re-soaked with the oil after 24 hours, the lint not being renewed until after 48 hours.—J. P. Steel, *Lancet*, ii/1935, 290.

Cod-liver oil, like other oily dressings, produces no coagulation of the damaged surface, and so allows the development of secondary shock and toxæmia.—W. M. Dennison, *Lancet*, ii/1939, 1107.

BURNS OF THE EYELIDS. The first dressing is a pad of lint saturated with the oil, covered with jaconet or oiled silk and a bandage, the patient being instructed to get a bottle of the oil and to keep the pad moist with it, leaving the pad undisturbed for 24 hours. There is never any septic discharge. The pad is changed every 24 hours. For use as drops at home, the easiest way is to pour the oil from a warmed teaspoon rather than use a dropper, which is difficult to keep clean, every 3 or 4 hours. One remarkable point is the almost instant relief from pain.—E. Stevenson, *Lancet*, ii/1935, 1376.

EYE AFFECTIONS. In addition to its use in burns of the lid and conjunctiva, cod-liver oil therapy is beneficial in corneal abrasions, dendritic ulcer, relapsing keratitis, degeneration due to mustard gas, blepharitis and general soreness of the lids.—E. Stevenson, per *Brit. med. J. Epit.*, ii/1936, 59.

For the treatment of the cornea, damaged by liquid mustard gas, the German Army use a mixture of cod-liver oil (emulsified with 1% sodium carbonate solution) and dextrose containing about 4% of pituitary (posterior lobe) extract.—J. H. Burn, *Brit. med. J.*, ii/1939, 972.

Dextrose and cod-liver oil ointment for the treatment of corneal ulceration caused by mustard gas may be prepared as follows: dissolve dextrose 3 dr., and sodium bicarbonate 30 gr., in water 2½ oz. Rub down anhydrous eucerin 240 gr., with cod-liver oil 1 oz., add 1 oz. of the aqueous solution and triturate briskly until emulsified. Gradually add the remainder of the aqueous solution and a further 2 oz. of oil with continuous trituration.—V. E. Benjafield, *Pharm. J.*, i/1940, 96.

The following is a satisfactory formula for cod-liver oil and dextrose cream. Cod-liver oil 3 fl. oz., eucerin anhydrous 5 dr., water 11 dr., dextrose 3 dr., sodium bicarbonate 30 gr. Melt the eucerin anhydrous at a temperature not exceeding 70°, add gradually a solution of the dextrose and sodium bicarbonate in the water, previously warmed to 60°, with constant trituration until emulsification is complete. The "primary" emulsion so formed is then diluted with the cod-liver oil to complete the preparation.—J. Morgan, *Pharm. J.*, i/1940, 112.

GASTRIC ULCER. Good results were obtained from the administration of cod-liver oil (20 g. 4 times daily) to patients with gastric ulcer when operative treatment was contraindicated. The best response was obtained when the ulcer was situated high in the lesser curvature and the ulcerative process had spread through to the neighbouring organs. Cod-liver oil leads to increase in weight, limits gastric motility and has a local therapeutic effect on the ulcerated tissue.—W. Löhr, per *Nutr. Abstr. Rev.*, Jan., 1936, 795.

OSTEOMYELITIS. Strikingly satisfactory results obtained in acute cases. The dressing is painless and need not be changed.—W. Löhr, *Dtsch. med. Wschr.*, 1936, 997.

TUBERCULOUS PHARYNGITIS. Tuberculous lesions of the throat and larynx respond well to spraying of the ulcerated areas three times a day with cod-liver oil. Of 91 patients so treated 27.5% were healed, 46.2% were improved subjectively and objectively, and 26.3% remained unimproved.—A. L. Banyai, per *Brit. med. J. Epit.*, i/1938, 97.

ULCERATIVE COLITIS. Ulcerative colitis successfully treated by retention enemata of cod-liver oil, using an initial dose of 2 oz. and increased by 2 oz. at a time to a maximum of 8 oz.—H. Gainsborough, *Lancet*, i/1939, 1319.

Rectal instillation of a 40% gum emulsion or 68% suppositories used for ulcerative colitis. Improvement noted in 9 out of 11 patients.—R. Spiegel, *Journal of Mt. Sinai Hospital, New York*, per *Amer. J. Pharm.*, 1938, 132.

WOUND TREATMENT. Three years' experience of the application of fresh unheated cod-liver oil, mixed with an indifferent oily medium to the consistency of a paste, to suitable wounds, e.g., recent uninfected accidental wounds, burns, compound fractures, amputation wounds, bed-sores, frostbite, etc. Dressing changed as infrequently as possible, and contact of the wound with the inner portion of the dressing left undisturbed.—W. Löhr, per *Brit. med. J. Epit.*, ii/1934, 86.

Treatment of 300 casualty cases from an explosion at a toluol factory, including badly infected compound fracture, open wounds of the joints, extensive muscle and tendon lacerations, complete removal of the scalp, and severe burns. The immediate surroundings of a wound having been shaved clean, it was filled with a cod-liver oil ointment and then lightly secured with sutures made from the muscles of horses and cattle. Over this was a layer of cod-liver oil ointment, kept in place by an adhesive dressing. Necrotic tissues quickly came away and the depths of the wound became filled with granulation tissue. The ease with which new skin grew rendered transplantation superfluous, although there had been no preliminary sterilisation.—P. Boase, *Dtsch. med. Wschr.*, 1935, 1638.

In the treatment of injuries affecting a very large area, special reference being made to the requirements of war surgery, the method which consists in excising the wound, filling it with pure vitamin A oil or ointment, and immediately applying a plaster of Paris dressing, constitutes a real advance.—S. Sandor, *Lancet*, ii/1936, 740.

Subcutaneous injection of fish liver oils into rabbits produces a marked stimulation of phagocytes, fibroblasts, and young capillaries. Liquid paraffin and olive oil are relatively inert. The vitamin A content of the oils is not responsible for this reaction. The cellular stimulation produced by cod-liver oil appears to facilitate the process of healing wounds.—J. Davson, *Lancet*, ii/1936, 738.

It is established that cod-liver oil has definite bactericidal power, and irradiation with ultra-violet rays greatly enhances this power. It is further established that the bactericidal action of an oil is closely related to its content of peroxides which is also increased by irradiation. The merits of cod-liver oil dressings are emphasised and a clinical trial of irradiated oil advocated.—M. Lichtenstein, *Lancet*, ii/1939, 1023.

Controlled Cod-liver Oil Mixture (B.S.S. No. 910—1940) is a preparation of cod-liver oil for animal feeding. It is produced only under licence granted by the Ministry of Food under the Cod-liver Oil (Control of Production) Order, 1940, and consists of veterinary cod-liver oil of a high vitamin potency diluted with a suitable marine oil, preferably of animal origin, supplied by the Ministry of Food. Controlled cod-liver oil mixture should contain not less than 600 i.u. of vitamin A and 85 i.u. of vitamin D per g.

Oleum Morrhuæ Aromaticum.

Dose.—1 to 4 drachms.

Coumarin 0.01, saccharin 0.5, vanillin 0.6, dehydrated alcohol 10.0, oil of lemon 20.0, oil of peppermint 3.0, cod-liver oil to 1000. The taste is covered but the odour persists to some extent.

Oleum Jecoris cum Iodo. *Syn.* OLIO DI FEGATO DI MERLUZZO IODATO (*P. Ital. V*). Contains 0.05% of iodine dissolved by trituration. *P. Helv. V* has 0.01%.

Oleum Morrhuæ Non-Destearinatum (U.S.P. XI) is the entire oil, i.e., not destearinated.

Emulsio Olei Morrhuæ (B.P. Add. II).

Dose.—Prophylactic, $\frac{1}{2}$ to 1 drachm (2 to 4 ml.), approximately equivalent to 1000 to 2000 units of vitamin A and 100 to 200 units of vitamin D. Therapeutic, $1\frac{1}{2}$ to 3 drachms (6 to 12 ml.), approximately equivalent to 3000 to 6000 units of vitamin A and 300 to 600 units of vitamin D.

Contains 50% v/v of cod-liver oil. *B.P.C.* is similar but has *dose*— $\frac{1}{2}$ to 1 ounce (8 to 30 ml.).

Loss of vitamin A depends more on conditions and time of storage than on method of preparation. The emulsion must be protected against light, heat and air, and is preferably stored in well-filled brown bottles at a temperature below 15°. There is no objection to the use of corks.—H. Lindholm, *Arch. Pharm. Chem.*, 1940, 47, 1.

Emulsum Olei Morrhue (U.S.P. XI).

Average daily dose.—Infants and adults, 4 drachms (15 ml.). If the content of vitamins A and D exceeds the U.S.P. minimum, the dose may be lowered proportionately.

Cod-liver oil 50%, with acacia and syrup and 0.4% of methyl salicylate, or not more than 1% of any other flavouring agent prepared with recognised substances. Agar, gelatin, tragacanth or mixture of these may be used instead of acacia, and if the emulsion is stored 7% of water should be replaced by alcohol.

Emulsio Olei Morrhue et Creosoti (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (8 to 30 ml.). Contains 33 $\frac{1}{3}$ % v/v of cod-liver oil with 4 m. of creosote per oz.

Emulsio Olei Jecoris Ferrata (P. Svec. X) has cod-liver oil 300, calcium hypophosphite 6, citric acid 2, iron pyrophosphate with ammonium citrate 9, acacia 53, syrup 60, vanillin 0.6, dissolved in dilute alcohol 5 and water to 600.

Ferrated Emulsion of Cod-Liver Oil consists of the plain emulsion with iron and ammonium citrate 5 gr. per oz.

Emulsion of Cod-Liver Oil with Glycerophosphates, v. p. 46.

Emulsio Olei Morrhue cum Hypophosphitibus (B.P.C.).

Syn. EMULSIO OLEI MORRHUE COMPOSITA.

Dose.— $\frac{1}{2}$ to 1 ounce (8 to 30 ml.).

Cod-liver oil 50% v/v with 1 gr. each of sodium and calcium hypophosphites per dr.

Emulsio Olei Morrhue cum Ovolecithino is the above with 5 gr. of lecithin per oz. *Dose.*—2 to 8 drachms (7 to 30 ml.).

Unguentum Zinci Morrhuatilis (B.P.C.). Contains about 14% of cod-liver oil, with zinc oxide, talc, and balsam of Peru in a basis of wool fat, solution of calcium hydroxide, beeswax and soft paraffin.

Cod-liver oil ointments may be prepared from the following formulæ, the waxes and other ingredients being melted first and the cod-liver oil added gradually at temperatures of 30° to 35°, avoiding the formation of air-bubbles. (a) White beeswax 10 g., spermaceti 10 g., cod-liver oil 80 g. (b) Yellow beeswax 20 g., soft paraffin 50 g., cod-liver oil 40 g.; this is very suitable for wounds and sores. (c) Beeswax 20 g., stearic acid 20 g., soft paraffin 30 g., hydrous wool fat 30 g., cod-liver oil 100 g. (d) Yellow beeswax 10 g., triethanolamine stearate 10 g., hydrous wool fat 25 g., cod-liver oil 75 g.; talc or zinc oxide can be added to this to increase its curative and cicatrising actions.—A. Ferraris, per *Quart. J. Pharm.*, 1939, 642.

Coco-Vitamin (Lilly, London). Cod-liver oil 40%, vitamin B extract 40%, malt extract 10%, potassium hypophosphite 1.7% with chocolate and aromatics. 1 oz. contains vitamin A 5500 units, B 16 units, D 1300 units.

Cytobiase (Bengué, London). Drops containing cod-liver oil extract 40 g. and excipient to 100 g. 25 drops = 4 oz. of cod-liver oil. *Dose.*—For adults 25 to 30 m. twice daily before meals.

Cod-Halibut-Liver Oil, 10 D (Allen & Hanburys, London). Cod-liver oil mixed with halibut-liver oil and containing vitamin A 10,000 units per g., vitamin D 1000 units per g.

Desitin (Coates & Cooper, London). Preparation of cod-liver oil for external use. Supplied as ointment or dusting powder for the treatment of burns, eczema, wounds, etc.

Jecocin (Boots, Nottingham). Medicated cod-liver oil, containing creosote, chloroform, cinnamon oil and amylmeta-cresol. *Dose.*—1 teaspoonful 3 or 4 times daily: not suitable for children. Infections of the lung and bronchi, e.g., chronic bronchitis, bronchiectasis, emphysema, etc.

Morelix (Gale, Bais, London). A combination of cod-liver oil with malt, hypophosphites, Virginian prune, and aromatics. A nutritious tonic.

Morvette Cod-liver Oil Tablets (*A. H. Cox, Brighton*) contain vitamin A, cholesterol and lipochrome-containing bodies, also phosphorus, bromine and iodine.

Reinforced Cod Liver Oil (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Contains per ml. 2000 i.u. of vitamin A and 500 i.u. of vitamin D.

"SevenSeas" High Potency Oil (*British Cod Liver Oil Producers, Hull*). Natural cod-liver oil four times as rich in vitamins as cod-liver oil, *B.P.* Dose.—5 minims. Also supplied in 5 m. capsules.

Sodii Morrhuas (B.P.C.).

Dose.—*Subcutaneously* $\frac{1}{2}$ ml. of a 3% solution slightly increased up to 2 ml., 2 or 3 times a week until reaction (febrile and local) occurs. When 2 ml. has been reached give this dose *intramuscularly* up to 4 ml.

For *intravenous* use as a sclerosing agent, *v. postea*.

Sodium morrhuate consists of a mixture of the sodium salts of the fatty acids or of a fraction of the fatty acids of cod-liver oil, prepared by the hydrolysis of cod-liver oil with sodium hydroxide. It is purified by extracting with ether. Sodium morrhuate is a light brown powder with a slightly fishy taste.

Soluble in warm water; almost completely soluble in alcohol (90%). The 10% aqueous solution should be clear.

Storage. It should be kept in well-closed containers, preferably stoppered bottles, and the making and stocking of large quantities is inadvisable. It is considered that the insolubility and darkening in colour of old samples of sodium morrhuate is due to hydrolysis rather than to oxidation, although the latter may also occur.—G. W. G. Smithers, *Quart. J. Pharm.*, 1938, 537.

Uses. Sodium morrhuate was originally used in the treatment of leprosy. It has also been administered as a 3% solution by injection in the treatment of lupus and tuberculosis. In none of these conditions, however, have the original claims as to its value been substantiated and it is now used chiefly as a sclerosing agent in the injection treatment of varicose veins. In most cases a 5% solution of sodium morrhuate is strong enough to obliterate the lumen with a minimum amount of inflammation. It causes strictly localised mild inflammation of the vein wall, followed by firm fibrous occlusion of the vessel. The size of the vein is the determining factor as to the dosage. In small or medium-sized veins 1 or 2 ml. is sufficient, while in large veins 3 to 5 ml. is necessary. The total dose should not exceed 10 ml. The injection of 2 to 5 ml. of the 5% solution, following aspiration, is also stated to give good results in the treatment of hydrocele.

Solid matter may separate from the solutions on standing, but redissolves on warming. The syringe should be warmed before filling with the solution.

Technique of Injection in Varicose Veins. Sodium morrhuate appears to be most effective when injected into a not fully distended vein; the patient is therefore best treated in a horizontal position by elevating the limb, and then applying digital pressure or a tourniquet above the point of injection. The standing position may be of advantage in the treatment of smaller veins. The effect on the injected vein is usually prompt. A few minutes after the injection

the vein begins to harden below the site of injection for about 2 to 4 inches. Injections are given at 24 to 48-hour intervals, according to the response of the patient to the drug.

GANGLIA treated by sodium morrhuate injections 5%, 0.2 to 5 ml., after aspiration.—Peter McEvedy, *Lancet*, ii/1930, 902.

HÆMORRHOIDS injected with sodium morrhuate.—A. S. Ross, *Brit. med. J.*, ii/1930, 86.

Two cases of severe anaphylaxis attending the use of sodium morrhuate for injection of hæmorrhoids.—N. J. Simmons, *New Engl. J. Med.*, i/1938, 527.

HYDROCELES, providing they are primary and have not been caused by some lesion of the testicle, react well to aspiration and subsequent injection of 2 ml. of a 5% solution of sodium morrhuate.—David Levi, *Practitioner*, i/1936, 506.

Drain off all the fluid after first anæsthetising with 2% Novocaine. Wash out the sac with 5 to 10 ml. of distilled water to remove albuminous fluid adhering to the walls of the sac. Examine the testicle—only if it is normal in size and shape is injection indicated. Then inject from 2 to 5 ml. of 5% sodium morrhuate; the amount required varies with the size and duration of the hydrocele and the consistency of its walls. After injection the scrotum should be actively massaged for 2 or 3 minutes so that the fluid is distributed as a coating over the walls of the sac. The puncture is sealed with collodion gauze and a scrotal support fitted. In carefully chosen cases one can safely predict 80% of cures. The likely failures are the very long-standing thick-walled sacs.—A. E. Porritt, *Med. Pr.*, ii/1936, 27.

VARICOSE VEINS. The most popular injection for varicose veins at St. Mary's Hospital is a 5% solution of sodium morrhuate in 0.5% phenol; 13,000 ml. of this solution was made during 1935.—C. M. Wilson, *Practitioner*, i/1936, 653.

Sodium morrhuate is definitely dangerous for intravenous injection. A case of sudden death in an elderly woman has been reported following injection of 2 ml., and other fatalities are reported in the literature.—David Levi, *Practitioner*, i/1936, 506.

Sodium morrhuate for veins not entirely free from danger.—A. H. Winchester, *Brit. med. J.*, ii/1930, 120. Urticiform wheals with pain for a week.—T. H. Treves-Barber, *ibid.*, 60, 195.

Sodium morrhuate thought to lead at times to immediate thrombus formation.—Reginald Payne, *Brit. med. J.*, i/1932, 237.

Sodium morrhuate must owe its very wide popularity as a sclerosing agent to the frequency with which 0.5 ml. may be spilled in perivenous tissues without subsequent trouble. Of the three agents, morrhuate, quinine, and salicylates, morrhuate is by far the least locally harmful, and experimental evidence suggests it is the most efficient. Its chief disadvantage is the occurrence in certain patients of morrhuate sensitivity. There may be immediate and profound collapse; more often this sensitivity is shown by a diffuse eczematoid skin reaction which itches intensely and lasts 2 or 4 weeks. Morrhuate sensitivity may be found in about 5% of cases.—P. Clarkson, *Lancet*, ii/1938, 69.

Three cases of severe allergic reaction, one of which came near to a fatal outcome.—G. A. Holland, *Canad. med. Ass. J.*, ii/1939, 262.

Injectio Sodii Morrhuatidis (B.P.C.).

Dose.—8 to 75 minims (0.5 to 5 ml.) intravenously.

Sodium morrhuate 5, alcohol 90%, 1, water to 100.

Solutions for injection should only be made from sodium morrhuate that answers the B.P.C. test for solubility. The addition of benzyl alcohol is more effective than the addition of ethyl alcohol, and if solutions are buffered at pH 9.6 they clear readily on gently warming. The following formula is suggested: sodium morrhuate 5 g., benzyl alcohol 2 ml., boric acid 0.31 g., sodium hydroxide 0.085 g., water to 100 ml. Dissolve the sodium morrhuate with gentle warming in a solution of the boric acid and sodium hydroxide in about 80 ml. of water. Cool, add the benzyl alcohol, shaking well until dissolved, adjust to volume and filter. It may be sterilised by autoclaving at 120° for thirty minutes.—G. W. G. Smithers, *Quart. J. Pharm.*, 1938, 536.

Varicane (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Solution of sodium morrhuate 5% and 10% for varicose vein injection.

See also quinine and urethane, sodium chloride, and sodium salicylate for other sclerosing agents for varicose veins.

Oleum Hippoglossi (B.P. Add. II).

Dose.—1 to 5 minims (0.06 to 0.3 ml.), approximately equivalent to 1500 to 7500 units of vitamin A.

The fixed oil extracted from the fresh or suitably preserved liver of the halibut *Hippoglossus vulgaris*. A pale to golden yellow liquid with a fishy odour and taste.

Soluble slightly in alcohol 90%, and miscible with ether, chloroform and light petroleum.

The oil is particularly rich in vitamin A, but the vitamin content of the natural oil varies widely (*for details see Vol. II*). *B.P. Add. II* requires a content of not less than 30,000 units of vitamin A activity per gramme. For commercial purposes the oil is adjusted by admixture with weaker oil or with a vegetable oil, and vitamin D is added so that the content of this vitamin, which varies between 2500 and 3000 units per g. bears a definite relationship to that of good cod-liver oil.

Halibol (*Allen & Hanburys, London*). Halibut-liver oil with added vitamin D. Vitamin A 60,000 i.u. and vitamin D 10,000 i.u. per g. *Dose*.—2 to 4 drops twice or thrice daily after food. Also supplied in 3 m. capsules either plain, or as **Halibol-B**, containing the addition of vitamins B₁ and B₂, equivalent to 5 gr. of yeast, or as **Halibol-Calcium**, containing the addition of calcium-sodium lactate 5 gr. **Halibol Malt** is extract of malt with halibut-liver oil, containing twice the proportions of vitamins A and D present in extract of malt with cod-liver oil *E.P.*

Haliborange (*Allen & Hanburys, London*) is a mixture of Halibol and concentrated orange juice. *Dose*.—1 to 8 drachms daily, according to age.

Haliver Oil Plain (*Abbott Laboratories, London*). Halibut-liver oil containing vitamin A 50,000 i.u., and vitamin D 850 i.u. per g. **Haliver Oil with Viosterol** is halibut-liver oil with viosterol, and contains vitamin A 50,000 i.u., and vitamin D 10,000 i.u. per g. **Haliver Malt with Viosterol** contains Haliver oil, viosterol, calcium, phosphorus, liver extract and malt.

Halidexol (*Crookes Laboratories, London*). Halibut-liver oil emulsion. Each teaspoonful contains 6200 i.u. vitamin A, 220 i.u. vitamin D.

Halimalt (*Crookes Laboratories, London*). Halibut-liver oil in malt extract. Each teaspoonful contains 4300 i.u. vitamin A, and 420 i.u. vitamin D.

Haliverol (*Parke, Davis, London*). Halibut-liver oil with added vitamin D. The vitamin D potency is stated to be 250 times and the vitamin A potency 60 times, that of cod-liver oil. *Dose*.—3 to 5 minims three times a day. Children 5 to 10 minims daily. Also available in capsules.

Halivitan (*Richter, London*). Halibut-liver oil preparations. Liquid contains 40,000 i.u. of vitamin A per ml. *Dose*.—5 to 10 m. thrice daily. Tablets contain 4000 i.u. of vitamin A in each. *Dose*.—1 or 2 tablets thrice daily.

Halivite (*Scott & Bowne, London*). Halibut-liver oil in pills and liquid.

Halycalcyne (*Crookes Laboratories, London*). Halibut-liver oil with calcium phosphate. A useful adjunct in treatment of chilblains and for dental caries.

Halycitrol (*Crookes Laboratories, London*). Halibut-liver oil, orange juice and glucose.

Nadola (*Parke, Davis, London*). Standardised preparations of vitamins A and D from halibut-liver and other fish-liver oils. Available as liquid, containing 55,000 i.u. of vitamin A and 5500 i.u. of vitamin D per g., and as capsules, each containing 9400 i.u. of vitamin A and 940 i.u. of vitamin D. *Dose*.—1 capsule (6 minims), or more, daily.

Oleum Percomorphum (*Mead, Johnson, Evansville, U.S.A.; Brooks & Warburton, London*). A mixture of the liver oils of various species of *percomorphi*, which is 100 times richer than cod-liver oil in vitamins A and D. Supplied in capsules and liquid.

Super-D Oil (*Crookes Laboratories, London*). Natural fish oils from fish of the order Scombridae, containing approximately 50,000 i.u. per g. of both vitamins A and D.

Vitapan (*Paines & Byrne, London*). Halibut-liver oil standardised to contain 35,000 i.u. of vitamin A and 7,500 i.u. of vitamin D per gramme. Supplied in perles and liquid. **Vitapan Co. Tablets** contain Vitapan $\frac{1}{2}$ m., parathyroid $\frac{1}{10}$ gr., and calcium glycerophosphate. **Vitapex Liquid** contains 35,000 i.u. of vitamin A and no vitamin D. Also supplied in capsules.

Mutton Bird Oil, the oil of the young sooty petrel, collected on the Stewart Island, south of New Zealand, has been advocated as a substitute for cod-liver oil in phthisis and bronchitis.

With a rachitogenic diet 2% of cod-liver oil could be replaced by 1% mutton bird oil. The latter was superior in growth-promoting value but for bone calcification the cod-liver oil appeared to be more satisfactory. Mutton bird oil at the rate of $\frac{1}{4}$ % failed to prevent rickets.—per *Nutr. Abstr. Rev.*, Apl., 1936, 1151.

Various specimens of the oil estimated by colorimetric methods show the vitamin A content to be of a very low order, and it is therefore virtually useless as a medicinal source of vitamin A. Its vitamin D content is also very low.—per *J. Amer. med. Ass.*, ii/1939, 871.

PULMONARY TUBERCULOSIS. A 33% emulsion recommended. Administration of the oil is stated to give very gratifying results. Description of the mutton bird (*Puffinus sp.*).—J. H. Blackburn, *Brit. med. J.*, ii/1936, 949.

An emulsion of mutton bird oil has been found to give good clinical results in pulmonary tuberculosis, there being increased weight, loss of cough, diminished sputum, and a general improvement. 100 patients treated.—J. H. Blackburn, *Brit. J. Tub.*, 1937, 285, per *Practitioner*, i/1938, 329.

Whale Oil. The oil obtained by boiling with water, the blubber of various species of *Balaena*. The best quality, known as Whale Oil No. 0, is of a pale yellow colour with a faintly fishy odour. The term "train oil," formerly applied to whale oil is now extended to the oil from the blubber of any marine animal, including seals.

Uses. Whale oil is used as a solvent for vitamins in medicinal preparations, for soap-making and as a burning oil. Hydrogenated whale oil is used in margarine manufacture.

OLEUM OLIVÆ

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

The oil expressed from the ripe fruit of *Olea europæa* (Oleaceæ).

Inferior brands are obtained by addition of the pulped fruit to boiling water and by fermentation processes. The *B.P.* requires an acid value of not more than 2.0, but permits the use of an oil having an acid value of not more than 6.0 in making official liniments, ointments and plasters.

Uses. Internally, olive oil is nutrient, demulcent and mildly laxative. It retards the flow of the gastric juice and is an excellent food in gastric and duodenal ulcer, being given either by the mouth or by stomach tube. It often gives relief to patients suffering from cholecystitis, from 2 to 8 fl. oz. being taken in divided doses during the day. As a laxative, from 4 to 8 fl. oz. are taken daily. It may also be given by rectal injection (5 to 20 fl. oz. warmed to about 90°F) in chronic constipation and to remove impacted faeces. Chronic colitis has been treated by retention enemas of 8 to 10 fl. oz. of the warm oil, continued nightly for a fortnight.

Externally, olive oil is emollient and soothing to inflamed surfaces, and is employed to soften the skin and crusts in eczema and psoriasis, and as a lubricant for massage. It has also been

employed as a protective to burns, but its use in this manner is condemned, since it facilitates bacterial growth.

In preparing emulsions of olive oil of low acid value for external use, *e.g.*, with lime water, a few drops of oleic acid may be necessary in order to produce sufficient calcium oleate to act as emulsifying agent.

A tablespoonful flavoured with peppermint before meals of value in digestive disorders and heartburn.—W. Morrell Roberts, per *Lancet*, i/1931, 537.

Emulsio Olei Olivæ (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 ounce (8 to 30 ml.). Contains 50% of olive oil.

Enema Olei Olivæ (B.P.C.). *Dose.*—20 ounces (600 ml.). 20% v/v in mucilage of starch. Undiluted, 5 to 20 ounces (150 to 600 ml.).

Enema Oleosum (L.H.). Olive oil 4, soft soap 1, warm water 16.

Huile d'Olive Neutralisée et Sterilisée (Fr. Cx.). Olive oil warmed with a sufficient quantity of sodium carbonate to neutralise it, and filtered. It is used in the preparation of oil solutions for injection, and before use must be heated to 135° to 140°.

Unguentum Aquosum (B.P.).

Distilled water 24, borax 1, olive oil 50, with white beeswax and white soft paraffin.

B.P. Add. II allows the use of either arachis, cottonseed or sesame oil instead of olive oil in making hydrous ointment.

Oleum Maydis (U.S.P. XI). Syn. CORN OIL.

The refined oil expressed from the germ of *Zea Mays* (Gramineæ). A light yellow oil slightly soluble in alcohol, miscible in all proportions with ether, chloroform, benzene and light petroleum. Sp. gr. 0.914 to 0.921. In Australia it may be used as a substitute for olive oil in *B.P.* and *B.P.C.* formulæ.

Oleum Papaveris (Fr. Cx.). Syn. POPPY-SEED OIL, MAW OIL.

The refined oil obtained by cold expression from the seeds of *Papaver somniferum*. A light yellow liquid, odourless and possessing a faint almond flavour. It is a drying oil, and is **soluble** in chloroform, ether and light petroleum.

Uses. Poppy-seed oil is used in *Oleum Iodisatum*, and as a substitute for olive oil.

OLEUM RICINI

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

Dose.—1 to 4 drachms (4 to 16 ml.). Doses of 1 fl. ounce (30 ml.) are often administered. *U.S.P. XI* average dose 4 drachms.

Expressed from seeds of *Ricinus communis* (Euphorbiaceæ). Soluble about 1 in 3½ of alcohol 90%. Miscible with ether and glacial acetic acid. The seeds, but not the oil, contain the poisonous protein, ricin; the "press cake," therefore, is poisonous. The purgative action is due to the fatty acids, of which ricinoleic is a principal member.

Pharmaceutical oil, as distinct from soap-makers' and other industrial oil, does not deposit in cold weather.

Ricin. A vegetable toxin or toxalbumin, is tremendously potent. When small doses are injected hypodermically immunity is produced, antiricin being formed. This fact paved the way for the foundation of serum therapeutics. Ricin has two biological functions—one toxic, and the other antigenic. Potassium permanganate, hydrogen peroxide (30%), ozone, chlorine, bromine iodine and ultra-violet rays, all destroy the toxic properties without affecting the antigenic. Ricin partially oxidised by potassium permanganate, when injected into rabbits, develops in them so great an immunity against untreated ricin that after 2 or 3 weeks they are able to receive 100 to 120 times the normal lethal dose, and 0.25 ml. of serum from these rabbits protects mice against a fatal dose of ricin.

Flavouring. May be prescribed as *Oleum Ricini Aromaticum*, or with 2 dr. of *Tinctura Cardamomi Composita* to the ounce, or in capsules.

Uses. A mild but effectual purgative. Especially valuable in acute diarrhoea, particularly when due to food poisoning. Small repeated doses may be given in the intestinal colic of children. It is rendered more efficacious when mixed with an equal quantity of glycerin. Castor oil is a soothing application to the conjunctiva and allays irritation due to foreign bodies in the eye. It is also employed for making solutions of alkaloidal bases for ophthalmic purposes.

Prolonged inhalation of the vapour of castor oil produces a purgative effect. It is generally known among flying officers that the fumes from rotary engines using pure castor oil as a lubricant keep the bowels open.—G. G. Macphree, *Brit. med. J.*, ii/1934, 1045.

Emulsio Olei Ricini Aromatici (B.P.C.).

Dose.—1 to 2 ounces (30 to 60 ml.). Contains 30% v/v of aromatic castor oil.

Enema Olei Ricini (B.P.C.).

Dose.—20 ounces (600 ml.). 10% v/v in 5% w/v aqueous soft-soap solution. 20% v/v in mucilage of starch or olive oil is also used, in doses of 10 oz.

Mistura Olei Ricini (B.P.C.).

Dose.—1 to 2 ounces (30 to 60 ml.).

An emulsion containing 3 dr. of castor oil per oz.

Oleum Ricini Aromaticum (B.P.C.).

Dose.—1 to 8 drachms (4 to 30 ml.).

Castor oil flavoured with vanillin, saccharin, chloroform and oils of cinnamon, clove and pimento. Should be recently prepared.

Unguentum Olei Ricini Compositum (L.H.). *Syn.* BURN OINTMENT.

Zinc oxide 1, yellow soft paraffin 2, hydrous wool fat 2, castor oil 3.

Magnesi Ricinoleas **Dose.**—1 to 4 drachms (4 to 16 g.).

A white powder, employed as a solid form of castor oil in powders, or pills.

Sodii Ricinoleas. *Prop. Name.* SORICIN (*W. S. Merrell, Cincinnati; Squire, London*).

The sodium salt of ricinoleic acid. A powerful detoxifying agent. Solution in water suitably flavoured is used as a mouth wash, and a paste of sodium ricinoleate 1 and white soft paraffin 3 is used in dentistry.

Uses. Sodium ricinoleate lowers surface tension and adsorbs bacterial toxins. Is used as an antiseptic. For oral use in the

treatment of pyorrhœa, a 1 to 4% solution is used, the solution being syringed into pyorrhœal pockets and allowed to remain a few minutes. Is also of value in gingivitis and Vincent's angina.

The antiseptic activity, although marked is limited to certain bacteria. Intestinal bacilli are resistant to all soaps and are unaffected. Bacilli found in respiratory organs and in the buccal mucous membrane are susceptible. Meningococcus, Pfeiffer's bacillus, diphtheria bacillus, tubercle bacillus, and *Brucella abortus* are destroyed. Streptococci are rapidly killed but staphylococci are unaffected, as also are moulds and yeasts.—H. Violle, *C. R. Acad. Sci., Paris*, 1933, 197, 714.

ACUTE GINGIVITIS. Trichloroacetic acid as a strong caustic leaves the gums in a weakened condition and liable to further infection. Sodium ricinoleate is better—probably acts by adsorption into the toxin molecule. Apply 33% of yellow variety, or 9% of white to the dried sockets. Follow with hot potassium chlorate and carbolic mouth wash.—J. Wheatley, *per Pharm. J.*, ii/1931, 227.

VARICOSE ULCERS are treated by the injection of a 5% solution of sodium ricinoleate into the largest vein proximal to the ulcer. A culture from the ulcer should previously be obtained and a Wassermann test made. After the injection an elastic adhesive bandage is applied by the Dickson Wright method. After two weeks another injection is made and the bandage re-applied. The treatment is repeated if necessary after one month.—S. Gordon, *Canad. med. Ass. J.*, 1940, 4.

VARICOSE VEINS. In persons whose varicosities were resistant to other sclerosing agents, or which recurred after the administration of other sclerosing agents, an excellent end-result after the use of sodium ricinoleate, employing from 1 to 4 ml. of a 2% solution. Reactions and pain less than with other sclerosing solutions. Repeated injections of from 1 to 3 ml. at different levels of the varicose veins is preferable to the injection of a larger amount at one injection.—F. M. Postlethwaite, *per J. Amer. med. Ass.*, ii/1936, 1505.

Jelopar (Research Products, London). Nasal jelly containing sodium ricinoleate, menthol, hexylresorcin, rosettol and liquid and soft paraffin. In catarrh, etc. Lodynic is a preparation of similar composition for use as a nasal spray.

[P1] **Oleum Crotonis (B.P.C., P. Helv. V, Fr. Cx.).** *Syn.* OLEUM TIGLII.

[P1] "*Croton, oil of.*"

Dose.— $\frac{1}{2}$ to 1 minim (0.03 to 0.06 ml.). *Fr. Cx.* gives max. during 24 hours 0.1 g. (= 2 minims nearly). Expressed from seeds of *Croton Tiglium* (Euphorbiaceæ). A yellow to brownish viscid liquid with nauseating odour and acrid taste.

Soluble in ether and in olive oil. Activity is due to croton-resin, a powerful irritant and vesicant.

Antidotes. Empty stomach by emetic or stomach tube. Keep patient lying down and warm. Give demulcent drinks freely. Stimulants, e.g., brandy $\frac{1}{2}$ oz., or aromatic spirit of ammonia $\frac{1}{4}$ dr., in water; spirit of camphor, 10 m. in milk, repeated. Tincture of opium by mouth to check the diarrhœa and relieve pain. Saline infusion.

Uses. The oil is a powerful skin irritant; it will blister and even cause suppuration and scarring. Internally it is so violent a purgative that it is rarely given except to lunatics for obstinate constipation, and in cases of apoplexy (1 or 2 drops placed on the back of the tongue). If used in this manner it must be diluted with sugar or butter to prevent local inflammation. It should never be given to children, pregnant women, or feeble subjects, and is contraindicated in the presence of hæmorrhoids and inflammatory conditions of the stomach and intestines.

[P1] **Linimentum Crotonis** (B.P.C.) contains 12% *v/v* of the oil with oil of cajuput and alcohol 90%.

Well diluted may stimulate growth of hair on bald patches. Also used as a counter-irritant, but may produce excessive inflammation.

Oleum Elliott, so-called to distinguish from croton oil, is obtained from the seeds of *Croton Elliottianus*. Dose.—1 to 3 minims, in capsules. A potent aperient.

OPIUM

B.P., U.S.P. XI, Fr. Cx., etc.

Syn. GUM OPIUM, RAW OPIUM.

[D] "**Raw Opium** (see p. 1133); **prepared opium** (see p. 1133); **medicinal opium**."

NOTE.—*The Dangerous Drugs Act, 1925, section 4 (1) defines medicinal opium as raw opium which has undergone the processes necessary to adapt it for medicinal use in accordance with the requirements of the British Pharmacopœia, whether it is in the form of powder or is granulated or is in any other form, and whether it is or is not mixed with neutral substances.*

[P1] "**Opium**."

[S1] "**Opium except substances containing less than 0.2% of morphine calculated as anhydrous morphine**."

[S6] "**Opium—specify the proportion of morphine contained in the preparation**."

See also Morphine.

The inspissated juice obtained by incision of the capsules of *Papaver somniferum* (Papaveraceæ). Only the older pre-monopoly forms of the Turkey and European varieties are included in the B.P. description. Manipulated forms of Turkey, Yugoslavian and Bulgarian opium are now imported and are suited for pharmacy. Other varieties, including Iranian and Afghanistan, are used chiefly for morphine manufacture. Indian opium is still produced but is not now available in Great Britain.

The B.P. requires opium in its moist state, as imported, to contain not less than 9.5% of anhydrous morphine. When Opium is prescribed Opium Pulveratum must be dispensed. Fr. Cx. requires 10% of morphine on the drug dried at 60°. I.A. requires 10%. Opium (U.S.P. XI) in its normal moist condition contains not less than 9.5% of anhydrous morphine. The standards are extremely low, and opiums containing such small proportions would now be regarded as being of very inferior quality. A more reasonable minimum standard for the morphine content of raw opium would be 12%.

Incompatible with vegetable astringents, alkaline carbonates, salts of mercury, iron, lead and zinc.

Antidotes. Treat as for poisoning by morphine, see p. 697.

Uses. Opium has the same therapeutic indications (and contraindications) as morphine, but its action is exerted less rapidly owing to its slower absorption, and it is more liable to upset digestion and cause constipation. This constipating action, however, renders it of great value in the treatment of diarrhoea and for the relief of intestinal, biliary, and renal colic. Morphine has a more rapid and potent anodyne action than opium, and the latter is employed for the slighter degrees of pain and to induce sleep, though it should not be employed for chronic insomnia. On the other hand, opium is more diaphoretic than morphine and is of value in conjunction with ipecacuanha (as in Dover's powder) in the early stages of a cold. Dover's powder is also the ideal medicament for a dry useless cough, the opium depressing the cough reflex and the ipecacuanha acting as an expectorant.

Opium is used externally in the form of the liniment in rheumatism and neuralgia, and in the form of ointment or suppositories for rectal conditions, but it exerts no action on the peripheral nerve endings, and its use in this manner is irrational.

Opium addiction is seldom met with in this country, though it is common in the East; treatment is the same as for morphine addiction (*q.v.*).

[P1-81] **Emplastrum Opii** (*B.P.* 1898). 1 in 10 of resin plaster (*exempt* [D]). [P1-81] *Fr. Cx.* has opium extract 1, elemi 1, diachylon plaster with gum (*Fr. Cx.*) 2 (*exempt* [D]). For preparations of similar composition also *exempt* [D], see p. 1140.

[P1] **Enema Opii** (*B.P.C.*). *Dose.*—2 to 4 ounces (60 to 120 ml.). Tincture of opium 0.5 to 6% *v/v* in mucilage of starch.

[D-P1-81] **Extractum Opii Liquidum** (*B.P.C.*).

Dose.—5 to 30 minims (0.3 to 2 ml.).

Contains 0.75% *w/v* of morphine.

[D-P1-81] **Extractum Opii Siccum** (*B.P.*). *Syn.* EXTRACTUM OPII AQUOSUM (*I.A.*), EXTRACTUM OPII (*P. Austr.*, *P. Helv.* V, *P. Belg.* IV, *P. Hung.*, *P.G. VI*, *P. Ned.* V, *P. Ital.* V, *F.E. VIII*).

Dose.— $\frac{1}{2}$ to 1 grain (0.016 to 0.06 g.). 1 grain contains $\frac{1}{2}$ grain of morphine. Standardised to 20% of morphine.

Fr. Cx. has a firm extract of similar strength with max. single dose 1 $\frac{1}{2}$ grains; max. in 24 hours 5 grains approximately.

[P1] **Linctus Scillæ Compositus** (*B.P.C.*). *Syn.* LINCTUS SCILLÆ OPIATUS, GEE'S LINCTUS, LINCTUS CAMPHORÆ COMPOSITUS (*K.C.H.*, *P.E.H.C.* (not for children), *St. G.H.*), LINCTUS SEDATIVUS (*St. T.H.*). *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Camphorated tincture of opium, oxymel of squill, and syrup of tolu, equal parts.

[P1] **Linctus Tolu cum Opio** (*Brompton H.*), Linctus Camphoræ Compositus (*L.H.*), and Linctus Scillæ et Tolu (*W.H.*), *syn.* LINCTUS SCILLÆ CO., use syrup of squill in place of oxymel in preceding.

[P1] **Linctus Opiatus** (*C.X.H.*). Tincture of opium 2 m., oxymel of squill 20 m., dilute sulphuric acid 5 m., treacle 20 m., water to 1 dr.

[P1] **Linctus Scillæ** (*St. M. H.*). Oxy-mel of squill $\frac{1}{2}$ dr., camphorated tincture of opium 15 m., honey to 1 dr.

[P1] **Linctus Scillæ Compositus** (*U. C. H.*) contains oxy-mel of squill $\frac{1}{2}$ dr., camphorated tincture of opium 10 m., tincture of ipecacuanha 5 m., mucilage of acacia to 1 dr.

[P1-S1] **Linimentum Opii** (*B. P. C.*).

Tincture of opium 1, liniment of soap 1; filter after a few days (*exempt* [D]). For preparations of similar composition also *exempt* [D], see p. 1140.

[D-P1-S1] **Liquor Opii Sedativus** (*B. P. C.*).

Dose.—5 to 30 minims (0.3 to 2 ml.).

Contains 1% *w/v* of anhydrous morphine, or about $\frac{1}{3}$ grain in 30 minims.

[P1] **Mist. Acid. c. Opio** (*N. I. F.*).

Aromatic sulphuric acid 10 m., liquid extract of opium 5 m., water to $\frac{1}{2}$ oz.

[P1] **Mistura Opii et Glycyrrhizæ Composita** (*U. S. P. XI*). *Syn.* BROWN MIXTURE. *Average dose.*—1 drachm (4 ml.).

Fluidextract of liquorice 12, potassium antimonytartrate 0.024, camphorated tincture of opium 12, spirit of ethyl nitrite 3, glycerin 12, in water to 100.

[P1] **Mistura Sodæ cum Opio** (*St. M. H.*). Tincture of opium 3 m., dilute hydrocyanic acid 2 m., sodium bicarbonate 6 gr., water to 1 oz.

[D-P1-S1] **Opium Pulveratum** (*B. P.*, *P. Belg. IV*, *P. Ital. V*, *P. Helv. V*). *Syn.* PULVIS OPII.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.). 3 grains contains $\frac{3}{10}$ grain of morphine.

Consists of opium dried at a moderate temperature, reduced to a fine or moderately fine powder and adjusted by the addition of lactose to contain 10% of anhydrous morphine.

U. S. P. XI includes **Opium Granulatum**, in No. 16 powder approx., and **Opium Pulveratum**, in very fine powder. Both contain 10 to 10.5% of anhydrous morphine.

[D-P1-S1] **Pilulæ Saponis cum Opio** (*B. P. C.*). *Syn.* PILULÆ SAPONIS COMPOSITÆ. *Dose.*—1 or 2 pills.

Each pill contains $\frac{3}{4}$ gr. of powdered opium and about 1 gr. of hard soap.

[P1-S1] **Pulvis Cretæ Aromaticus cum Opio** (*B. P.*).

Dose.—10 to 60 grains (0.6 to 4 g.). 60 grains contains about $\frac{1}{2}$ gr. of anhydrous morphine.

Contains opium 2½% in **Pulvis Cretæ Aromaticus** (*exempt* [D]). Tablets each contain 5 grains (0.3 g.).

[D-P1-S1] **Pulvis Opii Compositus** (*B. P. C.*).

Dose.—5 to 15 grains (0.3 to 1 g.).

Contains 10% of powdered opium with black pepper, ginger, caraway and tragacanth.

Note. **Pulvis Opii Compositus** (*P. Ned. V*) is Dover's powder.

[P1] **Sirop Diacode** (*Fr. Cx.*) contains tincture of opium 1% *w/v* in simple syrup. [P1] **Sirop d'Opium** contains 5%.

[P1] **Syrupus Camphoræ Compositus** (*B. V. H.*). *Dose.*—1 teaspoonful, containing tincture of opium about 1 m., vinegar of ipecacuanha 3½ m., and vinegar of squill 1½ m.

Camphor 30 gr., oil of anise 30 m., benzoic acid 45 gr., glacial acetic acid 1½ oz., tincture of opium 2½ oz., vinegar of squill 10 oz., vinegar of ipecacuanha 10 oz., sucrose 7 lb., burnt sugar *q. s.*, water to 1 gallon.

[D-P1-81] Tinctura Opii (B.P.). *Syn.* LAUDANUM, TINCTURA THEBAICA.

Dose.—5 to 30 minims (0.3 to 2 ml.). 30 minims contains $\frac{1}{4}$ grain of morphine.

Prepared by macerating opium in boiling distilled water to which alcohol is added after 6 hours. Contains 1% *w/v* of anhydrous morphine. *P. Ned. V*, *P. Hung.*, *P. Belg. IV* and *P. Ital. V* contain 1% of morphine, made with 70% alcohol. *P. Helv. V* is made with 5% of extract of opium, using 20 of alcohol 95% and 70 of water. *Fr. Cx.* and *F.E. VIII* dissolve 1 g. of opium extract in 19 g. of alcohol 70% to produce the same strength.—*Max. single dose* 35 minims; *max. during* 24 hours 110 minims approximately. *I.A.* requires 10% strength by percolation with alcohol 70% and 1% morphine.

[D-P1-81] Tinctura Opii (U.S.P. XI). *Syn.* TINCTURE OF DEODORIZED OPIUM. *Average dose.*—10 minims (0.6 ml.).

Granulated opium exhausted with water, the product evaporated, boiled for 15 minutes and allowed to stand overnight; the mixture is then heated to 80° and treated with hard paraffin; on cooling, the paraffin is removed and washed and the filtrate adjusted to volume with water, alcohol added and the product diluted with a mixture of alcohol and water so that the final tincture contains 1% of anhydrous morphine.

[P1] Tinctura Anticholerica Conradi. *Syn.* CONRAD'S KOLERADRAABER.

Dose.—Over 20 years, 40 drops; over 5 years, 1 drop for each year. Must not be given to a child under 5 years.

Tincture of opium 1, tincture of cascarrilla and camphorated spirit of ether, of each 2, bitter tincture of rhubarb 5.

[P1] Tinctura Thielemanni (P. Svec. X). *Syn.* THIELEMANN'S KOLERA-DRABER. *Dose.*— $\frac{1}{2}$ drachm (2 ml.).

Oil of peppermint 3, alcohol 90% 22, tincture of opium with saffron 10, tincture of ipecacuanha 25, ethereal tincture of valerian 40.

[P1] Tinctura Opii Ammoniata (B.P.C.). *Syn.* SCOTCH PAREGORIC.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 10% *v/v* of tincture of opium (equivalent to 0.1% of anhydrous morphine), 20% *v/v* of dilute solution of ammonia with oil of anise and benzoic acid. One ounce contains approximately $\frac{1}{4}$ grain anhydrous morphine.

[P1] Gasman's Drops. *Liq. Ammon. Fort.* 10 m., *Tinct. Capsici* 10 m., *Tinct. Opii* 60 m., *Aq. Chlorof.* ad 8 oz.

[P1] Tinctura Opii Camphorata (B.P.). *Syn.* TINCTURA OPII BENZOICA (*I.A.*), TINCTURA CAMPHORÆ COMPOSITA, PAREGORIC, PAREGORIC ELIXIR, ELIXIR PARÉGORIQUE (*Fr. Cx.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 drachm contains about $\frac{1}{37}$ grain of anhydrous morphine.

Tincture of opium 5% *v/v*, with benzoic acid, camphor and oil of anise in alcohol (60%). Contains 0.05% *w/v* of morphine.

Fr. Cx., *P.G. VI*, *P. Belg. IV*, *F.E. VIII*, and *P. Ned. V* have 0.05% of morphine, but amounts of the other ingredients differ. *P. Jap.* has 1 of opium in 200.

Tinct. Camph. Co. of the *Portuguese Pharmacopœia* is a **[D-P1-81]** liniment containing 20 times as much opium as the British tincture.

[P1] Tinctura Opii Camphorata (U.S.P. XI). *Average dose.*—60 minims (4 ml.).

Tincture of opium 4, oil of anise 0.4, benzoic acid 0.4, camphor 0.4, glycerin 4, in sufficient diluted alcohol to produce 100. Strength 0.035 to 0.045% *w/v*

of anhydrous morphine. It may also be prepared from powdered opium by a five-day maceration.

[P1] *Mist. Camph. Co. (N.I.F.)*. Camphorated tincture of opium 15 m., strong solution of ammonium acetate 15 m., tincture of ipecacuanha 6 m., potassium nitrate 5 gr., ammonium carbonate $1\frac{1}{2}$ gr., water to $\frac{1}{2}$ oz.

[D-P1-81] *Tinctura Opii Crocata (B.P.C., I.A.)*. *Syn.* SYDENHAM'S LAUDANUM. *Dose.*—5 to 30 minims (0.3 to 2 ml.).

Contains 1% w/v of anhydrous morphine (about $\frac{1}{3}$ grain in 30 minims) with clove and cinnamon, and tinted with saffron.

P.G. VI, F.E. VIII, P. Belg. IV, P. Ned. V, P. Helv. V, Fr. Cx. approximate this.

[P1-81] *Tabellæ Pulveris Ipecacuanhæ et Opii (B.P.C.)* contain 5 gr. (0.3 g.) (*exempt* [D]). For tablets of similar composition also *exempt* [D], see p. 1141.

[P1] *Trochisci Sedativi (T.H.)* contain $\frac{1}{10}$ gr. of extract of opium with fruit basis.

[D-P1-81] *Vinum Opii Crocatum*, as used in Thielemann's Koleradraaber (*q.v.*), in Norway, has the composition:—Opium powder 15, cinnamon 1, clove 1, saffron 5, Malaga wine 150.

[D-P1-81] *Koptalgos (Duncan Flockhart, Edinburgh)*. Denarcotised preparation of opium containing 0.375% of morphine. *Dose.*—5 to 40 m. in place of the tincture.

[D-P1-81] *Liquor Opii Sedativus "Battley" (Allen & Hanburys, London)*. A liquid preparation of opium containing 1 gr. of anhydrous morphine per dr. *Dose.*—5 to 10 minims.

[D-P1-81] *Nepenthe (Ferris, Bristol)*. A liquid preparation of opium containing 0.84% of anhydrous morphine (about 1 gr. in 130 minims).

[D-P1-81] *Somnigen (Hewlett, London)*. Dialysed solution of the hydrobromides of the alkaloids of opium in sherry, containing 0.75% w/v of anhydrous morphine. *Dose.*—5 to 40 m.

[D-P1-81] *Papaveretum (B.P.C.)*. *Syn. and Prop. Names.* OPIUM CONCENTRATUM (*P.G. VI*), EXTRACTUM CONCENTRATUM OPII (*Fr. Cx.*).

Dose.— $\frac{1}{4}$ to $\frac{1}{2}$ grain (0.01 to 0.02 g.); $\frac{1}{12}$ to $\frac{1}{4}$ grain (0.005 to 0.01 g.) by injection. *P.G. VI* has max. single dose $\frac{1}{2}$ grain; max. in 24 hours $1\frac{1}{2}$ grains.

The total or principal alkaloids of opium as hydrochlorides, adjusted to contain 50% morphine. *P.G. VI* gives elaborate instructions for preparation.

Soluble about 1 in 15 of water; less soluble in alcohol.

Uses. Papaveretum is less toxic than morphine and is better tolerated; it has a less depressant action on the respiratory centre, is less constipating and rarely causes vomiting. It has been recommended for use in place of opium, since it may be injected hypodermically, and it may be used in all cases in which morphine or opium is indicated.

[D-P1-81] *Tabellæ Papavereti (B.P.C.)* contain $\frac{1}{2}$ gr. (0.01 g.).

[D-P1-81] *Hydrochlorates Alcaloideorum Principalium Opii (P. Ned. V)*. *Syn.* OPIALUM, OPIAL. *Dose.*—Max. *per os* per diem 3 grains (0.2 g.), 2 grains (0.12 g.) by injection.

Contains narcaine hydrochloride 1, thebaine hydrochloride 2, codeine hydrochloride 2.5, papaverine hydrochloride 4, narcotine hydrochloride 30, morphine hydrochloride 50, and sodium chloride 10.5%.

[D-P1-81] **Opialum** (*P. Helv. V*) is similar, but contains 24.5% of narcotine hydrochloride and 66% of morphine hydrochloride, with no sodium chloride. There is less danger of toxic effects than from opium, as smaller quantities can be given.

Preferable to morphine as a sedative during first stage of labour. It may be administered orally or by injection in a dose of $\frac{1}{4}$ gr., the injection being supplemented by 2 ml. of 50% solution of magnesium sulphate intramuscularly and repeated 2-hourly for two succeeding doses, according to Gwathmey's technique. Administration of morphine should be withheld until the cervix will admit three fingers, or the patient is not helped by potassium bromide and chloral hydrate.—L. McIlroy and H. Rodway, *J. Obstet. Gynec.*, 1933, 1175.

[D-P1-81] **Alopon** (*Allen & Hanburys, London*). Preparations of papaveretum available as powder, oral tablets (containing $\frac{1}{4}$ gr.), solution (2%), ampoules ($\frac{1}{4}$ or $\frac{1}{2}$ gr. per ampoule) and hypodermic tablets ($\frac{1}{4}$ gr.). Also supplied in ampoules with atropine or hyoscine.

[D-P1-81] **Omnopon** (*Roche Products, Welwyn Garden City*). Preparations of papaveretum available as powder, oral tablets (containing $\frac{1}{4}$ gr.), hypodermic tablets ($\frac{1}{4}$ gr.) ampoules ($\frac{1}{4}$ gr. per ml.). Also supplied in ampoules with scopalamine in various strengths.

[D-P1-81] **Opioloid** (*Richter, London*). Tablets for oral use containing the alkaloids of opium, papaverine, codeine and $\frac{1}{2}$ gr. morphine hydrochloride. *Dose*.—1 or 2 tablets as required. Narcotic and sedative.

[D-P1-81] **Opoidine** (*Macfarlan, London*) and [D-P1-81] **Pavopin** (*T. & H. Smith, London*) are also preparations of papaveretum available in tablets and ampoules.

[P1] **Papaveris Capsula** (*B.P.C., Fr. Cx., P. Helv. V*). *Syn.* POPPY HEADS.

Note.—Fleurs de Coquelicot in France = poppy petals.

The dried fruits of *Papaver somniferum* before dehiscence has occurred. For making galenicals, the seeds are removed.

[P1] **Decoctum Papaveris et Anthemidis Forte** (*B.P.C.*). *Syn.* DECOCTUM PAPAVERIS ET ANTHEMIDIS CONCENTRATUM.

Contains 25% each of chamomile and poppy capsule in alcohol and water. Diluted with hot water it is used as a fomentation in neuralgia, peri-dental abscesses and gum-boils.

[P1] **Extractum Papaveris Liquidum** (*B.P.C.*). *Syn.* LIQUOR PRO SYRUPO PAPAVERIS.

Dose.—10 to 30 minims (0.6 to 2 ml.).

Contains about 0.17% of anhydrous morphine or about $\frac{1}{25}$ gr. in 30 m.

[P1] **Syrupus Papaveris** (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Liquid extract of poppy capsule 1 in 8 with syrup. Contains about $\frac{1}{25}$ gr. of morphine per drachm.

Rhœados Petalum (*B.P.C.*). *Syn.* RED-POPPY PETALS, COQUELICOT (*Fr. Cx.*). The fresh or dried petals of *Papaver Rhœas* (*Papaveracæ*).

Syrupus Rhœados (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). A solution of sucrose in an aqueous infusion of the dried petals. Used only as a colouring agent.

OVOLECITHINUM

B.P.C.

Syn. LECITHIN (*P. Ned. V, F.E. VIII*).

Dose.—Internally 3 to 8 grains (0.2 to 0.5 g.) preferably half an hour before meals. This dose may well be increased if it is digested, as an average egg contains 16 gr. approx. Is usually administered as the elixir or in pills.

Subcutaneously $\frac{1}{2}$ to 2 grains (0.05 to 0.12 g.) in sterile olive oil every second day.

A yellowish wax-like mass prepared from egg yolks by extraction with alcohol or ethyl acetate. When pure it consists of choline distearyl glycerophosphate, and is broken up by the pancreatic juice into glycerophosphoric acid, fatty acids and choline. It is a constituent of the brain 11%, and of yolk of egg 7%; milk (human, cows', etc.) contains varying amounts.

Soluble 1 in 30 of alcohol 90%, 1 in 5 of ether, and in chloroform, benzene, carbon disulphide and fatty oils. It combines with certain metals, e.g., copper.

Uses. Has been given in neurasthenia, various nervous diseases, diabetes, marasmus, tuberculosis, tabes and general paralysis, and in all diseases producing a disturbance of nutrition. It has also been employed in the withdrawal treatment of opium and morphine addiction (see p. 700). It is said to cause a marked increase in patient's weight, to improve the general well-being, and to augment the blood corpuscles, but since the ordinary diet furnishes an ample supply of lecithin and other phosphorus compounds, it is difficult to see how the small quantities employed can have any other than a psychic effect.

Elixir Ovocithini (B.P.C.). *Syn.* ELIXIR LECITHINI.

Dose.—1 to 4 drachms (4 to 16 ml.), half an hour before meals.

Contains 1 gr. of ovocithin per dr. in a lemon-flavoured basis.

Enema Ovi (B.P.C.).

Dose.—4 ounces (120 ml.). 1 or 2 yolks of egg in peptonised beef tea.

[P1-81] **Pilulæ Ovocithini (B.P.C.).** *Syn.* PILULÆ LECITHINI.

Dose.—1 to 4 pills. Contain $\frac{1}{80}$ gr. of strychnine and $1\frac{1}{2}$ gr. of ovocithin.

Bromlecithin (Richter, London). Described as a natural lecithin, containing 20% of bromine in tablets of $\frac{1}{2}$ gr. and $\frac{4}{3}$ gr. For anæmia, neurasthenia and hysteria. **Dose.**—1 to 2 tablets twice daily. **Iodolecithin** is a similar compound with 20% of iodine in place of bromine, in 4 gr. tablets and $1\frac{1}{2}$ gr. pills for arteriosclerosis, rickets and asthma. **Dose.**—1 tablet or 1 to 2 pills thrice daily.

Lecithinol (Richter, London). Emulsion of lecithin in ampoules, for administration in neurasthenia and malnutrition. **Dose.**—1 ml. injected 3 or 4 times weekly.

OXYGENIUM

B.P., U.S.P. XI, Fr. Cx.

O = 16.000.

Oxygen is obtained commercially by the rectification of liquid air by a process of fractional liquefaction, or by the electrolysis of water. It is of not less than 98% purity, and is sold compressed in cylinders, a common size containing the equivalent of 20 cubic feet (560 litres approximately).

Administration. Oxygen is administered in various ways, the most efficient but more elaborate methods being the "oxygen

chamber" and the "oxygen tent." A simpler method is the use of a mask or a nasal catheter, the gas being bubbled through hot water. Metal cylinders containing compressed oxygen should be fitted with a suitable reducing valve by which the rate of flow of the oxygen can be easily controlled. To avoid the possibility of explosion it is important that the reducing valve should be free from all traces of oil, and if the valve is of the rubber bellows type the tap of the reducer should always be opened before opening the main oxygen tap on the cylinder.

Uses. Oxygen inhalation is of great service in the treatment of anoxæmia, as in pneumonia, pulmonary œdema, anæmia, carbon monoxide poisoning, and the poisoning due to lung-irritant gases such as phosgene and chlorine. It is also of great value in respiratory failure due to post-operative pulmonary complications, and for resuscitation after partial drowning. Oxygen has little effect on the dyspnoea of cardiac disease or nephritis, but has been found of value in the treatment of emphysema and for the temporary relief of asthmatic attacks; in the latter condition it has recently been successfully employed in association with helium.

In acute anoxæmia the oxygen may be administered undiluted, but for continuous inhalation over long periods, as in pneumonia, the concentration should be maintained at about 50%, and never above 60%. The addition of 1% or more of carbon dioxide to oxygen stimulates the respiratory centre and causes deeper breathing, and such mixtures are often used for this reason; generally speaking, concentrations of carbon dioxide of 5% or more are dangerous, though they have been employed with beneficial effect in the treatment of coal-gas poisoning and post-operative collapse.

In congenital heart disease oxygen is of no avail; not indicated in cyanosis of cardiac origin, when lungs are comparatively clear. Chronic cyanosis of emphysema is temporarily relieved. Specially called for in acute pulmonary failure, together with inadequate ability for compensation by the heart and blood. Should be administered over hours or days.—*Per J. Amer. med. Ass.*, ii/1925, 1430.

Indications for oxygen therapy.—W. T. Richie, *Brit. med. J.*, ii/1927, 915.

Oxygen therapy.—W. M. Boothby (Council on Physical Therapy, A.M.A.), *J. Amer. med. Ass.*, ii/1932, 2026, 2106.

MIGRAINE. Severe migraine attacks are relieved within an hour or two by the inhalation of pure oxygen.—W. C. Alvarez, *Proc. Mayo Clin.*, 1939, 173.

Helium and Oxygen. Helium is an inert gas with a molecular weight of 4. Owing to its lightness it has a very high rate of diffusion, and if the nitrogen in the air is replaced with helium more oxygen is carried by the resultant mixture, which has an inherent mobility three times that of the air. In practice the mixture has proved of value in cases of intractable asthma and status asthmaticus, when oxygen alone was of no avail; it is also efficient in other obstructive lesions of the respiratory tract, especially in cases of post-operative or traumatic œdema of the larynx, and of transient paralysis of the vocal cords.

Since helium is an inert gas, it is important in practice to use cylinders containing a mixture of 20% oxygen and 80% helium, rather than have the gases separate; if separate cylinders are used

the helium may be turned on first and the patient asphyxiated before the oxygen is given.

ASTHMA. A mixture consisting of about $\frac{1}{2}$ oxygen and $\frac{1}{2}$ helium, administered by means of an air-tight oxygen tent with a specially designed hood just large enough for the head, is of definite value in relieving patients with severe intractable asthma. In status asthmaticus it can be life-saving. Its use may also be warranted in cases in which respiratory difficulty is so great that the cyanosis is not relieved by administration of 80% oxygen and 20% nitrogen. No ill-effects noted—one patient inhaled helium for nearly 24 hours continuously, and subsequently at intervals of 3 days. Effectiveness of helium believed due to its rapid diffusion.—C. K. Maytum, L. E. Prickman and W. M. Boothby, *Proc. Mayo Clin.*, 1935, 788.

In status asthmaticus the treatment may result in the saving of life; in severe, more or less continuous asthma, it produces an amelioration of the disease with recovery of complete sensitiveness to adrenaline in patients who previously had become refractory to it. In obstruction of the pulmonary airway from the bronchiole to the pharynx, inhalation of helium with oxygen lessens the respiratory effort and aids ventilation of the lungs in some instances thereby averting tracheotomy.—A. L. Barach, *J. Amer. med. Ass.*, ii/1938, 1278.

An artificial atmosphere of normal oxygen content (21%), but with 79% of helium replacing the normal nitrogen, is only one-third as heavy as ordinary air, and is about twice as easy to breathe. The mixture should be of great value in cases of respiratory obstruction, or in cases in which it is essential to economise muscular effort.—W. S. Sykes and R. C. Lawrence, *Brit. med. J.*, ii/1938, 448.

Helium and oxygen is a most valuable aid in terminating prolonged severe asthma when other methods fail to give relief, and it is of definite value in the treatment of other obstructive lesions of the respiratory tract.—C. K. Maytum, *Proc. Mayo Clin.*, 1938, 788.

Injection of Oxygen. Oxygen has been given by injection by various routes—intravenous, intraperitoneal, rectal and subcutaneous. *Subcutaneously*, it has been given in sciatica in doses of 250 to 400 ml., injected deeply, and in asphyxia, pneumonia, hæmoptysis and tuberculosis. *Intraperitoneal injections* are of value in tubercular diarrhoea, tubercular peritonitis and "tabes mesenterica." *Rectal injections* are of value in certain types of colitis. Growth of anaerobic bacteria is inhibited and the injured mucous membrane benefited.

Preferential site for injections is the outer border of the anterior surface of the thigh, three inches above the upper border of the patella. 150 to 500 ml. satisfactory. Valuable in neo-natal asphyxia, drowning, suffocation, carbon monoxide poisoning, lobar pneumonia, pleurisy, pulmonary tuberculosis, cardiac asthma, collapse due to hæmorrhage, and as a prophylactic of post-operative shock (500 ml. being injected at full pressure in 1 minute).—D. C. Welsh, *Brit. med. J.*, ii/1932, 147.

HÆMOPHTYSIS. Brilliant results in 80% of 50 cases following injection of 600 to 1000 ml. subcutaneously (site of injection not important).—A. Latinne, *Brux. méd.*, 1934, 219.

Tubercular hæmoptysis treated by oxygen injected subcutaneously, 500 to 600 ml. under the skin of the chest, if possible on the affected side. In 12 out of 20 cases hæmorrhage stopped at once, and in 4 after the injection had been repeated daily for 3 or 4 days.—A. Courcoux, per *Med. Annu.*, 1935, 453. Site of injection not important (may be given under skin of thigh), and smaller doses, e.g., 200 ml., are sufficient.—Pierre-Bourgeois, *ibid.*

PNEUMONIA. In pneumonia, as a preventive of chloroform or post-anæsthetic sickness, and in extensive burns and scalds. If sufficient is given to inflate an area of skin equal in size to the palms of two hands, the amount given is roughly 200 ml. In bad cases give at least 400 ml. and repeat in 6 hours if absorbed. The gas need not be heated or filtered, does not produce or aggravate lung trouble or cause local or general bad effects. Inject below and outside the nipple or breast.—T. S. Kirk, *Brit. med. J.*, ii/1928, 195.

PULMONARY TUBERCULOSIS. The injections, at a dosage of 200 ml. per injection, are given in the subcutaneous tissues of the anterolateral region of the thigh with an apparatus such as is commonly used for the performance of pneumothorax. The injections should be given slowly, and should be repeated every other day for about a month. The treatment results in disappearance of fever, increase of the blood pressure, improvement of the blood picture, formation of a greater number of erythrocytes and amelioration of the disease.—E. Frota, per *J. Amer. med. Ass.*, i/1936, 1430.

SCIATICA. The subcutaneous injection of oxygen affords a simple, painless and extraordinarily successful method for the relief of pain (and even for the complete cure) of acute and chronic sciatica. The method employed is as follows:—Connect by sterilised rubber tubing a cylinder of oxygen with fine adjustment to a sterile Record needle about $\frac{1}{2}$ mm. in diameter and 2 inches long, *via* a bottle containing warm water. When the gas is bubbling gently through the bottle the needle is introduced into the subcutaneous tissue at the back of the thigh, in the line of the sciatic nerve, just below the gluteal fold. The needle is introduced an inch or more, care being taken that it does not penetrate muscle, but remains confined to the cellular tissue. The subcutaneous tissue of the thigh quickly “balloons” with gas, and when the skin is sufficiently tense the needle may be removed. The emphysema subsides fairly soon and will have disappeared in 48 hours, when another injection should be made lower down in the middle line of the thigh over the sciatic nerve. If necessary a third injection may be given just above the popliteal space. If care is taken to inject into the subcutaneous tissues only, complete relief of pain may be expected.—H. H. Brown, *Brit. med. J.*, ii/1938, 1390.

Nitrogen. N = 14.008. Nitrogen is a colourless, odourless, tasteless gas constituting about 77% by weight (79% by volume) of the atmosphere. Nitrogen prepared from the atmosphere contains a small amount of argon and other rare gases.

ARTIFICIAL PNEUMOTHORAX. This consists in introducing nitrogen or sterile air between the two layers of the pleura through a special needle, and thus inducing collapse of the lung. There is no chosen spot for the puncture—it is commonly made in one of the axillary lines in the seventh or eighth intercostal space. The aim is to find a spot where the lung is healthiest and to avoid the neighbourhood of cavities. A hypodermic injection of morphine is given $\frac{1}{2}$ hour before the operation. A local anæsthetic such as 2% procaine hydrochloride is given to anæsthetise the body tissues down to the pleura.

The quantity of nitrogen or air injected is 200 to 300 ml. The intrapleural pressure and the amount of air introduced is recorded and at first the injections have to be repeated every two or three days. Later, the intervals between injections are increased to a fortnight or more and it is generally advisable to continue treatment for two or three years. X-ray control at frequent intervals is essential. The treatment is only applicable in carefully selected cases (estimated at about 5% of the total) and the best results are obtained in early cases of unilateral disease.

The young adult with a unilateral lesion and no tubercle bacilli in the sputum, the young adult with slight early infiltration without cavitation, with good general condition and normal blood picture and who is ambulant and afebrile, the man over 45 with slight fresh infiltration superimposed on an old fibroid tuberculosis, and a patient with bilateral disease and low resistance—are all examples of cases in which routine treatment, including rest, is indicated. Artificial pneumothorax is not in itself a cure for tuberculosis any more than a splint heals a broken leg. It is a means for putting a body with a diseased lung into a favourable condition to develop healing and powers of natural resistance. Beneficial as are its results

it demands expert technique, careful selection of cases and careful study of the individual patient.—*Rep. med. Offr. Minist. Hlth, Lond.*, 1933, 134.

Indications and contraindications.—L. S. T. Burrell, *Practitioner*, ii/1933, 392.

Highly satisfactory in the treatment of tuberculosis of the larynx. Of 35 cases, 24 were clinically cured or improved, in 6 the condition remained stationary and in 5 became worse.—R. Scott Stevenson, *Brit. med. J.*, ii/1933, 962.

In lobar pneumonia a pneumothorax should be produced as early as possible. 400 to 500 ml. usually given with ease, and two injections suffice in most cases, given at an interval of 24 hours. Striking relief of pain and dyspnoea, but severity and not course of disease altered.—A. Behrend and R. B. G. Cowper, *J. Amer. med. Ass.*, i/1934, 1907.

Though there has not yet been put forward absolute statistical proof that artificial pneumothorax or collapse therapy in general is very greatly superior to other methods of treatment, there is evidence accumulating gradually which points fairly clearly in this direction. The proportion of patients to whom treatment is applicable in its widest aspect, that is where completely efficient treatment can be instituted and where a good ultimate prognosis can be guaranteed, is not in an industrial community at present more than 5%. There are, however, very considerable numbers where the treatment is of temporary value, and where it may initiate the process of healing.—R. J. Peters, *Edinb. med. J.*, 1937, 276.

Nitrogenii Monoxidum (B.P., U.S.P. XI, Fr. Cx.).

Syn. NITROUS OXIDE, LAUGHING GAS. $N_2O = 44.02$.

A colourless gas with characteristic odour and faintly sweetish taste. Soluble 1 in 2 (by volume) of water at ordinary temperatures.

Prepared by heating ammonium nitrate to about 180° when it splits up into nitrous oxide and water vapour.

The gas is passed through a strong solution of ferrous sulphate to remove nitric oxide—the traces of acid being removed by passing through alkali.

Antidotes (for treatment if dangerous symptoms arise during inhalation of nitrous oxide). Pull out tongue with forceps and insert finger into mouth to make sure that it is free from obstruction and to remove mucus. Extend the head and push the jaw forward. Give the patient fresh air, loosen clothing, and if patient is upright place in a recumbent position. Flap the face and chest with the end of a wet towel. Apply artificial respiration and administer a mixture of oxygen and carbon dioxide. Inject stimulants, such as nikethamide and strychnine.

Contraindications. The use of pure nitrous oxide is contra-indicated in cases in which an asphyxial element already exists, e.g., patients suffering from tumours or inflammatory swellings in the neck, and in cases which will be aggravated by a sudden rise of blood pressure, e.g., patients with a dilated right heart, or those suffering from an aneurysm, or from extensive arteriosclerosis with high blood pressure.

Uses. Nitrous oxide is employed as an anæsthetic in minor surgery, in conjunction with oxygen as a general anæsthetic for major surgery and obstetrics, and for the induction of anaesthesia prior to maintenance with ether. Its advantages are that it is non-irritant, non-toxic, rapid in action, and recovery is equally rapid. Disadvantages are that unless oxygen or air is given, asphyxia occurs, while its effect is greatly reduced if more than minimal amounts of oxygen are admitted, muscular relaxation is

poor, and blood pressure is increased. As ordinarily administered *per se*, e.g., for dental extractions, anæsthesia is complete in about $\frac{1}{2}$ minute, lasts for 20 to 40 seconds and recovery is usually complete in 2 to 3 minutes. Nitrous oxide is administered by means of a bag into which the gas is led from the cylinders, the bag communicating with the face-mask through a valve by which the expired gas is passed out into the air. Various forms of apparatus are also available by which the gas may be administered intranasally.

Nitrous Oxide and Oxygen is used for minor operations, lasting from 5 to 15 minutes, and operations which do not demand a great degree of muscular relaxation, also in operations on patients suffering from severe shock or from acute sepsis. Its use is not advisable with children. Preliminary medication with hypnotics is utilised, since a higher proportion of oxygen may then be employed. Pure nitrous oxide is administered at first, oxygen being admitted after induction as required to prevent anoxæmia while maintaining a sufficient depth of anæsthesia. Anæsthesia with gas-oxygen is frequently supplemented by the administration of very small amounts of ether. With this addition heavy pre-operative medication may be avoided, thus lessening the risk of respiratory failure.

For operations on regions other than the mouth or nose, injections of atropine $\frac{1}{16}$ to $\frac{1}{8}$ gr., morphine $\frac{1}{2}$ to 1 gr., are given hypodermically $1\frac{1}{2}$ or even 2 hours before the inhalation. Crile and others add scopolamine $\frac{1}{16}$ to $\frac{1}{8}$ grain. At first nitrous oxide with 2% oxygen is given with a pressure of 4 to 40 mm. of mercury. More or less oxygen is given according to circumstances—more if patient is cyanosed, less if he struggles. Unconquerable rigidity is controlled by giving ether—this may occur in about 10% of cases.—D. W. Buxton's *Anæsthetics*, 6th Edition.

During the second stage of labour, nitrous oxide gas and oxygen (ideal proportions 80 and 20%, but oxygen increased if co-operation is not good), administered by Boyle's or McKesson's portable apparatus, appear to give the best results. Duration, strength and frequency of uterine contraction increased rather than diminished in over 50% of cases investigated, and no instance of post-partum hæmorrhage. Administration of anæsthetic continued for half to three-quarters of a minute after each pain has ceased. During birth of the head chloroform should be added, but should be regarded only as an adjunct to nitrous oxide, and only used in sufficient quantity to relieve pain at the most acute stage.—L. McIlroy and H. Rodway, *J. Obst. Gynec.*, 1933, 1175.

The best modern anæsthetic. Best administered by the McKesson apparatus, without the use of ether or chloroform, and preceded by Omnopon and scopolamine as premedication. Ensures complete absence of psychic shock, is not followed by vomiting and does not aggravate any pathological condition present.—R. Jarman, *Brit. med. J.*, i/1934, 799.

PANCREAS

The pancreas used as a source of medicinal products is the sweetbread of animals commonly used for food, and is generally obtained from the pig or the ox. It produces an external secretion or pancreatic juice, yielding enzymes which take part in digestive processes and reach the intestine along the pancreatic duct. Pancreatin is a mixture of these enzymes prepared from the pancreas by maceration with alcohol. The pancreas also contains small groups of cells or "islets of Langerhans," yielding the internal

secretion, and from which insulin is manufactured. In addition to insulin, recent work goes to show that there is a second internal secretion, which has been given the name "Lipocaic," and which is stated to be the active substance in pancreas responsible for the utilisation of fat.

The pancreatic juice contains several digestive ferments:—Trypsin, a proteolytic enzyme acting in an alkaline medium, converting protein, *e.g.*, casein of milk and fibrin, into peptones; amylase (amyllopsin) or pancreatic diastase which converts starch into dextrin, maltose and dextrose; lipase (steapsin), a lipolytic enzyme (emulsifies fats); and possibly the milk-curdling enzyme, rennin, converting casein into a form of peptone.

For invalids, aged persons, and those suffering from weak digestion, or those prostrated by fever or exhaustion, preparations of the pancreas may be employed, by means of which food may be partially or wholly digested previous to administration; their nutrition is thus maintained, and the stomach has time to regain its powers of digestion.

GRAVES' DISEASE. A simple and effective treatment consists in the administration of pancreatic extract (whole gland) thrice daily before food. Over-medication with iodine is to be deprecated, and in some successfully treated cases little or no iodine was given.—C. B. Macdonald, *Brit. med. J.*, ii/1937, 660.

Lipocaic. The depancreatized animal suffers from two known deficiencies, *i.e.*, of insulin and pancreatic juice. The fact that the adequate administration of insulin does not permit these animals to survive for long suggests that pancreatic juice may also be essential. It has been found, however, that the oral administration of fresh active pancreatic juice, together with insulin therapy, does not prolong life or prevent the characteristic fatty changes in the liver, but that these changes are prevented and the animals permitted to survive by the addition of raw pancreas to the diet. It was further shown that the choline or lecithin in pancreas could not account for this effect. The evidence seems to warrant that the active substance in pancreas responsible for the utilisation of fat, is other than choline and that it is specific and active in small amount. This internal secretion has been named *lipocaic*. It has been possible to secure an extract from the pancreas which exerts the typical effect of the gland in a daily dose of from 60 to 100 mg. of dry substance. This material is free of fat and contains not more than from 1 to 2% of free choline, and is effective both orally and subcutaneously. There is considerable evidence at present that the patient with diabetes mellitus is not returned to an entirely normal state by the administration of insulin. In particular he seems to suffer from a lessened capacity to utilise fats. It is definitely established that the diabetic patient, whether adequately treated or not, is much more liable to develop presenile atheromatosis and arteriosclerosis than the normal individual, and it has been said that the diabetic, who in the pre-insulin days used to die of acidosis, now dies from coronary disease or diabetic gangrene. Does this mean that many diabetic patients suffer not only from an insulin deficiency, but also from a deficiency of lipocaic, which manifests itself in a disturbance of fat utilisation, with deposition of fat in the liver and, in the more chronic cases, in the subendothelial layers of the arteries? Animal experiments suggest that this is the case.—L. R. Dragstedt, *J. Amer. med. Ass.*, i/1940, 29.

Angioxyl (Roussel Laboratories, London). An insulin-free pancreatic extract in 2 ml. ampoules containing 20 "hypotensive units." A vasodilator for use in the treatment of angina pectoris, Raynaud's disease, etc. *Dose.*—2 to 3 ampoules daily, by intramuscular injection. A syrup for oral administration is also available containing 4 hypotensive units per ml., for the treatment of mild vascular disturbances. *Dose.*—3 to 4 teaspoonfuls daily between meals.

Tissue Extract No. 568 (Sharp & Dohme, London). An insulin-free extract of the pancreas, with activity expressed in terms of units defined by its neutralising power against the pressor effect of adrenaline. Supplied in vials of 10 ml. (10 units per ml.). It has a vasodilator effect and is recommended for use in angina pectoris and related angiospastic conditions.

Pancreatinum (*B.P.*, *U.S.P. XI*, *Fr. Cx.*).

Dose.—3 to 10 grains (0.2 to 0.6 g.). *U.S.P. XI* average dose 8 grains. It should be given 2 to 3 hours after a meal to prevent its destruction by gastric acid, preferably with sodium bicarbonate.

A white or buff-coloured powder containing the enzymes trypsin, lipase and amylase, in respect of each of which the *B.P.* specifies a minimum standard of activity. It digests albuminoids and converts, if of *U.S.P.* standard, not less than 25 times its weight of starch into soluble carbohydrate.

It differs from pepsin in the rapid destruction of its proteolytic activity in the presence of acid.

Soluble in water, giving a turbid solution. Insoluble in alcohol 90% and in ether.

Incompatible with acids, caustic alkalis, tannin and astringent substances.

Uses. Aids the digestion of starch and protein, acting best in nearly neutral solution. Its activity is destroyed when solutions containing it are heated above 60°. Is used mainly for the preparation of pre-digested or peptonised foods (*vide infra*).

In chronic pancreatitis, pancreatin in suitable intestinal medication may be employed with advantage before the operation and also in cases unsuitable for operations. It has also been employed with success in sprue.

Enema Pancreatini (*B.P.C.*).

Dose.—4 ounces (120 ml.). Solution of pancreatin 6.5% *v/v* in equal parts of milk and beef tea.

Glycerinum Pancreatini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10.

Liquor Pancreatini (*B.P.C.*). *Syn.* LIQUOR PANCREATIS.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains 16 $\frac{1}{2}$ % *v/v* of glycerin of pancreatin with sodium bicarbonate in a diluted alcohol-glycerin solution.

Pulvis Pancreatini Compositus (*B.P.C.*). *Syn.* PULVIS PANCREATICUS, PEPTONISING POWDER.

Pancreatin 1, sodium bicarbonate 4.

Peptone Pancreatique (*Fr. Cx.*). A mixture of amino acids and polypeptides obtained by submitting beef to pancreatic digestion for 6 hours. It is usually in the form of a yellowish-white powder, soluble in water, insoluble in strong alcohol.

Peptonised Milk. To 25 gr. of compound pancreatin powder 5 oz. of tepid water is added, and then 1 pint of milk at 38°. The mixture is maintained at 38° for 15 minutes and then boiled to destroy the enzymes. Gruel, arrowroot, etc., may also be pre-digested in the same way. In the place of the water $\frac{1}{2}$ pint of lime water may be used to the pint of milk. The preparation, if desired for early use, may be kept at 15° for 3 or 4 hours; it need not necessarily be boiled.

Peptonised milk is useful in gastric ulcer, intestinal catarrh, for infants' use generally, and in all forms of weakened digestive functions.

Peptonised Beef Tea is made by simmering $\frac{1}{2}$ lb. minced meat with 1 pint of water containing a small quantity of sodium bicarbonate for 2 hours. The cooled mixture is treated with 25 gr. of compound pancreatin powder, set aside in a warm place, boiled and strained.

Peptonised Beef Jelly and Chicken Jelly (*Benger's Food, Manchester*). As a restorative, either may be taken alone by teaspoonful or dissolve 2 or 3 tea-

spoonfuls in a teacupful of boiling water (with pepper and salt). Enriches beef tea, soups, broths, etc. They are readily assimilated by weak digestions. Containing much of the flesh-forming elements of the meat in soluble form these peptonised preparations are superior to non-peptonised extracts.

Tabellæ Pancreatini (*B.P.C.*), *syn.* PEPTONISING TABLETS, contain pancreatin $2\frac{1}{2}$ gr. and sodium bicarbonate 10 gr.

Trypsinum (*B.P.C.*).

Dose.—3 to 10 grains (0.2 to 0.6 g.).

Trypsin is stated to be produced simultaneously with amylase, and from the same cells in the pancreas. This enzyme is prepared commercially in the form of whitish or yellowish powder, possessing an odour like that of pepsin.

It converts all soluble and many insoluble proteins into amino-acids and polypeptides. Its activity may be determined by the *B.P.* method for trypsin in pancreatin. It is 4 or 5 times as active as pancreatin. The activity is destroyed in general at 100°.

Soluble slightly in water, more so in glycerin.

Uses. It assists digestion in diabetes, and it is occasionally employed for peptonising milk. More usually it is administered as pancreatin.

Dipankrin (*Richter, London*). Active principles of pancreas and duodenum. *Dose.*—1 or 2 tablets thrice daily. In pancreatic deficiency.

Festan (*Bayer Products, London*). Preparation of pancreatic enzymes consisting of lipase, amylase, protease and hemicellulase in enteric-coated pellets. *Dose.*—1 pellet thrice daily after meals. Dyspepsia due to fermentative insufficiency.

Liquor Pancreaticus (*Benger*) (*Benger's Food, Manchester*). *Dose.*—1 to 2 drachms (4 to 8 ml.) in water with meals or in farinaceous gruel, when cool enough to sip to aid intestinal digestion. As an addition to nutritive enemata, a dessertspoonful should be added to beef tea or milk-gruel just before its administration. Will not keep diluted, and presence of acidity or heating over 140°F. destroys the ferment.

Liquor Trypsini Compositus (*Allen & Hanburys, London*). A solution of the tryptic and amylolytic ferments of the pancreas for oral use. *Dose.*—1 or 2 teaspoonfuls three times daily.

Lobulina (*Napp, London*). Tablets containing extracts of pancreas and yeast for oral administration in diabetes mellitus. *Dose.*—2 to 4 tablets after the principal meals.

Panacoids (*Reed & Carnrick, Jersey City; Coates & Cooper, London*). Tablets containing desiccated pancreas 2 gr. and desiccated duodenal substance 1 gr. Intestinal indigestion and disorders of the pancreas.

Pancrepatine (*Anglo-French Drug Co., London*). Combination of a special extract of the pancreas and hepatic extract in "globules" containing 0.25 g. for the oral treatment of diabetes. [P1] **Pancrepatine Compound** contains in addition 0.05 g. of phenazone and 0.002 g. sodium methylarsenate in each globule.

[P1-87] **Panlittol** (*Armour, London*). Tablets containing pancreas $2\frac{1}{2}$ grains, thyroid *B.P.* $\frac{1}{2}$ grain. Hypertension.

Panopsin (*Endocrines-Spicer, Watford*). Tablets contain $2\frac{1}{2}$ gr. of pancreatic amyllopsin. For digestive disorders.

Panterior Tablets (*Parke, Davis, London*). Enteric-coated tablets each containing 5 gr. of triple strength pancreatin equivalent to 15 gr. of pancreatin *B.P.* *Dose.*—1 to 2 tablets after each meal. To assist pancreatic digestion. **Panterior Compound Tablets** contain triple strength pancreatin with sodium glycocholate and sodium taurocholate.

Zymine (*Fairchild, Bros. & Foster, New York; Burroughs Wellcome, London*). Extract of pancreas containing trypsin, pancreatic diastase and lipase and other enzymes. *Dose.*—1 to 6 gr. twice or thrice daily after food.

PAPAINUM

B.P.C., Fr. Cx.

Dose.—2 to 10 grains (0.12 to 0.6 g.).

A proteolytic enzyme occurring as a whitish or light brown amorphous powder, prepared from the juice of the papaw, the unripe fruit of *Carica Papaya* (Passifloraceæ).

Papaw fruit, fresh, divested of its seeds, in shape like a vegetable marrow, is a refreshing dessert fruit, with flavour something like the melon.

The enzyme has a wider range of activity, both with regard to pH and temperature, and is more difficult to destroy than either trypsin or pepsin. Its optimal temperature zone is above that favourable to bacteria, and it can therefore be used for long periods of digestion without bacterial contamination. A digest media prepared from papain can be used for preparation of diphtheria toxin.—A. F. Watson, R. A. Jaggart, and H. F. Mannion, *Quart. J. Pharm.*, 1938, 391.

Isolation and Properties of Crystalline Papain. Crystalline papain was prepared from papaya latex by precipitation successively with different amounts of ammonium sulphate and sodium chloride at suitable pH in the presence of sodium cyanide. Crystalline papain was obtained in the form of thin needles which changed on standing in contact with water for several months into large plates, having elongated hexagonal faces. It was slightly soluble in dilute salt solution, but soluble in alcohol (70%). Its isoelectric point was about pH 9.—A. K. Balls and H. Lineweaver, *J. biol. Chem.*, 1939, 130, 669.

Uses. As a digestive in chronic cases of dyspepsia with acid eructations and painful gastric fermentation. It acts in acid, alkaline or neutral media, and like pepsin, has the property of digesting fibrin (as much as 200 times its weight in some cases). Like rennet, it has the property of curdling milk and might be used as a substitute for it. The liquid preparations are suitable for use in cases of enlarged tonsils; after persevering treatment, improvement in nasal breathing can be observed, due to reduction of the swellings. Ulcers and fissures of the tongue have been painted with a solution of papain 1 to 2 in 10 each of glycerin and water.

Juice from the unripe fruit is very acid and acts as an efficient vermifuge, and is also a galactagogue and antiscorbutic.—S. G. Willmott, *Pharm. J.*, ii/1928, 219.

Elixir Papaini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 3 gr. of papain per drachm.

Glycerinum Papaini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Papain 9% w/v in dilute hydrochloric acid, simple elixir and glycerin.

Is given with meals as a digestive; it has also been used as a pigment for chronic eczema and warts, and has been applied to diphtheritic exudation.

Liquor Papaini et Iridini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 1 gr. of pepsin and 1 gr. of extract of iris per drachm.

[P1-S1] *Pilula Papaini Composita.* *Dose.*—1 with meals.

Papain 2 gr., extracts of nux vomica $\frac{1}{2}$ gr., belladonna $\frac{1}{2}$ gr., aloes $\frac{1}{2}$ gr. A digestive laxative.

[P1] *Syrupus Papaini* (*Fr. Cx.*). Papain 0.4, cherry-laurel water 0.4, alcohol (60%) 4.2, simple syrup 95, all by weight.

PARAFFINUM

Paraffinum Durum (B.P.). *Syn.* PARAFFIN WAX, PARAFFINUM (U.S.P. XI, *Fr. Cx.*), PARAFFINUM SOLIDUM (P. Dan.). (PARAFFINUM SOLIDUM (P. Helv. V) is ceresin.)

A mixture of several of the harder members of the paraffin series of hydrocarbons from $C_{21}H_{44}$ to $C_{30}H_{62}$; obtained by distilling shale, separating the liquid oils by refrigeration and purifying the solid product. Colourless, semi-transparent, crystalline, inodorous and tasteless, slightly greasy to the touch. Sp. gr. 0.82 to 0.94. It burns with a bright flame, leaving no residue. Hard paraffins are supplied with various melting-points. B.P. specifies 50° to 60°; U.S.P. XI 50° to 57°.

Soluble about 1 in 80 of ether, slightly soluble in dehydrated alcohol, insoluble in water; also insoluble in acetone—a fact of value in the analysis of mixtures.

Uses. Principally as an ingredient of ointment bases, especially for protective ointments. Melted paraffin has been employed for the treatment of inflamed joints, sprains, etc. Injections of melted paraffin have been used in plastic surgery.

Solid Paraffin Injections. For subcutaneous injection in plastic operations this should be hard paraffin with m.p. 110 to 115°F., not an extempore mixture. Used to improve the size and shape of the nose, ear, etc., where abnormal, also for injecting into cavities after previously swabbing out with antiseptic lotion. The injection should be made in a warm room to allow of the flow of the melted substance through the syringe needle.

Paraffinoma. Two cases following paraffin injections. One of the rectum due to liquefied hard paraffin, the other stated to be due to an injection of camphor in liquid paraffin oil in the thigh.—A. T. Bazin, *Brit. med. J.*, ii/1929, 1102.

The publication of various cases of paraffinoma by authors in Europe and America has acted as a warning of the possible dangers of injecting mineral oil into the body tissues. A case of paraffinoma described.—Mason Bolam, *Brit. J. Dermat.*, 1935, 523.

PAINFUL RHEUMATIC JOINTS. Envelop the limb (previously shaved) quickly in a thin layer of melted paraffin at a temperature of 80° to 85° and add until layer is 1 to 2 cm. thick. Apply flannel bandage and leave on for 5 hours.—*per Practitioner*, i/1928, 397.

Paraffin wax bath over the whole body applied in sections at a time for applying heat to the skin.—H. W. Hales, *Lancet*, ii/1931, 586.

Paraffin Treatment of Burns.

Paraffin "No. 7" is made as follows:—Melt hard paraffin 67.75 and add soft paraffin 25 and olive oil 5. Then mix in carefully betanaphthol 0.25 dissolved in eucalyptus oil 2, after the mixture has cooled to about 55°. (Resorcin 0.25 to 1% may be used as an alternative, with a small quantity of dehydrated alcohol as solvent.) The finished article melts at about 48°.

Method of Use. Wash the burns with sterile water, dry thoroughly, for example with a fan, and spray or apply the melted preparation carefully with a flat camel-hair brush. Cover with a thin layer of wool and a second coating. A preliminary application of 1 to 1000 acriflavine is useful.

Paraffin "No. 7" Modified has been made using spermaceti and hard paraffin *p. æq.*, instead of hard paraffin. The preparation

melts at 49° and is filled into rubber-capped tubes for use at time of operation, after melting in the water-bath.

Ambrine (*Anglo-French Drug Co., London*). A similar preparation advised by B. de Sandfort, containing a compound of paraffin with 5% of oil of amber. Applied in similar manner.

Granulogen (*Parke, Davis, London*). Chloretone 22 gr. per oz., and cresylic acid (0.5%) in a basis of paraffin, m.p. 46°. For the treatment of cutaneous lesions. To be melted and applied with a sterile brush or by means of a suitable spray.

Paraseptic (*Duncan, Flockhart, Edinburgh*). "Paraffin No. 7" composed of a mixture of paraffin wax eucalyptus oil olive oil and resorcin in the form of small cakes. When melted it acts as a first-aid dressing to burns, scalds, etc.

Dental Wax. Hard paraffin 1 oz., beeswax 6 oz., melt together, add $\frac{1}{2}$ oz. alkanet and keep warm for 2 hours, then strain and add tincture of tolu 2 dr., otto of rose 5 drops. Generally supplied in sheet $6\frac{1}{2}$ by $3\frac{1}{2}$ inches.

Use. The sheet is warmed over the flame and moulded carefully over the model. It is used for mechanical purposes prior to vulcanisation.

Ceresin. A hard, white paraffin wax, m.p. about 65°, obtained by purifying ozokerite or earth wax, which occurs naturally near petroleum springs, especially in Galicia. Soluble 1 in 170 of ether, 1 in 125 of benzene and 1 in 80 of chloroform. Is used in the manufacture of candles and polishes.

Paraffinum Liquidum (*B.P., P. Helv. V, P. Dan.*). *Syn. and Prop. Names.* OLEUM PETROLEI, PETROLATUM LIQUIDUM (*U.S.P. XI*), CHRISMOL (*Allen & Hanburys, London*), COLONOL (*Kaylene, London*), DELECTOL (*Duncan, Flockhart, Edinburgh*), INTERNOL (*British Drug Houses, London*), NUJOL (*Stemco, London*), PAROLEINE (*Burroughs Wellcome, London*), PETREMOL (*Oppenheimer, London*), ETC.

Dose.— $\frac{1}{4}$ to 1 ounce (7.5 to 30 ml.).

A clear oily liquid obtained from petroleum after the more volatile portions have been removed by distillation. It consists of hydrocarbons ranging from $C_{16}H_{34}$ to $C_{27}H_{54}$. Sp. gr. 0.880 to 0.895 (*B.P.*). For spraying, as also for "Toilet Paraffin," a less viscous oil is preferred with gravity 0.865 to 0.870, *vide* Paraffinum Liquidum Leve. For internal use a high gravity preferred. Below 0.880 it is not suitable as an internal lubricant. *B.P. Add. I* requires a kinematic viscosity of not less than 64 centistokes at 37.8°. *U.S.P. XI* has two varieties—one termed Heavy, the other Light Liquid Petrolatum—with different viscosities.

Russian oil contains principally saturated hydrocarbons while American petroleum contains a large proportion of the unsaturated olefines. The Baku oils differ from Pennsylvania and other U.S. oils in consisting largely of hydrocarbons of the naphthene group (saturated single link ring compounds). American oils are best for chlorinating. *Cf. p. 396.*

Uses. Given internally, liquid paraffin acts as a lubricant, and is widely employed as a mild aperient in chronic constipation, especially in the presence of hæmorrhoids. It has no food value and, indeed, recent work has shown that it interferes with the organism's ability to absorb carotene from ingested food (*see*

A. C. Curtis and R. S. Ballmer, *J. Amer. med. Ass.*, ii/1939, 1785; and *Lancet*, i/1939, 462; in view of this finding it is suggested that the common practice of prescribing liquid paraffin at meal-times should be abandoned.

Externally, liquid paraffin may be used as an emollient to the skin in irritant conditions, and to remove crusts, and liquid paraffin dressings are stated to give relief from pain during the eruptive stages of herpes zoster. It also makes a good catheter lubricant.

It is used as a basis for laryngeal and nasal spray solutions or pigments, but for these purposes the B.P. oil is too viscous, and Paraffinum Liquidum Leve (*vide infra*) is preferable. *Alkaloidal bases are, in general, only slightly soluble in liquid paraffin.* A little oleic acid added assists solution.

Oleum Petrolei Flavum and Huiles Lourdes de Pétrole. Heavy petroleum oils—products from American petroleum distilling between 280° and 400°, sp. gr. 0.880 to 0.905. Used as a vehicle for hypodermic injections. For the suspension of insoluble mercurial salts, such as calomel, salicylate, succinimide, benzoate and yellow oxide of mercury, 1, 5 or 10% mixtures being employed.

Oleum Vaselini Fluidum, syn. HUILE DE VASELINE FLUIDE (Fr. Cx.), is prepared from Caucasian petroleum by purifying the fractions between 335° and 440°. Sp. gr. about 0.875, *i.e.*, it approximates Paraffinum Liquidum in character. Employed in Huile Grise, *q.v.* *F.E. VIII, P. Ital. V and P. Belg. IV* are similar.

Emulsio Olei Vaselinis (Fr. Cx.). Oil of Vaseline about 60% emulsified with agar and Irish moss in water.

Creosoted Oil. (Calot's formula). Liquid paraffin 70 g., sterilised by heating for $\frac{1}{2}$ hour. Allow to cool and add in order: creosote 5 g., guaiacol 1 g., iodoform (sterile) 10 g., ether 30 g. Used as a wound dressing.

Injection of 10 ml. weekly of Calot's fluid with olive oil in place of liquid paraffin of distinct value following aspiration of cold abscesses and in treatment of white swellings of joints. **Calot's No. 2 Paste:**—Phenol camphor 3 g., naphthol camphor 3 g., guaiacol 8 g., iodoform 10 g., lanolin 150 g., spermaceti 100 g., of value for injection in sinus formation in disease of hip, spine and knee. 10 ml. injected into sinus at temperature of 103°, repeated every fourth day for 10 occasions. Contraindicated in albuminuria and septic infections causing pyrexia.—R. Pollock, *Lancet*, i/1927, 225.

OTORRHOEA. Calot's solution of value. Instil 5 to 10 drops into ear canal. To get fluid into Eustachian tube close opening of external canal by pressing tragus against canal wall and bringing alternate pressure to bear on it so as to cause pumping action on mixture, and continue until patient feels medicament in throat. Repeat nightly for a week. When secretion becomes thin discontinue and dry up with insufflations of boric acid powder.—I. Hamick, *J. Amer. med. Ass.*, ii/1929, 66. Success in 85% of cases.—J. C. Scal, *Med. J. Rec.*, 1933, 244.

Emulsio Paraffini Liquidii Alkalina (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Mixture of magnesium hydroxide 1 part and emulsion of liquid paraffin with agar 3 parts.

Emulsio Paraffini Liquidii Composita (B.P.C.).

Syn. EMULSIO PARAFFINI CUM AGAR ET PHENOLPHTHALEINO.

Dose.—As above.

The formula is as above, incorporating also phenolphthalein $1\frac{1}{2}$ gr. per ounce.

Emulsio Paraffini Liquidii cum Agar (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.), or more if requisite, morning and evening. Children 1 to 2 drachms. Contains 50% *v/v* of liquid paraffin and 0.75% *w/v* of agar.

Emulsum Petrolati Liquidii (U.S.P. XI). *Average dose.*—1 ounce (30 ml.). Liquid petrolatum 50% with acacia or agar, etc., syrup and alcohol, and 0.004% of vanillin.

Emuls. Paraff. Liq. c. Phenolphthalein. et Agar (N.I.F.). Agar 36 gr., liquid paraffin 4 oz., phenolphthalein 16 gr., glycerin 390 m., acacia 60 gr., tragacanth 20 gr., glycerin of boric acid 112 m., sodium benzoate 18 gr., vanillin 1½ gr., double chloroform water to 8 oz.

Emulso Paraffini Liquidum cum Hypophosphitibus (B.P.C.).
Syn. EMULSIO PETROLEI CUM HYPOPHOSPHITIBUS.

Dose.—1 to 4 drachms (4 to 16 ml.).

Liquid paraffin 50% *v/v* with 1 gr. each of sodium and calcium hypophosphites per drachm.

Mistura Magnesii Hydroxidi et Paraffini Liquidum (B.P.C.).

Dose.—1 to 4 drachms (4 to 16 ml.).

Liquid paraffin 30% *v/v* emulsified in mixture of magnesium hydroxide by means of acacia, or by using an homogenising machine, in which case no acacia is needed.

Magnol (Duncan, Flockhart, Edinburgh). A preparation containing in each fl. dr. magnesium hydroxide 4 gr. in liquid paraffin. *Dose.*—1 to 2 teaspoonfuls.

Parogenum (B.P.C.). *Syn.* VASOLIMENT, LIQUID PAROGEN.

Liquid paraffin 40% *v/v* with oleic acid, ammoniated alcohol and alcohol 90%.

Cristolax (Wander, London). A compound of 50% of liquid paraffin with 50% of malt extract in powder form.

Olgar (Parke, Davis, London). Emulsion of refined liquid paraffin and agar.

Petrolagar (John Wyeth, London). An emulsion of liquid paraffin 65%, with agar. Also available with phenolphthalein 1½ gr. per oz., cascara sagrada (14-72% of a bitterless liquid extract), or alkaline (with magnesium hydroxide.)

Paraffinum Liquidum Leve (B.P.C.). *Syn. and Prop. Name.* SPRAY PARAFFIN, PARAFFINUM LIQUIDUM PRO NEBULIS, PAROLEINE (for spraying) (*Burroughs Wellcome, London*).

A variety of liquid paraffin of lower gravity and lower viscosity than the oil for internal administration, and more suitable for the preparation of sprays and brilliantines.

Evidence is gradually accumulating that the aspiration of oily substances may lead to well defined pulmonary changes, generally known as lipid cell pneumonia. This condition can be produced experimentally by the intratracheal administration of oil, large doses producing bronchiectasis. It is a macrophage response with phagocytosis of oil droplets and can be produced by any oil, though cod-liver oil and liquid paraffin produce the most severe reactions.—J. H. Paterson, *J. Path. Bact.*, 1938, 46, 151.

Paraffinum Molle (B.P.). *Syn. and Prop. Name.* PETROLATUM (U.S.P. XI) and PETROLATUM ALBUM (U.S.P. XI), PETROLEUM JELLY, VASELINA (F.E. VIII), VASELINUM (P. Ital. V, P. Belg. IV, P. Helv. V, Fr. Cx.), VASELINE (*Chesebrough Manufacturing Co., London*).

A white (Paraffinum Molle Album) or yellow (Paraffinum Molle Flavum) semi-solid mixture containing some of the softer or more fluid members of the paraffin series of hydrocarbons from $C_{15}H_{32}$ to $C_{20}H_{42}$. M.p. of the white variety 40° to 46°, of the yellow variety 38° to 46° (U.S.P. XI requires 38° to 54°). Is usually obtained by purifying the less volatile portions of petroleum.

Soluble in alcohol slightly, freely in ether, chloroform, and other organic solvents, insoluble in water and in acetone. When melted, it mixes with oil, and many waxes, oleates and oleic acid.

Soft paraffin is not readily absorbed, but is emollient, protective and useful as an ointment base for surface action.

For the treatment of minor burns on the face or hands the Ministry of Health recommends (1941) for use in the Emergency Medical Services gauze or lint impregnated with sterile soft paraffin (*see Tulle Gras*)—tannic acid should not be used on these areas. Similar emergency treatment should also be employed for serious burns in other parts of the body requiring admission to hospital (prior to coagulation treatment).

Fructolax (*Savory & Moore, London*). *Dose*.—2 to 3 drachms at bedtime. A laxative containing about 80% soft hydrocarbon with fruit basis.

Glegg's Mixture consists of 3 parts liquid paraffin and 1 part of white soft paraffin, flavoured with rosettol (or with $\frac{1}{4}$ gr. of menthol per oz.). Applied twice daily by a nasal pipette to the back of the nose for the prevention and treatment of the common cold.—E. P. Poulton, *Lancet*, i/1932, 933. If the cold cannot be aborted entirely by this treatment, at least it develops into a relatively mild affair.—E. P. Poulton and F. A. Knott, *Practitioner*, i/1936, 28.

Confectio Paraffini (*L.H.*). *Dose*.—1 to 2 drachms (4 to 8 g.).
Yellow soft paraffin 16 oz., alkanet root 42 gr., oil of lemon 32 m., oil of bitter orange 32 m.

Oculentum Simplex (*B.P.C.*). A sterile mixture of wool fat and yellow soft paraffin used as a basis for eye ointments of the *B.P.* and *B.P.C.*

All ointments for the eye should be made with the official basis of wool fat 10, soft paraffin 90, in accordance with the directions of the *British Pharmacopoeia*, unless otherwise ordered. If the medicament is readily soluble in water it should be dissolved in the smallest quantity of sterilised water. This solution should then be incorporated in the melted sterilised basis, and the mixture triturated continuously until cold. If the medicament is not readily soluble in water it should be finely powdered, thoroughly levigated with a small quantity of the basis and finally incorporated with the remainder.

The ointment should be packed in a sterilised container and stored in a cool place. Small collapsible tubes with special tapering ends are very suitable containers, since there is a much smaller risk of contamination than when a pot is used. The tubes are best filled by inverting them in cold water and pouring in the ointment, previously softened by carefully heating after the manner used for moulding suppositories. Sterilised soft gelatin capsules are also used as containers. This latter method of packing has the advantage that sufficient ointment for one dose may be placed in each capsule.

When the medicament is in the form of an aqueous solution of an alkaloidal salt emulsified in the basis, the action is exerted much more rapidly and is more powerful than when it is in the form of an alkaloid in solution or suspension in the base, because of the greater ease with which solution in the lachrymal secretion is effected.

Paranol (*B.P.C.*). An emulsion of water in wool fat and soft paraffin.

Unguentum Paraffini (*B.P.*).

White beeswax 2, hard paraffin 8, yellow or white soft paraffin 90.

Unguentum Paraffini made with hard paraffin (m.p. 54° to 57°) 27, soft paraffin 70, beeswax 3, is suitable for use with the atmospheric temperature 15°. May be modified to meet the exigencies of climate and temperature.

The addition of 3% of beeswax makes the ointment more uniform.

A hard paraffin with somewhat low melting point, e.g., 46° to 52°, is best. Melt together and set aside to crystallise (or allow to cool on the water bath) and then mill, rub down, or sieve again.

A small quantity of wool fat added to soft or liquid paraffins enables the production of a stable emulsion, *vide* Paranol.

Unguentum Simplex (B.P.).

Wool fat 5, hard paraffin 10, yellow or white soft paraffin 85.

Unguentum (U.S.P. XI). *Syn.* SIMPLE OINTMENT. Wool fat 5, white wax 5, white petrolatum 90. *P. Jap. V* has yellow beeswax 1, sesame oil 2, melted together and stirred till cool.

Petroleum Benzine is the fraction distilling below 150°, sp. gr. below 0.750. This is used for cleaning purposes. *Benzine means petroleum benzine.* Distinguish from benzene (benzol), the product obtained from coal tar, *q.v.* On fractionation it yields various products such as mineral naphtha or benzolin (boiling range 70° to 95°), ligroin or petroleum naphtha (boiling range 90° to 120°), and petrol.

Petroleum Leve (B.P.C., P. Dan., P. Helv. V). *Syn.* PETROLEUM SPIRIT, PETROLEUM ETHER. C_6H_{14} = 72.1 principally. At least 95% distils between 60° and 70°, and has sp. gr. of 0.620 to 0.700. *P. Helv. V* requires 90% to distil below 60°, sp. gr. 0.65 to 0.67.

Benzinum Purificatum (U.S.P. XI), syn. PETROLEUM ETHER, is purified petroleum benzine. It has sp. gr. 0.634 to 0.660, and distils entirely between 35° and 80°. **Petroleumum (P. Belg. IV)** has sp. gr. 0.64 to 0.67, boiling-range 50° to 75°. Higher fractions of petroleum are white spirit or turpentine substitute (boiling-range 140° to 220°), illuminating or solar oils (various boiling-ranges up to 300°) and heavy lubricating oils.

Kerosene. Distilled from petroleum and has a boiling range of 150° to 300° with sp. gr. about 0.800 to 0.811. Is used as an illuminating and fuel oil.

Kerosene poisoning in children—4 cases with 1 death.—J. P. Price, *J. Amer. med. Ass.*, ii/1932, 214.

Tar Oil Compound. Cottonseed oil 20, tar oil 5, kerosene 74, oil of lemon-grass 1. For head lice; rub onto the scalp and then wash the head with a solution of soft soap 2 lb., borax 4 oz., in water to 1 gallon.—Minist. Hlth Memo. No. 230 (*H.M.S.O.* 1940).

Lefroy's Crude Mineral Oil Emulsion. *Syn.* PETROLEUM INSECTICIDE.

Crude mineral oil (kerosene) 110, soft soap 50 (whale oil soap is specified) with about 10 of water to form a jelly. For use against lice, fleas, flies, etc., both destroying them, preventing their further attack and thereby acting as a prophylactic to many forms of infectious disease. It is used like ordinary soap for washing. If a little be allowed to dry into the clothes vermin will not approach. The same effect is secured by rubbing a little over the skin.

Cera Alba (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.) is obtained by bleaching yellow wax, **Cera Flava (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.)**, the secretion formed by *Apis mellifica* (Order, Hymenoptera) and used by the insect to form the cells of the honeycomb. Soluble in warm ether, in chloroform and in fixed and volatile oils; sparingly soluble in cold alcohol 90%. M.p. 62° to 64°.

Ceratum (U.S.P. XI). White wax 3, benzoinated lard 7.

Cera Aseptica (B.P.C.). A sterile mixture of white beeswax and almond oil containing 1% of salicylic acid.

Horsley's Wax. An aseptic wax for surgeons' use. Yellow beeswax 7, phenol 1, olive oil 2. It is employed warm at a temperature such that its consistence is just sufficiently soft for easy manipulation. It is heated at temperature of boiling water 5 minutes and then poured into saline or mercuric chloride solution at 105°F., from which it is used during the operation.

As a plugging for the exposed cancellous bone in drainage for empyema in tuberculous children—free drainage effected.—Denis Browne, *Lancet*, ii/1930, 736.

Oxyrocroceum Plaster (P. Helv. V). Yellow beeswax 35, colophony 25, elemi 10, ammoniacum 5, galbanum 5, myrrh 5, Venice turpentine 12, saffron 1, extract of rhatany 2.

Carnauba Wax is a hard yellowish or greenish wax exuded from the leaves of *Copernicia cerifera* (Palme), m.p. about 85°, sp. gr. about 0.995. Is used in polishes.

Japan Wax is a fat obtained from the berries of various species of *Rhus*. It is a pale yellowish wax, becoming white externally on keeping. M.p. about 55°, sp. gr. about 0.995. Is used in polishes.

Cetaceum (B.P.C., U.S.P. XI, *P. Helv. V.*, *P. Dan.*). *Syn.* SPERMACETI, BLANC DE BALEINE (*Fr. Cx.*).

Dose.—8 to 30 grains (0.5 to 2 g.).

Spermaceti is a white, unctuous crystalline substance (m.p. 42° to 50°), obtained from *Physeter macrocephalus* and other species of whale, e.g., *Hyperoodon rostratus*. Consists chiefly of cetyl palmitate, $C_{18}H_{37} \cdot COOC_{16}H_{33} = 480.5$.

Soluble 1 in $1\frac{1}{2}$ of chloroform, about 1 in 7 of ether, 1 in 50 of hot alcohol, and in carbon disulphide and oils. A common ingredient of cold creams. A good addition to theobroma suppositories for hot climates. An emulsion (with acacia or egg yoke, using spermaceti powdered with a little alcohol) has been administered as a demulcent for coughs.

Oleum Cetacei is obtained by removing the spermaceti which separates from the crude oil on standing. It is a thin yellow oil used for burning and as a lubricant.

Unguentum Cetacei (B.P.C.) contains 20% of spermaceti in white beeswax and liquid paraffin.

Higher Fatty Alcohols.

The higher fatty alcohols are the higher members of the monohydric alcohol series. They occur in waxes or in the wax-like unsaponifiable constituents of some fats. As these sources with few exceptions are severely limited, the higher fatty alcohols are prepared by the hydrogenation of the higher fatty acids. Cetyl alcohol, however, is usually obtained from spermaceti. These alcohols are solid, white, crystalline substances, melting without decomposition. They are not acted upon by dilute alkalis or acids, and on boiling with alcoholic potash and diluting with water, they are precipitated unchanged. The alcohols dissolve in concentrated sulphuric acid in the cold to form alkyl sulphates, the sodium salts of which are known commercially as the sulphonated fatty alcohols. Two members of the higher fatty alcohols are important from the point of view of their use in cosmetic and pharmaceutical products, namely, cetyl and stearyl alcohols. They possess good emollient properties without being greasy, and added to water-in-oil emulsions, increase the viscosity, improve the texture, and aid the stability of the preparation. Moreover, the pure substances do not turn rancid. They possess emulsifying powers which allow the reduction, in formulæ for water-in-oil emulsions, of the other emulsifying agents used, and they are also readily absorbed by the skin, thus increasing the efficiency of the preparations containing them.

Cetyl Alcohol. *Syn.* ALCOHOL CETYLICUS (*P. Helv. V.*), ETHAL. $C_{18}H_{37}OH = 242.3$.

It occurs in spermaceti combined with palmitic acid. A white, tasteless, odourless, crystalline substance, greasy to the touch.

Cetyl alcohol is non-irritating, does not become rancid, and is stable to light and air. M.p. 48° to 50°; b.p. 344°.

Insoluble in water; soluble in alcohol, chloroform, ether and other organic solvents. It is miscible with fats and oils.

Cetyl alcohol is of increasing importance in pharmacy and cosmetics. It forms water-absorbing emulsions, facilitating the inclusion of numerous medicaments, is readily included in compounded ointments, and is claimed to aid in the passage of certain medicaments through the skin. Cetyl alcohol is added in about 2 to 7% concentration to ointment bases, and in lesser proportion to stabilise emulsions. Equal parts of a 2% solution of cetyl alcohol in mineral oil, and a 1% soap solution, form a thick, stable emulsion. The alcohol has been found helpful in cream for eczema and pruritus. A common powder for such cases consists of equal parts of cetyl alcohol and boric acid. The preparation of ointments is described.—H. Goodman and A. Suess, per *Brit. chem. Abstr. (B)*, 1939, 1443.

Unguentum Cetyllicum (*P. Helv. V*). Cetyl alcohol 4, wool fat 10, white soft paraffin 86. This ointment is stated to exude water on standing, and may be improved by substituting stearyl alcohol for cetyl alcohol.

Stearyl Alcohol. *Syn.* OCTODECYL ALCOHOL. $C_{18}H_{37}OH = 270.5$.

Stearyl alcohol is obtained by the hydrogenation of stearic acid, and contains cetyl alcohol. It is a whitish, wax-like substance, neutral in reaction, and crystallises in large silvery laminae. M.p. 59°.

Lanette Wax SX (*Ronsheim & Moore, London*), consists of a partially phosphated (about 10%) cetyl-stearyl alcohol. It is a whitish, wax-like neutral substance, melting at about 50°, and easily self-emulsifiable to the oil-in-water type of emulsion. It is used as an emulsifying agent in cosmetics, ointments, hair-creams and other toilet preparations.

A new ointment base may be prepared as follows: Lanette Wax SX 15%, white soft paraffin B.P. 15%, water to 100%. The wax is shredded and melted and the white paraffin added. This is transferred to a warm jar and the water, previously heated, added with slow stirring. On cooling, with stirring, a base of fairly even texture is produced, which can, however, be greatly improved by homogenising while still warm and soft. The cost of the base is approximately that of B.P. lard. The base is of very wide application, acts as a detergent and is cosmetically elegant. It is not liable to rancidity, is non-greasy, and has excellent spreading qualities. It is neutral in action and does not exclude the cooling and heating action of air, and, if necessary, of light and sun. The skin surfaces can in most cases be readily visible even with this ointment on, as only a smear is required.—F. A. E. Silcock and A. Chamings, *Brit. med. J.*, ii/1939, 691.

Halden's Emulsifying Base (*J. Halden, Manchester*). *Syn.* "H.E.B." **SIMPLEX**.

Liquid paraffin 3, soft white paraffin 2, a mixture of higher fatty alcohols (hexadecyl and octadecyl alcohols) containing 10% acid esters (phosphated) of the alcohols 2.

"H.E.B." Simplex possesses the advantages of being neutral, stable in the presence of acid, alkali, metals and salts, and yielding an emulsion with water or aqueous solutions (it is thus readily removed from the skin by water alone). Oil-soluble and water-soluble medicaments can be simultaneously conveyed to the skin, and it has been used as a base for ointments in the treatment of acne, rosacea and seborrhoea with encouraging results.—P. B. Mumford, *Brit. J. Derm. Syph.*, 1938, 50, 542.

PELLETIERINA

[P1] "Alkaloids, the following; their salts, simple or complex:—Pomegranate, alkaloids of."

[S1] "Alkaloids, the following; their salts, simple or complex:—Pomegranate, alkaloids of, except substances containing less than 0.5% of the alkaloids of pomegranate."

[83] "*Alkaloids:—Pomegranate, alkaloids of—in pomegranate bark.*"

[86] "*Alkaloids:—Pomegranate, alkaloids of—specify proportion as the proportion of any one alkaloid of pomegranate that the preparation would be calculated to contain on the assumption that all the alkaloids of pomegranate in the preparation were that alkaloid.*"

Dose.—2 to 8 grains (0.12 to 0.5 g.).

A mixture of alkaloids obtained from pomegranate stem and root bark, *Punica Granatum* (Punicaceæ), the chief of which are pelletierine (punicine), a colourless liquid absorbing oxygen and becoming brown on exposure, and pseudo-pelletierine. Their amount varies between 0.5 and 0.9%. In addition the bark contains about 20% of tannin.

[P1-81] **Pelletierinæ Sulphas.** *Syn.* PUNICINE SULPHATE, PELLETIERINUM SULFURICUM (*Fr. Cx.*). $(C_8H_{15}NO)_2 \cdot H_2SO_4 = 380.3$.

Dose.—2 to 8 grains (0.12 to 0.5 g.).

Consists mainly of the sulphates of pelletierine and iso-pelletierine. Colourless crystals becoming yellow on keeping. It has been employed as a remedy for tapeworm, but is not so effective as the tannate.

The name pelletierine should be strictly reserved for the pure, optically active alkaloid so named by C. Tanret. Commercially, however, the name is applied to the total alkaloids of the stem and root bark of pelletierine. It is believed that the anthelmintic value of the bark depends chiefly on the content of *l*-pelletierine and its racemic isomer. From this point of view, the pelletierine sulphate of *Fr. Cx.*, which consists essentially of a mixture of the total alkaloids, from which the weak bases have been largely eliminated, appears to be more satisfactory therapeutically.—J. A. Goodson, *Quart. J. Pharm.*, 1940, 57.

[P1-81] **Pelletierinæ Tannas** (*B.P., U.S.P. XI*).

Dose.—2 to 8 grains (0.12 to 0.5 g.). *U.S.P. XI* average dose 4 grains.

A mixture of the tannates of the alkaloids. A light yellow powder. Soluble about 1 in 700 of water, and about 1 in 80 of alcohol 90%; insoluble in chloroform.

It has a specific action on tapeworms, but it is inadvisable to administer it to children owing to its toxic effects. For adults the dose is 5 to 8 grains, given in a little water on a fasting stomach, and followed in two hours by an ounce of castor oil.

Granati Fructus Cortex (*B.P.C.*). *Syn.* POMEGRANATE RIND.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ drachm (1 to 2 g.).

The dried pericarp of the fruit of *Punica Granatum* (Punicaceæ). It is a powerful astringent and is used as a decoction in diarrhoea and as a douche in leucorrhœa. Contains about 28% of gallotannic acid.

Granati Radicis Cortex (*B.P.C., P. Helv. V, P. Dan.*). *Syn.* GRANATI CORTEX, GRENADIER (*Fr. Cx.*), POMEGRANATE, MELOGRANO (*P. Helv. V*).

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ drachm (1 to 2 g.).

The dried bark of the stem and root, containing about 0.5 to 0.9% of alkaloids, chiefly pelletierine and pseudo-pelletierine. Used to expel tapeworm, the 1 in 5 decoction being given in doses of 2 ounces every two hours for four doses, the treatment being preceded and followed by the administration of a purge.

Better results have been claimed in tapeworm by passing into the duodenum by Einhorn's catheter 150 g. of powdered root bark infused for 12 hours in a litre of water, and boiled down to one half. Before use, warm to 100°F. and give three doses of 65 ml. at half-hour intervals, followed by laxative, after which catheter is withdrawn.

Spigelia. *Syn.* INDIAN PINK, PINK ROOT. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 g.). The dried rhizome and rootlets or the dried entire plant, *Spigelia marilandica* (Loganiaceæ). Anthelmintic for round-worms, being administered in conjunction with a purge either as powder or as an infusion. Should be followed by a saline purge.

PEPSINUM

B.P., U.S.P. XI, Fr. Cx., P. Helv. V.

Dose.—5 to 10 grains (0.3 to 0.6 g.) either with or immediately before or after meals, in a pill or cachet. It is not unpalatable sprinkled on meat like pepper. *U.S.P. XI* average dose 8 grains.

A proteolytic enzyme obtained from the gastric mucous membrane of the pig, sheep or calf, *Pepsina Porci* being usually preferred. Occurs as a light, yellowish-brown powder or in translucent scales or granules. It is supplied to dissolve 2500 (*B.P.*), 3000, 5000, or up to 10,000 times its weight of freshly coagulated egg albumen. *U.S.P. XI* requires it to digest 3000-3500 times its weight of egg albumen. Pepsin may be adjusted to a required strength by the addition of lactose.

Incompatibility. Its activity is destroyed by more than traces of salt, by boiling its solution, by heating in the presence of alkali, and by pancreatic ferments in neutral solution. It is active in the presence of dilute acid, but its activity is destroyed by more than about 0.5% of hydrogen chloride.

Uses. As a digestive, small doses, either in the form of powder, cachets or one of the following preparations. Pepsin and hydrochloric acid given immediately after eating may inhibit carbohydrate digestion in the stomach. It should not be taken until 30 to 45 minutes after a meal. It may be found of value in combination with hydrochloric acid in advanced achlorhydric (microcytic) anæmia and in Addison's anæmia, and it is claimed to have given good results in sprue and hill diarrhœa. Pepsin is also administered in tablet form with or without other ingredients, and in mixture form with bismuth. For the composition of a useful acid mixture containing bismuth sodium tartrate, *see* p. 304.

GASTRIC AND DUODENAL ULCERS (600 cases) cured by subcutaneous injections of a 1% pepsin solution (freed from albumin by pressure filtering through clay and containing phenol). Begin with 0.2 ml. thrice daily or every other day, increasing by 0.1 ml. to 0.5 ml., repeating this for 12 injections, and then decreasing in the same way to 0.2 ml. Injections said to be harmless and painless. Give olive oil before meals and bismuth after meals. Avoid belladonna and sodium bicarbonate, and give mixed diet.—K. Glaessner (Vienna), *Lancet*, i/1932, 78.

Achlorhydria in a variety of conditions cured by pepsin and hydrochloric acid.—T. H. Oliver and J. F. Wilkinson, *Brit. med. J.*, ii/1930, 1048.

Elixir Pepsini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains about 3 gr. of pepsin per drachm.

Glycerinum Pepsini (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.) in water.

A solution of pepsin 10% *w/v* in acidified glycerin and water. This is a very active solution. If made with good scale pepsin it keeps indefinitely.

Mist. Acid. Pepsin. (N.I.F.). Dilute hydrochloric acid 10 m., glycerin of pepsin 30 m., water to $\frac{1}{2}$ oz.

Glycerinum Pepsini Fortius (B.P.C.). *Syn.* GLYCEROL OF PEPSIN.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains about 8 gr. of pepsin per drachm, in acidified glycerin, simple elixir and water.

Liquor Pepticus (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains 1 in 8 of stronger glycerin of pepsin in acidified diluted alcohol.

[P1] **Liquor Diastos (Sharp & Dohme, London).** A compound pepsin preparation containing in each fluid ounce: pepsin (1 in 3000) 8 gr., papain $1\frac{1}{2}$ gr., rennin $\frac{1}{2}$ gr., dilute nitrohydrochloric acid 5 m., lactic acid $\frac{1}{2}$ m., nux vomica $\frac{1}{2}$ gr. *Dose.*—A dessert to a tablespoonful, before or after meals, as indicated. Achylia gastrica, atonic dyspepsia, and faulty digestion.

Liquor Pepticus (Benger) (Benger's Food Ltd., Manchester).

Dose.—1 to 2 drachms (4 to 8 ml.) in a wineglassful of water with meals. An active solution of the ferments in weak alcohol.

Pulvis Pepsini Compositus (B.P.C.).

Dose.—10 to 30 grains (0.6 to 2 g.).

Pepsin 15%, pancreatin 10%, diastase 1%, with lactic and hydrochloric acids and lactose.

Peptana (Burroughs Wellcome, London). Tablets contain pepsin, pancreatin and calcium lactophosphate, of each 1 gr. The external sugar-coating dissolves in the stomach, exposing the pepsin, whilst the pancreatin enclosed in a keratin coating dissolves in the intestine.

Vinum Pepsini (B.P.C.). *Dose.*—1 to 2 drachms (4 to 8 ml.) with meals.

Contains pepsin 2 gr. per drachm, hydrochloric acid 1 in 80 and glycerin in sherry-type wine.

Peptenzyme (Reed & Carmick, Jersey City; Coates & Cooper, London).

Dose.—10 to 20 grains (0.6 to 1.2 g.) before or after meals and at bedtime. A preparation containing the enzymes which enter into the process of digestion. Suitable for varied types of indigestion. Also supplied in tablets, granules and elixir.

Seriparium (B.P.C.). *Syn.* RENNET, RENNIN.

The partially purified, milk-curdling enzyme from the glandular layer of the fourth or true digesting stomach of the calf, occurring as greyish- or yellowish-white scales or powder slowly soluble in water. It deteriorates when stored. Coagulates not less than 25,000 times its weight of fresh cows' milk.

PEPTONUM*B.P.C.*

Dose.—5 to 15 grains (0.3 to 1 g.); $\frac{1}{8}$ to $1\frac{1}{2}$ grains (0.01 to 0.1 g.) by injection.

A mixture of cleavage products of proteins consisting of peptones with peptones and amino-acids, prepared from meat and other proteins by enzymatic degradation or other processes. It occurs as a whitish or buff-coloured powder, usually soluble in water. It varies much in composition according to the method of preparation and the purpose for which it is required. Peptone is used for making solutions for injection and as a constituent of culture media in bacteriology.

Injectio Peptoni (B.P.C.).

Dose.—3 minims (0.2 ml.) gradually increased to 25 minims (1.5 ml.) by intravenous or intramuscular injection.

A sterile neutral solution containing 5% *w/v* (for intravenous use), or 7.5% *w/v* (for intramuscular use) of peptone (*vide infra*).

Non-Specific Protein Therapy

Non-specific protein therapy is the treatment of disease by the injection of proteins, either bacterial or non-bacterial, which, by provoking a defensive reaction (rise of temperature, leucocytosis, etc.) similar to that produced by the invasion of the organism by a specific foreign protein, enables the patient to desensitise or immunise himself. The actual mechanism of this reaction is still obscure.

Numerous substances have been employed to produce this protein shock. Amongst the more important of these are (1) peptones; (2) milk and preparations made from milk; (3) vaccines (used non-specifically) and tuberculins; (4) artificially induced diseases, such as malaria; (5) blood; (6) vegetable and animal proteins, such as pollen extracts. These are dealt with in this order in the following pages.

(1) **Peptone Injections.** Peptone injections are employed for non-specific desensitisation in allergic conditions, particularly in asthma, hay fever, angioneurotic oedema, urticaria and cyclic vomiting. The injections may be given either intravenously or intramuscularly. For *intravenous treatment* in asthma a 5% solution is employed, and this is given in a series of ten graded doses, commencing with 0.3 ml. and gradually increasing up to 1.5 ml.; this is followed by a further course of six injections (three of 2 ml. and three of 2.5 ml.) given every fourth or fifth day. For *intramuscular treatment* a similar course of injections is given, employing a 7½% solution.

Though this form of non-specific desensitisation often gives extremely good results in asthma, certain types of cases are completely resistant; these include many of those with chronic bronchitis and developed emphysema, and cases presenting any degree of cyanosis, also those in whom, apart from asthmatical paroxysms, a more or less oppressed condition of the respiration is practically never absent. Children frequently respond well to the treatment, especially where the asthmatic attacks are of the clear-cut spasmodic type, but a small initial dose should be given to test the sensitivity of the patient.

(The treatment outlined above refers to the use of Armour's Peptone No. 2. A more potent preparation, known as Witte's peptone, or "Peptone Witte Special 30" and containing a higher proportion of primary proteoses, has also been employed in non-specific protein therapy, but in much lower dosage, e.g., 0.2 ml. of a 1% solution intramuscularly, gradually increased by 0.2 ml. at weekly intervals to 1.2 ml. It has also been employed orally in various allergic conditions, in a dose of 8 grains three times daily, before meals.)

ASTHMA. Treatment by desensitisation, though still empirical, has given very good results in some cases.—*Lancet*, ii/1931, 1140.

It is an undeniable fact that a small injection of animal protein in high dilution has very marked effect on the spasmodic attack associated with asthma.—T. Nelson and A. D. Porter, *Lancet*, ii/1931, 1344.

Asthma due to protein sensitiveness (dog). Opinion divided as to peptone.—C. J. Murphy, *Lancet*, i/1931, 813. Asthma well treated.—J. Mowbray, *Lancet*, i/1931, 813.

Eupepton (Allen & Hanburys, London). Therapeutic and bacteriological peptones. No. 1. For injection in non-specific protein therapy and for preparation of the culture medium for the Rideal-Walker test. No. 2. For preparation of culture media for general bacteriological purposes.

Paragen (Bayer Products, London). Described as a polypeptide and quino-line-urea compound with protein degradation products for intramuscular injection in the non-specific treatment of infective arthritis and other infections. Dose.—2 ml. once or twice daily.

(2) **Milk Injections.** Injections of sterilised milk (or milk proteins) have been employed as a form of protein shock therapy, the dose usually given being from 5 to 10 ml. intramuscularly. The injections give rise to a generalised anaphylactic reaction, characterised by chill, malaise, and a rise in temperature, and good results have been claimed for the treatment in acute gonorrhœa, erysipelas, and general paralysis of the insane.

ERYSIPELAS. Rapid recovery in 15 cases following intragluteal injection of 5 ml. Contraindications: pulmonary tuberculosis and chronic recurrent hematemesis.—*Brit. med. J. Epit.*, i/1928, 85.

An injection of 10 ml. of boiled milk intramuscularly promotes a cure within 12 hours.—*Brit. med. J.*, i/1938, 764.

LEPROSY well treated by intravenous milk injections. 12 cases treated with sufficiently good results to enable them to resume their employment. The treatment is drastic and dangerous and especially applicable to the late and more hopeless forms of the disease.—N. A. Dyce Sharp, *Trans. R. Soc. trop. Med. Hyg.*, Jan., 1928, 308.

Aolan (Herts Pharmaceuticals, Welwyn Garden City). Milk protein preparation for intramuscular injection in non-specific therapy.

(3) **Non-specific Vaccines.** Various vaccines have been employed including *B. coli*, gonococcus, streptococcus and typhoid, of which the last-mentioned is the most popular. T.A.B. vaccine has been injected intravenously with some measures of success in rheumatoid arthritis, chorea, G.P.I. and various forms of vascular disease. It is diluted with physiologic solution of sodium chloride until 1 ml. contains 100 million organisms; the initial dose for adults is from 10 to 25 million. Tuberculin has also been used, particularly in the treatment of asthma.

ARTHRITIS. T.A.B. vaccine intravenously produces rapid improvement in 80 to 90% of cases, which is maintained in between 50 and 60%, the types responding best being acute and subacute, where disease is confined to the peri-

articular tissues. Injections of no use unless all possible foci of infection removed. Reactions severe, but contraindications few—disease of myocardium, gross kidney disease, chronic alcoholism, tuberculosis and syphilis being the chief. Cases of the menopause group, of the chronic villous type and those showing achylia do not do well. Initial dose 100 million (in private practice 50 million), increased at each subsequent dose by 100 million, 4 days elapsing between injections. Dosage should be regulated to produce rigor, sharp rise of temperature, quick fall, and profuse perspiration. Of 50 cases treated 44 were discharged after 4 weeks as definitely improved.—W. Yeoman, *Lancet*, i/1926, 1246-50; see also *ibid.*, 1265.

ASTHMA. True cases of bronchial asthma benefited by prolonged injections of P.T.O. dilutions, beginning with 0.5 ml. of 1 in 1,000,000 and gradually increasing. The treatment must be kept up for a year at least and injections twice a week are given for the first 4 months, then once a week for 4 months, and lastly once a fortnight.—T. Nelson, *Practitioner*, i/1927, 382.

CHOREA. Treatment by pyrexia induced by intravenous injection of triple typhoid vaccine containing 1000 million typhoid and 750 million each of paratyphoid A and B per ml., beginning with 0.05 or 0.1 ml., the object being to attain a temperature of 104° to 105.5° and to maintain it for four hours. Treatment continued daily till choreic movements have disappeared—usually within a week.—D. Bateman, *Brit. med. J.*, i/1933, 1003. See also J. W. Cheetham, *ibid.*, 1130.

GENERAL PARALYSIS. Typhoid vaccine as a substitute for malaria therapy, *q.v.* T.A.B. containing 100 million *B. typhosus* and 750 million *B. paratyphosus* A and B, intravenously, 1 ml. for 10 days, starting with 300 million total, and rising to 6000; then 6 weeks' interval and recommence with 1500 million, rising to 20,000 in 10 days, with 4 injections of neoarsphenamine in the interval. Remission induced. Contraindications—arteriosclerosis, pulmonary disease, myocardial and advanced cardiovascular disease, and marked focal infections.—J. M. Mackenzie, *per Prescriber*, 1929, 302; *Lancet*, i/1929, 288.

SCIATICA of the sacro-iliac joint; T.A.B. vaccine intravenously gives the best chance of removal of symptoms in the shortest possible time.—W. Yeoman, *Lancet*, ii/1928, 1119.

VASCULAR DISEASE. One of the newer fields for foreign protein therapy is that of vascular disease, particularly thrombo-angiitis obliterans, the pain of which is often excruciating, and Brown considers the intravenous administration of typhoid vaccine the best medical measure for its relief. Allen and Smithwick have reported successful results with typhoid vaccine in Buerger's disease, in the gangrene of arteriosclerosis, and in purely vasomotor types of vascular occlusion. These authors used doses of from 125 to 300 million bacilli but Wright believes that the chill should be avoided and recommends small doses just enough to produce 2 or 3 degrees of fever. Wright recommends an initial dose of 10 million typhoid bacilli, with an increase of 10 million with each subsequent injection. Goodman and Gottesman have also reported enthusiastically on the use of fever therapy in vascular disease, particularly Raynaud's disease.—R. L. Cecil, *J. Amer. med. Ass.*, ii/1935, 1852.

Omnadin (*Bayer Products, London*). Compound sarcine vaccine containing albumins, lipoids and fats. *Dose*.—2 ml. intramuscularly daily. Non-specific therapy in all fevers and in acne and furunculosis.

(4) **Artificially Induced Disease.** This procedure is based on the principle that remissions in chronic disease may occur after an attack of acute specific fever, and it has been especially employed in the treatment of G.P.I. by the artificial induction of malaria. Subcutaneous injections are given of from 2 to 4 ml. of blood from the vein of a patient suffering from benign tertian malaria. After an incubation period of from 10 to 20 days, the temperature rises and the patient has a rigor. From nine to twelve paroxysms are allowed and the infection is then terminated by quinine. The mode of action of the malaria is uncertain, but the hyperpyrexia produced is probably the most important factor.

In treatment of general paralysis a rigor on alternate days is followed by greater benefit than a daily rigor. Allow the primary attack to go on 4 or 5 days then give 3 to 5 gr. of quinine to check temporarily and wait for relapse. In this way the temperature is nearly always of the true tertian character with rigors on alternate days.—Leader, On Report of First Results of Laboratory Work on Malaria in England.—Col. S. P. James and P. G. Shute, *Brit. med. J.*, ii/1926, 79.

Watch should be kept for undue enlargement of spleen, especially if patient has previously had malaria.—N. G. Harris, *Lancet*, ii/1928, 500.

Allow at least 8 rigors. Malaria effectively cured by quinine. No relapses with inoculated malaria—compared with 50% relapses with mosquito bites. Follow up with 3 g. of trypanamide intravenously and 0.2 to 0.4 g. of bismuth intramuscularly weekly in 10-week courses with intervals of 4 weeks.—R. Lees, *Brit. med. J.*, ii/1931, 338.

Ten years of malaria therapy: results in 368 cases. It undoubtedly improves the bodily health, prolongs life to a marked degree in some 35% of cases, and has beneficial action on habits and cleanliness. In 18 to 20% it produces clinical improvement apparently lasting many years, and often allows resumption of healthy and useful home life.—J. E. Nicole and E. J. Fitzgerald, *Brit. med. J.*, i/1934, 427.

(5) **Whole Blood Injections.** A simple and effective form of non-specific desensitisation is injection of the patient's own blood (autohæmotherapy). From 5 to 10 ml. of blood is withdrawn and immediately re-injected intramuscularly. These injections have been employed in a wide variety of conditions, and in particular have often been found of value in chronic dermatoses, including eczema, pruritus, psoriasis, pemphigus, and urticaria.

Of all the methods of desensitisation by non-specific injections, whole-blood therapy has much to recommend it. When indicated it should always be used first before recourse is had to more elaborate procedure.—C. Hardwick, *Practitioner*, i/1940, 79.

ASTHMA. Twenty-four asthmatic children received 5 injections each of 10 ml. of their own blood, which was withdrawn from the median basilic vein and injected immediately into the buttock, without admixture with citrate or separation of either plasma or serum. Observations over a period of 6 to 12 months afterwards indicated that in approximately three-quarters the frequency of attack was appreciably reduced and in every instance some alleviation of severity was manifest.—K. Maddox and R. F. Back, *Arch. Dis. Childh.*, 1935, 380.

TYPHUS. 16 severe cases treated by intramuscular injection of 10 ml. of the patient's blood. Each injection was followed by an immediate improvement in the general condition, and the duration of the disease seemed to be shortened by a series of 4 or 5 injections.—A. Babalian, per *Med. Annu.*, 1935, 463.

WHOOPIING-COUGH. After failure of vaccine therapy 20 severe cases in children aged from 25 days to 30 months in the paroxysmal stage were treated by one or two intragluteal injections of *maternal blood*; all but three showed rapid improvement.—V. de Gironcoli, per *Med. Annu.*, 1936, 509.

Antibacsyn (Antibody Products, Watford). A preparation derived from ox serum, "consisting of a suspension in carbol saline of serum euglobulin adsorbed to the hydroxides of calcium and magnesium." For use wherever protein therapy has been found effective. *Dose.*—1 or 2 ml. subcutaneously.

Edwenil (Endocrines-Spicer, Watford). Described as a deproteinised flocculus obtained by fractionation from an extract of beef muscle and normal horse serum suspended in 0.5% phenolised normal saline. It is stated to arouse the defences by stimulation of the reticulo-endothelial system and other defence mechanisms, and to produce rapid response in endotoxic infections without causing undesirable reactions. Advocated in pneumonia and diseases of the respiratory tract, also in furunculosis and whooping cough. *Dose.*—2 to 4 ml. subcutaneously every 12 hours in acute infections, 2 ml. daily in less acute conditions, and 2 ml. on alternate days in chronic infections. Contraindicated in acute infective processes where there is no drainage, e.g., acute appendicitis, sinusitis, cholecystitis and mastoiditis.

(6) **Vegetable and Animal Proteins.** Hay fever and most forms of asthma are due to a peculiar reaction of the tissues ("anaphylaxis") of sensitive individuals to certain proteins which are inhaled in the air or swallowed with food. Some individuals are sensitive to only one protein and others to a large number. The proteins to which sensitisation is most frequent are (1) pollen proteins, (2) epidermal proteins (from animal hair or feathers), (3) food proteins, and (4) bacterial proteins. It is frequently possible to determine by a cutaneous or, especially in the case of pollen sensitisation, by an ophthalmic reaction, employing test solutions of protein extracts, whether a patient is susceptible to a particular protein or group of proteins. In the skin test the protein extract is introduced either intradermally, by scarification, or by merely pricking the skin, using on an adjacent spot a control of normal saline, the areas usually chosen for the test being the forearm in men and the front of the thigh in women and children. In the case of a positive reaction a wheal will begin to appear within 5 minutes. The ophthalmic reaction consists in a slight reddening of the eye within 5 minutes of the instillation of a solution of a pollen extract into the conjunctival sac. The normal man never gives this reaction. The offending protein having been discovered the patient is then given a course of injections with the appropriate desensitising agent.

In England, the true hay fever due to grass pollen is a hundred times more important than all the other pollen fevers together. Extracts from all the various grass pollens furnish one and the same antigen for purposes of desensitisation to hay fever.—J. Freeman, *Lancet*, 1/1933, 573.

From an allergic study of 262 cases of dermatoses, including eczema, urticaria, prurigo, dermatitis venenata, etc., it was concluded that intradermal tests were of little value in determining the cause; though positive reactions were frequently obtained they were rarely of practical significance. The indiscriminate subjection of patients with dermatoses to a large number of skin tests is not justifiable.—H. V. Mendelsohn, *Arch. Derm. Syph.*, N.Y., 1934, 845.

Over 90% of 961 patients treated for hay fever in 1932 and 1933 were cured or relieved by prophylactic subcutaneous injections of pollen antigens. A mixed standard preparation containing extracts of all pollens found to be pathogenic in Central Europe preferable to searching for some specific antigen.—K. Hansen, per *Lancet*, ii/1935, 201.

The various regions of the body do not react alike to skin tests. The back reacts more strongly than the upper arm, the flexor surfaces than the extensor, the upper arm than the forearm. Hence in comparing results one must make sure that all tests were made on the same region of the body. For instance, one should not compare a test made on the back with one made on the forearm. As to the back itself, wheals induced four fingerbreadths below the spine of the scapula were only half as large as those produced in the region of the spine of the scapula itself.—W. Schmidt, *Klin. Wschr.*, 1935, 14, 378.

In choosing which skin tests to apply, it is well to remember that after infancy such inhalants as feathers, dusts, animal emanations and pollen, play a much greater part than foods, and treatment with such substances is more likely to be successful than any dietetic measures. In a study of 300 children with asthma, positive scratch tests showed 47% sensitive to animal emanations, 29% to pollens, 25% to foods, and 5% miscellaneous.—G. W. Bray, *Practitioner*, ii/1937, 363.

The intranasal application of a pollen solution is invaluable in hay fever, both as a preventive of attacks and for use in relieving an existing attack. It is convenient to arrange that the desired dose is contained in 0.25 to 0.5 ml. of fluid, as this is a suitable amount to apply at one time. Necessary dilutions of concentrated pollen solutions may be made with 0.5% phenol in normal saline. For preventive purposes, before the hay fever season begins, commence with 100 to

200 units of pollen solution, followed by a 30% increase at intervals of two days or more. In an average case seen during the season, with mild symptoms, give an initial dose of 10 units and repeat in 5 minutes if this does not produce mild sneezing; subsequent doses may be increased 25% at intervals if necessary. The solution should be sprayed on to the septum, the middle and inferior turbinates, and on any hypersensitive areas.—C. Francis, *Brit. med. J.*, ii/1938, 1263.

E. R. Bolland carried out investigations on the results of treatment by "desensitising injections" of proteins in the Asthma Research Clinic at Guy's Hospital. He found that the treatment had a beneficial effect in subduing the symptoms, but these effects were in no way superior to a control series in which equivalent volumes of normal saline solution were injected with similar ceremonial. In the treated cases and the control series the effects were equally transitory and were, in his opinion, psychological. It is not doubted that some cases of asthma are of allergic etiology, but it would seem that this is neither the most important nor the commonest factor.—G. Marshall, *Practitioner*, ii/1939, 489.

Standardisation of Pollen Allergens. As the exact nature of allergens is uncertain, there is no uniformity of standardisation. The following methods are used:— (1) Noon Unit—the quantity of extract obtained from 0.001 mg. of pollen. 1 Noon unit is equivalent to 80 to 100 pollen grains. (2) According to dilution (1 : 100; 1 : 1000; 1 : 10,000) of the weight of pollen per volume of menstruum. (3) According to amount of nitrogen found by precipitation of protein with phospho-tungstic acid, or trichloroacetic acid. (4) According to total nitrogen content.—J. J. Blackie, *Pharm. J.*, i/1938, 355.

Numerous Allergenic Protein Preparations have been accepted by the Council on Pharmacy and Chemistry of the A.M.A., and they are required to comply with the regulations of the U.S. Treasury Department regarding potency, sterility and labelling. They include allergenic extracts of numerous vegetable and animal substances, and concentrated pollen antigens, extracts, and solutions of a large number of plants.—N.N.R., 1940.

Mixed Inhalants Solution (Bencard, London). Proteins from feathers, animal hair, dust andorris root, with peptone. Also available without peptone. Adrenaline is also added to prevent a general reaction in sensitive patients. Available in two strengths, ordinary and continuation course. 10 ml. of the ordinary strength is usually sufficient for one patient.

Pollacine (Parke, Davis, London). A grass-pollen vaccine prepared from the pollen of Timothy grass and used for the prophylaxis and treatment of hay fever.

Pollergen (Duncan, Flockhart, Edinburgh). A combined pollen vaccine prepared in a series of 12 graded doses ranging from 50 to 15,000 Noon units for the treatment of hay fever.

Peptonum Bovinum. *Syn.* BEEF PEPTONE, DIETETIC PEPTONE. Is prepared by the action of pepsin on minced lean beef. Occurs as a white or yellowish powder or scales. Administered as lozenges (5 grains), enema (2 to 4 ounces of 1 in 8 solution), or as Suppositorium Nutriens.

Peptone may be manufactured by digesting 1 kilo of beef with 10 litres of water (containing 4 g. of hydrochloric acid per litre) with pepsin 10 g. for 8 hours at 50° with frequent shaking. Termination of reaction shown by absence of precipitate with nitric acid on adding to a little of the filtered liquid. Evaporate. 1 kilo yields 250 g. approximately.

Suppositorium Nutriens (B.P.C.). *Syn.* SUPPOSITORIUM PEPTONI. Contains 75% of beef peptone with gelatin and water.

Carrick's Liquid Peptonoids (G. W. Carrick, New York; Brooks & Warburton, London). A predigested food prepared from beef, milk and wheat, with wine. *Dose.*— $\frac{1}{2}$ tablespoonful at intervals.

Panopepton (Fairchild Bros. & Foster, New York; Burroughs Wellcome, London). A medicated wine prepared from beef and wheat.

Both the above may be dispensed by registered chemists without requiring a spirit licence to be taken out, providing it forms a constituent of a bona-fide medical prescription given by a duly qualified medical practitioner.

MEAT EXTRACTS

Meat Extract. The meat is cut up and all tendons removed. It is then minced and boiled. After settling, the soup is skimmed to remove the fat. Next it is filtered and evaporated to 25 Beaumé, and it then contains 16% moisture. The whole process takes 5 days, and 10 lbs. meat gives 1 lb.

Meat extracts have a stimulant action on the gastric mucosa. The water-soluble fraction of meat is almost as efficient in stimulating a flow of HCl as whole meat. The secretion of HCl is greater with Bovril than with any other substance examined (gruel, beef powder, extracted beef, direct extract, Bovril, sodium glutamate), including whole meat. Whole meat in the form of beef powder is the only substance examined which stimulated a flow of pepsin. The emptying time of the stomach is less with meat extracts than with whole meat. Bovril reduces the time by 60% as compared with beef powder.—W. R. Boon, *Brit. med. J.*, ii/1937, 412.

Meat juice is the fluid portion of muscle fibre obtained by pressure or otherwise and may be concentrated at a temperature below the coagulation point of the soluble proteins.

Beef and Malt Wine. Extract of beef 4 oz., extract of malt 8 oz., port wine 1 gallon (*Ph. Form.*): or a meat juice and liquid extract may be used instead of the solid extracts.

"The Chemistry of Flesh Foods and their Losses on Cooking," by R. A. McCance and H. L. Skipp. *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 187, 1933.

"**Allenburys**" Beef Juice (*Allen & Hanburys, London*).

Fresh beef is expressed and the juice concentrated *in vacuo*. It retains the vitamins present in beef and contains iron and copper.

Bovril (*Bovril Ltd., London*).

A combination of beef extract and finely powdered beef fibrin and albumen, used as a substitute for ordinary beef tea.

Brand's Meat Juice (*Brand, London*).

A teaspoonful in a wineglassful of water is a useful tonic. Is prepared by cold process resulting in retention of full activity of juice of the raw beef.

Eatan (*British Amino Products, Surbiton; Fassett & Johnson, London*).

An essence of beef, described as a liquefied form of liver and animal proteins.

Essence of Beef (*Brand, London*).

A soft, transparent, amber-coloured jelly, prepared from beef by exhausting with tepid water.

Ferrocarnis (*Brand, London*).

Dose.—One teaspoonful in water thrice daily with meals.

Described as a flavoured solution of iron in organic combination with concentrated raw meat juice. An iron tonic food.

Somatose (*Bayar Products, London*). Water-soluble meat albumoses.

Dose.—2 to 4 teaspoonfuls daily dissolved in water. Iron-Somatose contains 2% iron.

Trophonine (*Reed & Carnrick, Jersey City; Coates & Cooper, London*).

Tonic food prepared from beef, malt, barley, milk and cocoa and containing 19.5% v/v of alcohol.

Valentine's Meat-Juice (*Valentine's Meat-Juice Co., Richmond, Va.*)

Meat juice obtained in a state ready for immediate absorption. One teaspoonful to be dissolved in warm or cold water.

Albumen (*B.P.C.*). *Syn.* EGG ALBUMEN, WHITE OF EGG. The liquid white of the egg of *Gallus bankiva* var. *domesticus* (Gallinæ). A nearly colourless or pale yellow fluid contained in a fibrinous network broken up by beating. Sp. gr. about 1.045. Contains 12% of protein, and is coagulated on heating to about 70°, or by adding alcohol. Is used as an antidote to poisoning by soluble salts of mercury and other heavy metals, and is an effective first-aid treatment for burns.

BURNS. A simple and effective form of first-aid treatment for burns is the immediate application of white of egg (no attempt being made to clean the burnt area or to collapse blisters). For burns of the face no other dressing is needed, but for other areas patches of cellophane are placed over the burn and a light padding of cotton wool over these. Minor burns of the first two stages heal in a week or less, but should be protected for two weeks. Within a few seconds of application all pain ceases.—J. L. Aymard, *Brit. med. J.*, ii/1940, 168. This method is used extensively as a home remedy in Eastern Europe.—A. Freitag, *ibid.*, 206.

Preparation of Egg Protein for the Treatment of Hæmophilia. By incubating egg-white at 37° with potassium bromide for several days a substance can be prepared which, when added to blood *in vitro*, gives a clear, structureless gel which does not shrink. The substance was found of value in hæmophilia. It may be prepared as follows:—Potassium bromide 40 g., is thoroughly mixed with egg-white 200 ml., and the mixture incubated at 37° for three days; 200 ml. of water is added and then 6 vols. of alcohol 98%. The liquid is filtered, and to the filtrate an equal volume of acetone is added to precipitate the active material. The precipitate is warmed at 70° with 20% nitric acid, neutralised with potassium hydroxide, and concentrated *in vacuo* at 70° to one-twentieth of its volume. Alcohol 98% is then added to the original volume, potassium nitrate is filtered off, the filtrate again concentrated *in vacuo* at 70° to one-twentieth of its volume, and a mixture of equal parts of alcohol and ether is added until no more yellow precipitate forms. The clear solution is concentrated until free from alcohol and ether, and the cloudy solution then remaining is allowed to stand for 24 hours, filtered, and the active material crystallised from the filtrate by further concentration. The substance is administered by intravenous or intramuscular injection of an aqueous solution, the usual dose being 10 to 30 mg. Much larger quantities were given without the production of local or general intravascular clotting. Repeated injections are necessary. A derivative of mucic acid was found to have similar properties.—W. A. Timperley, A. E. Naish and G. A. Clark, *Lancet*, ii/1936, 1142.

Albumen Siccum (P. Ned. V).

Yellowish, transparent, horn-like flakes obtained by evaporating white of egg at not exceeding 50°.

Albumin Water, for infantile diarrhoea and invalids in general. White of 1 egg mixed with sterile water 8 oz., sodium chloride 5 gr. or *q.s.* and a little whisky or brandy added.

Ovi Vitellus, yolk of egg, has a slightly alkaline reaction and consists of about 50% of water and 20% of oil emulsified by about 7% of lecithin and 15% of vitellin. An emulsifying agent giving emulsions not readily broken by acids or other electrolytes.

Hæmoglobinum (B.P.C.).

Dose.—5 to 30 grains (0.3 to 2 g.) or more.

The principal constituent of red blood corpuscles. Is supplied commercially in reddish-black powder or in scale form consisting of the oxygen compound, oxyhæmoglobin. Is a combination of the protein, globin, with hæmatin, $C_{34}H_{30}O_4N_4Fe \cdot OH$; pure hæmoglobin contains about 0.34% Fe, 16% N and 0.6% S. May be given according to condition in cachet, capsule, or mixed with wine. It is used in secondary anæmia as a substitute for iron salts, which are more irritant to the stomach. Hæmoglobin solution gives a characteristic absorption spectrum. *Cf.* Vol. II for estimation in the blood and further details.

In the arterial circulation, hæmoglobin is present as oxyhæmoglobin (brilliant red in colour) the oxygen of which is given up to the tissues in its course, returning de-oxygenated (dark red) to the lungs by the venous system, where it is ready to take up fresh oxygen and so continue the process.

Elixir Hæmoglobini (B.P.C.). **Dose.**—1 to 2 drachms (4 to 8 ml.). Contains 10% *w/v* of hæmoglobin (about 5½ gr. per drachm). An agreeably flavoured preparation of hæmoglobin as hæmatin.

Hemoplase (*Lumière, Lyons; Anglo-French Drug Co., London*). "Hæmoglobin in its natural state." Supplied in ampoules and dragées. In anæmia, hæmorrhage, tuberculosis, etc.

Chlorophyll (*B.P.C.*). The green colouring matter of plants extracted first by ether, then alcohol—in which latter the chlorophyll is soluble, leaving the waxy matter behind, or it can be produced by acetone extraction. It is supplied commercially in solid extract and liquid form, and is employed principally for colouring fats, oils, soaps, etc. Oil soluble, alcohol soluble and water soluble varieties are available. Oil soluble chlorophyll is obtained by diluting the purified extract with a fat, alcohol soluble chlorophyll is obtained by dilution with castor or other oil, and the water soluble variety by the action of dilute alkalis on the purified extract. Is stated to possess blood-forming properties, especially in conjunction with iron.

Chlorophyll contains no iron in itself but bears some close relation to iron for it cannot be formed in a plant from which iron is excluded. It contains magnesium, and perhaps this supplies to the component parts of chlorophyll the same cement which iron is said to give to the hæmoglobin molecule. Phylloporphyrin, $C_{41}H_{54}N_4O$, one of the decomposition products of chlorophyll, has a close relationship to hæmatoporphyrin, $C_{41}H_{52}N_4O_2$, an iron-free decomposition product of hæmoglobin. Going a stage further, hæmopyrrol, $C_8H_{13}N$, can be obtained from both.

Medulla Rubra (*B.P.C.*).

Dose.—20 to 40 grains (1·3 to 2·6 g.).

The mixed fatty material from the bones of calves and young oxen. Contains erythroblasts from which the hæmoglobin-containing cells of the blood are developed. The bone marrow of older animals is yellow and contains no erythroblasts. Has been used in secondary anæmia, in leukopænia and in agranulocytic angina.

ANÆMIA. Desiccated red bone marrow and spleen, in equal proportions, given thrice daily in 5-grain doses, gave very definite improvement in 41 out of 46 cases of secondary anæmia. Treatment continued for 6 or 8 weeks.—*Brit. med. J. Epit.*, i/1925, 17.

LEUKOPENIA. Four patients with leukopenia and six with agranulocytic angina were treated with a yellow bone marrow concentrate *per os*; all recovered. Those with acute leukopenia showed clinical and hæmatologic improvement at the end of 40 to 48 hours. It is concluded that the yellow bone marrow concentrate contains a substance or substances which act to stimulate the maturation or liberation of leucocytes of the granulocyte series.—C. M. Marberg and H. O. Wiles, *Arch. intern. Med.*, 1938, 408.

PULMONARY TUBERCULOSIS improved by treatment with spleen extract and bone marrow, which definitely increased production of erythrocytes and hæmoglobin.—*Per J. Amer. med. Ass.*, ii/1925, 1513.

Extractum Medullæ Rubræ (*B.P.C.*). *Syn.* GLYCERIN EXTRACT OF RED BONE MARROW. *Dose*.—1 to 2 drachms (4 to 8 ml.).

1 in 4, in glycerin and chloroform water.

Virol (*Virol Ltd., London*). A preparation of bone marrow with malt, egg, and lime. Has nutrient properties for infants.

Bynotone (*Allen & Hanburys, London*). A combination of halibut-liver oil, bone marrow, yeast extract, hæmoglobin, malt extract and vitamin D. In malnutrition, pregnancy and convalescence.

Roboleine (*Oppenheimer, London*). A combination of bone marrow, malt, egg yolk, and lemon juice. In wasting diseases.

PHENACETINUM

B.P., P. Helv. V, P. Belg. IV, P. Ned. V, etc.

$\text{CH}_3\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{OC}_2\text{H}_5[\text{CH}_3\text{CO}\cdot\text{NH}:\text{OC}_2\text{H}_5 = 1:4] = 179\cdot1.$

Syn. ACETPHENETIDIN, ACETPARAPHENALIDE, ACETOPHENETIDINUM (*U.S.P. XI*), ETHOXYPARA-ACETANILIDE (*Fr. Cx.*), ACETYL-PHENETIDIN (*P. Ital. V*), FENIDINA, FENINA (*F.E. VIII*).

Dose.—5 to 10 grains (0·3 to 0·6 g.), in cachets, tablets, or suspended in mucilaginous fluids. *P.G. VI* has max. single dose 15 grains; max. during 24 hours 45 grains, approx.

An acetyl compound of phenetidin, $\text{C}_6\text{H}_4(\text{NH}_2)\text{OC}_2\text{H}_5$ (the ethyl ether of *p*-aminophenol). It is analogous to acetanilide (antifebrin). White, shining, laminar, tasteless crystals, m.p. 134° to 136° .

Soluble sparingly in water, about 1 in 1700, 1 in 70 of boiling water, 1 in 21 of alcohol 90%; also soluble in ether, chloroform, glycerin, and in sulphuric acid without colour.

Does not liquefy with sodium salicylate, but phenazone does, e.g., phenacetin 10 gr., caffeine citrate 2 gr., sodium salicylate 5 gr., are not incompatible.

Uses. Reduces temperature and soothes pain, very rarely causes rash or cyanosis. Successful in rheumatism, neuralgia, migraine and hysteria. In first stage of influenza relieves headache and mitigates aching of limbs. The safest of the antipyretics.

Antipyretic effect of phenacetin is enhanced by magnesium oxide in proportions of phenacetin 2 : magnesium oxide 1. Probable synergistic action.—*J. E. Winter and co-workers, J. Pharmacol., 1930, 347.*

Mist. Phenacetin. Co. (N.I.F.). Phenacetin 5 gr., caffeine citrate 1 gr. compound powder of tragacanth $7\frac{1}{2}$ gr., cinnamon water to $\frac{1}{2}$ oz.

Phenacetinum Effervescens (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 g.). About 1 in 20.

Phenacetinum cum Caffeina Effervescens (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 g.). About 1 in 20 of phenacetin and 1 in 60 of caffeine citrate.

Tabellæ Phenacetini (*B.P.C.*) contain 5 gr. (0·3 g.).

Tabellæ Phenacetini Compositæ (*B.P.C.*).

Dose.—1 or 2 tablets. Phenacetin 4 gr. and caffeine 1 gr.

Tabellæ Phenacetini et Caffeina Citratis (*B.P.C.*).

Dose.—1 or 2 tablets. Phenacetin 4 gr. and caffeine citrate 1 gr.

Dr. Faivre's Cachets (P. Basset, Paris; Wilcox, Jozeau, London). Contain oxyquinoline 0·2 g., phenacetin 0·3 g., and magnesium oxide 0·1 g. (They no longer contain amidopyrine).

Lactophenin (Boehringer, Mannheim; Coates & Cooper, London). Lactylphenetidin (*P.G. VI*) in $7\frac{1}{2}$ gr. tablets. *Dose.*—1 tablet several times daily, maximum daily dose 75 gr. Febrile conditions, insomnia in children, rheumatism, neuralgia, migraine.

[**P1-81**] *Treutabs (Camden Chemical Co., London).* Tablets containing phenacetin 0·25 g., aspirin 0·125 g., codeine phosphate 0·01 g., Hornburg salt 0·07 g. *Dose.*—1 or 2 tablets—not more than 8 in 24 hours. Analgesic in all painful and febrile conditions.

Phenocoli Hydrochloridum. *Syn.* AMINOACETO-*p*-PHENETIDIDE HYDROCHLORIDE. $\text{CH}_3(\text{NH}_2)\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{OC}_2\text{H}_5\cdot\text{HCl} = 230\cdot6$.

Dose.—8 to 15 grains (0·5 to 1 g.).

A white crystalline powder with sharp saline taste. Soluble about 1 in 16 of water.

An antipyretic resembling phenacetin in action, but more rapid in effect owing to greater solubility. It has been employed in rheumatic fever, malaria and influenza, and is stated to be of value in rheumatoid arthritis.

PHENAZONUM

B.P., U.S.P. XI, Fr. Cx., P.G. VI, P. Ned. V, P. Helv. V, P. Dan., etc.

Syn. ANALGÉSINE, ANTIPYRIN, DIMETHYL OXYQUINIZINE, PHENYL-DIMETHYL-ISO-PYRAZOLONE, 1-PHENYL-2 : 3-DIMETHYL-5-PYRAZOLONE.

Dose.—5 to 10 grains (0·3 to 0·6 g.) in cachets, tablets or solution. *U.S.P. XI* average dose 5 grains. *Fr. Cx.* has max. single dose 2 g.; max. in 24 hours 8 g. Hypodermically 4 grains (0·25 g.) is painful. Has been given with cocaine hydrochloride $\frac{1}{4}$ gr.

In white, crystalline, bitterish scales or powder, m.p. 111° to 113° . Gives a deep red colour with ferric chloride, nearly discharged by dilute sulphuric acid.

Soluble 1 in 1·2 of water, about 1 in 1·3 of alcohol 90%, 1 in 1·3 of chloroform, and 1 in 50 of ether.

Incompatible with spirit of nitrous ether, or other nitrites in the presence of free acid, an apparently inert bluish-green isonitroso-antipyrin being formed; also with the cinchona alkaloids, forming a precipitate which is soluble in weak acids.

Further, with phenol, tannic acid, iodine or mercuric chloride (precipitates); amyl nitrite, ammonia alum, hydrochloric acid, calomel, ferric chloride, ferrous and ferric sulphates, cupric sulphate, nitrous acid, sodium bicarbonate or orthoform.

Liquefies with butylchloral hydrate, betanaphthol and sodium salicylate, but solutions with the latter keep if dilute.

Antidotes. Treat as for poisoning by acetanilide, *see* p. 3.

AGRANULOCYTOSIS. In the recorded cases of agranulocytosis in which an analgesic drug has been suspected, an amidopyrine preparation has nearly always been held responsible. In view of the occurrence of cases following the use of Novalgin, it is important to bear in mind the possibility of antipyrin preparations being responsible when the causation of a case of agranulocytosis is under consideration. There are a number of proprietary preparations on the market containing antipyrin.—C. P. Donnison, *Brit. med. J.*, i/1936, 84.

Uses. It is an analgesic and antipyretic, its action being rapid, more transient, and more toxic than phenacetin. In doses of 4 to 15 grains it relieves locomotor ataxy, chorea, migraine, facial neuralgia, dysmenorrhœa, rheumatism, sciatica and sea-sickness. It sometimes causes skin rashes and other untoward symptoms, but not so frequently as acetanilide. A solution applied locally is

hæmostatic. Local hæmorrhage of hæmophilia has been treated by application of a strong solution of phenazone in ferric chloride.

In middle-ear diseases, otitis media and inflammation of the tympanum, and tympanic membrane, a 5% solution in glycerin has been used by instillation.

GLOSSOPHARYNGEAL NEURALGIA well treated by phenazone and gelsemium. —J. P. Martin, *Brit. med. J.*, i/1931, 533.

SCIATICA. The following relieves the painful symptoms:—Phenazone 6 gr., phenacetin 3 gr., methylacetanilide $1\frac{1}{2}$ gr., potassium sulphate $1\frac{1}{2}$ gr., Dover's powder (*sine ipecacuanha*) 3 gr. To be given in a cachet 3 or 4 times in the 24 hours. Good effects are also obtained from the following:—Phenazone 5 gr., phenacetin 5 gr., opium powder $\frac{1}{4}$ gr., in a cachet; 3 to 6 of which can be taken each day.

Phenazone (4 g. in 10 ml. of water with a little procaine hydrochloride) by perineural injection also alleviates pain.

If there is not prompt improvement following rest in bed and the administration of sedatives such as aspirin, amidopyrin and antipyrin, local injections of a 25% solution of antipyrin in alcohol may be used with benefit. Two or three ml. of the solution are injected at two or three points along the painful portion of the sciatic nerve. To avoid the alcohol reaching the nerve, a needle through which 1 ml. of 1% novocaine has been injected is then withdrawn at least 4 cm. —J. Paraf, *per Practitioner*, i/1937, 783.

Mist. Phenazon. Co. (N.I.F.). Phenazone 5 gr., potassium bromide $7\frac{1}{2}$ gr., solution of burnt sugar 5 m., sodium salicylate 5 gr., aromatic solution of ammonia 15 m., water to $\frac{1}{2}$ oz.

Phenazonum Effervescens (B.P.C.). *Syn.* EFFERVESCENT ANTIPYRIN. *Dose.*—1 to 2 drachms (4 to 8 ml.). About 1 in 12.

Phenazonum cum Caffeina Effervescens (B.P.C.). *Dose.*—1 to 2 drachms (4 to 8 g.). Contains about 1 in 12 of phenazone and 1 in 60 of caffeine.

Phenazoni et Caffeina Citras. *Syn. and Prop. Name.* ANTIPYRIN CAFFEINO-CITRICUM (*P. Austr.*, *P. Helv.* V and *P. Ned.* V), MIGRÆNINUM (*P. Jap.* V), MIGRAININE (*Bayer Products, London*).

Dose.—8 to 15 grains (0.5 to 1 g.). Contains phenazone 90%, caffeine 9% and citric acid 1%. Soluble 1 in 2 of water.

Incompatibles as phenazone *q.v.* Is serviceable in headache, but apt to cause sleeplessness.

Pommade Antiseptique Composée à l'Iodoforme (*Fr. Cx.*). *Syn.* POMMADE DE RECLUS. Phenazone 25, mercuric chloride 0.1, phenol 2.5, salol 6, iodoform 5, boric acid 15, alcohol 60% 15, soft paraffin 1000. The formula is often modified; it may be diluted or made stronger. For burns [P1] 1.2% of orthocaine may be added.

Tabellæ Phenazoni (B.P.C.). Contain 5 gr. (0.3 g.).

Phenazoni Acetylsalicylas. *Syn.* ANTIPYRIN ACETYLSALICYLAS. $C_{11}H_{12}ON_2 \cdot CH_3 \cdot CO_2 \cdot C_6H_4 \cdot COOH = 368.2$.

Dose.—8 to 15 grains (0.5 to 1 g.).

A white crystalline powder, soluble 1 in 160 of water, but about 1 in $3\frac{1}{2}$ of alcohol 90%. Analgesic, antipyretic and anti-arthritis, used in sciatica, influenza, etc.

Phenazoni Salicylas (B.P.C.). *Syn.* ANTIPYRINUM SALICYLICUM (*P. Austr.*, *P. Belg.*, *Fr. Cx.*, *P. Helv.* V, *P. Dan.*, *P. Jap.*, *P.G. VI*, *P. Ned.* V), SALIPYRIN, PYRAZOLONUM PHENYLDIMETHYLICUM-SALICYLICUM. $C_{11}H_{12}ON_2 \cdot C_6H_4(OH)(COOH) = 326.2$.

Dose.—5 to 20 grains (0.3 to 1.2 g.). Max. single dose 2 g.; max. in 24 hours 6 g.

CC*

A white crystalline powder, with sweetish taste, soluble 1 in 240 of water, 1 in 4 of alcohol 90%, and in ether and chloroform; incompatible with acids, alkalis and nitrites.

Useful in acute rheumatic fever and in chronic rheumatism, and sciatica; also for influenza and acute catarrh; as antipyretic in dose double that of phenazone.

Dismenol (*Roberts, London*). Tablets containing *p*-sulphamidobenzoic acid 0.05 g., phenazone 0.25 g., lactose 0.25 g. *Dose*.—1 tablet 2 or 3 times a day. For dysmenorrhœa.

Saridone (*Roche Products, Welwyn Garden City*). Tablets containing phenyldimethylisopropylpyrazolone 1½ gr., phenacetin 2½ gr., caffeine ½ gr. *Dose*.—1 to 3 tablets 3 or 4 times daily. Analgesic and antipyretic.

Sedonan (*Napp, London*). 5% solution of phenyldimethylpyrazolone in glycerin. For instillation in otitis media, otalgia and other inflammatory ear conditions.

Spasmolyth (*Warwick Pharmacals, Coventry*). Powders for the relief of asthma containing phenapyrine-caffeine 0.5 g. (a condensation product of phenazone 0.275 g., phenacetin 0.125 g., and caffeine 0.1 g.), phenyldimethylpyrazolone 0.45 g., codopyrine 0.03 g., extract of grindelia 0.01 g., *cereus grandiflorus* 0.01 g. *Dose*.—1 to 3 powders daily, one hour after meals; to be taken for several weeks.

[P1-81-84] **Amidopyrina** (*B.P.*). *Syn. and Prop. Name*. 4-DIMETHYLAMINO-1-PHENYL-2 : 3-DIMETHYL-5-PYRAZOLONE (*Fr. Cx.*), DIMETHYLAMINOPHENAZONE, PHENYLDIMETHYLDIMETHYL-AMIDOISOPYRAZOLONUM (*P. Ital. V*), DIMETHYLAMINOANTIPYRINUM (*P. Helv. V, P. Dan.*), AMINOPYRINA (*U.S.P. XI*), AMIDOFEBRIN, PYRAMIDON (*Bayer Products, London*). $C_{11}H_{11}(N[CH_3]_2)_2O = 231.2$.

[P1], [81] and [84] "*Amidopyrine; its salts.*"

Dose.—5 to 10 grains (0.3 to 0.6 g.). *P. Helv. V* max. per day 15 grains. *U.S.P. XI* average dose 5 grains.

A white powder with m.p. 108°. Soluble about 1 in 18 of water and 1 in 2 of alcohol 90%; readily soluble in ether, chloroform and benzene.

Incompatible with amyl nitrite, apomorphine, acacia and oxidising agents.

Antidotes. Treat as for poisoning by acetanilide, *see* p. 3.

Toxic Effects. The prolonged use of amidopyrine, or its use in susceptible persons, may give rise to agranulocytosis, a condition characterised by a marked fall in the leucocyte count, pyrexia, severe pharyngitis and ulceration of the mouth and throat, marked prostration, and a rapidly fatal outcome in the majority of untreated cases. It should therefore be used with extreme caution, especially in analgesic mixtures, and its employment should be *immediately* stopped on the first signs of intolerance, *e.g.*, weakness, exhaustion, pyrexia, pharyngitis, and a tendency to sleepiness. Its use is best avoided entirely in elderly persons and in those suffering from severe and long-continued ill-health.

172 cases cited in which the illness has definitely followed the use of these substances.—R. R. Kracke and F. Parker, *J. Amer. med. Ass.*, ii/1935, 960.

Since May 1933 no less than 128 cases have been reported in which agranulocytosis developed after therapeutic doses of amidopyrine; 70 of them were fatal.—F. Plum, *Lancet*, i/1935, 14.

Barbiturates inhibit the acute toxic actions of amidopyrine, but not the chronic toxic effects. The combination of amidopyrine with barbiturates appears thus to possess certain peculiar dangers, because the latter are likely to mask any immediate effects of overdosage with amidopyrine.—Danielopolu and co-workers, *Brit. med. J.*, ii/1935, 1108.

In 26% of cases of agranulocytic angina the disease followed the administration of amidopyrine or allied drugs. That in these instances the disease may have been actually caused by the therapy is possible, perhaps probable. In another 30% of the cases the evidence shows that in spite of the fact that these drugs were taken in considerable quantities they definitely have no causative relation to the disease. Of these patients 44% received no drugs of this type whatsoever, yet their clinical and hematologic pictures were similar in every respect.—H. Jackson, *Amer. J. med. Sci.*, 1934, 188, 482.

The administration of large doses of amidopyrine to 103 patients (1 or 2 g. daily) over a prolonged period (40 days or more) caused no significant decrease in the number of leucocytes or granulocytes. The entirely negative results of this clinical experiment would seem to substantiate the widely held opinion that granulopenia, when associated with amidopyrine medication is a matter of individual susceptibility. Except in the presence of some predisposing factor, amidopyrine is probably incapable of causing granulopenia.—S. D. Simon and M. H. Metz, *J. Lab. clin. Med.*, 1936, 1154.

A dose of 30 grains of amidopyrine was given daily to each of 32 patients over periods extending from 2 weeks to 3 months and their granulocytic counts followed. There was no marked change in any of the counts. The absence of any ill effects may have been due to the following of a routine, i.e., withdrawal of the drug as soon as any symptoms of toxicity arise, such as indigestion, lack of appetite, dizziness, etc. It would seem that if this simple procedure were followed there would be no need of frequent blood counts. It seems unwarranted to condemn a drug which has been found useful for so many years without a definite and clear reason for so doing. Whether there is an individual susceptibility in the nature of an allergic reaction, or whether the cases are simply based on the law of chance association, must be determined.—J. S. Davis and L. F. Frissell, *J. Lab. clin. Med.*, 1937, 23, 107.

Uses. Amidopyrine is analgesic and antipyretic, resembling phenazone in its action, but being effective in smaller doses; its action is exerted somewhat more slowly and is of longer duration. It has been employed in acute pyrexial conditions and for the relief of pain in sciatica, neuralgia, migraine and dysmenorrhœa. It has also been advocated for use in measles (1 gr. for each year of age up to 5 gr., given 4-hourly until temperature drops), but the clinical evidence as to its value is conflicting.

INFLUENZA IN CHILDREN well treated by giving a 3 or 4% solution. From birth to 1 month 0.05 g., 3 to 6 months 0.1 g., 6 to 12 months 0.15 g., 2 to 5 years 0.2 g. Given 2-hourly till temperature reached normal, then 3-hourly, then 4-hourly, and later 3 times daily. No unpleasant symptoms and temperature fell after third or fourth day.—G. Petrányi, *Amer. J. Dis. Childh.*, Dec., 1933, 1011.

RHEUMATISM. Investigation on a series of 1000 patients as to the value of amidopyrine combined with physiotherapy in rheumatic conditions. 500 patients received physiotherapy alone, and the other 500 received physiotherapy plus 2 to 3 grammes of amidopyrine a day for 6 weeks. No advantage was detected from the addition of amidopyrine to the physiotherapeutic measures.—K. E. Rotschuh and M. Benard, *Klin. Wschr.*, 1936, 1838.

[P1-S1-84] **Tabellæ Amidopyrinæ** (B.P.C.) contain 5 gr. (0.3 g.).

[D-P1-S1-84] **Tabellæ Amidopyrinæ Composita** (L.H.). Amidopyrine 4 gr., acetylsalicylic acid 5 gr., diamorphine hydrochloride $\frac{1}{15}$ gr., carmine q.s. in 1 tablet.

[P1-S1-84] **Amidopyrinæ Salicylas.** White crystals. Analgesic for neuralgia and rheumatism. Tablets contain 5 gr.

[P1-S1-84] **Amidophen** (Lilly, London). Capsules containing amidopyrine $3\frac{1}{2}$ gr., phenacetin 1 gr., caffeine $\frac{1}{2}$ gr., and dry hyoscyamus extract $\frac{1}{2}$ gr. Analgesic, sedative and antipyretic.

Causyth (*Josper Ltd., London*). The cyclohexatrienepyrindinesulphonate of a pyrazolone derivative, available in powder form or as tablets containing $7\frac{1}{2}$ gr. or suppositories containing 15 gr. Antirheumatic, antipyretic and analgesic. *Dose*.—1 to 4 tablets three times a day or, as an enema, 45 to 90 gr. in 50 ml. of water.

[P1-S1-S4] **Compral** (*Bayer Products, London*). $\frac{1}{4}$ -gr. tablets containing amidopyrine combined with trichlorethylurethane for use in dysmenorrhœa and pain generally. *Dose*.—1 or 2 tablets 3 times daily before meals. A rapidly acting, mildly sedative analgesic.

[P1-S1-S4] **Gardan** (*Bayer Products, London*). A combination of amidopyrine and Novalgin in 5-gr. tablets. *Dose*.—5 grains (1 tablet) 2 or 3 times daily as an antipyretic and analgesic.

Novalgin (*Bayer Products, London*). Sodium phenyldimethylpyrazolon-methylaminomethanesulphonate in 5-gr. tablets. *Dose*.—1 tablet 3 or 4 times daily after meals, with water.

An amidopyrine derivative introduced as an anti-rheumatic, stated to be better tolerated and more effective than salicylates, for use in articular and muscular rheumatism, sciatica, polyarthritis, and lumbago.

An injection of 1 to 2 ml. of 50% Novalgin solution, available in ampoules, is also given as an analgesic.

[P1-S1-S4] **Sinepan** (*Richter, London*). Amidopyrine 3 gr., codeine hydrochloride $\frac{1}{2}$ gr., narcotine hydrochloride $\frac{1}{2}$ gr. *Dose*.—1 when indicated. Substitute for morphine and opium preparations.

Triamid (*Richter, London*). α -Acetyl- β -methyl- β -dimethylamide- β -phenylhydrazine (dioxamidopyrine), an analgesic, antipyretic and sedative stated to have negligible toxicity. M.p. 37° , soluble in water (1 in 3), more soluble in the presence of salicylates and benzoates. Available in tablets containing $\frac{1}{4}$ or 5 gr. *Dose*.— $1\frac{1}{2}$ to 10 grains thrice daily.

[P1-S1-S4] **Trigemin** (*Bayer Products, London*). Combination of amidopyrine and butylchloral hydrate. *Dose*.—0.25 to 0.5 g. Analgesic.

PHENOL

B.P., U.S.P. XI, Fr. Cx., P. Dan., P. Helv. V.

$C_6H_5\cdot OH = 94.05$.

Syn. ACIDUM CARBOLICUM, PURE CARBOLIC ACID, PHENYL HYDRATE, BENZOPHENOL (P. Belg. IV), FENOL (F.E. VIII).

[P1] "Phenols (any member of the series of phenols of which the first member is phenol, and of which the molecular composition varies from member to member by one atom of carbon and two atoms of hydrogen) except in substances containing less than 60%, weight in weight, of phenols; compounds of phenol with a metal, except in substances containing less than the equivalent of 60%, weight in weight, of phenols."

[P2] "Phenols as defined in Part I of this List (see [P1] above) in substances containing less than 60%, weight in weight, of phenols; compounds of phenol with a metal in substances containing less than the equivalent of 60%, weight in weight, of phenols."

[S3] "Phenols—in Carvacrol; creosote obtained from coal tar; essential oils in which phenols occur naturally; medicines containing less than 1% of phenols; nasal sprays, mouth-washes, pastilles, lozenges, capsules, pessaries, ointments, or suppositories containing less than 2.5% of phenols; smelling bottles; soaps for washing; solid substances, other than pastilles, lozenges, capsules, pessaries,

ointments and suppositories, containing less than 60% of phenols; tar (coal or wood), crude or refined; tertiary butyl cresol; thymol."

[86] "Phenols—specify proportion as the proportion of phenols (added together) contained in the preparation."

"Compounds of phenol with a metal—specify as the proportion of phenols (added together) that the preparation would be calculated to contain on the assumption that the compounds of phenols with a metal had been wholly converted into the corresponding phenols."

Dose.—1 to 3 grains (0.06 to 0.2 g.). Fr. Cx. max. single dose $1\frac{1}{2}$ grains; max. during 24 hours $4\frac{1}{2}$ grains approximately. U.S.P. XI average dose 1 grain.

In colourless crystals or agglomerated masses liable to become pink on keeping unless stored in a cool place and protected from light. M.p. 39° to 40° .

Solubility. 100 parts are liquefied by 10 of water, form a clear liquid with 30 to 40 of water, and are completely dissolved by 1300 of water. Also soluble $3\frac{1}{2}$ in 1 of glycerin, 3 in 1 of chloroform (nearly), 1 in 2 of olive oil, 5 in 1 of ether, δ in 1 of alcohol (90%), $2\frac{1}{2}$ in 1 of benzene, 4 in 1 of acetic acid and 1 in about 20 of soft paraffin.

1% of phenol in liquid paraffin forms a saturated solution. More will dissolve warm but is thrown out again on cooling. It was thought that the addition of menthol might form a non-escharotic compound, and hence alleviate the effect of the phenol, but this is erroneous.

Incompatible with alkaline salts, acetanilide, phenazone, quinine salts, phenacetin and iron salts. Mixtures of phenol with camphor, chloral hydrate, menthol or thymol liquefy.

A solution of lead subacetate gives a precipitate with phenol, but there is no change with the acetate. Other phenols, cresols, etc., do likewise, except pyrogallol. The precipitate may be prevented by adding a trace of acetic acid to the subacetate solution.—G. A. Medley, *Pharm. J.*, ii/1926, 149.

The precipitate formed is apparently of the formula $\text{Pb}(\text{O}\cdot\text{C}_6\text{H}_5)_2\cdot\text{Pb}(\text{OH})(\text{O}_2\text{C}\cdot\text{CH}_3)$.—E. A. Lum, *ibid.*, 1/1929, 149, 251; J. E. Driver, *ibid.*, 251; see also E. Matthews, 297 and E. H. Lane, 321.

Antidotes. Give emetic (not always effectual). Empty stomach by stomach tube, using 2 oz. of magnesium sulphate or sodium sulphate in 2 gallons of water. Give 1 oz. of magnesium sulphate in 1 pint of water to be retained. Demulcents, such as white of egg, mucilaginous drinks; do not give alcohol, oils, fats or glycerin. Keep patient warm. Artificial respiration and oxygen inhalation if necessary. Strychnine, $\frac{1}{8}$ gr., hypodermically. Saline infusion.

Case of phenol poisoning recovered after successive aspiration of stomach and gastric lavage with saline, diluted egg albumen and 50% alcohol respectively; caffeine and adrenaline given as stimulants; glucose and saline intravenously; 40 ml. of 1% methylene blue solution intravenously. Suggested that this may have influenced favourable outcome.—W. M. Sheppe, *Milit. Surg.*, 1935, 76, 30.

Inhalation of fumes of carbolic acid caused grave poisoning symptoms. Intravenous saline, 2 pints, with addition of 2 drachms of sodium bicarbonate saved life. Breathing (assisted by the use of oxygen) improved at once.—R. Eccles Smith, *Lancet*, ii/1922, 1359.

Absorption of crude carbolic acid through the skin with fatal result. A bottle broke in a man's pocket on his journey home by train—extensive burning of hip, thigh and scrotum. Ultimate death.—W. R. M. Turtle and T. Dolan, *Lancet*, ii/1922, 1273.

Liquefied phenol, instead of a dilute solution, was applied by mistake as a dressing for neuritis in the arm. The patient died.—per *Analyst*, 1939, 679.

Uses. Externally phenol is employed for its antiseptic and deodorant properties, and a 5% solution is widely employed for the disinfection of utensils, instruments, hands, etc. Strong solutions are irritant and caustic and are seldom used, though the pustules of acne and small-pox may be treated by evacuating the contents and applying the smallest possible quantity of a mixture of phenol and camphor equal parts. Carbolic camphor (25%) has been employed as a paint to the cervix uteri, and for the relief of pain in toothache, and a mixture of equal parts of phenol and collodion has also been employed for the latter purpose. When applied to the skin in weak or moderately strong solutions (1 or 2%) phenol produces local anæsthesia, and this, combined with its antiseptic action, encouraged its use as a wound dressing. Unfortunately it is absorbed from the skin and mucous membranes and its prolonged use may give rise to toxic symptoms; in particular, solutions of phenol should not be applied as dressings to the fingers or toes, since gangrene may result. A 1% lotion may be employed, however, with benefit for its antipruritic effect in the relief of itching skin affections. For use as an antiseptic mouth-wash or gargle, or as a nasal and pharyngeal spray (e.g., in acute coryza) it is employed in a $\frac{1}{2}$ to 1% aqueous solution. Similar strength solutions are also of value as a vaginal injection in leucorrhœa and uterine ulceration. Phenol also has a powerful antizymotic action, and may be used either as a lotion or an ointment in the treatment of parasitic skin diseases such as ring-worm, sycosis, pityriasis, eczema, pediculosis capitis, etc.

The presence of glycerin retards the local action of phenol, and a solution of phenol in glycerin is almost non-caustic and only slightly toxic, and is employed as a paint in inflammatory conditions of the mouth and throat, for infections of the external auditory meatus and for otitis media.

Phenol has been employed by *injection* for its sclerosing action (2 to 4 m. of undiluted liquefied phenol) in varicose veins, hæmorrhoids, and rectal prolapse (5% phenol in almond oil); chronic hydrocele has been treated by injection into the sac of iodised phenol; and a 5% solution of phenol has been successfully employed in the treatment of anthrax, injections being made underneath and round the pustules.

Internally, in small doses, phenol stimulates the gastric secretions and has a carminative action. In 2 minim doses it has been found of value in persistent vomiting and in gastritis. It is of little value as an intestinal antiseptic owing to its prompt absorption and marked toxicity.

ANTHRAX. 1 to 2 ml. of 5% phenol beneath and round the pustule effects complete and dramatic cure. Cheap and painless and all except severe cases treated as out-patients.—G. C. Dorling, *Brit. med. J.*, i/1932, 123.

Inject 2 to 3 ml. of 5% phenol in 2 to 4 places around and into the base of the pustule; if very large 5 ml. may be needed. Merely a simple dressing is then applied. If, on the following day, there are any signs of the pustule progressing, a further injection is made at that site, but often only one injection is required. Within 48 to 72 hours the pustule dries up and in 7 to 10 days the centre separates, but unless an excess of carbolic has been used the scar is usually quite small. Of 16 cases 2 died, and they were in an advanced stage.—G. C. Dorling, *Chinese med. J.*, 1935, 662.

HERNIA; INJECTION TREATMENT. Good results are reported from the use of the following solution:—Phenol 30, alcohol 15, tincture of thujæ 15. The dose is 4 to 8 m., and an average duration of treatment is 8 to 12 injections which should be given once or twice weekly.—W. McMillan and D. Cunningham, *J. Amer. med. Ass.*, 1/1936, 1791. (See also Obturatorin, p. 810).

TETANUS treated by intrathecal injections. Phenol kills tetanus toxin in vitro. 1 in 400 solution employed—30 to 40 ml. for adults. 10 out of 14 cases recovered.—S. Suvansa, *Lancet*, 1/1931, 1075.

VARICOSE VEINS. Injection of undiluted liquefied phenol 2 to 4 minims preferable to quinine-urethane, sodium salicylate, etc., which give rise to considerable pain and are dangerous in cases of idiosyncrasy. The carbolic acid is at once locked up in the clot, which forms immediately. 4 minims is sufficient to obliterate a large varicose saphenous vein. The injection is practically painless and the vein almost immediately hardens. Four to eight veins may be injected at a sitting. Veins do not become immunised to the acid.—P. P. Dalton, *Brit. med. J.*, ii/1928, 1037.

VOMITING. Immediate and dramatic effect in a case of persistent and uncontrollable vomiting in a case of uræmia, following a 2-minim dose of phenol. Phenol is a gastric sedative of great value, and is of benefit in many cases of gastritis and, used with morphine, gives astonishing relief in inoperable carcinoma of the stomach.—J. C. Lyth, *Brit. med. J.*, ii/1935, 903.

WOUNDS. Wounds received in the Spanish Civil War were first cleansed with a mixture of ether 1 part, and hydrogen peroxide 3 parts. Then a solution of phenol 4 g., camphor 3 g., thymol 2 g., glycerin 10 ml. in alcohol to 100 ml. was applied. In all cases injections of tetanus antitoxin and polyvalent gas gangrene sera were given.—S. Perez-Vazquez, *Pharm. J.*, ii/1939, 265.

Carbasus Phenolis (B.P.C.). *Syn.* CARBOLIC GAUZE. Contains 1 to 3% of phenol when freshly prepared.

Gossypium Carbolisatum. *Syn.* PHENOL WOOL.

To prepare this, impregnate absorbent cotton 1 under pressure with 1 of an ethereal solution (5%) of phenol. Spread out and dry rapidly. **Linteum Phenolis** is also prepared.

Cataplasma Phenolis (B.P.C.). 2% in linseed poultice.

Collodium Carbolisatum (B.P.C.). A jelly consisting of equal parts of phenol and simple collodion. A local anæsthetic for application to decayed teeth.

Collut. Pot. c. Phenol. (N.I.F.). Solution of potassium hydroxide 2 dr., liquefied phenol 2 dr., solution of bordeaux B 40 m., water to 8 oz. 1 tablespoonful in $\frac{1}{2}$ pint of warm water.

Gargarisma Phenolis (B.P.C.). Glycerin of phenol 5% v/v in water. For foul breath and sore throat.

Garg. Phenol. Co. (N.I.F.). Liquefied phenol 2 dr., solution of potassium hydroxide 2 dr., trypan blue $\frac{1}{2}$ gr., water to 8 oz. 1 tablespoonful to $\frac{1}{2}$ pint of warm water.

[P2] Glycerinum Phenolis (B.P.). *Syn.* GLYCERINUM ACIDI CARBOLICI.

Dose.—5 to 15 minims (0.3 to 1 ml.).

Phenol 16, glycerin 84. The preparation is *unnecessarily strong* for general local use. *Fr. Cx.* has 3% w/w. It is employed as a throat pigment and has been used in acute middle ear catarrh with good results. Carbuncles are well treated by applying pledgets soaked in the glycerol. As soon as pus shows, the

epithelium is turned back and the part may be later syringed out.

A solution of phenol in glycerin is almost non-caustic and only slightly toxic. *Caution (B.P.).*—Dilution with water renders it caustic. It may be diluted with glycerin.

In the treatment of acute otitis media the glycerin of phenol of the B.P. is too concentrated and should be diluted with four to six volumes of glycerin, giving a concentration of 4 to 2½% of phenol.—F. C. Ormerod, *Practitioner*, i/1937, 522.

[P2] **Aurist. Phenol. (N.I.F.).** Glycerin of phenol 3 dr., glycerin 5 dr.

For earache, a few drops, slightly warmed, are invaluable. This strength is ample.

[P2] **Injectio Phenolis et Olei Amygdalæ (C.X.H.).** Phenol 20 gr., menthol 1 gr., almond oil to 1 oz. For perivenous injection in hæmorrhoids; 5 ml. can be injected around each of not more than two separate hæmorrhoids at a time.

[P2] **Carbolised Almond Oil.** Phenol 1, sterile almond oil to 20.

HÆMORRHOIDS well treated by injection of 1 to 2 ml. for each pile, under the mucous membrane, and injections continued at 5 to 7-day intervals until piles are of parchment-like hardness. Requires special instruments, skill, and experience.—A. S. Morley, *Lancet*, i/1928, 545. See also W. B. Gabriel, *Lancet*, i/1930, 162.

V. Meisen now adopts 5% phenol in almond oil.—*Lancet*, i/1931, 877.

W. S. Perrin uses phenol 1, glycerin 2 and water 2—usually a 5-minim dose.—*Lancet*, i/1929, 569. W. B. Gabriel uses 5% of phenol in almond oil—with usually 3-ml. dose—as also E. T. C. Milligan. Sir Charles Gordon Watson uses 15% phenol in glycerin and A. S. Morley 5% in oil.—*Brit. med. J.*, i/1931, 897.

If the vegetable oil be boiled for an hour and then filtered and the phenol added subsequently, the influenza-like symptoms which sometimes follow injection will not occur.—G. Sacks, *Brit. med. J.*, i/1933, 813.

The solution which is used at all the out-patient clinics at St. Mark's Hospital is 5% phenol in almond oil with 2 grains of menthol to 1 oz. (**Albright's Solution**). The ideal cases for injection are first-degree piles; a single small vascular pile can almost invariably be cured by a single injection; second-degree piles are less favourable, and third-degree piles are not suitable for injection. It is essential to use a sufficiently long proctoscope and to inject the phenol in oil into the submucous layer at the upper pole of the internal hæmorrhoids; no pain should be caused by the injection. The amount injected is usually 2 or 3 ml., and sufficient should be used to produce a smooth, rounded swelling in the submucous layer, slightly pale but not white. When a pile is particularly vascular and bleeds freely from its lower pole from 6 to 8 m. of 20% phenol in glycerin and water can be injected into the substance of the pile, either at the same time as the submucous injection high up or at a later session. Subsequent injections are given at weekly intervals.—W. B. Gabriel, *Brit. med. J.*, ii/1939, 1266.

The addition of menthol, as in Albright's Solution, has no advantages and sometimes gives rise to unpleasant side-effects. The injection treatment is equally suitable and satisfactory for third-degree piles (giving five weekly injections into each pile).—A. S. Morley, *Brit. med. J.*, i/1940, 72.

COMPLETE RECTAL PROLAPSE satisfactorily treated by carbolised almond oil, but injections should be given deeply enough to reach the muscular coat, the aim being to inject all round the rectal wall: usually 2 to 3 ml. is required, 4 or 5 injections being given at weekly intervals. Relapses are probable, but patients should be given the option of trying the injections before resorting to more drastic operations.—A. S. Morley, *Brit. med. J.*, ii/1934, 204.

[P2] **Obturatorin (Mayer's Formula).**

Zinc sulphate 1 dr., phenol cryst. 6 dr., glycerin 4 dr., Aq. Cinnamomi 1 oz., fluid extract of *Pinus Canadensis* (dark) 5 dr., redistilled water 2 oz. Dissolve the zinc sulphate in the cinnamon water; liquefy the phenol by heating; add the glycerin, shake and cool. Add the distilled water and the *Pinus Canadensis* and shake. Allow to stand for a week, shaking daily. Filter. The solution is muddy when cold but becomes clear on heating. Boil before injection. For the injection treatment of inguinal hernia inject ½ ml. first interval and 1 ml. subsequently (15 to 20 being the average at 4 to 7-day intervals). Insert needle

vertically over site of internal ring till point is felt to pierce the aponeurosis: withdraw needle after every few drops to make sure the point is still outside any vessel. End-results compare favourably with operation. Patients not suitable for the treatment are those in which the hernia is not completely reducible or satisfactory fitting of a truss is impossible, active venereal disease or history of tuberculosis; in children, cases of hæmophilia.—St. G. B. Delisle Gray, *Brit. med. J.*, ii/1932, 13. "Obturatorin" is not a proprietary.—*Ibid.*, ii/1932, 385.

At the hernia clinic in the Minneapolis General Hospital, 1000 patients have been treated with this method without a death and in general with excellent results, but familiarity and skill in the use of injection methods is essential to success.—F. B. Bowman, *Canad. med. Ass. J.*, 1937, 277.

Twenty patients with hernias were treated by the injection method (Mayer's Solution in 11 cases, Synasol in 5, and Tripoli Suspension in 4) and carefully followed. At the end of four years two patients were cured. The injection treatment of hernias is not satisfactory and should be used only when the patient must not be operated on.—R. Slater, *New Engl. J. Med.*, ii/1939, 895.

[P2] **Liquor Phenolis Alkalinus (B.P.C.).** *Syn.* SOLUTION OF SODIUM PHENATE.

Phenol 10% w/v with sodium hydroxide and water. Diluted with 20 to 30 parts of water it is used as a mouth-wash.

[P2] **Phenol Sodique Dissous (Fr. Cx.).**

Phenol 100 g., sodium hydroxide solution 20 g. (30% by weight), water to 1000 ml. The sodium hydroxide in this is insufficient to combine with the phenol. The *Fr. Cx.* preparation, in fact, contains about 8.6 g. per 100 ml. of free phenol, only 1.4 of the total 10 g. being in the combined condition.

[P2] **Liquor Potassii Phenatis Compositus (B.P.C.).** *Syn.* LIQUOR POTASSII CARBOLATIS COMPOSITUS.

A flavoured preparation containing 5% v/v of liquefied phenol in alkaline solution.

[P2] **Liquor Sodii Phenatis Compositus (B.P.C.).** *Syn.* LIQUOR SODII CARBOLATIS COMPOSITUS, PHENOL SODA. A flavoured preparation containing 3% w/v of phenol as sodium phenate.

[P2] **Lotio Phenolis (B.P.C.).** *Syn.* CARBOLIC ACID LOTION.

1 in 80, coloured pink.

Carbolic ochromosis due to use of 5% phenol lotion as dressing to leg ulcers over 35 years.—J. L. Berry, *Lancet*, ii/1931, 124.

[P2] **Lotio Phenolis (R.L.O.H.).** *Syn.* LOTIO ACIDI CARBOLICI (R.L.O.H.).

Liquefied phenol 24 m., sterilised water at 50° to 1 oz. [P2] *N.I.F.* has liquefied phenol 2 dr., trypan blue $\frac{1}{4}$ gr., water to 8 oz.

[D-P1-81] **Lotio Phenolis et Cocainæ.**

Phenol $\frac{1}{2}$ dr., cocaine hydrochloride $\frac{1}{2}$ dr., cherry laurel water 1 oz., rose water 3 oz. For pruritus.

In the later stage of treatment of chronic eczema a lotion containing phenol, Liquor Picis Carbonis, glycerin and spirit may be used as a stimulant to growth of healthier epidermis.

[P2] **Smith's Sterilising Solution.** Phenol 20, borax 5, glycerin 200, peppermint water 30, water to 1500 parts.

[P2] **Ravogli's Liniment.** Phenol 1, glycerin 2, alcohol 90% 16, rose water to 32. In skin affections.

[P2] **Oleum Carbolisatum (B.P.C.).** *Syn.* CARBOLIC OIL.

1 in 20, in arachis oil. For burns and scalds.

[P2] **Oleum Lubricans (B.P.C.).** *Syn.* LUND'S OIL, CATHETER OIL.

Phenol 5% w/v in castor oil and arachis oil. For oiling catheters. Carbolic catheter oil has no value.—O. S. Gibbs, *Brit. med. J.*, i/1931, 581.

Surgical Lubricant for catheters, etc.

Starch 4, glycerin 35, add water $8\frac{1}{2}$; heat to boiling, remove from flame and add boric acid in powder $2\frac{1}{2}$, warm to dissolve, and when nearly cold add phenol 1. The lubricant is non-greasy and does not attack rubber goods. It can be removed by water. It will not attack metal instruments if left in contact for a short time, but is not intended as a coating to store them in—for this, soft paraffin or liquid paraffin is best.

[P1] **Catheter Lubricant (Meltzer's Formula).**

Triturate tragacanth 3 with glycerin 20, add water 100, and sterilise, then add mercury oxycyanide 0.25.

See also *Pasta Tragacanthæ Composita*, p. 1003.

Pastillus Phenolis (Glycogelatin Basis).

Contains $\frac{1}{2}$ grain (0.03 g.) phenol. Antiseptic and stimulant. For ulcers in the mouth or throat and for purifying the breath.

[P2] **Phenol cum Camphora (B.P.C.).** *Syn.* CARBOLIC CAMPHOR. Phenol 25% *w/w* with camphor.

Is not miscible with water or glycerin. Antiseptic and local anæsthetic, serviceable in toothache.

Ulcers produced by X-ray burns have been treated locally by a mixture of equal parts of phenol and camphor.

Caution. Not intended for extensive use. It is not suited for applying all over the face. Accidents have occurred.

[P1] **Phenol Iodisatum (B.P.C.).** *Syn.* IODISED CARBOLIC ACID, PIGMENTUM IODI CARBOLICUM.

Iodine 10% *w/v* in liquefied phenol.

[P1] **Acidum Carbolicum Liquefactum et Iodum (C.H.W.)** has iodine 1, liquefied phenol 4.

For intrauterine medication on cotton wool. Chronic discharging sinuses have been treated by 5 minutes' application of iodised phenol, also inoperable uterine carcinoma after curetting. Useful also for ringworm of the scalp.

CHRONIC HYDROCELE of the tunica vaginalis well treated by injection into the cavity of iodised phenol (4 parts of iodine to 2 parts of phenol); withdraw all fluid from the sac and, with the needle *in situ*, inject iodised phenol 3 minims for every ounce of fluid withdrawn. Massage scrotum for 5 minutes and apply collodion dressing. Patient rests in bed for 24 hours with scrotum supported on a pillow. Not more than 5 ml. should be given at one sitting. Better to commence with 2 ml.—Morton Whitley, *Brit. med. J.*, ii/1932, 241.

Carefully distinguish from:—

Dilute Iodised Phenol Injection. Lugol's solution 2.5, phenol 1, boiling water to 200. Much weaker than the preceding. Is used as a pigment in diphtheria, or as a gargle or inhalation. Is useful also as a nasal douche in ozæna and for intrauterine injection.

[P1] **Phenol Liquefactum (B.P.).** *Syn.* ACIDUM CARBOLICUM LIQUEFACTUM.

Dose.—1 to 3 minims (0.06 to 0.2 ml.). *U.S.P. XI* average dose 1 minim.

Contains 80% *w/w* of phenol. Sp. gr. about 1.063. The congealing point of liquefied phenol of this strength is 3° , and the trouble experienced with the *B.P.* '14 preparation (87% *w/w* of phenol) from crystallisation in cold weather is thus obviated. If cooled below the congealing point it should be completely melted before use. *Fr. Cx.*, *P. Belg.* IV and *P. Jap.* V have phenol 10, water 1; *P. Dan.* phenol 9, water 1; *P. Helv.* V phenol 85, water 15.

[P1] Phenol Liquefactum (U.S.P. XI).

Average dose.—1 minim (0.06 ml.). Prepared by liquefying phenol in its unstoppered container by heating in a water bath and adding 1 part by weight of water to 9 parts by weight of phenol.

[P2] Soluté Antiseptique de Phénol Salicylé (Fr. Cx.). Syn. PHENOSALYL.

Phenol 150 g., glycerin 100 g., sodium salicylate 18 g., sodium benzoate 3 g., menthol 0.5 g., water to 1000 g. 0.2 to 0.4% in conjunctivitis and 1% in eczema.

[P2] Pigmentum Carbol-Fuchsin (St. T. H.). Saturated solution of basic fuchsin 10 ml., phenol 5 g., boric acid 1 g., resorcinol 10 g., water 100 ml. Dissolve the phenol in the water, add the fuchsin solution, filter, add the boric acid, allow to stand for 2 hours and add the resorcinol. To be stored in the dark in a stoppered amber-coloured bottle.

Pilula Phenolis. Syn. PILULA ACIDI CARBOLICI.

Phenol 2, powdered liquorice 1, powdered althaea 1. In grains for 1 pill, in grammes for 15 pills.

Resina Acidi Carbolic (R.D.H.).

Colophony 4, phenol 4, chloroform 3. Dissolve and filter.

This is used as an obtundent and a temporary antiseptic filling. *Method.*—Syringe out all food from the cavity and remove as much decay as possible. Apply on a wool pledget to relieve toothache.

Resina Carbolisata (B.P.C.). Phenol 1, mastic 1, colophony 2, chloroform 1.

[P2] Solutio Phenoli (I.A.) contains 2% of phenol. *Aqua Phenolata (P. Helv. V, P. Jap. V)* is this strength.

[P2] Solutio Phenolis et Glycerini (St. T. H.). Phenol 48 gr., glycerin 2 dr., water to 4 dr. *Dose.*—2 to 5 minims paravenously. For hæmorrhoids.

[P2] Preservative Solution for anatomical specimens.

Phenol 1, glycerin 4, methylated spirit 5.

Stupa Phenolis (B.P.C.). Syn. CARBOLISED TOW. Contains 5% of phenol when freshly prepared.

[P2] Suppositorium Phenolis (B.P.). Syn. SUPPOSITORIUM ACIDI CARBOLICI.

Unless otherwise stated, contains 1 grain (0.06 g.) of phenol in a 15-grain suppository. May be made with $\frac{1}{2}$ grain of white beeswax and oil of theobroma *q.s.*

[P2] Trochiscus Phenolis (B.P.). Syn. TROCHISCUS ACIDI CARBOLICI. Contains $\frac{1}{2}$ grain (0.03 g.) with sugar basis. For sores in mouth and throat.

The loss of phenol from the lozenges is considerable under all ordinary conditions of storage, and may average 1 mg. per month. The strength is usually under 0.03 g. per lozenge.—C. A. Hill and A. D. Powell, *Quart. J. Pharm.*, 1934, 535.

[P2] Unguentum Phenolis (B.P.). Syn. UNGUENTUM ACIDI CARBOLICI. Phenol 3% in a basis of white beeswax, lard, hard and soft paraffins. Lard is used owing to the small solubility of phenol in paraffins. For ulcers and parasitic skin diseases.

Water-miscible bases should be used for all ointments, such as ointment of phenol, intended for use as bactericides.—E. Gershenfeld and R. E. Miller, *Amer. J. Pharm.*, 1933, 194.

The loss of phenol from phenol ointment during the preparation of small quantities may be from 3.7 to 5.2% of the phenol added. Ointments prepared in accordance with the *B.P.* and stored in pots at room temperature lose phenol rapidly, and the strength may fall as low as 2% after two years' storage. More rapid loss occurs at higher temperatures. Specimens stored in collapsible tubes show little loss of phenol after ten months' storage.—G. R. Page, *Quart. J. Pharm.*, 1933, 373.

The loss of phenol in preparing about 250 g. of phenol ointment by ordinary methods is approximately 5%. Storage in collapsible tubes reduces the loss of phenol to a negligible amount even after one year. In well-closed containers the loss in nine months may reach about 8%.—H. Brindle, *Pharm. J.*, ii/1940, 20.

Unguentum Phenolis (U.S.P. XI). Phenol 2, yellow wax 5, petrolatum 93. The yellow wax and phenol are melted on a water-bath, the petrolatum added and the mixture stirred until it congeals. It is required to contain from 1·8 to 2·2% of $C_6H_5\cdot OH$.

[P2] **Unguentum Phenolis Compositum (B.P.C.).** Phenol about 18%, with sulphur, olive oil, beeswax and strong ointment of mercuric nitrate.

BOILS. Boils of a subacute type may respond favourably to the following ointment: phenol 1%, camphor 3%, salicylic acid 2%, lanoline-Vaseline $\frac{1}{2}$ oz. A thick layer of the ointment on a piece of lint is laid on the boil and changed as often as required. Soothing, antiseptic, and hastens separation of the slough. —John Fraser, *Practitioner*, i/1936, 359.

Vapor Phenolis.

20 drops of liquefied phenol in a pint of water at 60°. Inhaled or as a spray in pertussis and for throat ulcers.

[P1] **Vapor Phenolis Compositus (B.P.C.).** Creosote 1% v/v, oils of eucalyptus and Siberian fir 2% v/v, in liquefied phenol.

Smelling Salts, Carbolised.

Phenol 24, ammonium carbonate 16, strong solution of ammonia 44, oil of lavender 1½, camphor 3, pine sawdust (sifted) q.s. For coryza, hay fever, influenza, etc.

Anti-Catarrhal Salts.

Phenol 1, eucalyptus oil 1, oil of pumilio pine $\frac{1}{2}$, strong solution of iodine $\frac{1}{2}$, camphor 1, ammoniated alcohol 2, pine sawdust 2 or q.s.

[P1] **Anusant Suppositories (Allen & Hanburys, London)** contain phenol, adrenaline, zinc oxide, benzocaine and Peru balsam in a lanolin base. **Anusant Ointment** contains the first three ingredients in a lanolin base. For hæmorrhoids, etc.

[P2] **Emollientine (Parke, Davis, London).** Ointment containing phenol 4½ gr. and mercuric chloride $\frac{1}{2}$ gr. per ounce, with lead oxide, zinc sulphocarbonate, etc. Beneficial in eczema, hæmorrhoids, ulcers, etc.

Inhalone (Parke, Davis, London). Ointment containing phenol 1½ gr. per oz., menthol and eucalyptol in soft paraffin. Relieves congestion of nasal passages.

Phenofax (Burroughs Wellcome, London). Phenol ointment containing 3% of phenol. In pruritus and irritant skin conditions and as a stimulating dressing for small wounds.

Acidum Phenolsulphonicum. $C_6H_4(OH)\cdot SO_3H = 174\cdot 1$.

Syn. SULPHOCARBOLIC ACID, SOZOLIC ACID.

Prepared by the action of strong sulphuric acid on phenol. The *para*-acid is produced in the warm, the *ortho*- when working in the cold; cr. crystallises with difficulty, dissolves readily in water, alcohol, and glycerin, and is a strong antiseptic and disinfectant.

Sodii Phenolsulphonas (B.P.C.). *Syn.* SODII SULPHOCARBOLAS. $C_6H_4(OH)SO_3ONa\cdot 2H_2O = 232\cdot 1$.

Dose.—5 to 15 grains (0·3 to 1 g.).

In white rhombic crystals, slightly efflorescent in dry air.

Soluble 1 in 6 of water, 1 in 150 of alcohol 90%, 1 in 5½ of glycerin.

Uses. In dilatation of the stomach due to flatulence and fermentation. For flatulence, the dyspepsia of phthisis and in tonsillitis 5 to 10 grains every 2 hours have been given.

Mist. Sod. Sulphocarb. (N.I.F.). Sodium phenolsulphonate 5 gr., potassium bicarbonate 10 gr., water to $\frac{1}{2}$ oz.

Zinci Phenolsulphonas (B.P.C.).

Syn. ZINCI SULPHOCARBOLAS. $(C_6H_4(OH)SO_3)_2Zn \cdot 8H_2O = 555.7$.
Colourless rectangular crystals. Soluble 1 in 2 of water, 1 in $2\frac{1}{2}$ of alcohol 90%.

In gonorrhœa and leucorrhœa; 2 or 3 gr. per oz. for injection. Also as a nose or throat spray (5 gr. per oz.).

Tribromophenol. *Syn.* BROMOL. $C_6H_2Br_3 \cdot OH = 330.7$.

Dose. $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) in pill.

In silky needles, nearly insoluble in water, soluble 1 in 3 of alcohol 90%, 1 in 1 of ether, 1 in 3 of chloroform and glycerin; also soluble in fats and oils. M.p. 85° . Is used as an intestinal disinfectant and in typhoid, also in minute doses for cholera infantum.

Bismuthi Tribromphenas (B.P.C., P. Helv. V, P.G. VI). *Syn. and Prop. Name.* BROMPHENOL BISMUTH, BROMPHENOBIS, BISMUTUM TRIBROMOPHENYLICUM (P. Ital. V), XEROFORM (Heyden, Dresden; Braun, London). No formula is given in B.P.C. P. Helv. V gives $(C_6H_2Br_3O)Bi(OH)_2Bi_2O_3$.

Dose.—5 to 15 grains (0.3 to 1 g.).

A yellowish insoluble powder, with faint odour and taste, containing 40.5 to 49.5% of Bi. An intestinal antiseptic, e.g., for cholera.

PHENOLPHTHALEINUM

B.P., U.S.P. XI, Fr. Cx., etc.

Syn. and Prop. Name. DIHYDROXYPHTHALOPHENONE, LAXOIN (Oppenheimer, London).

Dose.—1 to 5 grains (0.06 to 0.3 g.). Larger doses are used. U.S.P. XI average dose 1 grain.

A white crystalline powder, made by interaction of phenol and phthalic anhydride. M.p. (B.P. Add. I) not below 258° ; commercial samples may melt at temperatures up to 260° .

Soluble 1 in 10 of alcohol 90%, also soluble in ether; almost insoluble in water.

Uses. A mild, tasteless purgative, of value in habitual constipation, and ordinarily non-toxic even in large doses. It acts in about six hours and is best given at bed-time; its action continues with diminishing intensity for two or three days. Usually a dose of $\frac{1}{2}$ to 3 gr. is sufficient, but bed-ridden patients may require up to 8 gr. It is more active than cascara and less griping, and is said to be the ideal purgative in intestinal toxæmia. In susceptible subjects it occasionally gives rise to an urticarial rash, and cases are on record in which the absorbed drug has produced backache, albuminuria and free hæmoglobin in the urine.

An investigation into the effect of phenolphthalein upon patients and normal individuals showed that medicinal doses do not produce albuminuria, and even in those patients who already had albuminuria the administration did not result in any increase in the proportion of albumen in the urine.—B. Fantus and J. M. Dyniewicz, *J. Amer. med. Ass.*, i/1937, 439.

In case of an overdosage there should be administered at the earliest possible moment at least twenty-five times the amount of activated charcoal diffused through water—this may be given in divided doses if necessary. If the patient

has taken a very large quantity of phenolphthalein it might possibly be advisable to follow this by a tablespoonful of castor oil, which is preferable to magnesium sulphate.—B. Fantus and J. M. Dymiewicz, *J. Amer. med. Ass.*, 1/1938, 1656.

Tabellæ Phenolphthaleini (B.P.C.) contain 2 gr. (0.12 g.) in chocolate basis.

[P1] **Tabellæ Phenolphthaleini Compositæ (B.P.C.)**.

Dose.—1 to 3 tablets.

Phenolphthalein 1 gr., strychnine hydrochloride $\frac{1}{100}$ gr., dry extract of belladonna $\frac{1}{100}$ gr. A useful combination.

Isolax (Richter, London). Diphenolisatin in tablets containing 0.005 g.

Dose.—1 or 2 tablets nightly. Aperient.

[P1-S1] **Phenalos (Sharp & Dohme, London).** Tablets contain phenolphthalein $\frac{1}{2}$ gr., aloin $\frac{1}{2}$ gr., strychnine nitrate $\frac{1}{100}$ gr., extract of belladonna $\frac{1}{2}$ gr., powdered ipecac. $\frac{1}{10}$ gr.

Purgen (Kirby, London). Tablets containing phenolphthalein. Supplied as infant ($\frac{1}{2}$ gr.), adult ($1\frac{1}{2}$ gr.) and strong ($7\frac{1}{2}$ gr.).

Fluoresceinum Solubile (B.P., U.S.P. XI). *Syn.* SODIUM FLUORESCIN, URANIN, OBITURIN. $C_{20}H_{10}O_5Na_2 = 376.1$.

Red crystalline powder, forming a red solution with intense greenish-yellow fluorescence which disappears on acidifying.

Soluble 1 in 1 of water, 1 in 5 of alcohol 90%.

Uses. The solution is used for detecting corneal lesions, *e.g.*, when due to a minute foreign particle in the eye. Portions of the cornea not covered by epithelium are stained green. Has been employed by injection as a proof of death. If life is extinct there is no reaction; if death is only apparent, the integument and the eyes turn green in a few minutes. A slightly alkaline (not neutral) solution of soluble fluorescein sprayed or painted widely over the surface of the growth, followed by radium or X-ray irradiation of moderate penetration, has been employed in the treatment of cancer. (*For formulæ of paint, injections, and capsules see Vol. I, 21st Edn., pp. 755-6.*)

Guttæ Fluoresceinæ (B.P.C.). *Syn.* LIQUOR FLUORESCINÆ.

Soluble fluoresceine 2% w/v.

Eosin (Colour Index No. 768) is the sodium or potassium salt of tetrabromofluorescein. A reddish-brown powder soluble in water giving a red solution with green fluorescence. Ethyl eosin or spirit-soluble eosin (Colour Index No. 770) is the potassium salt of dibromo-dinitrofluorescein.

Fluorescein. *Syn.* TETRAOXYPHTHALOPHENONE ANHYDRIDE, RESORCIN-PHTHALEIN ANHYDRIDE. $C_{20}H_{10}O_5 = 332.1$.

In yellowish-red powder, sparingly soluble in water, more so in presence of an alkali, *e.g.* sodium hydroxide, forming soluble fluorescein showing a green fluorescence.

Iodophthaleinum (B.P.).

$COONa \cdot C_6H_4 \cdot C \leq C_6H_2I_2 = O, 3H_2O = 919.8$.

Syn. and Prop. Names. IODOPHTHALEINUM SOLUBILE (U.S.P. XI), SODIUM TETRAIODOPHTHALEIN, IODO-RAY (Martindale, London), IOD-TETRAGNOST (Merck, Darmstadt; Martindale, London), OPACIN (Pharmaceutical Specialities (May & Baker) Ltd., London), STIPOLAC (Burroughs Wellcome, London), T.I.P. (Boots, Nottingham).

Dose.— $\frac{1}{8}$ to $\frac{1}{2}$ grain per pound body weight up to 75 grains (0.04 to 0.06 g. per kilogramme body weight up to 5 grammes). By intravenous injection, up to 45 grains (3 g.). *U.S.P. XI* average doses, oral 8 grains, intravenous 5 grains, per 10 kg. body weight.

A blue-coloured powder, somewhat hygroscopic, with a saline astringent taste. An aqueous solution may throw out on standing, owing to absorption of carbon dioxide and deposition of the acidic body. It yields not less than 85% of the cream-coloured tetraiodophenolphthalein on precipitation with hydrochloric acid, the separated precipitate containing 61 to 62% of I.

Soluble 1 in 7 of water; slightly soluble in alcohol 90%.

Uses. It has been advocated as the most suitable of numerous chemicals which, following intravenous or oral administration, are excreted by the liver into the gall-bladder, rendering it opaque to X-rays (cholecystography). (*See Vol. II.*)

Sodium Tetrabromphenolphthalein.

Dose.—The dose *per os* is from 4 to 7 g., according to weight of the patient, the average dose being about 5 g.

A pale mauve powder readily soluble in distilled water. Both the powder and solutions should be preserved from the action of the air, as carbon dioxide is slowly absorbed. It has been used for cholecystography, but iodophthalein is now preferred.

Phenol-Rubrum (*B.P.C.*, *U.S.P. XI*).

Syn. PHENOL RED, PHENOLSULPHONPHTHALEIN (*Fr. Cx.*).

Dose.—(By injection) $\frac{1}{10}$ grain (0.006 g.). A bright to dark red crystalline powder slightly soluble in water. Employed as a test for permeability of the kidney. (*See Vol. II.*)

PHOSPHORUS

B.P.C., *Fr. Cx.*, *P. Helv. V*, *P. Dan.*

P = 31.02.

[P1] "Phosphorus, yellow."

Dose.— $\frac{1}{100}$ to $\frac{1}{25}$ grain (0.0006 to 0.0025 g.). *Fr. Cx.* has max. single dose $\frac{1}{4}$ grain; max. during 24 hours $\frac{1}{2}$ grain.

A poisonous, non-metallic element melting at 44° and igniting at a slightly greater heat, forming white fumes of phosphorus pentoxide.

Phosphorus necrosis, in consequence of the introduction of the sulphide method of making matches, has entirely disappeared.—Sir Thos. Oliver, *Brit. med. J.*, ii/1925, 530.

Soluble about 1 in 320 of absolute alcohol, about 1 in 80 of ether, about 1 in 25 of chloroform, about 1 in 100 each of oleic

acid, suet and oils of almond, olive, castor and theobroma, 2 in 1 of carbon disulphide, almost insoluble in water; combines chemically with oils of turpentine and peppermint, forming non-luminous and comparatively non-poisonous liquids.

Antidotes. Wash out stomach thoroughly with 1% potassium permanganate solution, using stomach tube. If this is not available give 5 gr. of copper sulphate in water, repeating the dose, first as emetic then as antidote; or use stomach tube with dilute solution of copper sulphate, 15 gr. to 2 gallons of water. Give medicinal charcoal with $\frac{1}{2}$ oz. of magnesium sulphate, repeating the charcoal frequently. Alkaline drinks and dextrose, but *not* oils, fats or eggs.

BURNS. The best immediate treatment is intermittent immersion of the burnt part in a warm 5% solution of sodium bicarbonate which neutralises the phosphoric acid evolved. The part must be taken out from time to time to allow complete combustion of adherent particles of phosphorus, and treatment must be continued until P_2O_5 can no longer be detected by emission of white vapour or garlicky smell and there is no luminosity in a darkened room.—W. Starz, *Munch. med. Wschr.*, 1/1936, 47.

Uses. Phosphorus has been employed as a nerve stimulant in various affections of the central nervous system and in osteomalacia and rickets, but is now rarely used in the elemental state in medicine. It enters the blood as phosphorus, and acts as such, not as phosphoric acid.

N.B.—Preparations should be recently made and kept from light.

[P1] **Elixir Phosphori.**

Add compound solution of phosphorus 1 to glycerin 4.

Dose.—15 to 60 minims (1 to 4 ml.) in water. Contains $\frac{5}{8}$ gr. in 1 dr. A palatable, well-tolerated "fluid" form of phosphorus.

[P1] **Liquor Phosphori Compositus (B.P.C.).** *Syn.* TINCTURA PHOSPHORI COMPOSITA.

Dose.—3 to 12 minims (0.2 to 0.8 ml.), on sugar.

Phosphorus 0.2% w/v in chloroform and dehydrated alcohol. 12 minims contains about $\frac{1}{16}$ gr. of phosphorus.

[P1] **Oleum Phosphoratum (B.P.C.).**

Dose.—1 to 5 minims (0.06 to 0.3 ml.), on sugar or in perles.

Contains 1% w/w of phosphorus in almond oil flavoured with oil of lemon. *P. Ital. V* is 0.1% in olive oil. *P. Belg. IV* contains no oil of lemon. *P. Helv. V* and [P1] **Phosphorus solutus (P.G. VI)** are 0.5% w/w in liquid paraffin with ether 2½% w/w. *P. Svec. X* has 1% in liquid paraffin with 5% of ether.

ORIENTAL SORE. Best results in old intractable cases with extensive ulceration, the oil being dabbed on after removing the scab, every other day. When ulcerative process not well developed and lesion is nodular, inject 3 to 5 m. hypodermically round or into nodule once or twice weekly; injection practically painless. No general reaction and local reaction slight, but signs of acute inflammation occasionally develop. The delayed action of phosphorus on the liver should be kept in mind.—A. Castellani, *J. trop. Med. (Hyg.)*, 1925, 377. See also *ibid.*, 1923, 194.

[P1] **Pilulæ Phosphori (B.P.C.).**

Dose.—1 to 4 pills. Contain $\frac{1}{100}$ gr. of phosphorus.

Compound phosphorus pills are sometimes used containing $\frac{5}{8}$, $\frac{3}{8}$ or $\frac{1}{8}$ gr., with strychnine $\frac{5}{8}$ gr., or extract of nux vomica $\frac{1}{8}$ gr. Also with extract of damiana or zinc valerianate and in combination with reduced iron and quinine sulphate.

Zinci Phosphidum (B.P.C., Fr. Cx.). $\text{Zn}_3\text{P}_2 = 258.2$.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.003 to 0.016 g.) in pill. Fr. Cx. has max. single dose $\frac{1}{4}$ grain; max. during 24 hours $\frac{1}{2}$ grain approx.

A grey powder with slight phosphorus odour. Exerts the same action as phosphorus and can be administered in pills, but is incompatible with acid vegetable extracts (e.g., extract of gentian) owing to liberation of hydrogen phosphide.

PHYSOSTIGMA

B.P.C.

Syn. PHYSOSTIGMATIS SEMINA, CALABAR BEAN (Fr. Cx.), ORDEAL BEANS.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Calabar bean, alkaloids of.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Calabar bean, alkaloids of.*"

[S6] "*Alkaloids—calabar bean, alkaloids of—specify proportion as the proportion of any one alkaloid of calabar bean that the preparation would be calculated to contain on the assumption that all the alkaloids of calabar bean in the preparation were that alkaloid.*"

Dose.—1 to 4 grains.

The ripe seeds of *Physostigma venenosum* (Leguminosæ), from West Africa. The poisonous properties are due chiefly to the presence, in the cotyledons only, of physostigmine (up to about 0.25%).

Antidotes. Empty stomach by emetic or by stomach tube, using 60 gr. of potassium permanganate in 2 gallons of water. Medicinal charcoal or Lugol's solution has been recommended. Atropine sulphate, $\frac{1}{16}$ gr. hypodermically, is the physiological antidote. Give $\frac{1}{4}$ oz. of brandy or $\frac{1}{2}$ dr. of aromatic spirit of ammonia, in water freely. Strychnine, $\frac{1}{8}$ gr. hypodermically. Artificial respiration may be necessary.

Pulmonary oedema, with death in 15 minutes, following injection of $\frac{1}{16}$ gr. of eserine in a young woman. Atropine injection did not affect the result.—W. E. Cooke, *Brit. med. J.*, i/1937, 1052.

Uses. The properties of the calabar bean are virtually those of the alkaloid physostigmine (*vide infra*), and it is used only as the source of this alkaloid and its salts.

[P1-S1] **Physostigmina.** *Syn.* ESERINE (Fr. Cx.).

$\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_2 = 275.2$.

Dose.— $\frac{1}{100}$ to $\frac{1}{50}$ grain (0.0006 to 0.0013 g.).

In colourless crystals, slightly soluble in water, freely in alcohol and ether, soluble 1 in 180 of soft paraffin, also soluble in other fixed oils. Is used for the preparation of ointments and solutions in oil for use as miotics. For corneal ulcers, [P1-S1] solution of 2 gr. per oz. may be dropped into the eye; also in mydriasis and glaucoma.

Uses. The physiological actions of physostigmine may be divided into four main groups:—(1) INCREASED IRRITABILITY OF THE AUTONOMIC NERVES, resulting in slowing of the pulse by

stimulation of the vagus and contraction of the pupil by stimulation of the oculomotor nerve. By virtue of its miotic action, it is widely used in glaucoma to decrease intra-ocular tension, to prevent and treat prolapse of the iris in peripheral corneal ulcer or wound, and to counteract the effect of atropine or homatropine. (2) STIMULATION OF UNSTRIPED MUSCLE, especially that of the intestine. As a stimulant to peristalsis it is useful in chronic constipation, post-operative intestinal atony, post-operative distension and flatulent colic. It may also be employed to increase tonicity in routine X-ray examination of the stomach when it is dilated and borders are indistinct. (3) DEPRESSION OF THE CENTRAL NERVOUS SYSTEM, resulting in diminution of the reflex activities; and as a sedative of the spinal cord it has been used in tetanus. (4) TWITCHING OF THE VOLUNTARY MUSCLES; while small doses lower the threshold to stimulation of striped muscle, somewhat larger doses produce fibrillary twitchings. This effect has been beneficially employed in the treatment of myasthenia gravis. The unpleasant symptoms, such as abdominal discomfort and nausea, may be prevented by the previous administration of atropine or tincture of belladonna.

[P1-81] **Guttæ Physostigminæ Oleosæ (B.P.C.).** Physostigmine (base) $\frac{1}{2}\%$ in castor oil. Keeps well for ophthalmic use.

Severe frontal headache in young persons due to increased intra-ocular tension, cured by eserine instillations *i.d.s.*—R. L. Raymond, *Brit. med. J.*, i/1934, 103.

[P1-81] **Unguentum Physostigminæ.** *Syn.* UNGUENTUM ESERINÆ (R.L.O.H.). Physostigmine 1 or 2 gr. dissolved in minimum quantity of chloroform and mixed with yellow soft paraffin (at 61°) to 1 oz.

[P1-81] **Physostigminæ Salicylas (B.P., U.S.P. XI, P. Helv. V, etc.).** *Syn.* ESERINE SALICYLATE (*Fr. Cx.*).

$C_{15}H_{21}O_2N_3, C_7H_5O_2 = 413.2$.

Dose.— $\frac{1}{100}$ to $\frac{1}{50}$ grain (0.0006 to 0.0012 g.). Doses of up to $\frac{1}{50}$ grain (0.003 g.) are sometimes administered. *U.S.P. XI* average dose $\frac{1}{50}$ grain.

In needle-shaped or columnar crystals. Soluble about 1 in 100 of water and 1 in 12 of alcohol 90%. Solutions are less liable to turn pink than those of the sulphate.

To open the bowels in acute abdominal conditions, $\frac{1}{100}$ grain hypodermically until 6 doses have been given (4-hourly). This dose is safe—higher dose may act too severely and necessitate bismuth and opium to check the resulting diarrhoea. If no action, give a turpentine enema the following day.

MYASTHENIA GRAVIS. Physostigmine, being a partial antagonist to curare, was tried in the hope that it would counteract the effect of the unknown substance which might be exerting the curare-like effect on the myoneural junctions. Hypodermic injections of physostigmine salicylate were found to have a striking though temporary effect. Injections of $\frac{1}{50}$ gr. once daily were of value, but effect wore off in 2 to 4 hours. Greater improvement with $\frac{1}{50}$ gr., lasting 4 to 5 hours. —M. B. Walker, *Lancet*, i/1934, 1200.

[P1-81] **Guttæ Physostigminæ (B.P.C.).** *Syn.* GUTTÆ ESERINÆ.

Physostigmine salicylate 1% *w/v*, with boric acid, in distilled water. *N.I.F.* has $\frac{1}{2}$ gr. in water to 2 dr.

[P1-81] **Lamella Physostigminæ (B.P.).** *Syn.* LAMELLA ESERINÆ.

Each contains $\frac{1}{1000}$ grain (0.00065 g.) of physostigmine salicylate.

[P1-81] **Oculentum Physostigminæ (B.P.).** *Syn.* OCULENTUM ESERINÆ.

Contains 0.125% of physostigmine salicylate.

[P1-81] **Physostigminæ Sulphas (B.P.C., P.G. VI, P. Ned. V, F.E. VIII).** *Syn.* ESERINE SULPHATE.

$(C_{15}H_{21}O_2N)_2 \cdot H_2SO_4 = 648.5$.

Dose.— $\frac{1}{100}$ to $\frac{1}{30}$ grain (0.0006 to 0.0012 g.). (B.P. '14, $\frac{1}{64}$ to $\frac{1}{32}$ grain.)

In yellowish, granular, deliquescent crystals, soluble about 4 in 1 of water and 2.5 in 1 of alcohol 90%. Solution becomes pink on exposure, but does not lose much in efficacy.

In doses of $\frac{1}{100}$ grain (0.0006 g.) of value in tympanites as occurring in typhoid fever.

[P1-81] **Guttæ Physostigminæ (R.L.O.H.).** $\frac{1}{2}$, 1, 2 or 4 gr. to 1 oz. *St. T.H.*, 0.125, 0.25, 0.5 or 1%. *St. M.H.*, 0.25, 0.5 or 1%.

In glaucoma the 0.5 to 1% drops are suited for prolonged use.

The 1% solution instilled 2 or 3 times a day is of value. It contracts the pupils and greatly improves vision.—*J. trop. Med. (Hyg.)*, 1926, 303.

[P1-81] **Mistura Physostigminæ Laxativa (B.V.H.).** Physostigmine sulphate $\frac{1}{10}$ gr., liquid extract of cascara sagrada 1 dr., ammoniated tincture of podophyllum 15 m., liquid extract of liquorice 15 m., syrup 15 m., compound decoction of aloes to 1 oz.

Geneserine (*Amido Laboratories, Paris; Wilcox, JozEAU, London*). The amino oxide of eserine. Supplied in granules containing 0.5 mg. (*dose*—from 6 to 10 granules daily in three doses); in 1 in 1000 solution (*dose*—20 drops = 1 mg. of Geneserine, three times daily); and in ampoules containing 2 mg. for subcutaneous injection. Therapeutic action and indications similar to those for eserine but is much less toxic and better tolerated.

Prostigmin (*Roche Products, Welwyn Garden City*). Dimethyl-carbamic ester of 3-hydroxyphenyltrimethylammonium-methylsulphate. A synthetic peristaltic stimulant allied to physostigmine, but stable in solution and safer in use. It is given by subcutaneous, intramuscular or intravenous injection in post-operative intestinal paresis, severe constipation, retention of urine, myasthenia gravis, etc. Ampoules of 1 ml. contain 0.5 mg. of active substance. Also supplied in concentrated solution, 1 ml. containing 2.5 mg., and in tablets each containing 15 mg.

Severe poisoning of a research worker following experimental ingestion of 45 mg. Recovery after injection of atropine sulphate, $\frac{1}{30}$ grain intramuscularly. If Prostigmin is needed in myasthenia gravis it should be given parenterally so that dosage can be controlled. If the latter is impossible it seems wisest to rely on other therapeutic measures until more is known concerning oral Prostigmin.—L. S. Goodman and W. J. Bruckner, *J. Amer. med. Ass.*, 1/1937, 965.

MYASTHENIA GRAVIS. Beneficial results in every one of 7 cases which, though lasting for only a few hours, surpassed anything experienced with other methods of treatment. The injection was given subcutaneously—Prostigmin 2 ml. with atropine $\frac{1}{30}$ gr. Unpleasant symptoms only of a mild nature.—L. P. E. Laurent, *Brit. med. J.*, 1/1935, 465.

Seven patients treated with Prostigmin, usually 5 ml., in conjunction with atropine sulphate $\frac{1}{30}$ gr. In each case improvement set in within 5 minutes of the injection, passing off completely in 8 hours.—E. A. B. Fritchard, *Lancet*, 1/1935, 432.

From the practical point of view it is now possible to abolish the more serious symptoms and to keep the patients in a tolerable state of health by means of ephedrine and eserine or Prostigmin.—A. M. Cooke and R. Passmore, *Quart. J. Med.*, Jan., 1936, 28.

From 25 to 30 mg. of Prostigmin *per os* gives a result comparable in intensity and duration with an injection of 0.5 mg.—L. P. E. Laurent and M. B. Walker, *Lancet*, i/1936, 1457.

The oral administration of Prostigmin seems at present to be the most valuable therapeutic agent in the treatment of myasthenia gravis, although some patients are not completely relieved of symptoms by its use.—A. M. Harvey and M. R. Whitehill, *J. Amer. med. Ass.*, i/1937, 1329.

It is possible that Prostigmin may find its widest usefulness as a test to differentiate myasthenia gravis from other causes of muscular weakness, since it relieves no other condition. As a test dose from 1.5 to 2 mg. hypodermically is used with atropine sulphate $\frac{1}{16}$ grain. Children tolerate about half the adult dose.—G. D. Gammon and H. Schlie, *J. Amer. med. Ass.*, ii/1937, 413.

Oral administration of Prostigmin may be safely used in the treatment of patients with myasthenia gravis in daily doses of from 3 to 12 tablets of 15 mg. each. When ingestion of the drug is carefully spaced (usually three- to four-hourly intervals between doses) patients maintain a reasonable degree of muscular efficiency. No ill effects were noted in 18 patients treated for one to fourteen months.—H. R. Viets *et al.*, *J. Amer. med. Ass.*, ii/1937, 1956.

The results of the treatment of 44 patients with myasthenia gravis over a period of 2½ years indicate that *Prostigmin bromide*, taken by mouth and supplemented by ephedrine sulphate, potassium chloride and guanidine, is the most efficient form of treatment now available. Of the 44 patients, 5 have died and 7 have shown full remissions so that Prostigmin is no longer required. Prostigmin bromide may be given in daily doses of from 20 to 25 pills of 15 mg. each. More important than the size of the dose is the spacing of the drug through the 24-hour period, and regulation of the dosage to ensure max. effects being produced without tolerance or disagreeable effects may take weeks or even months.—H. R. Viets and R. S. Schwab, *J. Amer. med. Ass.*, ii/1939, 559.

Recently it has been observed that a combination of guanidine hydrochloride (0.0125 g.), potassium chloride (5 to 10 g.), and Prostigmin (0.015 g.), taken with meals, gives a sustained effect for 3 or 4 hours, though such a combination of anti-myasthenia drugs is only necessary in the most desperate cases.—J. H. Talbot and R. S. Schwab, *New Engl. J. Med.*, i/1940, 585.

PARALYTIC ILEUS cured by 5 ml. of Prostigmin subcutaneously after almost every known remedy (except acetylcholine) had failed.—W. E. David, *Lancet*, i/1935, 1100.

Prevention of post-operative ileus with Prostigmin.—W. R. Lewis and E. L. Axelman, *Amer. J. Surg.*, i/1936, 308.

After enemas of all kinds, Pituitrin and acetylcholine had all failed, a case was successfully treated by two injections subcutaneously of 5 ml. of Prostigmin, one given at noon and one at 7 p.m.—R. C. Begg, *Brit. med. J.*, ii/1937, 581.

As a result of its use in a series of 175 cases it was concluded that Prostigmin is a satisfactory agent for the prevention or treatment of distension and paralytic ileus. It has a wide margin of safety and injections may be made at two-hourly intervals.—J. R. Harger and J. L. Wilkey, *J. Amer. med. Ass.*, i/1938, 1165.

The presence of intestinal flatus often results in poor definition in X-ray films of the abdomen. A preliminary injection of Prostigmin 2 ml. (1 mg.) the night before examination and a similar dose the following morning one hour before taking the X-ray photograph leads to the production of a more satisfactory film.—M. J. Farrell, *New Engl. J. Med.*, ii/1938, 270.

POST-OPERATIVE DISTENSION. Prostigmin is a valuable prophylactic for preventing post-operative distension and gas pains. With inhalation anaesthetics the first injection is given 3 to 4 hours after operation, followed by a second injection 4 hours later; four injections are given at intervals of 4 hours the first day after operation, and the last dose followed immediately by a low soapuds enema. With this method the prophylactic peristalsis is established within 24 hours of the operation, whereas prior to its use in abdominal cases peristalsis was not established for 48 and in some cases 72 hours. There is no systemic

or local reaction.—W. R. Levis and E. L. Axelman, per *J. Amer. med. Ass.*, ii/1936, 310.

Esmodil (*Bayer Products, London*). An 0.3% isotonic aqueous solution of trimethyl-methoxy-propanyl-ammonium bromide, for stimulation of the parasympathetic nerves. *Dose*.—1 ml. intramuscularly or subcutaneously, repeating $\frac{1}{2}$ ml. in 2 to 3 hours if necessary.

PILOCARPINA

[P1] "*Alkaloids, the following; their salts, simple or complex:—Jaborandi, alkaloids of.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Jaborandi, alkaloids of, except substances containing less than 0.5% of the alkaloids of jaborandi.*"

[S3] "*Alkaloids—Jaborandi, alkaloids of—in substances containing less than 0.025% of the alkaloids of jaborandi.*"

Dose.—Fr. Cx. has max. single dose $\frac{1}{2}$ grain (0.02 g.); max. in 24 hours $\frac{3}{4}$ grain (0.05 g.).

An alkaloid obtained (0.5%) from *Pilocarpus microphyllus* (Maranham Jaborandi) and other varieties.

Easily **soluble** in water. Soluble in alcohol, ether, chloroform and benzene.

Antidotes. Empty stomach by emetic or stomach tube. Give potassium permanganate, 10 gr. in 1 pint of water, by stomach tube, and repeat the dose if necessary. Atropine, $\frac{1}{100}$ gr., hypodermically, or tincture of belladonna by mouth; this is the specific antidote. Stimulants, e.g., brandy, $\frac{1}{2}$ oz., or aromatic spirit of ammonia, $\frac{1}{2}$ dr., in water freely.

Uses. A powerful sudorific and sialogogue when administered internally. Large doses have an emetic action. The sweating and salivation commence about 10 minutes after taking a dose and persist for 2 to 5 hours. Hypodermically it acts in 3 to 5 minutes. It has been given in dropsy of renal origin, but must not be given in cardiac dropsy owing to its depressant action on the heart and it should be avoided in pulmonary disease, since the increase of mucus and the action on the circulation may result in pulmonary oedema. It increases the flow of biliary mucus, and has been given to assist the passage of gall-stones. In puerperal eclampsia and uræmic convulsions, it has been given to induce diaphoresis, preferably in conjunction with the external application of heat. In tinnitus aurium (acute labyrinthine) hypodermic injections with gradually increasing dosage are of value in suitable cases. For hiccough small doses every 2 or 3 hours are of value. Salts of pilocarpine have been employed as antidotes to belladonna poisoning, but they do not prevent death from large doses since they only act peripherally. $\frac{1}{10}$ gr. doses have been given to counteract the effects of hyoscine used in the treatment of morphine addiction by sudden withdrawal and to relieve the dryness of the

mouth associated with the atropine or belladonna treatment of parkinsonism. Externally preparations of jaborandi and pilocarpine are used to stimulate growth of hair in alopecia. The 2% solution is used as a miotic; it is less irritating than physostigmine, but its action is weaker and more evanescent, miosis lasting for 18 to 24 hours.

POST-OPERATIVE RETENTION OF URINE. Pilocarpine *intrav.* $\frac{1}{2}$ grain, or *per rectum* $\frac{1}{2}$ grain, often successful where hexamine fails.—*per Med. Annu.*, 1931, 10. Brief experience favourable.—A. R. Short, *ibid.*

[P1-81] **Pilocarpinæ Hydrobromidum.** *Dose.*— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.003 to 0.012 g.). White crystals soluble in water. Used similarly to the nitrate.

Syrupus Potassii Bromidi et Pilocarpinæ (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

1 drachm contains potassium bromide about $5\frac{1}{2}$ gr. and pilocarpine hydrobromide $\frac{3}{17}$ gr. in an orange-flavoured medium.

Bromocarpine (prepared in England by *Roberts & Co., London*) is a similar product, stated to have the composition potassium bromide 10, pilocarpine hydrobromide 0.005, orange syrup and glycerin *q.s.* to 100, *by weight.* *Dose.*—For children 3 to 7 years of age 1 to 3 drachms daily; 7 to 15 years 1 to 6 drachms daily; adults $\frac{1}{2}$ to 1 ounce daily, *all in divided doses.*

[P1-81] **Pilocarpinæ Hydrochloridum (B.P.C., P.G. VI, Fr. Cx., P. Ned. V, P. Helv. V, etc.).** $C_{11}H_{16}O_2N_2.HCl = 244.6$.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.003 to 0.012 g.) by mouth or hypodermically.

In minute, granular, snow-white crystals, slightly deliquescent and very soluble in water. Used similarly to the nitrate.

[P1-81] **Pilocarpinæ Nitrates (B.P., U.S.P. XI, Fr. Cx., F.E. VIII, P. Ned. V).** $C_{11}H_{16}O_2N_2.HNO_3 = 271.2$.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.003 to 0.012 g.). *Fr. Cx.* has max. single dose $\frac{1}{2}$ grain; max. in 24 hours $\frac{3}{4}$ grain approx. *U.S.P. XI* average dose $\frac{1}{12}$ grain.

In minute, white, granular, snow-like crystals, but may be obtained in large, white, prismatic crystals. Soluble 1 in 8.2 of water, but very slightly in cold alcohol.

[P1] **Guttæ Pilocarpinæ (B.P.C.).** 0.5% of pilocarpine nitrate. Used to contract the pupil of the eye.

[P1-81] **Lamella Pilocarpinæ.** $\frac{1}{80}$ gr. in a gelatin base.

[P1-81] **Lotio Pilocarpinæ.** For the hair.

Pilocarpine nitrate 2 gr., quinine hydrochloride 8 gr., glycerin 2 dr., rose water 6 dr. [P1-81] Tincture of cantharidin 1 dr. may be usefully combined with above quantities.

Applied locally to the scalp, pilocarpine seems to have an action in promoting the growth of hair in alopecia or dandruff. Used also in [P1-81] **Ointment**, 4 gr. to the ounce of a mixture of wool fat and soft paraffin ointment.

[P1-81] **Jaborandi (B.P.C., Fr. Cx., P. Helv. V).** *Syn.* PILOCARPUS.

The dried leaflets of *Pilocarpus microphyllus* (Rutaceæ), containing the alkaloids, pilocarpine (up to about 0.5%), isopilocarpine and pilosine. *P. Helv. V* describes the dried leaves of *P. Jaborandi*, and *Fr. Cx.* those of *P. microphyllus*, *P. Jaborandi* and *P. pennatifolius*.

[P1-81] **Extractum Jaborandi Liquidum** (B.P.C.). 1 in 1.

[P1] **Tinctura Jaborandi** (B.P.C.).

Dose.—10 to 30 minims (0·6 to 2 inl.). Liquid extract of jaborandi 1, alcohol 45% to 5.

PILULÆ

Excipients. The chief consideration in the preparation of pill masses is the choice of excipient. The following scheme for their preparation is of almost general application.

- (a) When binding material such as gum, fibre, or soft or dry aqueous extracts is present, the ingredients should be massed with syrup of liquid glucose.
- (b) When no binding material is present, as in the case of camphor, sulphur, thymol, resins, reduced iron and crystalline substances such as ferrous sulphate, 5% of compound powder of acacia should be added and the ingredients massed with syrup of liquid glucose. In certain cases it is advisable to substitute liquid glucose for the syrup to give greater cohesiveness.
- (c) Volatile oils and similar substances should be absorbed in powdered curd soap and the mass stiffened with powdered liquorice.
- (d) Oxidising substances such as potassium permanganate should be made into a paste with the minimum amount of wool fat, and the mass stiffened with kaolin or diatomite.

Coatings. The practice in vogue in most pharmacies of invariably coating pills, unless otherwise ordered, is advantageous from every point of view. Coated pills are tasteless and elegant in appearance, they are less liable to deteriorate on keeping and are usually more acceptable to the patient than uncoated pills. The following coatings are in general use:—

VARNISH COATING. A solution of sandarac in alcohol (95%) 1 in 2 or, for quicker drying, equal volumes of alcohol (95%) and ether. This is the usual form of coating used on the dispensing counter. About 5 to 8 drops of the solution suffice to coat one dozen 5-grain pills.

SILVER LEAF COATING. About two leaves are sufficient for twelve 5-grain pills. The pills should be made tacky with dilute mucilage of acacia and then rotated with the silver leaf in a warm, dry, porcelain pot. Silver coating should not be used for pills containing substances liable to affect it, such as sulphides, unless they are previously varnished.

SUGAR COATING. This is effected by placing the pills in a hemispherical metallic pan, kept warm while making revolutions, and they are alternately moistened with syrup and dusted with finely-powdered sugar until dry and uniformly covered.

PEARL COATING. The pills are first covered with a mucilage of tragacanth (4 grains to 1 fluid ounce with $\frac{1}{2}$ drachm of syrup); they are then coated by rotating in a pot with French chalk. The operation is repeated several times until a suitable coating has been formed.

GELATIN COATING. The pills are held on needles or by suction in a frame, dipped in a solution of 1 part of gelatin in 4 parts of water, and dried. Gelatin coating is very satisfactory.

Enteric Coatings. These are coatings designed to render the pills insoluble in the stomach but soluble in the intestines (*see also* glutoid capsules, p. 543). Many substances are used for this purpose, but none of them is perfectly satisfactory. The following are in general use:—

GLUTOID COATING OR FORMALDEHYDE-GELATIN. The pills are gelatin-coated in the usual manner, then immersed for 15 minutes in a 2% solution of formaldehyde and dried.

The longer gelatin-coated pills or capsules are immersed in the formaldehyde solution the sooner they disintegrate in an alkaline pancreatic mixture.—H. N. Dale, *Pharm. J.*, ii/1932, 494.

STEARIC ACID. The pills are rotated in melted stearic acid and caused to roll out on a large sheet of paper so that the coating dries evenly. When the pill mass is of a non-greasy character it is advisable to moisten the pills with a solution of white wax in ether, allowing the latter to evaporate. Unless this is done the coating tends to crack readily and peel off.

Stearettes (*Martindale, London*) are tablets made with a coating containing stearic acid with other ingredients to prevent cracking.

SALOL COATING. This is applied in the same manner as stearic acid. Non-greasy pill masses should be similarly waxed before coating, otherwise the salol will not adhere.

KERATIN COATING. The pills are moistened by rotation in a pot with a 10% solution of keratin in equal parts of alcohol and strong solution of ammonia, and then shaken out on an oiled tile to dry. The operation is repeated several times and three or four coatings applied.

A solution containing 10% *w/v* each of cetyl alcohol and mastic in acetone is advocated as an enteric coating.—L. M. Mills, *J. Amer. pharm. Ass.*, 1937, 479.

A mixture of 20 parts castor oil and 100 parts shellac dissolved in alcohol was found to be satisfactory.—J. J. Goorley and C. O. Lee, *J. Amer. pharm. Ass.*, 1938, 379.

Mastic-magnesium stearate is recommended for the enteric coating of pills.—F. S. Bukey and C. J. Klemme, *J. Amer. pharm. Ass.*, 1939, 87.

Keratinum (B.P.C.).

A group of proteins forming the chief constituents of horns, hoofs, feathers, etc., and resistant to enzyme or chemical action. Occurs as a brownish-yellow powder or greyish-white scales.

[P2] **Liquor Keratini (B.P.C.)** is a 10% *w/v* solution in ammoniacal alcohol. Used for the enteric coating of pills, capsules, etc.

Pulveres pro Pilulis.

It is often possible to prepare from a formula for a pill mass all the ingredients, with the exception of the excipient, in the form of a powder. This facilitates the preparation of repeated batches of the pills, since one weighing of the compound powder will replace three or more in the ordinary manner of dispensing. The following are the relations by weight between the "*Pulvis pro pilulis*" and the quantity of the excipient, syrup of liquid glucose, necessary to produce a pill mass of suitable consistence.

Pill.	Weight of powder.	Weight of syrup of liquid glucose.

PINUS

Pinus Alba (B.P.C.). *Syn.* WHITE PINE BARK. The bark of the Weymouth pine, *P. Strobus* (Pinaceæ).

Extractum Pini Albi Liquidum (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 ml.). 1 in 1. Sometimes included in cough syrups.

Syrupus Pini Albi Compositus (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Liquid extract of white pine, 1 in 20, with syrup of tar, liquid extract of squill and ammonium chloride, in a glycerin-syrup basis.

[P1] **Anodyne Pine Expectorant (Parke, Davis, London).** Combination of extracts of white pine, wild cherry, balsam poplar buds, etc., with chloroform 4 m. and morphine acetate $\frac{1}{10}$ gr. in 1 oz.

Pinus Canadensis (B.P.C.). *Syn.* HEMLOCK SPRUCE, PINUS BARK.

The dried inner bark of *Tsuga canadensis* (Pinaceæ). Contains 8 to 15% of tannin.

Extractum Pini Canadensis Liquidum (B.P.C.). *Dose.*— $\frac{1}{4}$ to 1 drachm (1 to 4 ml.). 1 in 1. It is used as an astringent in leucorrhœa and given internally for diarrhœa, hæmoptysis and night sweats.

Pinus Sylvestris. *Syn.* SCOTCH FIR OR PINE.

From the wood of this tree (principally in America, France and Russia) much of the oleo-resin, common turpentine, oil of turpentine, gum thus or American frankincense, resin or colophony, and wood tar (*vide* *Pix Liquida*) are produced. From its leaves also are prepared an extract and volatile oil.

Oleum Pini Sylvestris is a commercial name for the oil distilled from various coniferous leaves and twigs; it is not distilled from *Pinus sylvestris*.

Oleum Terebinthinæ (B.P., U.S.P. XI, P. Helv. V, P. Dan.).

Syn. OLEUM TEREBINTHINÆ ÆTHEREUM (*Fr. Cx.*), OLEUM TEREBINTHINÆ RECTIFICATUM, CAMPHINE.

Dose.—3 to 10 minims (0.2 to 0.6 ml.). Anthelmintic dose 2 to 4 drachms (8 to 16 ml.).

Is distilled from the oleo-resin, turpentine, obtained from *Pinus sylvestris* and other species of *Pinus*. *U.S.P. XI* and *P. Helv. V* contain Oleum Terebinthinæ and Oleum Terebinthinæ Rectificatum, the latter to be dispensed when for internal use. *Fr. Cx.*, *P. Helv. V* and *P. Dan.* recognise the oil of *P. maritima* (*P. Pinaster*) only.

Soluble 1 in 7 of alcohol 90%; miscible with alcohol 95%, ether, chloroform and glacial acetic acid.

By "Turpentine," *i.e.*, Terebinthina (*N.F. VI, P. Suec. X* and in other countries), is meant the concrete oleo-resin obtained as exudate from various species of *Pinus*. Synonyms for this natural product are Gum Thus, Thus Americanum and Common Frankincense. Bordeaux Turpentine is a variety obtained in S.W. France.

Antidotes. Empty stomach by emetic or stomach tube. Give purgative dose of magnesium sulphate. Demulcent drinks. Hot applications to loins. Morphine, $\frac{1}{4}$ gr. hypodermically, or tincture of opium by mouth, for pain.

Death of a man of 39 following drinking of 6 oz. of oil of turpentine. Lining of stomach completely macerated and lying in small pieces in the gastric cavity. The wall of the stomach felt like leather.—F. P. Maitland, *Brit. med. J.*, ii/1931, 77.

TURPENTINE IDIOSYNCRASY. Vesicular eruption, urticaria and vomiting following use of Linimentum Album (B.P.C.) on unbroken skin.—W. W. Jeudwine, *Brit. med. J.*, i/1933, 513.

Idiosyncrasy by no means unusual. Turpentine causes rubefaction and vesiculation on any skin if applied sufficiently concentrated, and will cause this irritation in some individuals in very small dosage, the irritation in these cases not being limited to the site of application, but a papular, urticarial rash, which may become oozing and eczematous, appears at the periphery of the point of contact and may become quite generalised. The application of turpentine to the skin contains a real element of danger.—R. L. Sutton, *Brit. med. J.*, i/1933, 805; J. T. Ingram, *ibid.*, 894.

Uses. Oil of turpentine has the therapeutic action of other essential oils. Internally it is carminative, producing a sensation of warmth in the mouth and stomach and assisting the expulsion of flatus. It is excreted especially by the kidneys and lungs, and has been given in cystitis as an antiseptic and for promoting diuresis, and in bronchitis as an expectorant. Large doses are irritant to the bladder and urethra and even small doses may increase a pre-existing inflammation. Given with castor oil to prevent absorption, large doses are administered as a vermifuge for tape-worm. As an enema it is employed to evacuate the bowel, to expel flatus and also to remove tape-worm and thread-worm. Mixed with olive oil it is of value as an enema in the tympanites of typhoid fever. Externally it is rubefacient, and is employed in numerous liniments for rheumatism, stiffness, etc., and a turpentine stupe consisting of $\frac{1}{2}$ to 1 dr. of the oil sprinkled on flannel wrung out of hot water is commonly used as a counter-irritant for the relief of abdominal pain. The oil is an effective hæmostatic, and may be applied on gauze to arrest hæmorrhage from a tooth socket or the nose.

Subcutaneous or intramuscular injections of turpentine are given to promote the formation of a "fixation abscess" in the treatment of various diseases of microbial origin. The oil may be given as a 15% admixture with olive oil, sometimes with the addition of 0.5% each of benzocaine and quinine hydrochloride. The adult dose is 0.5 to 1 ml. every 4 to 7 days; children may receive 4 m., and infants up to 5 years 1 to 2 m. weekly. Increased leucocytosis is produced, and the treatment has been found valuable in septicæmia, erysipelas and other streptococcal infections, also in furunculosis, acne, etc. Fixation abscess treatment may also assist in the isolation of the infecting organisms in infections of unknown origin.

TYPHOID. Give 20 m. of turpentine emulsion or a capsule of 5 m. oil of cinnamon 2- or 4-hourly and a $\frac{1}{2}$ pint ox-gall enema, and apply heat to the abdomen if there is no hæmorrhage.—A. E. Gow, *Lancet*, i/1930, 39.

Emulsion Olei Terebinthinæ (U.S.P. XI). Average dose.— $\frac{1}{2}$ drachm (2 ml.). Rectified oil of turpentine 15% with acacia and water.

Enema Terebinthinæ (B.P.C.). Dose.—20 ounces (600 ml.). Oil of turpentine 2.5 to 5% v/v in mucilage of starch or in 5% aqueous soft soap.

Enema Terebinthinæ (St. M.H., St. Mark's H.). Oil of turpentine $\frac{1}{2}$ oz., soap enema (1 in 20) to 1 pint. W.H. is the same except that the soap enema is 1 in 40. St. T.H. uses oil of turpentine $\frac{1}{2}$ to $\frac{1}{2}$ oz. in $\frac{1}{2}$ to 1 pint of mucilage of starch. St. G.H. has oil of turpentine 1 oz. in starch enema ($\frac{1}{2}$ oz. boiled with 20 oz. of water) to 1 pint. Mid. H. has 1 oz. of oil in 20 oz. of simple enema (soft soap 1 oz., water to 1 pint). L.H. is the same, using $\frac{1}{2}$ to 4 dr. of oil. K.C.H.

uses 1 oz. of oil of turpentine emulsified in milk 2 oz., or yolk of egg, and made up to $\frac{1}{2}$ to 1 pint with soap enema (1 in 20). *Gt. Orm. H.* uses 2 dr. of oil mixed with 10 oz. of starch mucilage prepared with 2 dr. of starch. *C.X.H.* has oil of turpentine 1 oz., starch enema (1 in 40) to 15 oz.

Gossypium Terebinthinæ. *Syn.* TURPENTINE WOOL (*R.D.H.*). Cotton wool or gauze soaked in the oil and squeezed dry, packed into the tooth socket as a stupe.

Hastus Terebinthinæ (*St. G.H.*). Oil of turpentine 10 m., tincture of quillaia 10 m., syrup 30 m., cinnamon water to 1 oz.

Dutch Drops. *Syn.* HAARLEM DROPS. For lumbago and rheumatism. *Ph. Form* states:—Form now generally adopted in Denmark and Holland is:—Heat to 165° in an iron vessel large enough to allow some frothing, linseed oil 4 and sulphur 1, with stirring until mixture drops off the stirrer with a glassy appearance. Remove from the fire and add 15 parts (by weight) of oil of turpentine, and agitate until solution is complete or nearly so, then filter. The liquid should be limpid and of a brownish-red colour. Has been given in a dose of 5 to 30 m. (0.3 to 2 ml.).

Linimentum Album (*B.P.C.*). *Syn.* EGG LINIMENT, WHITE EMBROCATION, LINIMENTUM ALBUM ACETICUM. An egg emulsion containing about 40% of oil of turpentine and 8% of acetic acid.

Lin. Album (*N.I.F.*). *Syn.* LIN. COMMUNE. Soft soap 66 gr., ammonium chloride 11 gr., oil of turpentine $\frac{1}{2}$ oz., hot water to 2 oz.

Linimentum Terebinthinæ (*B.P.*). Contains oil of turpentine 65% *v/v* with camphor 5% *w/v*, soft soap and distilled water.

Knight's method is satisfactory. Mix solution of potash (*B.P.* '98) 3 oz. with water 3 oz. in a bottle, add oleic acid 7 dr. previously mixed with oil of turpentine 3 oz., and mix gently. To this emulsion add oil of turpentine 10 oz. with camphor 1 oz. dissolved in it, in portions of 1 oz. or more at a time. *Liquor Potassæ* (*B.P.* '98) contained 6.19% *w/v* of KOH.

Linimentum Terebinthinæ Aceticum (*B.P.*). Glacial acetic acid 110 ml., liniment of camphor 445 ml., oil of turpentine to 1000 ml.

Linimentum Terebinthinæ Aceticum (*N.F. VI*). *Syn.* STOKES' LINIMENT, ST. JOHN LONG'S LINIMENT. Oil of turpentine 400 ml., oil of lemon 16 ml., acetic acid 80 ml., yolks of 4 eggs, whites of 2 eggs, water to 1000 ml.

Linimentum Terebinthinæ Compositum (*B.V.H.*). Salicylic ester of dihydroxy-ethane 1 oz., oleoresin of capsicum 5 gr., olive oil 2 oz., oil of turpentine to 5 oz.

Sapo Olei Terebinthinæ. Turpentine 1, soft soap 2, glycerin 1. As a vermicide—also a stimulant local application.

Spiritus "Antiparalyticus." Turpentine oil 4, oil of amber 4, camphorated spirit 64, dilute solution of ammonia 28. Used as a liniment.

"Sanitas" Fluid (*Sanitas Co., London*) is prepared by the action of water upon air-oxidised turpentine. It contains as its active principles hydrogen peroxide, thymol, a soluble camphor, and some camphoric acid. A household disinfectant and oxidiser. Non-poisonous, does not stain linen. Is used in midwifery. "Sanitas" Oil has sp. gr. 0.95. A strong oxidising agent. For inhalation in phthisis. Diluted with spirit used as spray in a room, or 1 in 8 to 20 of olive oil for skin affections.

Terebinthina Canadensis (*B.P.C.*). *Syn.* CANADA BALSAM, BALSAM OF FIR.

The oleoresin from *Abies balsamea* (Pinaceæ) occurring as a pale yellow, viscid liquid soluble in all proportions of benzene, xylene, chloroform and ether; about 80% is soluble in alcohol

90%. After preparation by warming for some hours in an open dish until a small portion sets to a brittle solid on being cooled, and dissolving the residue in an equal quantity of xylene it is used as a microscopic mounting medium.

Venice Turpentine is the oleoresin from *Larix europæa* (Pinaceæ). It is a viscid yellow fluid soluble in dehydrated alcohol.

Terebinthina Veneta (*P. Helv. V*), *syn.* TERÉBENTHINE DU MELEZE (*Fr. Cx.*), is from *L. decidua*.

Commercial Venice turpentine is usually a factitious substance.

Soluble 1 in 5 of alcohol, and in ether and chloroform.

Balsamum Locatelli. Venice turpentine 18, yellow beeswax 12, olive oil 18, balsam of Peru 2, dragon's blood 1. For chilblains (even if broken).

Terebinthina Veneta Factitia (*B.P.C.*). A mixture of colophony, linseed oil and oil of turpentine melted together and allowed to cool.

Larix (*B.P.C.*). *Syn.* LARCH BARK.

The bark of *Larix europæa*, containing tannin. **Tinctura Laricis**, *dose.*—20 to 30 minims, 1 in 8, has been used as an expectorant in chronic bronchitis.

Oleum Pini Pumilionis (*B.P.C., U.S.P. XI, P. Helv. V*).

Dose.—1 to 5 minims (0.06 to 0.3 ml.).

The oil of the leaf of *Pinus Pumilio* (Coniferæ). Is more aromatic than the oil of Siberian fir. It is used for inhalations.

Syrupus Pini (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 1 in 160 of oil of pumilio pine in glycerin, sucrose and water.

[D-P1-81] **Pinheroin** (*Oppenheimer, London*). Preparation containing diamorphine hydrochloride $\frac{1}{10}$ gr. and terpine hydrate 1 gr. per dr. with essence of Canadian pine, for use as a respiratory stimulant. *Dose.*—1 drachm every 2 or 3 hours if necessary.

Oleum Abietis (*B.P.*). *Syn.* OIL OF SIBERIAN FIR, OIL OF PINE. Distilled from the fresh leaves of *Abies sibirica*. Contains 33 to 45% w/w of esters calculated as bornyl acetate, $C_{12}H_{20}O_2$.

MOSQUITO LARVÆ AND PUPÆ. Pine oil has a powerful soporific or paralyzing effect, resulting in their death. A mixture of crude oil and pine oil, in the proportion of 9 parts of the former to 1 of the latter, is effective in destroying all stages of Anopheline and Culicine larvæ and pupæ.

Olibanum (*B.P.C., Fr. Cx.*), *syn.* FRANKINCENSE, is the dried oleoresin from *Boswellia Carterii* and other species (Burseraceæ). In ovoid yellowish, bluish or greenish tears. Used in incense and fumigating powders.

Terebenum (*B.P., U.S.P. XI*).

Dose.—5 to 15 minims (0.3 to 1 ml.). *U.S.P. XI* average dose 4 minims.

A colourless liquid consisting of dipentene and other hydrocarbons, produced by the action of sulphuric acid on oil of turpentine and distillation. Sp. gr. 0.862 to 0.870. It has an agreeable odour resembling fresh-sawn pine-wood.

Soluble 1 in 5 of alcohol 90% and in all proportions in absolute alcohol or chloroform. It is not miscible with water, but may be emulsified by mixing it with one-sixth its weight of tragacanth powder, then adding water and shaking.

Uses. An agreeable antiseptic, disinfectant and deodorant. The vapour is a useful sedative and antiseptic inhalation in whooping cough and chronic bronchitis.

WHOOPIING COUGH cured by 1 to 2 minims on sugar occasionally.—*Lancet*, ii/1929, 34.

Vapor Terebeni. Equal parts of terebene, phenol and spirit of chloroform. 10 drops on the pad of an oro-nasal respirator.

[P1] **Bronchol** (*Sharpe & Dohme, London*). Capsules containing terebene 1 m., oil of sandalwood $1\frac{1}{2}$ m., creosote $\frac{1}{2}$ m., eucalyptol $\frac{1}{2}$ m., strychnine $\frac{1}{100}$ gr., olive oil to 5 m. For bronchitis, bronchial catarrh, etc. *Dose*.—1 or 2 capsules after meals.

Terpini Hydras (*B.P.C., U.S.P. XI, P. Ned. V, P. Helv. V*). $C_6H_8(OH)_2 \cdot CH_3 \cdot C_3H_7, H_2O = 190.2$. *Syn.* TERPINE (*Fr. Cx.*), TERPENE HYDRATE.

Dose.—3 to 10 grains (0.2 to 0.6 g.), in cachets, capsules or pills, or suspended in a mixture.

In prismatic crystals.

Soluble 1 in 280 of water, 1 in 32 of boiling water, 1 in 14 of alcohol 90%, 1 in 100 of ether, 1 in 200 of chloroform.

Uses. Lessens cough; has been used with success in bronchitis, chronic and subacute; it assists expectoration, e.g., in initial catarrh of phthisis.

Elixirium Terpinis Codeinque Compositum (*Fr. Cx.*). Terpene 0.5%, codeine 0.1%, brandy 60%, syrup of tolu 34.4%, cherry-laurel water 5%, all by weight.

Terpinol. An agreeably aromatic liquid containing various terpenes ($C_{10}H_{16}$), and oxygenated bodies, including terpineol, obtained by the action of dilute sulphuric acid on terpin hydrate. Miscible with alcohol in all proportions, but insoluble in water. Has been given in pulmonary hæmorrhage in 3-drop doses. Is used mainly in perfumery for its hyacinth odour.

Terpineol. *Syn.* TERPILENOL. $C_{10}H_{18}OH = 154.1$. A colourless viscid liquid obtained by the fractional distillation of terpinol. Used for disguising odour of iodoform and in perfumery, having a lilac odour.

Terpoflor (*Wilcox, JozEAU, London*). Contains cedrene, pinene, anethol, camphoric aldehyde, cineole, methyl orthoamidobenzoate, linalyl acetate, terpineol and sesquiterpenes in liquid paraffin. Supplied in gelatin capsules, the contents of which are instilled into the nose. For use in nasal congestion.

PITUITARIUM

Syn. PITUITARY GLAND, HYPOPHYSIS CEREBRI.

[P1] "Pituitary gland, the active principles of."

[S6] "Pituitary gland, the active principles of—specify proportion as either:—

- the number of units of activity as defined in the "British Pharmacopœia" contained in a specified quantity of the preparation; or
- the proportion of pituitary gland, or of anterior or of posterior lobe of the gland, as the case may be, contained in the preparation; or
- the amount of pituitary gland, or of anterior or of posterior lobe of the gland, as the case may be, from which a specified quantity of the preparation was obtained, together with an indication whether the amount relates to fresh or to dried gland substance."

[87] *Medicines made up ready for the internal treatment of human ailments containing—Pituitary gland, the active principles of—must be labelled with the words "Caution. It is dangerous to take this preparation except under medical supervision."*

A small reddish-grey, ductless gland weighing, in man, about 10 grains, situated at the base of the brain in the sella turcica of the sphenoid bone. The average total weight of the gland in the ox is 2.5 g.; the anterior part being 2 g., and posterior 0.5 g.

Anatomically the gland consists of the anterior lobe, the *pars intermedia*, the posterior lobe and the *pars tuberalis*. The *pars intermedia* lies between the (larger) anterior lobe and the (smaller) posterior lobe; it is developed in connection with the anterior lobe as an upward growth (Rathke's pouch) of the ectoderm lining the bucco-pharyngeal cavity. The posterior lobe is developed from that portion of the diencephalon which forms the floor of the third ventricle with which it is connected by the neck or infundibulum (a funnel). In man, both neck and body are solid, with traces of a cavity in the neck. The *pars tuberalis* is a thin layer which forms a collar for the infundibulum, and spreads out over a small adjacent part of the base of the brain.

Histologically the anterior lobe is composed of irregular columns of cells separated by connective tissue and large vascular sinuses. The cells are differentiated into two groups according to the intensities of the staining reactions of their cytoplasm—chromophobe cells with clear non-granular cytoplasm and chromophil cells with deeply staining granules—further differentiated as acidophil (oxyphil) and basophil cells, according to the affinities of their cytoplasm for acid and basic dyes respectively. The posterior lobe, or *pars nervosa*, is composed of neuroglia cells, fibres and pituicytes, but no nerve cells have been identified in it. In the human pituitary gland the bulk of the tissue of the posterior lobe is made up of larger pyramidal or spindle-shaped cells termed pituicytes, which often contain greenish-brown granules. The *pars intermedia* is closely applied to the *pars nervosa*, and consists of short columns of small polyhedral cells with round, centrally-placed nuclei and granular cytoplasm.

Physiologically the resemblance of the minute structure of the anterior portion of the gland to a typical secreting gland is consistent with the production of an internal secretion, but the resemblance of the cells of the *pars nervosa* to those of nervous tissue has led to the suggestion by many investigators that the secretion of the posterior lobe is elaborated in the *pars intermedia*.

The hypophysis and metabolism (with a bibliography containing 437 references).—B. A. Houssay, *New Engl. J. Med.*, i/1936, 961.

The Physiology and Pharmacology of the Pituitary Body, by H. B. Van Dyke.

Posterior Lobe

[P1-87] **Extractum Pituitarii Liquidum (B.P.).** *Syn. and Prop. Names.* SOLUTUM EXTRACTI HYPOPHYSÆ (*Fr. Cx.*), GLAND-UITRIN (*Richter, London*), HYPOPHYSIN (*Bayer Products, London*), INFUNDIBULIN (*Evans, Sons, Lescher & Webb, Liverpool*), INFUNDIN (*Burroughs Wellcome, London*), PITIBULIN (*Allen & Hanburys, London*), PITON (*Organon Laboratories, London*), PITOXYLIN (*Oxo, London*), PITUITRIN (*Parke, Davis, London*).

Dose.—2 to 5 units (0.2 to 0.5 ml.) by subcutaneous injection.

Pituitary (posterior lobe) extract is prepared with 0.25% acetic acid, and is assayed and adjusted to contain 10 units per ml. and to pH 3 to 4.

The preparation of a stock powder for the manufacture of the official extract when required is described.—H. Gartside, J. Pritchard and F. E. Rynill, *Quart. J. Pharm.*, 1938, 401.

[P1-87] Liquor Pituitarii Posterioris (U.S.P. XI).

Average dose.—15 minims (1 ml.), by hypodermic injection.

1 ml. produces an activity upon the isolated uterus of the virgin guinea-pig equal to 80 to 120% of that produced by 0.005 g. of a standard powdered posterior pituitary.

Therapeutic Substances Regulations. The unit is the activity corresponding to that yielded by 0.5 mg. of the *standard preparation* when extracted by an approved method. The acidity of the aqueous extract shall be not less than pH 4 nor more than pH 3. Samples must be tested for sterility, and the label must indicate the strength (units per ml.), batch number and licence number, and name and address of manufacturer.

The B.P. directs that extracts should not be used when more than 18 months old.

The statement in the B.P. as to the reduction in activity during storage is only correct if the average temperature does not rise above 5°.—F. Wokes, *Pharm. J.*, ii/1932, 476.

Uses. The most potent action of pituitary (posterior lobe) extract is its stimulation of smooth muscle. This is especially marked in respect of the uterus, and it is in the stimulation of uterine contractions in obstetrics that this extract finds its most important therapeutic application. In the early days it was used to hasten delivery, but its use for this purpose has now been largely abandoned, since if the cervix is not fully dilated the too powerful contractions may cause rupture of the uterus. It is now mainly employed in the third stage, *i.e.*, after expulsion of the placenta, to produce prompt and firm contraction of the uterus and thus check post-partum hæmorrhage. If it is given before delivery of the child the dose should never be more than 2 units, and then should only be given when the os is approaching full dilatation.

The next most important action of pituitary (posterior lobe) extract from the therapeutic aspect, is its antidiuretic effect, which is attributable to a specific limitation of the water-excreting capacity of the kidneys, resulting in decreased volume and increased concentration. This action is employed with striking effect in diabetes insipidus to relieve the thirst and control the diuresis.

The stimulant effect of pituitary (posterior lobe) extract on the smooth muscle of the intestine, causing increased peristalsis, is made use of in paralytic ileus, where an immediate action of the bowel may follow the injection of $\frac{1}{2}$ to 1 ml.

Posterior lobe extract, when injected, also produces a rise in blood pressure, due to vasoconstriction, and it may be found of value in minor degrees of shock. It also antagonises the action of insulin (by retarding the peripheral utilisation of the blood sugar) and may be employed in hypoglycæmic coma.

DIABETES INSIPIDUS. Pituitary (posterior lobe) causes a marked antidiuretic effect lasting some hours in patients with diabetes insipidus or in normal subjects who have previously drunk large quantities of water.—See W. W. Burgess, A. M. Harvey and E. K. Marshall, *J. Pharmacol.*, 1933, 49, 237. See also I. Gersh, *J. Pharmacol.*, 1934, 52, 231.

Intranasal administration of 1 ml. liquid extract applied with a spray (also by insufflation of powder) successful in many cases of diabetes insipidus.—per *Brit. med. J. Epit.*, ii/1928, 82; also *ibid.*, i/1929, 21.

HÆMOPTYSIS. The most effective immediate remedy is the subcutaneous injection of 1 ml. of pituitary (posterior lobe) extract.—W. H. Wynn, *Brit. med. J.*, ii/1934, 833.

HERPES ZOSTER. Relief of pain following injection of 1 ml. It appears to act most dramatically when the pain is most intense.—F. H. Gillett, *Lancet*, ii/1934, 307.

Cases of herpes zoster involving branches of the trigeminal nerve and unrelieved by all other forms of treatment obtained relief from the injection of 1 ml. of Pituitrin. The pain disappeared within a few minutes and did not return for 24 hours, when the injection was repeated.—S. H. Portnoy, per *J. Amer. pharm. Ass. (Abstr.)*, 1939, 398.

LABOUR. The multipara with the flabby uterus must not be given any oxytocic drug. It is safer for the general practitioner to reserve pituitary extract for the termination of the third stage.—B. Solomons, *Lancet*, ii/1934, 11.

Nasal method of administration safe and efficient for accelerating labour already in progress. Insert a pledget of cotton wool moistened with 20 m. pituitary extract under the anterior end of the inferior turbinate of one nostril, withdraw after an hour or two and, if necessary, apply a fresh pledget to the opposite nostril.—Hofbauer and Hobiner, per *Prescriber*, 1928, 180.

Intravenous injection of pituitary (posterior lobe) extract in doses of 1 minim given in a number of cases; said to be safe. Best results when given after the membranes have ruptured and in secondary inertia, before full dilatation or with full dilatation when the head is on the perineum; results also good in post-partum hæmorrhage and after cesarean section.—H. A. Barron, *J. Obstet. Gynec.*, 1935, 322. See also *Lancet*, i/1935, 1398.

There is not sufficient advantage to justify the routine use of pituitary extract in the third stage of labour.—B. L. Williams, *Proc. R. Soc. Med.*, 1939, 32, 920. The intramuscular use of 5 units of Pituitrin directly after the birth of the child showed: (1) that duration of the third stage is not appreciably affected, (2) the average loss of blood is less, (3) the incidence of post-partum hæmorrhage is less, (4) there is no tendency for chorion to be retained, (5) there is no tendency for contraction ring to form, (6) there is no case of Pituitrin shock.—R. C. Percival, *ibid.*, 923. The average duration of labour is slightly shorter in cases where Pituitrin is given, the incidence of post-partum hæmorrhage of over 20 ounces is not reduced, and there is a danger of hour-glass spasm of the uterus.—S. G. Clayton, *ibid.*, 926.

As the result of an experiment covering over 1000 consecutive cases, with a similar number of controls, it was concluded that there is no danger whatever in giving 1 ml. (10 units) of Pituitrin (or Pitocin) during the third stage of labour, and that the amount of hæmorrhage is not much affected, though there was a tendency to a smaller post-partum loss in the Pituitrin cases. It is not claimed, however, that posterior pituitary extract should be given in the third stage as a routine treatment for all cases, nor should control of the fundus, or the very watchful care necessary at this stage, be relaxed or be replaced by any oxytocic drug.—G. W. Blomfield, *Brit. med. J.*, ii/1938, 1083.

PARALYTIC ILEUS. Pituitary (posterior lobe) intravenously extremely valuable, given in a dose of 0.5 to 1 ml. into the median antecubital vein very slowly (0.1 ml. every 5 seconds). Dramatically sudden result in every one of three cases.—F. F. Rundle, *Brit. med. J.*, ii/1935, 1208.

Description of three further cases successfully treated.—S. O. Aylett, *Med. Pr.*, 1938, 386.

POST-PARTUM HÆMORRHAGE. In cases of post-partum hæmorrhage, pituitary (posterior lobe) extract should be injected into the fundus uteri through the abdominal wall, provided the bladder is empty. The uterus must be compressed bimanually, a fist being inserted into the anterior fornix and the external hand behind the organ pressing it forwards and upwards.—W. F. Rawson, *Brit. med. J.*, i/1935, 1317.

Hypersensitiveness to pituitary extracts occurs in only a small percentage of persons. The constituent of the extract responsible is neither the vasopressor nor the oxytocic principle. The symptoms are usually swelling of the face and hands with urticaria.—Senior and Ryder, *J. Amer. med. Ass.*, i/1936, 512.

Spasm of the cervix which on rare occasions occurs with retention of the placenta after the proper use of pituitary extract may be relieved by injection, of 5 m. of adrenaline solution 1 : 1000.—G. G. Copeland, *Canad. med. Ass. J.*, i/1936, 317.

SOME PROPRIETARIES CONTAINING PITUITARY (POSTERIOR LOBE) EXTRACT

[P1-87] **Lysasthmin** (*Richter, London*). Glandutrin (posterior pituitary extract) 0.5 ml., adrenaline (1 in 1000) 0.5 ml. *Dose*.—0.5 to 2 ml. subcutaneously or intramuscularly. Bronchial asthma, cardiac and renal dyspnea, etc.

[P1-87] **Pitalin** (*Paines & Byrne, London*). Ampoules of 1 ml. contain 5 units of pituitary (posterior lobe) extract and 0.5 mg. of adrenaline. *Dose*.—1 ampoule repeated as necessary. Asthma.

[P1-87] **Pitraphorin** (*Schering, London*). Pituitary posterior lobe extract for intramuscular or subcutaneous injection (1 ml. contains 10 i.u.). Menorrhagia, post-partum hæmorrhage, induction of labour, intestinal atony.

[P1-87] **Pituchinol** (*Camden Chemical Co., London*). Pituitary (posterior lobe) extract and quinine base. Ampoules contain 1 ml. = 3 units of pituitary extract and 1 g. of quinine. Stimulating and regularising uterine contractions in all stages of labour.

Active Principles of the Posterior Lobe.

From the posterior lobe of the pituitary gland, two extracts with different effects have been separated, the oxytocic or uterine-stimulating principle, and a vasopressor principle which elevates the blood pressure, stimulates the bowel, particularly the colon, and inhibits diuresis. It is not yet certain whether there is a third principle affecting carbohydrate metabolism. The oxytocic and vasopressor principles have been markedly concentrated and nearly completely separated from each other, but are not yet available as pure substances. Study of these concentrated preparations has led to the conclusion that the two active principles are amines.

A practical advantage arising from the separation of the oxytocic principle from the vasopressor principle is that the effect of pituitary extract on uterine muscle can be obtained without the simultaneous occurrence of changes in blood pressure. It happens very occasionally that the administration of pituitary extract is followed by the collapse of the patient apparently caused by a fall in blood pressure. So far as is known this fall is due to the vasopressor principle, and therefore in using the oxytocic principle no danger of such a collapse can arise.

Evidence is offered that mild insulin hypoglycæmia in dogs can be completely abolished by small doses of oxytocic hormone of the posterior lobe of the pituitary; corresponding doses of the pressor fraction have little or no effect. Larger doses of the oxytocic hormone not only abolish the insulin effect, but cause a rise in the blood-sugar level above normal.—H. C. Ellsworth, *J. Pharmacol.*, 1936, 66, 420.

Blood pressures and intestinal actions of pituitary (posterior lobe) extract, injected intravenously in the unanæsthetised dog, vary markedly with the fraction used, even when equal pressor-assayed dosages are employed. The presence of the oxytocic hormone may inhibit or abolish the typical effects of the pressor constituent. It is thus concluded that the pressor hormone *per se* causes, under such conditions, a fall of blood pressure, stimulation of intestinal activity, and defecation; while the oxytocic constituent *per se* in sufficient dosage exerts a definite antagonistic influence in respect of these actions. These observations may explain some of the conflicting reports on the clinical usefulness of the agents in question.—K. I. Melville, *J. Amer. med. Ass.*, 1/1936, 105.

The Oxytocic Principle of the posterior lobe of the pituitary has been named oxytocin or α -hypophamine. It affects the muscle of the uterus in child-birth, causing increased rate of

rhythmic contraction, improving the tone, and ensuring that the uterus remains contracted after delivery, thus preventing post-partum hæmorrhage.

[P1-87] **Orasthin** (*Bayer Products, London*). Oxytocic principle of the posterior pituitary in 1 ml. ampoules containing 3 Veeglin units.

[P1-87] **Pitocin** (*Parke, Davis, London*). Solution of the oxytocic principle containing 10 i.u. per ml. and available in 0.5 or 1 ml. ampoules.

The Vasopressor Principle of the posterior lobe of the pituitary gland has been called vasopressin or β -hypophamine. Its action can be divided into three main parts, one elevating the blood pressure, one stimulating the intestine, and a third inhibiting diuresis. Whether these three properties are due to separate substances is not yet known, many investigators believing that the most potent preparations with vasopressor effects are the most potent preparations with anti-diuretic effect.

The pressor property causes elevation of the blood pressure by a direct stimulant action on the smooth musculature of the small arteries and arterioles, whereby the muscle contracts and reduces the diameter of the vessel and so raises the blood pressure. It may also cause constriction of the capillaries and venules. This property is used when the blood pressure is unusually low after surgical operations. The vasopressor principle is most important, however, not for its pressor action, but because it brings about water retention. This property is used to relieve the symptoms of diabetes insipidus, which is characterised by a large intake and output of water. Injections of pituitary extract diminish the excretion and consequently the thirst. The power possessed by the pressor principle of stimulating peristalsis is used in post-operative or paralytic ileus. Injection of large quantities of vasopressin produces a severe hæmorrhagic lesion in the acid-bearing areas of the stomach, caused essentially by inhibition of the gastric secretion. It is also said to produce marked transient impairment of the heart, an effect which may be lessened or prevented by ephedrine, histamine, morphine, nitrites or papaverine.

Doses of 1 ml. of Pitressin intramuscularly, repeated every 4 hours up to 8 or 12 doses, the first dose being given directly following operation, recommended for the prevention of post-operative intestinal distension in abdominal operations.—Potter and Müller, *Ann. Surg.*, 1932, 96, 364.

Pitressin found more effective than the use of enemas for elimination of confusing gas shadows during cholecystography. Report of 73 cases.—Collins and Root, *J. Amer. med. Ass.*, ii/1936, 32.

Pitressin greatly aids in the elimination of obscuring intestinal flatus for the production of better cholecystograms. There is no appreciable alteration in blood pressure or pulse rate following intramuscular injection of 1 ml. (20 pressor units), but it should be used with caution and is contraindicated in cardiac disease, especially coronary disease, arteriosclerosis, hypertension and old age if the vascular system is weakened; also in post-operative cases in which the probability of thrombus or embolus formation is enhanced by possible slowing of the blood stream, and in the later months of pregnancy.—B. R. Kirklin *et al.*, *Proc. Mayo Clin.*, 1939, 502.

The action of the uterine muscle to pituitary preparations is markedly affected by the nature of that ovarian, placental or anterior pituitary hormone whose influence is predominant at the time of injection. During the early stages of pregnancy the human uterus does not react to Pitocin, probably because of the inhibitory effect of the luteal secretion. It does, however, respond to small

doses of Pitressin; whether this is an effect of the drug *per se* or is due to mechanical factors remains a moot point. Later in the gestation period the reactivity to Pitocin returns, and during parturition the uterus is very reactive to this substance, and also to solution of pituitary.—E. M. K. Geiling, *J. Amer. med. Ass.*, i/1935, 738.

DIABETES INSIPIDUS. The active principle, vasopressin, is absorbed through the nasal mucous membrane. It can be administered as a spray, or on a pledget of cotton wool soaked in pituitary extract and placed in contact with the turbinates, or as a snuff containing the finely powdered dry gland. The snuff taken every four hours controls diuresis quite satisfactorily. Occasionally it causes asthma, and should then be replaced by a snuff consisting of vasopressin 1% in lactose.—O. Leyton, *Brit. med. J.*, ii/1936, 1042.

[P1-87] **Pitressin** (Parke, Davis, London), formerly known as vasopressin, a solution of the pressor principle containing 20 pressor units per ml. 1 pressor unit is the pressor activity exhibited by 0.5 mg. of international standard pituitary (posterior lobe) powder.

[P1-87] **Tonephin** (Bayer Products, London). Vasopressor principle of the posterior pituitary in 1 ml. ampoules, representing 5 Voegtlin units.

Pitressin Tannate. A water-insoluble chemical combination of a pressor fraction of the posterior lobe of the pituitary with tannic acid. The pressor fraction is precipitated with tannic acid and the precipitate removed by filtration and washed and dried. Five pressor units of Pitressin tannate are suspended in 1 ml. of peanut oil, the pH of the solution being that of oil. The subcutaneous injection of 1 ml. of the solution controlled the symptoms of diabetes insipidus in three patients for periods varying from 30 to 82 hours without giving rise to disagreeable side-effects.—J. A. Greene and L. E. January, *J. Amer. med. Ass.*, ii/1940, 1183.

Intermedin. The hormone of the *pars intermedia* which acts on the chromatophores of cold-blooded animals.—B. Zondek, *J. Amer. med. Ass.* i/1935, 637.

J. H. Collip and D. K. O'Donovan, with a number of other workers, have discovered a new metabolic factor which can be separated from all the other pituitary ones except the melanophore hormone and which therefore probably comes from the *pars intermedia*. It raises the basal metabolic rate even in the absence of the thyroid and lowers the respiratory quotient. This latter fact implies that the increased metabolism is at the expense of the fat, which suggests its use in the treatment of obesity. It may be the ketonic factor previously attributed to the anterior lobe, since it excites ketonuria in fasted rats, and in dogs, without pancreas or pituitary. It also seems to play a large part in the regulation of carbohydrate metabolism.—*Med. Annu.*, 1940, 364.

A new extract of the pituitary, known as No. 622, and found by O'Donovan and Collip to increase the metabolism of animals, was also found to increase the rate of metabolism in man. The increase of metabolism occurs to an appreciable extent at the expense of fat. The possible uses of this extract in the treatment of obesity, and in conditions where an increase of metabolism is desirable, are now being investigated.—I. M. Rabinowitch and Co-workers, *Canad. med. Ass. J.*, i/1939, 105.

Anterior Lobe

Functions of the Anterior Lobe. For the most part, the data show that the anterior lobe of the pituitary gland is the most important division of the pituitary body in mammals. Through its hormones it appears to touch nearly all the physiological processes of the vertebrate organism, some more profoundly than others. The growth processes, the ovarian and testicular activities seem most completely under pituitary-hormone control. The rest of the endocrine system and the processes of metabolism are less deeply affected, while the nervous system is the least influenced, according to present information. This is partly shown by the

effect of the removal of the pituitary gland (hypophysectomy) from the body; this produces immediate changes in the gonads, the suprarenal cortex and the thyroid, and possibly also in the parathyroid and the islets of Langerhans in the pancreas, and causes cessation of growth.

It is impossible to state how many hormones are *secreted* by the pituitary gland. By means of various crude or refined physico-chemical manipulations many extracts differing in their physiological or pharmacological effects have been obtained. The number of such extracts, however, cannot be taken to correspond to the number of hormones actually elaborated by the pituitary body, and indeed many of the pituitary-gland products have not yet been shown to be true pituitary-gland hormones, that is, secreted into the body fluids by this gland in health or disease. It is now recognised that the application of various physical and chemical processes to the isolated pituitary may give rise to the development of specific chemical entities which are not secreted as such by the gland *in situ*.

At the present time the controlling hormones which appear to emanate from the anterior lobe of the pituitary include a growth hormone, a gonadotrophic hormone, a thyrotrophic hormone, a lactogenic hormone and a suprarenal-cortical-stimulating hormone. In addition to these there are factors affecting the carbohydrate metabolism and the functioning of other glands such as the parathyroid and the thymus. None of these substances has been isolated and their existence as definite chemical entities is open to doubt. The properties of the active extracts so far prepared suggest that either the true hormones are protein-like, or that they are closely associated with protein-like substances. Some investigators believe that they may in part be cleavage products of one or more larger molecules.

Much has been written concerning "anti-hormones," substances which are said to be secreted in the body in response to repeated injections of preparations of pituitary hormones. It has been found, for example, that gonadotrophic, thyrotrophic and growth-stimulating extracts, among others, all cause the production of substances which circulate in the blood and antagonise the effects of pituitary extracts. With the gonadotrophic extracts equally good evidence has been produced to show that such substances are not found in response to gonadotrophic hormones secreted by the intact gland.

The least encouraging aspect of the situation to-day is the clinical application of the experimental findings in the pituitary field. These findings have improved the diagnosis of pituitary disorders in man, but have added little to their control. This may be due in part to the complexity of the pituitary hormone relationships, and in part to the relative inactivity of the hormone preparations administered orally. Greater success in the therapeutic field is dependent upon the greater production of purer preparations for parenteral administration.

The following are some of the physiological effects that have been ascribed to anterior lobe extracts, determined in many instances by the response of normal as well as of hypophysectomised animals: (1) A specific stimulus to general bodily growth. (2) A thyrotrophic action, illustrated by (i) the restoration to normal of the atrophic thyroid of the hypophysectomised animal; (ii) the production of hyperplasia in the thyroid of a normal animal; (iii) the increase in metabolism of the hypophysectomised or normal animal. (3) A gonadotrophic effect shown by the acceleration in the rate of development of the gonads of either sex, as seen for example in immature rats treated with potent extracts. (4) An adrenotrophic or corticotrophic effect demonstrated by the restoration of the suprarenal cortex to normal in the hypophysectomised rat, or a cortical hypertrophy in immature animals treated under well-controlled conditions. (5) A mammary secretagogue action or prolactin effect, best demonstrated by the stimulation of the crop gland in the immature dove or pigeon. (6) A diabetogenic action, shown by the production in dogs of a state quite comparable to pancreatic diabetes, in which there is hyperglycaemia, glycosuria, ketosis and an increased nitrogen elimination in the urine. (7) A ketogenic effect, best demonstrated by the production of ketonaemia and ketonuria in the fasted male rat. (8) An increase in liver fat. (9) A decrease in blood lipoids. (10) An increased secretion of insulin (pancreatrophic effect). (11) Lowering of the respiratory quotient. (12) Increase in metabolism in the thyroidectomised animal. (13) Inhibition of insulin hypoglycaemia (contra-insulin effect). (14) Inhibition of adrenaeline hyperglycaemia. (15) Retention and increase of the carbohydrate stores (glycostatic and glycotrophic effects). (16) Chromatophore and erythrocyte expanding effect (melanophore hormone and intermedin of Zondek, probably produced entirely in the *pars intermedia*).

The number of apparent specific physiological effects of anterior lobe preparations is remarkable, but in view of the fact that there are only three different cell types in the gland, it is highly improbable that the number of individual hormone substances elaborated by the normal functioning gland can greatly exceed the number of cell types. It is suggested that some if not all of the active principles of the anterior lobe exist as prosthetic groups in a very few individual protein substances. The process of secretion from the normal intact gland could then consist in either the liberation of massive protein molecules, each containing active groups of specific hormone nature, or the liberation of the active groups themselves from mother molecules by enzymatic or other action. Until such time as anterior lobe hormones can be identified in and separated from the circulating blood, the true nature of anterior lobe secretion cannot be determined.—J. B. Collip, *Edinb. med. J.*, 1938, 783.

Anti-hormones. If the thyrotrophic hormone is injected into an animal, the basal metabolic rate rises, stays up for some days, then falls, and however much is then given no further rise occurs. The falling-off in action is due to the secretion of an anti-thyrotrophic hormone. Similar anti-hormones have so far been prepared also for the gonadotrophic, ketogenic and growth fractions.—E. C. Dodds and R. L. Noble, *Brit. med. J.*, ii/1936, 824. (*See also under Thyroid.*)

An antidiabetogenic effect of a primary alcoholic extract of pituitary tissue administered orally.—J. B. Collip, *Canad. med. Ass. J.*, i/1940, 109.

Active Principles of the Anterior Lobe.

The Growth Hormone. *Syn.* PHYONE. It is now well known that removal of the pituitary gland from young and growing animals markedly inhibits growth. Injection into such animals of preparations of the so-called "growth hormone" causes a resumption of growth. Furthermore, in view of the fact that over-secretion of the anterior lobe of the pituitary in man before completion of growth produces gigantism, or after completion produces acromegaly, it is to be expected that growth at a faster rate and beyond the normal could be brought about by administration of pituitary. In certain animals both of these expectations have been realised. The pituitary in fact, among the endocrine glands, is the most important regulator of growth, but whether this action is due to a

specific growth-promoting hormone is not yet known. It has been suggested that the action is due to the lactogenic hormone, and again to the combined action of the lactogenic and thyrotrophic hormones, but it is significant that although hypophysectomised rats are very sensitive towards the growth-promoting extracts of the pituitary gland, no investigator has yet succeeded in causing such animals to grow by administering either lactogenic hormone or thyrotrophic hormone, or a combination of the two. The maximum effect on the growth of dwarfed mice has been obtained by administering a growth-promoting extract ("Phyone") which was only partially purified and contained lactogenic, thyrotrophic and gonadotrophic hormones. Some authors have reported success in extracting from the anterior lobe of the pituitary, a growth-promoting principle free from gonadotrophic and lactogenic hormones.

A method of preparing a potent, non-irritating phyone extract suitable for clinical use.—H. B. Van Dyke and Z. Wallen-Lawrence, *J. Pharmacol.*, Dec., 1930, 413.

Treatment of endocrine dwarfism with growth hormone from the anterior pituitary gland.—W. Englebach and R. L. Schaefer, *Endocrinology*, 1934, 18, 387.

The growth hormone of the anterior pituitary.—H. M. Evans, *J. Amer. med. Ass.*, 1/1935, 1232.

Growth factor of the anterior hypophysis.—*Lancet*, 1/1935, 505.

There exist in the pituitary, not only the somatotrophic growth hormone discovered by Evans, but also other growth-controlling substances, namely, in the anterior lobe a growth-stimulating, and in the posterior lobe a growth-inhibiting substance. It is suggested that the latter be named "amicine." The growth-stimulating substance accelerated the growth of normal young animals compared with controls under the same conditions. The growth-inhibiting substance from the posterior lobe antagonised this effect, and two or three months later the treated animals were only slightly heavier than the controls, and were also quite normal. The substances were extracted by acetone.—B. Lustig and H. K. Wachtel, *Nature, Lond.*, 1939, 602.

[P1-57] Antuitrin "Growth" (*Parke, Davis, London*). Preparation of the growth hormone obtained from anterior pituitary, standardised to contain 10 rat-units per ml. *Dose*.—Single doses of 2 to 5 ml. hypodermically, the weekly dosage varying from 6 to 10 ml.

[P1-57] Krescone (*Paines & Byrne, London*). 1 ml. ampoules containing the growth hormone from 2 g. of fresh anterior pituitary. *Dose*.—1 ml. every other day, alternated with 1 ml. of anterior pituitary extract.

The Gonadotrophic Hormone. Anterior pituitary secretion is necessary to the normal functioning of the gonads of all classes of vertebrates. Removal of the pituitary body is followed by the cessation of the oestrus cycle in the female animal, and diminution in size of the external genitals of the male; in course of time the secondary sexual characters atrophy completely in both male and female. This can be treated by implantation of anterior lobe in the hypophysectomised animal or, alternatively, by injecting suitable extracts of the anterior lobe. Many attempts have been made to separate the gonadotrophic principle, and although partial purification has apparently been achieved, it is not yet possible to enumerate satisfactorily the different fractions of this principle. Evidence points to the presence of two gonadotrophic hormones, one facilitating follicle-growth and maturation (follicle-stimulating hormone or prolan A), the other promoting the conversion of the

cells of the membrana granulosa and theca into lutein cells (luteinizing hormone or prolán B). Both hormones are said to be necessary to produce ovulation. There is evidence also that these two hormones have an action on the male sex organs, the follicle-stimulating hormone maintaining spermatogenesis in the testis, whereas the luteinizing hormone acts upon the testicular interstitial cells, causing them to secrete the male sex hormone.

Separation of the two constituents (prolán A and B) has recently been attained. In the male infant animal, prolán A is apparently without effect, but prolán B has a strong stimulant effect on the development of the penis, the descent of the testes and on the seminal vesicles.—*Brit. med. J.*, i/1935, 426.

The gonadotrophic hormone is very similar to the thyrotrophic in many ways. Potent extracts may be prepared in exactly the same manner, but to obtain a product high in gonadotrophic activity and relatively low in thyrotrophic substance, one uses sheep anterior lobes, whereas cattle pituitaries serve best for the preparation of thyrotrophic extracts. The stability of the gonadotrophic hormone to heat and varying pH are in general of the same order as for the thyrotrophic hormone.—J. B. Collip, *Edinb. med. J.*, 1938, 791.

Gonadotrophic Factors from other Sources. Gonadotrophic substances similar to the principle obtained from the anterior lobe of the pituitary gland are also derived from sources other than the pituitary, and have been termed anterior-pituitary-like hormones. Perhaps the most important are those obtained from the blood serum of pregnant animals and the placenta and urine of pregnant women. These hormones are not secreted by the anterior lobe of the pituitary, but probably originate in the epithelial cells of the chorion, and their effects differ in one or more ways from those of gonadotrophic hormones secreted by or extracted from the anterior lobe.

The Gonadotrophic Factor from Human Pregnancy Urine. Human pregnancy urine contains a gonadotrophic substance whose action in the main is luteinising, although it also contains an interstitial-cell-stimulating factor. Most recent observations support the view that this substance, which is commonly referred to as prolán, is secreted by the chorionic cells of the placenta. The best commercial source is still the urine of pregnant women, the largest amounts being secreted in the first months of pregnancy, especially about 50th to 60th day following the last menstrual period, when an enormous secretion is observed. It is in addition, widely distributed throughout the tissues and body fluids of the mother. Following placental death, abortion or normal delivery, the amount of prolán in the urine diminishes rapidly, and may disappear in less than a week after pregnancy. Many investigators consider prolán to be a mixture of the two gonadotrophic hormones, prolán A and prolán B.

The International Unit for the gonadotrophic substance of human urine of pregnancy (chorionic gonadotrophin) has been defined as the specific gonadotrophic activity of 0.1 mg. of a standard international preparation which is dispensed in tablets, each containing approximately 100 international units. The standard substance has an activity similar to that required under

the conditions used by many workers to cause cornification of the vaginal epithelium of the immature rat.

The Gonadotrophic Factor from the Blood-Serum of Pregnant Mares differs in several respects from that of human pregnancy urine. Considerable quantities are present in the serum only during a limited part of the gestation period, approximately between the 40th to the 80th day. It is not excreted in significant amounts in the urine even at times when its concentration is highest in the serum, and as might be inferred, it is only slowly metabolised, so that the administration of a single dose, during a period of several days, may be as effective as repeated doses. The hormone which is secreted by the endometrium, as well as by the chorionic epithelium, is far more complete in its gonadotrophic effects than is that obtained from pregnancy urine. Whereas the latter is chiefly a hormone facilitating the growth and function of lutein tissue in the ovary or of the interstitial cells of the testis, the gonadotrophic principle of pregnant-mare serum resembles anterior pituitary gonadotrophic principles in respect of the adequacy and completeness of its effects. The chorionic-endometrial hormone of the pregnant mare can maintain the gonads of male and female animals from which the pituitary gland has been removed, and therefore affects the follicles, corpora lutea, and interstitial tissue of the ovary, or the interstitial cells and germinal epithelium of the testis. This hormone appears to have much greater promise as a therapeutic agent than that of pregnancy urine, both because its gonadotrophic effects are more nearly complete, and because it is remarkably slowly metabolised, apparently not being excreted but only undergoing a slow destruction.

The International Unit for the gonadotrophic substance of pregnant mares' serum has been defined as the specific gonadotrophic activity contained in 0.25 mg. of the standard preparation which is dispensed in tablets, each containing 100 international units.

Uses of the Gonadotrophic Factors. Most of the early clinical work on the gonadotrophic factors was conducted with extracts prepared from human pregnancy urine. It was assumed that these represented the whole of the gonadotrophic principle of the anterior pituitary, but their therapeutic effectiveness in the female was subsequently found to be limited to their action on the second phase of the menstrual cycle, *i.e.*, to their luteinising action, and in the male to the development of the connective tissue elements of the testis and the structures associated with its natural descent into the scrotum. Their main indications therefore are in threatened or habitual abortion and in the treatment of undescended testis, in both of which conditions they are reported to have given good results.

More recent work, conducted with the factor obtained from pregnant mares' serum, indicates that this has a more complete

gonadotrophic action than the factor from human pregnancy urine. In the female it exerts a follicle-stimulating action, and in the male it controls spermatogenesis and the development of testicular tissues. It therefore has a wider range of indications than the factor obtained from human pregnancy urine; these indications include sterility in the male, when due to azoospermia, and in the female, when due to ovarian insufficiency; amenorrhœa, due to insufficient ovarian stimulation; cryptorchidism; and pituitary infantilism.

TEST FOR PREGNANCY. The presence of the gonadotrophic substance in urine is used as the basis of the well-known Aschheim-Zondek test for pregnancy. The urine is injected in a dose of 0.2 to 0.4 ml. into immature female mice twice daily for three days. The mice are then killed and their ovaries examined for the presence of blood-filled follicles and corpora lutea. If they are present, the woman from whom the urine was obtained is pregnant.

ABORTION. In habitual abortion, 100 rat units twice weekly from second to fifth month of pregnancy.—A. Bourne, *Practitioner*, ii/1933; also L. Williams, *Lancet*, ii/1935, 796.

In seventeen pregnancies under urinary prolan, in women who previously had had fifty-one successive pregnancies ending in abortion, stillbirth, or early neonatal death, fifteen ended in the birth of a surviving child—i.e., a 100% failure was transformed into an 88.2% success. There is evidence that vitamin E plays a part in the prolan-progesterone mechanism of pregnancy.—James Young, *Brit. med. J.*, i/1937, 953.

CRYPTORCHIDISM. Treatment with gonadotrophic extract of anterior lobe of pituitary glands caused descent of the testes in 12 out of 17 cryptorchid boys.—Werner and co-workers, *J. Amer. med. Ass.*, i/1936, 1541.

Six injections of Pregnyl to enlarge the testis are recommended before operation and 12 injections to prevent atrophy after operation.—E. McLellan, *Lancet*, i/1936, 999.

Spontaneous descent occurs by the seventeenth year in 87% of cases, and treatment with gonadotrophic hormone should be withheld until after the age of 16.—P. Williams, *Lancet*, i/1936, 426.

Successful results obtained by doses of 500 rat units of hormone intramuscularly twice weekly; an account of 33 cases; period of treatment ranged from two weeks to 14½ months.—Spence and Scowen, *Lancet*, ii/1935, 1335; see also *Proc. R. Soc. Med.*, 1935, 427.

18 boys aged from 1½ to 17 years were treated with injections of anterior pituitary-like hormone, the dose usually given being 200 rat units three times a week. Descent occurred in 4 within one month, in all of which the testis was in the inguinal canal before treatment. In 1 the testis returned to the inguinal canal on cessation of treatment. In the remainder treatment failed even when continued for an average of 5 months. At subsequent operation in 7 cases, anatomical factors preventing descent were found, but the treatment was considered to have made operative procedures less difficult.—W. O. Thompson *et al.*, *Endocrinology*, 1937, 220. See also A. J. Cramer, *ibid.*, 230.

The effect of the anterior pituitary-like principle from the urine of pregnant women in the treatment of undescended testes appears to be exaggerated. With 38 patients of all ages descent was produced in only 10 of 50 undescended testes, or in 20% compared with an average of 61% of successful results reported in the literature. In the majority of cases of true undescended testes operative procedures are still necessary because of mechanical factors which prevent descent. It is possible that this material causes descent only of those testes which would descend without treatment about the time of puberty.—W. O. Thompson and N. J. Heckel, *J. Amer. med. Ass.*, i/1939, 397.

STERILITY. Two cases of sterility in males in which spermatogenesis followed administration of gonadotrophic hormone from pregnancy urine. Dose.—100 rat units weekly.—V. E. Lloyd, *Lancet*, i/1936, 474.

PREPARATIONS OF GONADOTROPHIC FACTORS

From Pituitary.

[P1-57] **Ambinon A** (*Organon Laboratories, London*). 1 ml. ampoules of Ambinon solution equivalent to 100 to 300 guinea-pig units of thyrotrophic hormone and 50 rat units of pituitary gonadotrophic hormone, packed with ampoules containing 100 i.u. of Pregnyl powder, the latter to be dissolved in the former just before administration. **Ambinon B** consists of 1 ml. ampoules of Ambinon solution alone.

[P1-57] **Glanduantin** (*Richter, London*). Dry ampoules, with ampoules of solvent, containing 100 rat units of the gonadotrophic fraction of the anterior pituitary.

[P1-57] **Gonadotraphon** (*Paines & Byrne, London*). Dry ampoules containing 100 or 500 rat units of the gonadotrophic hormone from the anterior pituitary. Tablets containing 100 or 200 rat units and capsules containing 500 rat units are also available.

From Pregnancy Urine.

Antoxylin S (*Oxo, London*). Dry ampoules, with ampoules of saline, each containing 100 or 500 rat units of anterior pituitary-like hormone from pregnancy urine.

Antutrin S (*Parke, Davis, London*). *Syn.* ANTROIDIN. 10 ml. vials containing 100 rat units per ml., and 5 ml. vials containing 500 rat units of anterior pituitary-like hormone from pregnancy urine.

Atregone (*Abbott Laboratories, London*). Anterior pituitary-like chorionic gonadotrophic hormone from human pregnancy urine, standardised to contain 166 i.u. in each ampoule.

Gonadotraphon S (*Paines & Byrne, London*). Dry ampoules, with ampoules of solvent, containing 100 or 500 rat units of anterior pituitary-like hormone from pregnancy urine.

Gonan (*British Drug Houses, London*). Dry ampoules, with ampoules of solvent, containing 100 or 500 i.u. of anterior pituitary-like hormone from pregnancy urine.

Physostab (*Boots, Nottingham*). Dry ampoules, with ampoules of solvent, containing 100 mouse units of anterior pituitary-like hormone from pregnancy urine.

Pregnyl (*Organon Laboratories, London*). Dry ampoules, with ampoules of solvent, containing 30, 100, 500 and 1500 i.u. of anterior pituitary-like hormone from pregnancy urine. Also available in tablets containing 100 or 500 i.u.

Prolan (*Bayer Products, London*). Dry ampoules, with ampoules of solvent, containing 100, 500 or 2000 i.u. of anterior pituitary-like hormone from pregnancy urine.

From Pregnant Mares' Serum.

Antostab (*Boots, Nottingham*). Dry ampoules, with ampoules of solvent, each containing 100 mouse units (equivalent to 200 rat units) of gonadotrophic hormone from pregnant mares' serum.

Gestyl (*Organon Laboratories, London*). Dry ampoules, with ampoules of solvent, each containing 40 "double ovarian weight rat units" of gonadotrophic hormone from pregnant mares' serum.

Gonadyl (*Roussel Laboratories, London*). Dry ampoules, with ampoules of solvent, each containing 40 Evans units (about 400 mouse units of follicular maturation) of gonadotrophic hormone from pregnant mares' serum.

Luteoantin (*Richter, London*). Dry ampoules, with ampoules of solvent, each containing 100 or 400 rat units of gonadotrophic hormone from pregnant mares' serum.

Serogan (*British Drug Houses, London*). Dry ampoules, with ampoules of solvent, each containing 200 or 1000 rat units of gonadotrophic hormone from pregnant mares' serum.

The Thyrotrophic Hormone. One of the impressive effects of removal of the pituitary body in animals is a marked fall of the

rate at which heat is produced. This change is due principally to inadequate functioning of the thyroid gland, and can be correlated with morphological changes in the thyroid, undischarged colloid accumulating in vesicles lined by flat "inactive" epithelial cells. A specific substance called the thyrotrophic hormone is secreted only by the anterior lobe of the pituitary. It is responsible for the maintenance of the normal thyroid function, and may be important in disorders attributed to deficient or excessive thyroid secretion. Removal of the thyroid gland from animals causes enlargement of the anterior lobe of the pituitary, and it is found that persons with large parenchymatous goitres have enlarged anterior pituitaries. The most significant action of the thyrotrophic hormone is to facilitate or promote the discharge of thyroid hormone from the thyroid gland. This has led to efforts to attribute deficiency or hyperfunction of the thyroid in man to a deficient or abnormally rapid rate of secretion of thyrotrophic hormone. The hyperthyroidism associated with acromegaly probably is the result of the secretion of excessive amounts of thyrotrophic hormone. On the other hand, thyroid deficiency in man less often seems to depend upon a disturbance of the anterior pituitary, and the clinical value of the thyrotrophic hormone in thyroid disorders is still *sub judice*.

The unit is defined as the daily dose, administered for five days, which causes the thyroid lobes of female guinea-pigs approximately to double their size.

Thyrotrophic hormone prepared from the anterior pituitary gland of the pig raised the metabolic rate in man in health and in cases of pituitary insufficiency, but was without effect in myxoedema.—E. F. Scowen, *Lancet*, ii/1937, 799.

The hormone is ineffective when administered orally, and is completely inactivated in the test-tube by pepsin and trypsin. The possible relationship between clinical hyperthyroidism and alterations in the secretory activity of the anterior lobe as regards the thyrotrophic hormone is still speculative. Recent work seems to indicate that in exophthalmic goitre the level of thyrotrophic hormone is decreased, whereas in myxoedema it is raised. The responsiveness of the patient's thyroid to injected thyrotrophic hormone may become a valuable therapeutic test to determine whether a condition of apparent hypothyroidism is of primary anterior lobe or thyroid origin.—J. B. Collip, *Edinb. med. J.*, 1938, 787.

[P1-57] **Thyroantin** (*Richter, London*). Contains the thyrotrophic principle of the anterior pituitary for intramuscular injection; each ampoule contains 100 Junkmann Schoeller units. For hyperthyroidism, low metabolism, obesity.

[P1-57] **Thyrogan** (*British Drug Houses, London*). Dry ampoules, with ampoules of solvent, containing 50 guinea-pig units of the thyrotrophic hormone of the anterior pituitary. *Dose*.—1 ampoule 2 to 3 times weekly by intramuscular injection.

[P1-57] **Thyrotropin** (*Paines & Byrne, London*). Dry ampoules, with ampoules of solvent, containing 100 guinea-pig units of thyrotrophic hormone from the anterior pituitary gland.

The Lactogenic Hormone. The manner in which the anterior pituitary controls the development of the breasts and the secretion of milk is more complex than was at first suspected. The important and probably essential glands of internal secretion are the anterior lobe of the pituitary, the ovaries and the cortex of the suprarenal gland. For the growth and development of the breasts an oestrogen analogous to that obtained from ovarian tissue must be secreted

or injected, but removal of the pituitary gland prevents this development due to œstrogens. A working hypothesis regarding the growth and development of the breasts is as follows: gonadotrophic hormones from the anterior pituitary are essential for the normal secretory activity of the ovaries; ovarian secretions (or placental secretions, or both in pregnant animals) bring about the elaboration of a new anterior pituitary secretion which causes growth and development of the mammary glands. Provided that prelactation development has occurred in the breasts, another anterior pituitary hormone, the lactogenic hormone brings about lactation, but it cannot alone initiate lactation in hypophysectomised animals, the presence of the suprarenal cortical hormone or the suprarenal-cortical-stimulating hormone from the pituitary gland being apparently necessary. It is probable that the maintenance of lactation depends upon additional hormones, including those responsible for the continued development of the breasts.

The lactogenic hormone, for which the names "prolactin" and "galactin" have been suggested, has been isolated as a crystalline substance, which is either a protein or closely related to proteins.

The International Unit for prolactin is defined as the specific activity (based on the response of the crop-gland of pigeons) contained in 0.1 mg. of the standard preparation which is dispensed in tablets containing 100 international units.

Prolactin has been tried clinically with reported success in women whose supply of milk had failed.—*Prescriber*, 1936, 184.

The clinical use of prolactin.—*Endocrinology*, 1934, 18, 18.

In a controlled clinical experiment in which one group of nursing mothers was given a daily injection of 1000 pigeon units (Riddle) of lactogenic hormone and another a daily injection containing no hormone, the group receiving prolactin showed no significant increase of milk secretion over the control group.—H. L. Stewart and J. P. Pratt, *Endocrinology*, 1939, 25, 347.

Of 43 women with deficient milk secretion in the first 8 weeks of lactation satisfactory nursing was induced in three-quarters with prolactin.—M. Kenny and E. King, *Lancet*, ii/1939, 828.

Physolactin (*Glaxo Laboratories, London*). Preparation of prolactin, the lactogenic hormone of the anterior pituitary, available in 15 ml. bottles, containing per ml. not less than 60 Riddle-Bates units of activity. Used to stimulate the flow of breast milk in cases of failure of lactation, or deficient secretion. The preparation is given by deep subcutaneous injection into the thigh, the dosage being 5, 5, 2, 2 and 1 ml. on successive days. The effect is usually apparent within 24 to 36 hours of treatment. The product has been used successfully up to the sixth week after parturition.

The Diabetogenic Factor. The anterior lobe appears to be the principal division of the pituitary gland concerned in the metabolism of carbohydrates. After removal of the pituitary body the concentration of sugar in the blood may be normal or reduced, sometimes markedly, and usually starvation promptly causes hypoglycemia, which may be so severe as to cause convulsions. These effects result from the absence of a diabetogenic hormone, secreted by the anterior pituitary, which may be viewed as an antagonist of insulin, although there is evidence that the antagonism is indirect and depends upon the support of adequate suprarenal function. The diabetogenic hormone probably prevents the prodigal waste of important carbohydrate reserves which, for

example, are maintained in spite of fasting, and which in a body rendered more sensitive to insulin by removal of the pituitary gland are used up at an abnormally high rate. If the pancreas is removed from an animal the secretion of the anterior lobe of the pituitary is not antagonised by insulin, and may be regarded as an important contribution to changes which threaten life, e.g., the accumulation of acetone bodies. If, however, both glands are removed, the important means of regulating carbohydrate metabolism are lost. A unique derangement of metabolism appears and, depending upon conditions such as the nutritional state before operation, the animal resembles sometimes the diabetic animal and sometimes the animal with pituitary deficiency.

It has also been shown that it is possible to produce an extract which when injected on a number of occasions into intact dogs, will cause a permanent condition of diabetes mellitus. This important observation indicates for the first time the production of diabetes by the injection of an extract of normal tissue. The islets of Langerhans are no longer to be seen in the pancreas of these animals, and the diabetes is characterised by a severe glycosuria, relative resistance to insulin and the absence of ketonuria.

The daily administration of a crude anterior-lobe extract to normal rats for two weeks leads to a rise of the insulin content of the pancreas to nearly twice the normal value. The evidence available permits the assumption that the anterior lobe of the pituitary contains a "pancreatotropic" or "insulin-increasing" substance which is not identical with either the diabetogenic or the growth-promoting principle, but at the present stage it cannot be assumed that the substance is a hormone.—H. P. Marks and F. G. Young, *Lancet*, i/1940, 493.

Diabetogenic effect. Some points in connection with this factor are worthy of special note: (1) Preparation and conservation of the extract at low temperature are essential. (2) Individuals of certain species (mouse, rat, and guinea-pig) are almost completely insensitive to diabetogenic extracts effective in dogs. (3) The dog is the best animal in which to demonstrate the effect, but some rabbits and cats respond (25 to 50%). The true diabetogenic activity of extracts should be clearly differentiated from simple hyperglycemic responses occurring within a few hours of the injection of the extract.—J. B. Collip, *Edinb. med. J.*, 1938, 795.

As the result of the daily administration of anterior pituitary extract, two dogs became diabetic and remained so after injections were stopped. The permanent diabetes produced differed from that of depancreatized dogs in that the pituitary dogs appeared to be able to survive without insulin, retaining good vigour, and, in one case, without loss of weight.—F. G. Young, *Lancet*, ii/1937, 372.

The Suprarenal-Cortical-Stimulating Factor. Another of the earliest signs of removal of the pituitary body is a very rapid diminution in the size of the suprarenal gland, which is due almost entirely to atrophy of the cortex, the medulla being affected scarcely at all. There is a corresponding loss of activity on the part of the cortex. In some species, particularly birds, the interference with the cortical function is so severe as to cause death. In the duck, for example, it is necessary to inject cortin in order to maintain life after hypophysectomy. The administration of a suitable extract of the anterior pituitary not only restores the cortical function, but may cause enlargement of the cortex so that

the suprarenal glands become larger than any ever encountered in normal animals. The physiological interrelationships of the suprarenal cortex and the anterior lobe of the pituitary are important and numerous but they have been exploited only imperfectly. The suprarenal-cortical-stimulating hormone, for which the terms "adrenotrophic" and "corticotrophic" have been suggested, is probably secreted at an increased rate if there is a cortical deficiency, whereas a change in the opposite direction takes place if abnormally large amounts of suprarenal cortical hormone are present in body fluids. Little is known of the chemistry of this hormone, and the methods proposed for its assay have received no careful quantitative study.

This hormone is present in the primary aqueous extract made at pH 5 from the anterior lobes of cattle, pig, or sheep. Most satisfactory results are obtained by using acetone-defatted and dehydrated desiccated anterior lobes and pre-treating them with several volumes of dilute aqueous alkali at pH 10 for 2 to 4 hours at room temperature, thus destroying in part some of the contaminating posterior lobe principles, and probably by hydrolytic action allowing of better extraction of the active principles subsequently, at pH 5. The filtrate obtained at this pH contains practically all of the thyrotrophic and gonadotrophic hormones. It contains some adrenotrophic hormone, but the iso-electrically precipitated protein and glandular residue contain many times as much of this hormone. It is possible that the adrenotrophic hormone exists in two forms, one present in a readily extractable form, the other firmly attached to protein which can only be extracted in a much more acid medium. It has been found that 80% ethyl alcohol, or 70% acetone at a pH of about 2.5, are the most satisfactory solvents to use at this stage to obtain maximum yields of the protein fraction. The acid-alcohol extract is filtered and the pH adjusted to 7 to 8. The precipitated proteins represent the major part of the growth and adrenotrophic hormones contained in the original tissue. The adrenotrophic substance is the most resistant to boiling of all the anterior lobe principles. Prolactin activity has been observed after boiling for 10 minutes at pH 3 and at pH 8. Growth activity is entirely lost in most cases after 10 minutes' heating at pH 2.—J. B. Collip, *Edinb. med. J.*, 1938, 792.

A principle has been demonstrated in primary extracts of pituitary glands which has a trophic effect upon the so-called "dark cells" of the adrenal medulla of hypophysectomised rats. The principle is active by the mouth.—J. B. Collip, *Canad. med. Ass. J.*, 1940, 2.

(For details of biological tests for the anterior pituitary hormones see Vol. II.)

Dried Pituitary Preparations.

[P1-57] **Pituitary Body, Dried (entire gland)** of the ox.

Dose.—1 to 3 grains (0.06 to 0.2 g.) thrice daily.

Five parts of fresh gland yield about 1 of dried gland.

Uses. Has been employed to improve metabolism, to raise arterial tension, to increase diuretic action and to improve appetite. Given in menstrual disorders and in exophthalmic goitre and with thyroid (*q.v.*) in obesity.

OBESITY. "I have seen too many instances of greater improvement under the combined (oral) administration of pituitary and thyroid extracts than of the latter by itself to attribute them to mere coincidence."—Sir W. Langdon-Brown, *Brit. med. J.*, ii/1936, 984.

[P1-57] **Pituitary (Anterior Lobe) Substance, Dried.**

Dose.—1 to 4 grains (0.06 to 0.25 g.). Much larger doses, up to 60 gr. (4 g.), are often given. 5 parts of fresh substance yield 1 part of dried substance.

Uses. Has been thought to exercise a stimulating action upon growth, but for this purpose it should be replaced by standardised extracts of growth hormone. The anterior lobe has been given in certain types of obesity, also in later stages of acromegaly but not earlier stages; also in bronchial asthma.

[P1-57] **Antuitrin** (*Parke, Davis, London*). 1 ml. ampoules of a solution prepared from the anterior lobe of the pituitary. *Dose*.—1 ml. hypodermically or intravenously, daily.

[P1-57] **Pitexan** (*Paines & Byrne, London*). Standardised preparation of anterior pituitary lobe in capsules. *Dose*.—1 capsule thrice daily before meals, increased to three thrice daily.

[P1-57] **Preloban** (*Bayer Products, London*). Dry ampoules of whole anterior lobe extract, with ampoules of solvent, containing 25 cockerel testicle maturation units. Also available in pellets for oral administration.

[P1-57] Pituitary (Posterior Lobe) Substance, Dried.

Syn. PITUITARIUM POSTERIUS (*U.S.P. XI*).

Dose.—1 to 4 grains (0.06 to 0.25 g.). *U.S.P. X* average dose $\frac{1}{2}$ grain. No dose is given in *U.S.P. XI*. 4.5 parts of the fresh substance yield about 1 of dried substance.

Uses. Has been used in exophthalmic goitre, acromegaly, intestinal paresis, diabetes insipidus, amenorrhœa and enuresis.

DIABETES INSIPIDUS. 7 cases in which nasal administration of powdered posterior lobe controlled the thirst and polyuria, with establishment of "compensation" on the second day. The powder, diluted with lactose, was sniffed up the nose thrice daily, and contained 1000 Vœgtlin units per gramme, the average dose being 15 to 90 units.—*F. Mainzer, Brit. med. J. Epit.*, i/1935, 72.

PEPTIC ULCER. Satisfactory clinical results in 67 out of 76 cases of peptic ulcer treated by intranasal insufflation of posterior pituitary powder, the dosage being approximately $\frac{1}{2}$ gr. given four times daily about 30 minutes after meals and at bedtime. As a rule no symptoms or epigastric tenderness were present after 7 to 21 days of treatment. The improvement was frequently accompanied by a gain in weight, appetite and strength. Should be considered complementary to accepted principles of peptic ulcer management.—*Metz and Lackey, Amer. J. digest. Dis.*, 1940, 27.

[P1-57] **Di-Sipidin** (*Paines & Byrne, London*). Powdered pituitary posterior lobe extract for insufflation. *Dose*.—1 gr. sniffed up the nose 2 or 3 times daily. In diabetes insipidus.

[P1-57] **Veinotrope** (*Continental Laboratories, London*). Mixed gland tablets containing parathyroid, suprarenal, posterior pituitary, ovary or testicular extract, and plant extracts. For varicose veins, hæmorrhoids, venous congestion at the menopause, etc.

Thymus Gland, Desiccated. (1 part = 5 of fresh gland.)

A yellowish amorphous powder, prepared by desiccating the thymus glands, freed from fat, of healthy calves.

Dose.—*B.P.C.* states 2 to 4 grains (0.12 to 0.25 g.); much larger doses have been given.

Until recently the general opinion was against the inclusion of the thymus amongst the endocrine glands. There is no evidence that its removal produces any appreciable result. The work of Hanson (*U.S.A.*) indicates that extracts of thymus may contain a growth-accelerating factor. The clinical use of thymus gland is still purely empirical. The dried gland substance has been given by mouth in defective nutrition of childhood, Graves' disease, hæmophilia, anæmia, leucocythæmia, and rheumatoid arthritis, but evidence of its value in these conditions is lacking.

The absolute weight of the thymus increases rapidly during the first two years of life, changing little till the seventh year, when it again increases, to fall slightly after the eleventh year. Heavier in the male at birth and for the first four years of life, after which the weight is approximately equal in the two sexes until the eleventh year, when it tends to be absolutely heavier in the female.

The Biological Effects of Thymus Extract. Hanson's extract is prepared from thymus glands of 2- to 6-week-old calves by extracting with hot 0.5% hydrochloric acid. 1 ml. of extract equals 0.6 g. of fresh calf thymus. pH is about 5. Golden yellow colour; said to be very stable at room temperature.—L. G. Rountree and J. H. Clarke and A. M. Hanson, *J. Amer. med. Ass.*, ii/1934, 1425.

Of late the claims of the thymus to be regarded as an endocrine structure have been discredited, but now there is a reaction. Hanson's thymus extract has been shown by Rountree and others to accelerate the growth and development of rats and to increase their fertility while hastening the onset of adolescence in the offspring of rats thus treated.—Sir W. Langdon-Brown, *Med. Annu.*, 1936, 459.

The arguments in favour of the presence of an active principle in thymus gland are: (a) Hanson's extract produces acceleration in growth and development which is increased in each succeeding generation; (b) removal of thymus gland from rats results in retardation of growth and development of offspring, even in second generation; (c) this retardation is not apparent in the offspring when the parents have received injections of thymus extract.

For résumé of Hanson's results, see Editorial, *Brit. med. J.*, i/1935, 983.

The thymus gland. A general review.—L. G. Rountree, *J. Amer. med. Ass.*, i/1935, 592.

Thymocrin Solution (*Endocrines-Spicer, Watford*). Solution prepared from thymus for intramuscular injection, 1 ml. representing 20 gr. of fresh gland. In certain dermatoses, especially psoriasis. *Dose*.—1 ml. daily or on alternate days. In chronic psoriasis, 1 ml. is given daily for five days a week, and continued for 12 to 16 weeks.

[P1-57] **Thymophysin** (*Camden Chemical Co., London*). A combination of extracts of the thymus gland and of the posterior lobe of the pituitary gland, containing 10 i.u. per ml., and stated to have a more prolonged action than that of pituitary extract alone.

Pineal Body. Syn. CONARIUM.

A small reddish-grey cone-like structure, situated behind the third ventricle of the brain above the superior corpora quadrigemina. Little is known of the functions of the pineal gland; it is suggested that it may contain a substance which antagonises the action of the anterior lobe of the pituitary.

Pineal extract (Hanson) in rats has retarded the rate of growth and accelerated the rate of differentiation, and has hastened the onset of adolescence in the offspring of treated parents. The end result is "dwarfism" associated with sexual precocity and relative macrogenitalism. The injection of succeeding generations of parent rats has resulted in the amplification of these biologic effects in their young.—L. G. Rountree, J. H. Clarke, A. Steinberg and A. M. Hanson, *J. Amer. med. Ass.*, ii/1935, 373.

An extract of pineal glands neutralises the growth-stimulating effect of pituitary.—P. Engel, *Klin. Wschr.*, 1934, 13, 1248.

The chief activity of the pineal is an antagonodotrophic effect. The substance having this action can be extracted in slightly alkaline aqueous solution.—P. Engel, *Wien. klin. Wschr.*, 1935, 481.

The injection of preparations of from 1 to 4 beef pineal glands failed to reveal antagonodotrophic activity in infantile female rats, and the injection of preparations of from 4 to 9.5 beef pineals failed to reveal oestrogenic activity in adult spayed rats.—N. J. Wade, *Endocrinology*, 1937, 681.

Epiphysan (*Richter, London*). Ampoules containing 0.5 g. of fresh pineal gland in 5 ml. *Dose*.—2 to 3 ampoules weekly. Hypersexual conditions.

PIX LIQUIDA

B.P.

Syn. TAR, PIX PINI (U.S.P. XI), PIX ABIETINARUM (P. Helv. V),
GOUDRON VÉGÉTAL (Fr. Cx.).

Dose.—2 to 10 grains (0.12 to 0.6 g.) in a pill with lycopodium, or in perles (2½ grains each).

Is known in commerce as Stockholm tar and is obtained by the distillation of the wood of various species of *Pinus* (Pinaceæ).

Soluble in alcohol 90%, ether, chloroform, and fixed and volatile oils.

Uses. Internally, wood tar is employed only as an expectorant in chronic bronchitis, usually in the form of a syrup. Externally, it is employed in the form of ointments or lotions in the treatment of chronic skin diseases.

Aqua Picis (P. Ned. V). *Syn.* AQUA PICEA, EAU DE GOUDRON. 5% by mixing with pumice. P. Helv. V prepares by heating water with tar 5% and sodium bicarbonate 3%.

Liquor Picis Lignl. Tar 5, powdered quillaia 10, alcohol 90% to 100. Prepare a tincture of quillaia by percolation and macerate the tar in the tincture for two days at 50°. Cool, filter and make up to 100.

Pilula Picis Liquidæ. *Dose.*—1 to 5 grains (0.06 to 0.3 g.). Tar 1, soap 1, compound tragacanth powder ½, powdered liquorice 2½. Useful for coughs and for hæmorrhoids—best freshly made.

Syrupus Picis Liquidæ (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Tar 0.5% w/v with alcohol 90%, sucrose and water.

[P1] *Sirupus Picis cum Codeino* (P. Helv. V).

Dose.—½ to 2 drachms (2 to 8 ml.). Codeine 1, tar water 100, glycerin 50, alcohol 95% 10, syrup 839.

Unguentum Picis Liquidæ (B.P.C.).

Contains 70% of tar in a basis of beeswax and lard. Useful in psoriasis and chronic dry eczema.

Unguentum Picis Compositum (P. Ned. V). *Syn.* RINGWORM OINTMENT. Heat together water 20, tar 16, resin 4, and add with stirring starch 16 mixed with water 30, then Venice turpentine 4, acetic acid 30% 8, and water to 100.

Unguentum Picis Pini (U.S.P. XI).

Pine tar 50, yellow wax 15, petroleum 35.

Oleum Picis (B.P.C.).

Dose.—1 to 5 minims (0.06 to 0.3 ml.).

A reddish-brown empyreumatic oil obtained by the distillation of tar from various species of *Pinus*. On distillation it yields **light oil of tar** or **spirit of tar**, a colourless or pale yellow oil, free from empyreumatic odour. The residue on distillation yields rectified oil of tar (*Oleum Picis Rectificatum*), a light yellow oil, darkening on keeping and having an odour similar to that of the original oil.

Uses. Rectified oil of tar is deodorant, antiseptic and parasiticide. It has been employed internally as an intestinal antiseptic, and in the form of an inhalation in hot water for chronic catarrh. Externally it is used in the treatment of eczema and other skin affections.

Oleum Picis Rectificatum (U.S.P. XI) is the volatile oil from pine tar rectified by steam distillation. *Average dose.*—3 minims.

Syrupus Picis Pini (U.S.P. XI). *Average dose.*—2½ drachms (10 ml.). Mix rectified oil of tar 1 with water 450 and shake 15 minutes. Set aside 24 hours, filter and dissolve sugar 850 in the filtrate and make up to 1000. [P1] to 1 gr. of apomorphine hydrochloride may also be added to each dose. Useful in chronic bronchitis and winter cough.

Ether-Soluble Tar Paste (Martindale, London). *Syn.* E.S.T.P. An ointment prepared by distilling tar in steam and incorporating the ether-soluble distillate in a zinc and lanolin basis. For infantile eczema, chronic eczema with lichenification, lichen simplex chronicus (Widal) and pruritus ani.

Tar Dermament (Parke, Davis, London). A combination of alcohol-soluble phenolic resin with 6% of washed crude coal-tar in the form of a paint for the treatment of skin diseases and to relieve the itching of neuro-dermatitis.

Taroxide (Abbott Laboratories, London). Ether-soluble coal-tar distillate 1.5%, powdered zinc oxide 10%, starch 25%, petrolatum 58.5%. Also available containing 5% of coal-tar distillate. Moist eczema.

Pix Burgundica (B.P.C.). *Syn.* BURGUNDY PITCH (a misnomer, as it comes from Finland and the Black Forest).

The exudate from *Picea excelsa* (Pinaceæ), occurring as a reddish or yellowish-brown mass. Is a mild counter-irritant, and is used in the manufacture of plasters.

Emplastrum Picis (B.P.C.). *Syn.* POOR MAN'S PLASTER. Contains about 50% of Burgundy pitch, with olibanum, colophony, yellow beeswax, olive oil and water.

Pix Carbonis (B.P.C.). *Syn.* COAL TAR, PIX LITHANTHRACIS (P. Helv. V), OLEUM LITHANTHRACIS, GOUDRON DE HOUILLE (Fr. Cx.).

The chief constituents of coal tar are benzene, C_6H_6 , and its homologues, isolated by fractional distillation from the light oil (b.p. below 170°); phenol, cresols and naphthalene, $C_{10}H_8$, from the middle (or carbolic) oil (b.p. 170° to 230°); cresols and their homologues from the heavy oil (b.p. 230° to 270°); anthracene, $C_{14}H_{10}$, from the green oil (b.p., 270° to 400°); the residue is pitch. The tar also contains small quantities of basic compounds such as aniline, pyridine, acridine, carbasole, etc., and sulphur compounds such as thiophene, C_4H_4S .

Uses. Coal tar is used for application to the skin in psoriasis, eczema and other skin affections. The liquor is used in lotions and ointments.

Pix Carbonis Præparata (B.P.).

Commercial coal tar heated at 50° for one hour.

Soluble almost entirely in chloroform and benzene; partly soluble in alcohol 90%; almost insoluble in water.

Uses. Infantile eczema has been well treated by purified coal tar and zinc oxide of each 2 parts, corn starch and soft paraffin of each 16 parts. In obstinate cases a tar paint (crude coal tar 1 oz., collodion 1 oz., acetone 1 oz.) may be used. Applied with brush, repeated every two or three days.

Balneum Picis Carbonis. *Syn.* BALNEUM BITUMINIS (L.H.).

Solution of coal tar 8 oz., water at $95^\circ F$. 30 gallons.

Collyrium Picis Carbonis (B.P.C.). Solution of coal tar 0.6% *v/v*.

Liquor Picis Carbonis (B.P.).

A solution made by macerating prepared coal tar 20% and quillaia 10% in 90% alcohol or industrial methylated spirit for seven days and filtering. The quillaia enables the solution to form an emulsion with water.

Lotio Picis Carbonis Aromatica.

Coal tar 3 oz., ether 2 oz., alcohol 90% 1 oz. Dissolve, filter and add balsam of Peru 6 dr., salicylic acid $1\frac{1}{2}$ dr.

Lotio Picis Carbonis Alkalina (B.P.C.). Solution of coal tar about 1 in 50, with sodium bicarbonate in water.

Lot. Picis Alk. (N.I.F.). Methylated solution of coal tar 1 dr., sodium bicarbonate 30 gr., water to 8 oz.

Lotio Picis Carbonis et Plumbi (B.P.C.). Solution of coal tar about 1 in 50 and strong solution of lead subacetate about 1 in 30 in water.

Pasta Picis Carbonis (B.P.C.). Coal tar 15 gr., compound paste of zinc oxide to 1 oz.

Pasta Zinci et Picis Carbonis (C.X.H.). *Syn.* WHITE'S TAR PASTE. Coal tar 30 gr., zinc oxide 30 gr., starch 180 gr., soft paraffin to 1 oz.

This ointment offers excellent results in the treatment of infantile eczema, especially of the face; the ointment is applied as often as is necessary to keep the face covered. It should not be used if pyogenic infection is present.—F. Wise and J. Wolf, *J. Amer. med. Ass.*, ii/1938, 2106; L. W. Hill, *ibid.*, 2113.

Pigmentum Picis Carbonis (St. T. H.). Crude coal tar 10 g., benzene 20 g., acetone 70 g.

[P1] Unguentum Petrolei Compositum cum Acido Salicylico (St. J. H.). Solution of coal tar 1 dr., ammoniated mercury 15 gr., salicylic acid 20 gr. paraffin ointment to 1 oz.

Unguentum Picis Carbonis (B.P.C.).

Solution of coal tar about $6\frac{1}{2}\%$ in yellow soft paraffin.

[P1] Unguentum Picis Carbonis Compositum (B.P.C.).

Solution of coal tar about $6\frac{1}{2}\%$ and ammoniated mercury about 3% in yellow soft paraffin.

Anthrasol (Knoll, London; Savory & Moore, London). An oily, non-staining tar substitute.

Liquor Carbonis Detergens (Wright, Layman & Umney, London).

A preparation of coal tar resembling Liquor Picis Carbonis. Used as a lotion, from 1 dr. to 1 oz. to a pint of distilled water, it forms a yellowish milky emulsion; or, as an ointment, Liquor Carbonis Detergens 1, Unguentum Hydrargyri Nitratis 3, Unguentum Simplex 4. In prurigo and chronic scaly skin diseases.

The following is also useful in eczema: Liquor Carbonis Detergens 2, Liquor Plumbi Subacetatis 2, Zinci Oxidum 4, Glycerinum 4, Aqua 36.

Oleum Cadinum (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.). *Syn.* JUNIPER TAR OIL, OLEUM JUNIPERI PYROLIGNEUM.

A dark reddish-brown or nearly black oily liquid obtained by the distillation of the wood of *Juniperus Oxycedrus* (Pinaceæ). This oil is very variable.

Soluble 1 in 3 of ether, and in chloroform; partly soluble in cold alcohol 90%, almost completely in hot alcohol 90%; very slightly soluble in water.

Uses. Employed in psoriasis, dry eczema and seborrhæic conditions of the scalp. The latter is well treated with soap and water followed by a salicylic lotion, and by oil of cade 1 in 5 of olive oil, gradually increasing the strength till the pure oil is used.

Oleum Cadini Aceticum.

Acetic acid 1, cade oil 10. This and the oil itself are used for alopecia.

Unguentum Olei Cadini (B.P.C.).

Oil of cade 25% in beeswax and yellow soft paraffin.

Unguentum Olei Cadini et Sulphuris.

Oil of cade 10, sulphur 1, soft paraffin 15, hydrous wool fat 15.

Ung. Sedativ. (N.I.F.). Calamine 60 gr., zinc oxide 60 gr., oil of cade 15 m., hydrous wool fat 120 gr., yellow soft paraffin to 480 gr.

Oleum Fagi Pyroligneum. Syn. OIL OF BEECH TAR.

Used on the Continent as a source of creosote.

Linimentum Picis (Lassar).

Beech tar 4, birch tar 3, olive oil 1, alcohol (70%) 1.

Unguentum Betulæ Compositum (St. G. H.).

Oil of cade 1 dr., resorcinol 10 gr., ichthammol 10 gr., oil of sweet birch 10 m., lard to 1 oz.

Oleum Rusci (B.P.C.). Syn. BIRCH TAR OIL, OLEUM BETULÆ ALBÆ, OLEUM BETULÆ PYROLIGNEUM.

Obtained by the destructive distillation of the wood and bark of *Betula alba*, allowing the distillate to stand, and pouring off the oily upper layer from the residual tar. Occurs as a thick brownish-black liquid. To be distinguished from *Oleum Betulæ* (p. 101).

Unguentum Rusci Compositum (B.P.C.).

Contains 8% of birch tar oil with resorcinol, zinc oxide and starch in a wool fat and paraffin basis. For chilblains, eczema, prurigo and psoriasis, and for irritation due to piles.

Pix Betula (P. Helv. V). Syn. BIRCH TAR. A yellowish-brown oil from *Betula alba* (L.).

Huile de Bouleau is obtained by distillation of *Betula alba*.

Ung. Sedresol (Ferris, Bristol). A combination of beech tar, zinc oxide and antiseptics. Sedative, antiseptic and healing in eczema, psoriasis, erysipelas, shingles, erythema, seborrhœa, dermatitis, pruritus ani and vulvæ, in inflammations and eruptions of the skin, and in burns and scalds.

PLUMBUM

Pb = 207·22.

[P1] "Lead acetates; compounds of lead with acids from fixed oils."

[S1] "Lead, compounds of, with acids from fixed oils."

[S3] "Lead acetate—in substances containing less than 4 per cent of lead acetate."

"Lead, compounds of,—in machine-spread plasters."

[S6] "Lead, compounds of, with acids from fixed oils—specify proportion as the proportion of lead oxide (PbO) that the preparation would be calculated to contain on the assumption that the lead in the poison had been wholly converted into lead oxide."

[P1] **Plumbi Acetas (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.).**

Syn. SUGAR OF LEAD, SACCHARUM SATURNI.

$(\text{CH}_3\text{COO})_2\text{Pb} \cdot 3\text{H}_2\text{O} = 379\cdot3$.

Dose.— $\frac{1}{4}$ to 2 grains (0·03 to 0·12 g.).

Colourless crystals or masses efflorescing in warm air.

Soluble 1 in less than 2·5 of water, 1 in 30 of alcohol 90%, 1 in 2 of glycerin.

Incompatible with carbonates, soluble chlorides, sulphates, tannates, potassium iodide and opium preparations. The *subacetate* is incompatible with acacia mucilage.

Antidotes. In acute poisoning. Empty stomach by emetic, then give $\frac{1}{2}$ oz. of magnesium sulphate in water; or use stomach tube with 2 oz. of magnesium sulphate in 2 gallons of water. Demulcent drinks. Hot applications to abdomen, and morphine, $\frac{1}{2}$ gr. hypodermically, if necessary for pain. Sodium thiosulphate, 5 ml. of 10% solution intravenously, said to be useful.

In cases recognised before the onset of convulsions, fairly large doses of calcium lactate or phosphate are useful with vitamin D to increase its absorption. In cases with convulsions, 20 to 30 ml. of 8% solution of magnesium sulphate subcutaneously or 30 to 50 ml. of 50% dextrose intravenously. Magnesium sulphate by mouth. Later, large doses of calcium gluconate intramuscularly; calcium phosphate and vitamin D for 2 or 3 months. Iron for the anaemia.—J. R. Ross and A. Brown, *Canad. publ. Hlth J.*, 1935, 26, 237.

A case of severe lead poisoning with recovery in a woman after the ingestion of 110 gr. of lead acetate taken over a period of a month for purposes of criminal abortion. The patient was first put on a high calcium diet, and given 15 gr. of calcium lactate thrice daily, and when the acute symptoms had subsided was switched to a low calcium intake with parathyroid extract parenterally.—J. N. M. Chalmers and S. L. Tompsett, *Lancet*, i/1938, 994.

Heavy Metal Antidote. Dissolve sodium hydroxide 2 g. in 1 l. of water and saturate the solution with hydrogen sulphide. Add the solution to a solution of magnesium sulphate 7.5 g. and sodium bicarbonate 25 g. in 1 l. of water. Cool to 0°, again saturate with hydrogen sulphide and store in rubber-stoppered bottles sealed with paraffin. It is effective against antimony, bismuth, silver, cadmium, cobalt, copper, iron, manganese, mercury, nickel, osmium, lead, thallium and zinc, also against arsenic.—L. Freudweiler, *Schweiz. ApothZtg*, 1937, 75, 25.

In chronic poisoning. Formerly the method of treatment was to administer potassium iodide in full doses to dissolve out the lead salts accumulated in the tissues, and these were then eliminated from the circulation by the daily use of magnesium sulphate. This method has now been largely superseded by treatment with large doses of ammonium chloride (90 gr. daily taken in 15 gr. capsules at intervals throughout the day, followed by copious draughts of water) and a diet low in calcium. Parathormone may also be used to mobilise lead and calcium from the bones, but it is not so safe and the results cannot so readily be controlled. (See Whitla's Dict. of Treatment, 8th Edn., 1938.)

Patients suffering from chronic lead poisoning showed clinical improvement when treated with supplements of vitamin C. The constant absorption of lead, as for example by painters, may cause the exhaustion of the vitamin C reserves due to the formation of poorly ionised compounds of lead and vitamin C which are much less toxic than the metal itself. Thus additional amounts of vitamin C are required, and may be obtained by daily doses of 50 mg. of ascorbic acid added to a diet already rich in the natural vitamin.—H. N. Holmes *et al.*, *Science*, 1939, 89, 322.

DISTRIBUTION AND STORAGE OF LEAD IN THE ORGANISM. It has been shown that lead is retained indefinitely in the solid portion of the bones. Such lead is harmless, but is held at a point where its liberation would flood the organism with toxic soluble lead. A depleted alkali reserve tends to mobilise the stored lead.—A. S. Minot and J. C. Aub, *J. Pharmacol.*, March 1924, 159.

Lead is absorbed most easily through the respiratory tract, and as little as 1 to 2 mg. daily is likely to produce chronic poisoning.—*J. Amer. med. Ass.*, ii/1925, 2034.

Gastro-intestinal absorption of lead is of less importance than respiratory, since the liver forms a very effective barrier to the passage of lead into the circulation, but lead compounds entering the lungs as fume or dust are absorbed rapidly from the lungs and directly enter the circulation. A concentration of lead in air of 2 mg. in 10 c.m. is the maximum permissible if full health and vigour is to be maintained.—R. E. Lane, *Lancet*, ii/1936, 206.

CIDER. An outbreak of lead colic in Devonshire among cider-drinkers due to lead conducting pipes, used to draw the cider from the cask to the engine. Owing to its greater acidity, cider is a more active solvent of lead than beer.—M. C. N. Jackson and L. N. Jackson, *Lancet*, ii/1932, 717.

SNUFF wrapped in tinfoil caused three cases of chronic poisoning.—J. Uttal, *J. Amer. med. Ass.*, i/1928, 290.

A serious case of chronic lead poisoning due to theatrical grease paint which was found to contain nearly 40% of lead present in the form of a lead oxide or litharge (PbO).—E. L. Bartleman and C. Dukes, *Brit. med. J.*, i/1936, 528.

LEAD IN FOOD. A collection and examination of the information available on the subject is published by G. W. Monier-Williams, Reports on Public Health and Medical Subjects, No. 88, H.M.S.O., per *Analyst*, 1939, 33.

For references to lead poisoning by paint and tetra-ethyl lead see Vol. II.

Uses. Both internally and externally (on broken skin) lead salts exert a potent astringent action. They are employed internally in severe diarrhoea, dysentery and catarrhal conditions of the intestines, but careful watch should be kept for toxic effects. Externally lotions are employed for their soothing and astringent properties in skin conditions such as pruritus ani and eczema, and in burns and bruises. Suppositories are employed for rectal hæmorrhage and (with opium) for piles.

[P1] **Glycerinum Plumbi Subacetatis (B.P.C.).**

Prepared by evaporating Liquor Plumbi Subacetatis Fortis and taking up the residue in glycerin.

In chronic eczema glycerin of lead subacetate is useful. It should first be applied diluted 1 part with about 7 of glycerin, or better 1 with 7 of water, and the strength gradually increased; it desiccates the eruption without producing a hard crust. Some uterine affections are well treated with the diluted glycerin.

Injectio Plumbi (L.H.). (Vaginal).

Strong solution of lead subacetate 60 m., water to 20 oz.

Linimentum Boeckii (P. Svec. X).

Dilute lead subacetate solution 56, talcum 18, starch 18, glycerin 8.

Liquor Plumbi Subacetatis Dilutus (B.P.). *Syn.* LIQUOR PLUMBI SUBACETATIS, GOULARD'S LOTION or WATER, LOTIO PLUMBI.

1 of the concentrated solution with water to 80.

For inflamed joints after injury to bruised surfaces, lead lotion (warmed) is useful.

[P1] **Liquor Plumbi Subacetatis Fortis (B.P.).** *Syn.* GOULARD'S EXTRACT.

Prepared by digesting lead monoxide in an aqueous solution of lead acetate. Contains 19 to 21.5% w/w of Pb, and alkalinity corresponding to 10.2 to 11.6% of PbO.

Lot. Picis Carb. et Plumbi (N.I.F.). Solution of coal tar (methylated) 2 dr. strong solution of lead subacetate 2 dr., water to 8 oz.

[P1] **Lotio Plumbi cum Opio (B.P.C.).**

Tincture of opium 1 in 20 in dilute solution of lead subacetate.

Although used to a certain extent in this form, opium is said to be entirely devoid of peripheral anæsthetic effects and lead likewise, because the precipitation of proteins is prevented by the intervention of the epithelium.

[P1] **Lot. Plumbi c. Opio (N.I.F.).**

Liquid extract of opium 20 m., strong solution of lead subacetate 4 dr., water to 8 oz.

Lotio Plumbi Evaporans (B.P.C.). Strong solution of lead subacetate 1 in 80 in alcohol and water.

Lot. Plumbi Evap. Conc. (N.I.F.). Strong solution of lead subacetate $\frac{1}{2}$ oz., industrial methylated spirit 2 oz., water to 8 oz.

[P1-S1] **Pilulæ Plumbi cum Opio (B.P.C.).** *Dose.*—1 or 2 pills.

Contain lead acetate $1\frac{1}{2}$ gr., and powdered opium about $\frac{1}{4}$ gr. (*exempt* [D]).

[P1-S1] **Suppositorium Plumbi cum Opio (B.P.).** *Syn.* SUP-
POSITORIUM PLUMBI COMPOSITUM.

Unless otherwise stated contains 3 grains (0.2 g.) of lead acetate and 1 grain (0.06 g.) of powdered opium in oil of theobroma q.s. to 15 grains (*exempt* [D]).

[P1-S1] **Tabellæ Plumbi cum Opio (B.P.C.).** *Dose.*—1 tablet.

Contain in each lead acetate 3 gr. and powdered opium $\frac{1}{2}$ gr. (*exempt* [D]). For preparations of similar composition also *exempt* [D] see p. 1141.

Unguentum Glycerini Plumbi Subacetatis (B.P.C.).

Glycerin of lead subacetate 1 in 6, in white paraffin ointment.

[P1] **Unguentum Plumbi Acetatis (B.P.C.).**

Lead acetate 4%, in white paraffin ointment.

Unguentum Plumbi Subacetatis (B.P.C.).

Strong solution of lead subacetate 1 in 8, in a wool fat and paraffin basis.

[P2-S1] **Plumbi Arsenas.** A white insoluble powder. Used in paste form in horticulture.

Plumbi Carbonas (B.P.C., P. Helv. V). *Syn.* WHITE LEAD, CERUSSA (P. Helv. V, P. Ned. V).

Composition corresponds approximately to $2\text{PbCO}_3 \cdot \text{Pb(OH)}_2 = 775.7$.

Heavy white insoluble powder, soluble in dilute acetic and nitric acids. Used as dusting powder for burns and as a 1 to 10% ointment in skin diseases.

Unguentum Plumbi Carbonatis (B.P.C.). 10% in white paraffin ointment.

Paré's Ointment (British Drug Houses, London). An ointment containing finely powdered lead amalgam for application to malignant ulcers.

Plumbi Iodidum (B.P.C., Fr. Cx., P. Helv. V). $\text{PbI}_2 = 461.1$.

Yellow crystalline powder. Very slightly soluble in water. Used to reduce swellings and as a 5 to 10% ointment in skin diseases.

Unguentum Plumbi Iodidum (B.P.C., Fr. Cx.). 10% in benzoinated lard.

Plumbi Monoxidum (B.P., P. Helv. V, Fr. Cx.). $\text{PbO} = 223.2$. *Syn.* PLUMBI OXIDUM, MASSICOT, LITHARGE.

Yellowish-red powder or scales soluble in acetic acid and caustic alkalis. To prepare lead plasters and Liquor Plumbi Subacetatis.

Minium (*P. Belg. IV, P. Helv. V*). $Pb_3O_4 = 685.7$. *Syn.* RED LEAD.
Made by heating massicot.

Colloidal Lead and Colloidal Lead Selenide. Colloidal lead, either as the metal or in combination, has been employed in the treatment of cancer. Its use was first suggested by W. Blair Bell in 1922 and was based on the abortifacient action of lead due to its toxic action on the cells of the chorionic villi; since these cells somewhat resemble malignant cells in growth, it was argued that the action of lead would be inimical to the growth of cancer cells. Many lead-containing substances, including colloidal lead, colloidal lead phosphate, colloidal lead iodide, and colloidal lead selenide were tried. They were administered intravenously, usually in conjunction with X-ray or radium therapy. The treatment gave rise to considerable discussion among clinical research workers, but owing to the lack of concordant results and the serious toxic effects which were frequently encountered it did not achieve widespread recognition, and has now been largely abandoned.

For further details as to methods of preparation, dosage, and clinical results, see Vol. I, 21st Edn., pp. 792-794.

PODOPHYLLI RESINA

B.P., U.S.P. XI, Fr. Cx., P. Helv. V.

Syn. PODOPHYLLIN.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

A yellowish powder, or in brownish-grey masses consisting of a mixture of resins obtained either from podophyllum or from Indian podophyllum. It is very irritating to the eyes and requires careful handling.

Soluble completely or almost completely in alcohol 90%, insoluble in cold water, partly soluble in hot water but precipitated again on cooling, partly soluble in chloroform, ether and dilute solution of ammonia.

Uses. Resin of podophyllum is a potent cholagogue and purgative. It is slow in action, taking from 10 to 12 hours to cause evacuation, and producing several soft stools. It causes severe griping when given alone and is thus usually administered with hyoscyamus or belladonna; moreover, since individual reaction to it varies considerably it is advisable to begin with small doses. It is mainly employed in habitual constipation associated with hepatic insufficiency. For the treatment of gall-stones it may be advantageously combined with calomel in a pill.

[P1-81] **Pilulæ Podophyllini, Belladonnæ et Nucis Vomicae** (*B.P.C.*).

Dose.—1 or 2 pills.

Contain 1 gr. of aloes and $\frac{1}{2}$ gr. each of resin of podophyllum, dry extract of belladonna and dry extract of nux vomica.

[P1] **Pilulæ Podophyllini Compositæ** (B.P.C.). *Dose*.—1 pill.

Contain resin of podophyllum $\frac{1}{2}$ gr., mercurous chloride 1 gr. and dry extract of belladonna $\frac{1}{2}$ gr.

[P1] **Pilulæ Podophyllini et Quininae** (B.P.C.). *Syn.* POORE'S PILLS.

Dose.—1 pill. Quinine sulphate 1 gr., resin of podophyllum $\frac{1}{2}$ gr., dry extract of belladonna $\frac{1}{2}$ gr., aloe 1 gr. Useful "dinner pills"; must be taken with food.

Tinctura Podophylli (B.P.C.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

Resin of podophyllum 3.65% in alcohol 90%.

In dose of 2 to 4 drops in tea or coffee, taken night and morning, is useful in sick headache and biliousness, where the bowels and liver are sluggish. Also relieves constipation with clay-coloured motions following diarrhoea of infants; 1 or 2 drops on sugar twice or three times a day.

Tinctura Podophylli Indici (B.P. '14) is also made same strength.

Tinctura Podophylli Ammoniata (B.P.C.).

Dose.—10 to 20 minims (0.6 to 1.2 ml.), diluted, as a purgative and cholagogue. Resin of podophyllum 2% w/v in aromatic spirit of ammonia. Is miscible with water. The sal volatile acts as a corrective.

Podophyllum (B.P., U.S.P. XI, Fr. Cx.). *Syn.* MAY APPLE ROOT, AMERICAN MANDRAKE, VEGETABLE MERCURY.

Dose.—2 to 10 grains (0.12 to 0.6 g.).

The dried rhizome and roots of *Podophyllum peltatum* (Berberidaceæ) from eastern U.S.A. and Canada. Used mainly in the form of the resin of which it yields from about 2 to 8%. U.S.P. XI requires a minimum of 4%.

Podophyllum Indicum (B.P.).

Dose.—2 to 10 grains (0.12 to 0.6 g.).

The dried rhizome and roots of *Podophyllum emodi* (Berberidaceæ) from the Himalayas. It yields from 6 to 12% of resin not identical with that from podophyllum.

Collinsonia (B.P.C.). The rhizome of *C. canadensis* (Labiate), known also as stone-root or knob-root, heal-all, hardhack. Has been employed in gravel and other urinary affections. Is an antispasmodic in flatulent, infantile, and biliary colic, and locally in lax conditions of the uvula, pharynx, and vocal cords. *Liquid extract*, 1 in 1, *dose*.—15 to 30 minims.

Tinctura Collinsoniæ (B.P.C.). *Dose*.— $\frac{1}{2}$ to 1 drachm. 1 in 10.

Has action of podophyllum but does not cause griping.

POTASSII HYDROXYQUINOLINI SULPHAS

B.P.C.

Syn. and Prop. Name. OXYCHINOLINUM SULFURICUM (*P. Helv. V*), POTASSIUM OXYQUINOLINE SULPHATE, CHINOSOL (*Chinosolfabrik, Hamburg; C. Zimmermann, London*).

Consists of a mixture of potassium sulphate and 8-hydroxyquinoline sulphate, ($C_9H_7(OH)N$)₂.H₂SO₄ = 388.2, containing the equivalent of about 50% of 8-hydroxyquinoline. Chinosol was originally stated to be potassium-oxyquinoline sulphate, but the

content of potassium in the original article of commerce does not agree with theory. Occurs as a light yellow, crystalline powder partially melting at about 178° , and giving a strongly acid solution.

Soluble in water, sparingly soluble in alcohol, insoluble in ether.

Uses. An antiseptic used in skin affections in 1 in 2000 to 1 in 500 solution. Tricophytic conditions of face, arms and wrists have been cured by repeated applications of 1 in 2000 solution. Is an ingredient of some perspiration deodorants and is extensively used in proprietary chemical contraceptives.

CONTRACEPTIVE USE. As a few women apparently absorb sufficient quinine to cause sleeplessness and slight digestive disturbances, a suppository of Chinosol in cocoa-butter is recommended by the C.B.C. Med. Research Committee.—*Lancet*, ii/1927, 42.

Chinosol in any medium is not tolerated by a considerable number of women. Its use frequently produces inflammation and discharge, whilst sterility is stated in one instance to have been caused by it. A lactic acid pessary in conjunction with an occlusive pessary found most efficient.—Norman Haire, *Lancet*, ii/1927, 143. See also *ibid.*, *Lancet*, ii/1927, 256, 308 and 360.

Bircon Tablets (*London Rubber Company, London*). A foaming tablet said to contain Chinosol, zinc phenolsulphonate, sodium bicarbonate and other suitable antiseptics and deodorants.

Lomolo (*Napp, London*). Contraceptive foaming tablets of hydroxyquinoline sulphate, zinc phenolsulphonate and an effervescing base.

Mil-San (*Menosine Ltd., London*). A jelly with high viscosity and low surface tension containing boric, acetic, formic, lactic and tartaric acids, aluminium acetate and potassium hydroxyquinoline sulphate in a colloid base. Contraceptive supplied in single application tubes.

Ortho-Gynol (*Johnson & Johnson, Slough*). Boric acid, hydroxyquinoline sulphate and glycerin in a water-soluble vegetable gum base. Supplied in individual tubes, each with applicator, or in bulk tube with single applicator.

Quinolol Compound Ointment (*Squibb, New York; Savory & Moore, London*). Chlor-hydroxyquinoline 0.5 g., benzoyl peroxide 10 g., aromatic oils 0.24 g., soft paraffin and deodorised wool fat to 100 g. Advocated for cutaneous affections and superficial lesions.

Chiniofonum (*B.P. Add. D*). *Syn. and Prop. Names.* PULVIS CHINIOFONI (*U.S.P. XI*), QUINOXYL (*Burroughs Wellcome, London*), YATREN (*Bayer Products, London*).

Dose.—1 to 8 grains (0.06 to 0.5 g.); by rectal injection, 15 to 75 grains (1 to 5 g.). *U.S.P. XI* average dose, 15 grains.

Consists of a mixture of approximately 4 parts of 7-iodo-8-hydroxyquinoline-5-sulphonic acid and 1 part of sodium bicarbonate. It contains 28.2 to 29.6% of I and 18 to 22% of NaHCO_3 , and occurs as a light yellow, odourless powder with a taste at first bitter, subsequently sweetish. *U.S.P. XI* describes it as a mixture of 7-iodo-8-hydroxyquinoline-5-sulphonic acid, sodium bicarbonate and sodium iodohydroxyquinoline suphonate containing 26.5 to 28.9% of I. It is stable in the tropics if kept dry and protected from light.

A mixture of chiniofon 95%, and opium 5%, is *exempt* [D].

Soluble 1 in about 25 of water with effervescence; insoluble in alcohol, ether and chloroform. Aqueous solutions are decomposed by boiling.

Uses. In acute and chronic amoebic dysentery up to 15 grains may be given 3 or 4 times daily for a week repeated on 2 or 3 days during 2 following weeks; or a daily enema of 200 to 600 ml. of $\frac{1}{2}$ to 1% solution at a temperature not above 44° has been advised. In acute and the more serious chronic cases combined rectal and oral administration may be adopted.

In mixed amoebic and bacillary types quite contraindicated *per os*—too irritant.—J. Graham Willmore, *Proc. R. Soc. Med.*, 1928; G. C. Low, *ibid.*

Enema solutions. It is convenient to prepare a stock 5% solution by heating four-fifths of the total volume of freshly distilled water required to 60° to 80° (but no higher), adding the chiniofon slowly with frequent stirring and, when effervescence has ceased, adjusting to the required volume with water. Tap water must not be used. Solutions should be freshly prepared every few days.—O. Turner, *Trans. R. Soc. trop. Med. Hyg.*, 1940, 34, 112.

Neuroyatrein (Bayer Products, London). A combination of autolysates of *B. prodigiosus*, *Staphylococcus aureus*, and *B. pyocyaneus* with Yatren.

Of value in the treatment of disseminated sclerosis. In the majority of 25 cases treated there was either amelioration of symptoms or arrest in hitherto progressive cases. A dose of 0.1 ml. intravenously or 0.4 ml. intramuscularly to commence with.—S. Silverman, *Brit. med. J.*, ii/1935, 1129.

Yatren-Casein Ampoules are made for intramuscular and in rare cases intravenous injection. "Weak": Yatren 0.45 g. plus casein 0.38 g.; "strong": Yatren 0.45 g. plus casein 0.75 g. Doses ranging from 1 to 5 ml. are used as non-specific shock therapy in acute and chronic diseases of muscles and joints, in acute and chronic eye inflammations and in broncho-pneumonia.

Vioform (Ciba, Horsham) is iodochlorhydroxyquinoline, proposed as a substitute for iodoform. It contains about 40% of I and about 12% of Cl. Almost insoluble in water, sparingly in alcohol, but soluble in hot glacial acetic acid.

Enterovioform (Ciba, Horsham). Iodochlorhydroxyquinoline in 0.25 g. tablets to be taken *per os* or crushed and suspended as enema. In amoebic dysentery, 3 tablets being given daily for 10 days and repeated after a week's rest.

AMOEBIASIS well treated. Clinical cure (as determined by stool examinations during a follow-up period of 3 to 6 months) in 38 out of 47 unselected cases. A total dose of 15 g. orally in 2 courses of 0.75 g. daily for 10 days, with a week's rest period between, clears the stools of *E. histolytica* in the average case.—N. A. David and co-workers, *J. Amer. med. Ass.*, i/1933, 1660.

Clinically, Vioform compares favourably with carbarsone. Untoward symptoms (which may occur with as little as 4.0 g. of the drug) are severe gastric distress, with nausea, vomiting, colicky pains, diarrhoea, excessive flatulence, with mucus and blood in the stools. When used rectally, severe local irritation results with concentrations as low as 1:500. Vioform should not be administered in retention enemata for this reason.—H. A. Anderson, *J. trop. Med. (Hyg.)*, 1935, 271.

Carbantren (Ciba, Horsham). An association of iodochloroxyquinoline-hismuth (10%), pectin (20%) and charcoal (70%) in the form of odourless and tasteless granules. **Dose.**—2 to 3 teaspoonfuls twice daily with meals. For the treatment of enteritis, fermentative dyspepsia, summer diarrhoea, and intestinal conditions with a tendency to hæmorrhage.

POTASSIUM

K = 39.10.

Notes on other potassium salts are included under the corresponding acids (see Index).

As a war emergency measure an order (S.R. & O. 1941, No. 273) has been made authorising the replacement of certain potassium

salts by an equal quantity of the corresponding sodium salt in any prescription, unless the contrary is specifically stated. (See p. 1151.)

Potassii Bicarbonas (B.P., U.S.P. XI, Fr. Cx., P. Helv. V).
 $\text{KHCO}_3 = 100.1$.

Dose.—15 to 60 grains (1 to 4 g.).

White powder or crystals soluble 1 in 4 of water, insoluble in alcohol 90%.

Uses. Potassium bicarbonate is used as an antacid, as a liquefying expectorant, and as a diuretic. It is valuable in acute catarrhal conditions of the bladder and urethra, and to prevent the formation of urate calculi. It has a considerable reputation in acute and chronic rheumatism, gout, etc., though the rationale of its action is unknown.

[P1] *Mist. Pot. Bicarb. c. Hyosc. (N.I.F.)*. *Syn.* MIST. POT. CIT. c. HYOSC. Potassium bicarbonate 15 gr., potassium citrate 20 gr., liquid extract of hyoscyamus 5 m., water to $\frac{1}{4}$ oz.

Potassii Carbonas (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.).
 $\text{K}_2\text{CO}_3 = 138.2$. *Syn.* SALT OF TARTAR.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

White deliquescent powder. Soluble 4 in 3 of water; insoluble in alcohol 90%. Contains about 16% of H_2O , corresponding approximately to $\text{K}_2\text{CO}_3 \cdot \text{H}_2\text{O}$.

Uses. Its properties are similar to those of the bicarbonate, but it is seldom used internally owing to its caustic and irritant action. Externally it has been employed as a lotion in eczema and urticaria (30 grains to 1 pint).

Potassii Chloras (B.P., U.S.P. XI, Fr. Cx., P. Helv. V).
 $\text{KClO}_3 = 122.55$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

Manufactured by the electrolysis of a hot aqueous solution of potassium chloride. A white powder or crystals with saline taste.

Soluble 1 in 16 of water, 1 in 2 of boiling water, 1 in 30 of glycerin, 1 in 152 of alcohol 60%, almost insoluble in alcohol 90%.

Incompatible with oxidisable substances, ferrous salts, sugar, nitrites, calomel, hypophosphites, vegetable powders, potassium iodide.

Antidotes. Empty stomach by emetic or stomach tube. Give sodium bicarbonate in water freely. Keep patient warm. Stimulants if necessary, e.g., caffeine sodium benzoate, 2 gr. subcutaneously. Blood transfusion.

Less toxic than potassium chloride. Average lethal dose in rats intravenously 1.5 g. per kilo (chloride 0.82 g.).—J. L. Ulrich and V. A. Shternov, *J. Pharmacol.*, Jan., 1929, 8.

A fatal case of poisoning in a man by taking from 30 to 35 g. over a period of three days in mistake for potassium chloride. Death occurred five days after the last dose.—W. J. Cochrane and R. P. Smith, *Canad. med. Ass. J.*, 1940, 23.

Toxic encephalopathy in a child suffering from ulcerative stomatitis treated with a saturated solution of potassium chlorate in a dose of one teaspoonful every three hours. After a week of this treatment, and a total of 7 to 8 g. of the drug, the child began to show signs of cerebral damage. The condition improved slowly, but doubtful if child will be entirely normal.—per *J. Amer. pharm. Ass. (Abstr.)*, 1939, 389.

Prolonged use of products containing potassium chlorate (*e.g.*, mouth-washes, gargles, dentifrices) might result in sufficient absorption of chlorate, particularly when aided by frictional devices, local lesions such as ulcers and pus pockets, and other inflammatory states, to produce injurious effects. The administration of potassium chlorate has been a common practice in physiologic laboratories to produce damage to kidneys. The traditional use of potassium chlorate in oral preparations lacks a rational or scientific basis. A salt action when desired may be obtained with ordinary sodium chloride.—A.P. Richardson, *J. Pharmacol.*, 1937, 60, 101.

The Council on Dental Therapeutics of the A.M.A. will not accept any dentifrice for daily use which contains potassium chlorate. In Austria a dentifrice containing more than 10% of potassium chlorate cannot be sold without a physician's order.—*J. Amer. med. Ass.*, 1/1937, 1343.

Uses. It is used as a mouth-wash in stomatitis, especially mercurial and ulcerative, and in other foul conditions of the mouth. It is also an effective gargle in pharyngitis and tonsillitis. Its internal use has been condemned owing to the formation of methæmoglobin. It should be given only with care to young children, and never when there is renal disease.

LARYNGITIS. After the very acute stage has been passed the following makes a very satisfactory gargle:—potassium chlorate 12 gr., potassium bicarbonate and sodium bicarbonate of each 6 gr., to an ounce of water. For use, the solution is diluted with equal parts of hot water.—F. C. Ormerod, *Med. Pr.*, ii/1939, 70.

Collunarium Potassii Chloratis Compositum (C.L.T.H.).

One teaspoonful of a mixture of equal parts of potassium chlorate, borax and sodium bicarbonate (*Pulvis Potassii Chloratis Compositus C.L.T.H.*) to be dissolved in a quarter pint ($\frac{1}{4}$ tumbler) of tepid water. Half of the solution to be injected with a syringe along the floor of each nostril night and morning. Afterwards blow the nose freely.

Gargarisma Chlorig (B.P.C.) (N.I.F.).

A chlorinated solution obtained by dissolving in water the products of the interaction of potassium chlorate and hydrochloric acid. To be used diluted with water.

The taste is improved if made with chloroform water.

Gargarisma Potassii Chloratis (B.P.C.).

Potassium chlorate 1 in 40 in water acidified with hydrochloric acid. It contains practically no free chlorine.

Garg. Pot. Chlor. c. Phenol (N.I.F.). Potassium chlorate 2 dr., liquefied phenol 1 dr., trypan blue $\frac{1}{2}$ gr., glycerin 1 oz., water to 8 oz. Dilute 1 tablespoonful with $\frac{1}{2}$ pint of warm water.

Mist. Pot. Chlorat. c. Ferro (N.I.F.). Potassium chlorate 5 gr., solution of ferric chloride 10 m., glycerin 20 m., water to $\frac{1}{2}$ oz.

[P2] **Mist. Pot. Chlorat. et Hydrarg. (N.I.F.).** Solution of mercuric chloride 1 dr., potassium chlorate 7 $\frac{1}{2}$ gr., glycerin 20 m., water to $\frac{1}{2}$ oz.

Mist. Pot. Chlor. c. Sod. Salicyl. (P.M.H.). Potassium chlorate 7 $\frac{1}{2}$ gr., sodium salicylate 10 gr., tincture of orange 10 m., water to 1 oz.

Tabellæ Potassii Chloratis (B.P.C.) contain 5 gr. (0.3 g.).

Tablets containing potassium chlorate should not be carried carelessly in the pockets, since there is a likelihood of fire from contact with matches or surfaces containing phosphorus compounds.

Tabellæ Potassii Chloratis et Boracis (B.P.C.) contain potassium chlorate 3 gr. and borax 2 gr.

Trochisci Potassii Chloratis (B.P.C.) contain 3 gr. of potassium chlorate.

Potassii Hydroxidum (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.).
Syn. POTASSA CAUSTICA. KOH = 56.1.

[P2] "*Potassium hydroxide.*"

[83] "*Potassium hydroxide—in substances containing less than 12% of potassium hydroxide; accumulators; batteries.*"

[86] "*Potassium hydroxide—specify proportion as the proportion of potassium monoxide (K_2O) which the preparation would be calculated to contain on the assumption that the potassium hydroxide in the preparation had been wholly converted into potassium monoxide.*"

[87] *Potassium hydroxide and articles containing it must be labelled "Caution. This substance is caustic."*

Manufactured by the electrolysis of potassium chloride solution. White deliquescent sticks or cakes, containing not less than 85% of total alkali calculated as KOH.

Soluble 1 in 1 of water and about 1 in 3 of alcohol 90%; very soluble in boiling dehydrated alcohol.

Antidotes. Treat as for poisoning by ammonia, *see* p. 180.

Uses. Caustic for nævi and warts. Given occasionally in mixtures as *Liquor Potassii Hydroxidi*, as an antacid.

Liquor Potassii Hydroxidi (B.P.). 5% w/v.

Dose.—10 to 30 minims (0.6 to 2 ml.), freely diluted.

[P2] *Pasta Potassæ et Calcis.* *Syn.* VIENNA PASTE. Potassium hydroxide 5, slaked lime 6, made into a paste when required for use, with alcohol or glycerin. Used as an escharotic.

[P2] *Pasta Londinensis* is similar, using sodium hydroxide.

REMOVAL OF TONSILS. "London Paste," freshly made from the powder with a little alcohol useful. About 8 weekly applications sufficient.—H. Norman Barnett, *Lancet*, i/1929, 872.

Potassii Nitris. KNO_2 = 85.10.

Dose.— $\frac{1}{4}$ to $1\frac{1}{2}$ grains (0.016 to 0.1 g.).

Antidotes. Treat as for poisoning by amyl nitrite, *see* p. 180.

A crystalline deliquescent powder. It is a vasodilator, improves the cerebral circulation, and is given for migraine, asthma and epilepsy.

Potassa Sulphurata (B.P., U.S.P. XI, Fr. Cx., P. Helv. V).
Syn. LIVER OF SULPHUR.

Deliquescent masses, yellowish-brown externally, pale liver-brown internally, becoming yellowish on exposure to air, smelling of sulphuretted hydrogen. Used in skin affections, particularly scabies, either in the form of a bath or as ointment.

Balneum Sulphuratum (B.P.C.). Contains 8 oz. of sulphurated potash per 30 gallons.

Balneum Sulphuris (St. M. H.) contains 10 oz. of sulphurated potash in 30 gallons.

Sal Aperiens Sulphuratum (B.P.C.). *Syn.* HARROGATE SALTS.

Dose.—1 to 2 drachms (4 to 8 g.).

Sulphurated potash 3% and potassium acid tartrate 15% in exsiccated magnesium sulphate.

Unguentum Potassæ Sulphuratæ. Sulphurated potash 1, sodium carbonate 1, lard 8. For ringworm.

Unguentum Potassii Polysulphidi (B.P.C.). *Syn.* DANISH OINTMENT, MARCUSSEN'S OINTMENT, LOMHOLT'S OINTMENT. Contains polysulphides of potassium equivalent to $12\frac{1}{2}\%$ of sulphur with zinc hydroxide and benzaldehyde in a wool fat and paraffin basis.

TREATMENT OF SCABIES. After a hot bath and a thorough scrubbing with soft soap and a brush, the skin is dried and the ointment rubbed into every part of the body except the face and scalp. On the following three days the ointment is again rubbed in night and morning without bathing, and on the fourth day a plain bath is taken. All bed-linen and articles of clothing must be disinfected.

A certain cure for scabies or itch.—A. Cannon, *Brit. med. J.*, i/1930, 148. *Kathiolan (Ferrosan, Copenhagen; C. Zimmermann, London)*. An ointment used for the same purposes as potassium polysulphide ointment.

PYRETHRUM

(with DERRIS, NICOTINE and STAPHISAGRIA)

Pyrethri Flos (B.P.C., P. Helv. V). *Syn.* CHRYSANTHÈME INSECTICIDE (*Fr. Cx.*), (DALMATIAN) INSECT FLOWERS.

The dried flower heads of *Chrysanthemum cineræfolium* (Compositæ), containing pyrethrin I (ester of chrysanthemum monocarboxylic acid and the keto-alcohol, pyrethrolone) and pyrethrin II (the ester of the corresponding dicarboxylic acid). The B.P.C. requires a minimum of 0.4% of pyrethrin I.

Uses. An insecticide and insect repellent. Kerosene extracts of pyrethrum are commonly used in the preparation of fly-sprays and horticultural insecticides. Pyrethrum ointment has been employed in the treatment of scabies.

SCABIES. Pyrethrum ointment affords an efficient agent for the treatment of scabies; it is non-irritant, cleanly, and has a pleasant odour. The ointment consists of an absorbent fatty base in which is dissolved the extractive matter of pyrethrum flowers. It contains 0.75% of pyrethrins, hence 100 g. of the ointment represents 83 g. of pyrethrum flowers. The treatment is as follows: All clothing is removed and the bedclothes changed. On the first night the patient remains in a hot bath for 20 minutes and is then soaped all over with liquid soap; he re-enters the bath, rinses off the lather, and dries himself with a rough towel. The ointment is applied over the whole body. On the second night the ointment alone is applied, but on the third the first night's procedure is repeated. In 517 cases the treatment was perfectly satisfactory in from 5 to 7 days.—S. E. Sweitzer and J. W. Tedder, per *Brit. med. J. Epit.*, i/1936, 36.

DESTRUCTION OF MOSQUITOES IN AIRCRAFT. An efficient culicide is the following solution, employed as a spray: Petrol 1000 ml., concentrated extract of pyrethrum 5 g., oil of sassafras 5 ml., methyl salicylate 20 ml. The concentrated extract is prepared by extracting powdered pyrethrum flowers with petrol-ether in a Soxhlet apparatus, the extract being then concentrated to the consistence of treacle. The quantity of the spray required is from 4.8 ml. per cubic metre in small spaces to 2.5 ml. per cubic metre in large spaces.—N. M. J. Jitta, per *Bull. Hyg.*, Jan., 1936, 43.

A mixture of 1 part of pyrethrum extract in kerosene (containing 2% of pyrethrins) and 4 parts of carbon tetrachloride (containing no pyrethrins) has been tried. 5 ml. per 1000 cubic feet, with 5 minutes' exposure, killed 100% of exposed *Aedes ægypti*. By ordinary tests this mixture is non-inflammable.—C. L. Williams, *Publ. Hlth Rep.*, Wash., 1935, 1401.

As an anti-malaria measure the spraying of huts, barrack-rooms and tents with pyrethrum extracts of various formulæ is a very useful procedure. A popular formula in India is: paraffin (2nd grade) 124 oz., liquid extract of pyrethrum 2 oz., carbon tetrachloride 4 oz., oil of citronella 8 oz., petrol 22 oz.—*Trans. R. Soc. trop. Med. Hyg.*, 1939, 33, 299.

Mosquito Larvicide. A stable stock emulsion suitable for use as a larvicide in fresh waters and waters of less than 5% salinity is prepared by emulsifying a

mixture of kerosene-pyrethrum extract (obtained by treating 2 lb. of pyrethrum flowers with 2 gal. of kerosene), 1 gal. of water and 8 oz. of 40% liquid coconut oil soap. The emulsion mixed with 10 parts of water kills mosquito larvæ but is not injurious to fish, plants or water fowl. The pyrethrum does not remain toxic after 48 hours. An emulsion suitable for use on waters of more than 5% salinity is prepared by adding a mixture of 2 oz. of cresylic acid and 2 gal. of kerosene-pyrethrum extract to a mixture of 1 lb. of powdered skim milk in 1 gal. of water. Diluted with 10 parts of water, this larvicide has no effect on goldfish and water fowl. Both larvicides are equally effective against mosquito pupæ and larvæ when used at a rate of 50 gal. or more per acre.—J. M. Ginsburg, *per Trop. Dis. Bull.*, 1936, 248.

Tinctura Pyrethri Floris (B.P.C.). 1 in 4.

Diluted 1 to 10 with water, it is applied to the skin to prevent insect bites.

Pymosel (Harwood Laboratories, Watford). Active principles of pyrethrum. In tablets, for oxyuria, ascariis, ankylostoma, etc.; in granules for tenia.

Pyrethri Radix (B.P.C., Fr. Cx.). *Syn.* PELLITORY ROOT, SPANISH PELLITORY. Dried root of *Anacyclum Pyrethrum* (Compositæ).

Pyrethrum root has sialagogue properties and is used to promote a flow of saliva in dryness of the mouth and throat. The tincture may be applied on cotton wool, or rubbed on the gums for the relief of toothache.

Pastilli Pyrethri (B.P.C.) contain 1 gr. (0.06 g.).

Tinctura Pyrethri (B.P.C.). 1 in 5. A useful sialagogue, causing considerable salivary effusion. Must be given with caution to children, as it is powerful in effect.

[P1] **Tinctura Pyrethri Composita.** Tincture of pyrethrum (root) 2, clove oil 1, camphorated chloroform 1. As toothache drops.

Derris (B.P.C.). *Syn.* TUBA ROOT, AKER-TUBA.

The dried rhizome of *D. elliptica* and *D. malaccensis* (Leguminosæ), climbing plants indigenous to Malay and the East Indies. Contains up to 10% of a colourless crystalline substance, rotenone, $C_{23}H_{32}O_6$, together with the crystalline substances deguelin, tephrosin and toxicarol, and also a toxic substance isomeric with tephrosin. A valuable horticultural and agricultural insecticide. An insecticidal wash effective against a wide range of pests may be made from 1 lb. of powdered root, 4 oz. of soft soap with water to 1 gallon. The powder produces unpleasant symptoms when inhaled, but is probably harmless to human beings and warm-blooded animals.

SCABIES. Application 1 or 2% lotion of rotenone resulted in complete cure of every one of 24 cases. In the majority, four applications resulted in complete involution of the lesions in three or four days.—*Brit. med. J.*, ii/1940, 231.

Derris Dressing for Warble Fly in Cattle. All cattle are now required to be treated with a derris preparation for the control of the warble fly. The dressing must be used between March 15th and 22nd, and thereafter at intervals of 27 to 32 days until June 30th. The dressing, which must be prepared immediately before use by diluting with water a preparation in powder form containing powdered derris, must contain per gallon either $1\frac{1}{2}$ oz. of derris resins or $\frac{1}{2}$ oz. of rotenone, and 4 oz. of soap. The soap may be added at the time of dilution or included in the powdered preparation.

Sarevan (Evans, Sons, Lescher & Webb, Liverpool). A non-oily emulsion of rotenone for the treatment of scabies and dermatitis of parasitic origin.

Nicotina (B.P.C.). $C_{10}H_{14}N_2 = 162.1$.

[P2] "Nicotine; its salts."

[S1] "Alkaloids, the following; their salts, simple or complex:—Nicotine."

[S3] "Alkaloids—Nicotine—in Tobacco."

A colourless, hygroscopic, volatile, liquid alkaloid from tobacco, *Nicotiana Tabacum* (Solanaceæ). The content may be from 0.5 to 5%, combined as malate or citrate. Sp. gr. about 1.01.

Antidotes. Empty stomach by emetic, or by stomach tube using dilute tannic acid solution. Give 5 gr. doses tannic acid, repeated if necessary, or medicinal charcoal in water, freely. Keep patient lying down and warm. Stimulants, e.g., brandy $\frac{1}{2}$ oz. or aromatic spirit of ammonia $\frac{1}{2}$ dr. in water; strychnine $\frac{1}{8}$ gr., or caffeine sodium benzoate 2 gr., hypodermically. Artificial respiration and oxygen inhalations may be necessary.

Nicotine poisoning is a temporary respiratory emergency comparable to drowning (or electrical shock) and should be treated as such. Experiments on dogs with nicotine poisoning treated by (a) artificial respiration alone, and (b) artificial respiration with intracardiac injection of adrenaline. Results quoted in detail. It is suggested that prolonged artificial respiration and, when the heart has stopped, intracardiac injection of adrenaline, should be tried in cases of acute nicotine poisoning in the human.—Frank and Thomas, *J. Amer. med. Ass.*, 1/1936, 507.

Nicotine is a powerful poison when applied to the skin. Collapse of a girl in an insecticide factory following the spilling on her overall sleeve of 2 drachms of 95% solution. Saved by emetics and scrubbing the skin with soap and cold water (hot water accelerates absorption).—L. P. Lockhart, *Brit. med. J.*, 1/1933, 247; see also A. M. Aitken, *ibid.*, 341.

Accidental poisoning of an American florist by spilling on the clothes an insecticide containing 40% of free nicotine. Nausea, vomiting, sweating and dyspnoea. Symptoms cleared up in 3 weeks.—J. M. Faulkner, *J. Amer. med. Ass.*, 1/1933, 1664.

A boy of 5 became unconscious and vomited continually immediately after an enema consisting of 60 ml. of strong tobacco juice in 1000 ml. of water, which was given for threadworms. Recovery took place after three doses of sodium benzoate and copious enemas to eliminate the nicotine.—H. W. Willis, *J. Pediat.*, 1937, 65.

Uses. Is practically never used in medicine, but has been suggested for use in post-encephalitic parkinsonism. Nicotine is used as a horticultural insecticide either as vapour or as a spray. For vaporisation 1 oz. is sufficient for 2000 to 8000 cu. ft. As a spray $\frac{1}{2}$ to 1 oz. of nicotine with $\frac{1}{4}$ to 1 lb. of soft soap is used in 10 gallons of water.

POST-ENCEPHALITIC PARKINSONISM treated by nicotine. Cases which may benefit are those where voluntary muscular control is intact, but movement is hampered by excessive plastic tone. Nicotine base is used. Signs of intolerance are nausea, fainting, tachypnoea, and are watched for. Patient is kept in bed. Initial dose $\frac{1}{16}$ grain *ter die*. If no appreciable change in pulse chart the dose was increased to $\frac{1}{8}$ or $\frac{1}{4}$ grain *ter die*. Immediate results indisputable.—H. Moll, *Brit. med. J.*, 1/1926, 1079.

[P2-S1] Nicotine Sulphas. A water-soluble salt used in solution as an insecticide in horticulture and as a dressing for animals.

Staphisagria (B.P.C., Fr. Cx.). Syn. STAVESACRE SEEDS.

[P1] "Alkaloids, the following; their salts, simple or complex:—Stavesacre, alkaloids of."

[S1] "Alkaloids, the following; their salts, simple or complex:—Stavesacre, alkaloids of, except substances containing less than 0.2% of the alkaloids of stavesacre."

[S3] "Alkaloids—Stavesacre, alkaloids of,—in soaps; ointments; lotions for external use."

[86] "*Alkaloids—Stavesacre, alkaloids of,—specify proportion as the proportion of any one alkaloid of stavesacre that the preparation would be calculated to contain on the assumption that all the alkaloids of stavesacre in the preparation were that alkaloid.*"

Antidotes. Give medicinal charcoal stirred up in water, then follow this with an emetic or the use of the stomach tube. Keep patient lying down and quiet.

The seeds of *Delphinium Staphisagria* (Ranunculacæ), containing about 30% of oil and 1% of alkaloids, the most important of which is delphinine, which resembles aconitine in its action.

Staphisagria is used chiefly in the form of lotion and ointment to destroy pediculi.

Lotio Staphisagrie (B.P.C.). *Syn.* NURSERY HAIR LOTION.

A perfumed decoction of *staphisagria* in dilute acetic acid with alcohol, glycerin and water.

Unguentum Staphisagrie (B.P.C.). A mixture of benzoinated lard and yellow beeswax in which *staphisagria* has been digested.

PYROGALLOL

B.P.C., U.S.P. XI, P. Ned. V, P. Helv. V, Fr. Cx.

$C_6H_3(OH)_3 = 126.0$.

Syn. PYROGALLIC ACID, 1 : 2 : 3-TRIHYDROXYBENZENE.

In light, small, white, odourless crystals, with m.p. 129° to 135°, producing a sensation of coolness on the tongue. Is obtained by heating gallic acid. Alkaline solutions absorb oxygen rapidly.

Soluble 1 in 2 of water, about 1 in 1 of alcohol 90% and 1 in 10 of melted lard.

Uses. Pyrogallol is not used internally, since it exerts a toxic action on the blood, causing methæmoglobinuria and jaundice. Externally, it is used, similarly to chrysarobin, in psoriasis, lupus vulgaris, ringworm and other parasitic skin diseases, but it is not suitable for application over large areas or denuded surfaces, owing to the possibility of toxic effects from absorption. Jarisch's ointment, which is composed of 60 gr. of pyrogallol in an ounce of lard, is sometimes used in chronic eczema and in phagedenic chancres. Pyrogallol has the disadvantage of staining the skin and hair black. Stains on the skin are removed by ammonium persulphate. It is used as an ingredient of hair dyes and as a developer in photography.

Fatal poisoning following treatment of a universal psoriasis with ointment containing pyrogallol. Patient collapsed 5 minutes after covering about two-thirds of body with ointment. Estimated absorption of about 10 g. of pyrogallol. —*per J. Amer. med. Ass., ii/1925, 555.*

LUPUS VULGARIS. Pyrogallol is the most successful caustic as it has an elective caustic effect on tuberculous granulation tissue. Best employed as: soft paraffin 11, pyrogallol 3, salicylic acid 3, resorcinol 3. The ointment is smeared on a piece of lint, cut to fit the plaque to be treated, and fastened by a bandage. The dressing is changed night and morning, as much destroyed tissue as possible being removed each time. Treatment is rather painful and only tolerated for a few days at a time, when it is replaced by an indifferent soft ointment or a compress of 0.2% resorcinol solution. Valuable in dealing with

the verrucose form of lupus as a preliminary to light treatment.—*Brit. med. J.*, ii/1934, 291.

SYPHILITIC ULCERATIONS, resistant to usual treatment, well treated with pyrogallol ointment—2% for 2 days, 10% for 2 days, 20% for 2 days, and 30% for 8 days. The urine has to be controlled (black coloration with overdoses), undermined edges removed, and surrounding tissues protected with zinc paste.—*J. Amer. med. Ass.*, ii/1925, 314.

Unguentum Pyrogallolis (B.P.C.). *Syn.* UNGUENTUM ACIDI PYROGALLICI. 12½% in white soft paraffin.

Unguentum Pyrogallolis Compositum (B.P.C.). *Syn.* UNGUENTUM ACIDI PYROGALLICI COMPOSITUM, UNNA'S COMPOUND PYROGALLOL OINTMENT. Pyrogallol 5%, ichthammol 5%, salicylic acid 2% in yellow soft paraffin.

Acidum Pyrogallicum Oxidatum. *Syn.* OXIDISED PYROGALLOL. A brownish insoluble powder prepared by the action of air and ammonia on pyrogallol. 3 to 10% ointment for skin affections.

Hydroquinone. *Syn.* QUINOL, HYDROCHINON. $C_6H_4(OH)_2$ 1 : 4 = 110.0. *Dose.*—½ to 5 grains. An isomide of resorcinol.

A white powder soluble 1 in 20 of water and 1 in 4 of alcohol. It possesses stronger antiseptic and antipyretic properties than resorcinol. Is used as a photographic developer.

Eugallol (Knoll, London). Pyrogallol monacetate, a yellowish syrupy liquid used either undiluted or diluted with acetone for local application in psoriasis and eczema.

Lenigallol is pyrogallol triacetate, a white powder used with zinc paste in acute and chronic eczema.

PYROXYLINUM

B.P., U.S.P. XI, Fr. Cx.

Syn. COLLOXILINA (*F.E. VIII*), COLLOXYLINUM (*P. Helv. V*), CELLOIDINE.

Prepared by the action of nitric and sulphuric acids on cotton. It has approximately the composition of a cellulose tetranitrate. $C_{12}H_{16}O_6(ONO_2)_4$. *P. Helv. V* describes it as a mixture of the di- and tri-nitrates.

Soluble freely in methyl alcohol, acetone, amyl acetate, glacial acetic acid and in ether mixed with an equal volume of either ethyl or methyl alcohol.

In making gun-cotton, cellulose hexanitrate, $C_{12}H_{14}O_4(ONO_2)_6$, the mixture of acids contains a larger proportion of nitric acid and the time of action is longer. This body is insoluble in a mixture of alcohol and ether.

Collodium Acetonum (B.P.C.). Pyroxylin 1 in 20 with oil of clove and amyl acetate in benzene and acetone.

A collodion giving a perfectly plasticised adherent film is produced from the following:—Pyroxylin 1, castor oil 0.5, Cellosolve 2, acetone to 20. The use of medicated collodions is condemned on the ground that an efficient film encloses the medicament and so inhibits any therapeutic action.—*H. Berry and L. G. Goodwin, Quart. J. Pharm.*, 1937, 23.

Collodium Flexile (B.P.). *Syn.* COLLODION.

Pyroxylin 2% with colophony and castor oil in alcohol 90% (or industrial methylated spirit) and ether. *Fr. Cx.* has pyroxylin 5,

95% alcohol 20, ether 75 (all by weight); *U.S.P. XI* has 4, 25 and 75, *P. Dan.* 4, 84 and 12, and *P. Helv. V* 4, 66 and 30, respectively.

Collodium Flexile (*U.S.P. XI*).

Collodion with 2% of camphor and 3% of castor oil.

Collodium Elasticum is collodion with castor oil 5% (*Fr. Cx.*), 3% (*P. Helv. V*), 2% (*P. Austr.* and *P. Ned. V*), or 1% (*P. Dan.*).

Collodium Simplex (*B.P.C.*). Pyroxylin, about 1 in 50, in ether and alcohol 90%.

Celluloid. Made by dissolving pyroxylin 50 in a solution of camphor 25 in ether 100 and manipulating the mass until it has become plastic. It is then dried. Colours may be incorporated. It is supplied in thin sheets and, being light, rigid and washable, is useful in surgery for splinting; it is rendered plastic by rolling up and macerating in hot spirit for a few minutes; it may then be wrapped round the limb with a layer of wool outside and quickly sets. *N.B.* Very inflammable.

Soluble in acetone and in amyl acetate, but the film resulting in the first case is liable to be opaque. Mixtures of these solvents are frequently used. A collodion can be readily made strength 1 in 20 using equal parts of the solvents. (The celluloid should be shredded.)

"Non-inflammable" Celluloid is cellulose acetate. It is not actually unburnable, but is as safe as paper. It burns slowly without the evolution of dangerous gases.

QUINIDINE

(with CINCHONIDINE and CINCHONINE)

Quinidina (*B.P.C.*). $C_{20}H_{24}O_2N_2 \cdot 2H_2O = 360 \cdot 2$.

Dose.—3 to 10 grains (0.2 to 0.6 g.).

White amorphous powder or acicular crystals, m.p. when anhydrous 168° . It usually contains 20 to 30% of the closely related alkaloid, hydroquinidine.

Soluble 1 in 2200 of water, 1 in 750 of boiling water, 1 in 17 of alcohol 90%, 1 in 70 of ether. The anhydrous alkaloid is soluble 1 in 1.6 of chloroform.

Its solution in sulphuric acid has a blue fluorescence, as in the case of quinine, and it gives a similar thalleioquin reaction. It differs from quinine in m.p., and its acid tartrate and the hydroiodide are only slightly soluble.

Uses. Quinidine and its salts are generally considered to be as useful as quinine in malaria, especially the benign tertian form, but they are more depressant to the heart. The salts, chiefly the sulphate, are given in auricular fibrillation.

Quinidinæ Hydrochloridum (*P. Ital. V*). $C_{20}H_{24}O_2N_2 \cdot HCl \cdot H_2O = 378 \cdot 7$. Colourless silky crystals, soluble 1 in 60 in water.

Quinidinæ Hydrochloridum Acidum. $C_{20}H_{24}O_2N_2 \cdot 2HCl \cdot H_2O = 415 \cdot 1$. Colourless crystals, soluble 1 in 4 of water.

Quinidinæ Sulphas (*B.P.*, *U.S.P. XI*, *P. Ned. V*, *Fr. Cx.*, *P. Belg. IV*, *P. Helv. V*). $(C_{20}H_{24}O_2N_2)_2 \cdot H_2SO_4 \cdot 2H_2O = 782 \cdot 5$.

Dose.—3 to 10 grains (0.2 to 0.6 g.). *U.S.P. XI* average dose 3 grains 4 times a day.

Occurs as needle crystals, darkening on exposure to light.

Soluble 1 in about 90 of water, 1 in 10 of alcohol 90%, and 1 in 15 of chloroform.

Uses. In addition to its efficacy in malaria, quinidine may be employed in all forms of fever, and wherever quinine has been used.

The main use of quinidine sulphate is in the treatment of persistent auricular fibrillation. It has a specific depressant effect on the muscle of the auricle, prolonging the refractory period of the muscle and thus tending to render it incapable of maintaining the circus movement of fibrillation and replacing it by normal sinus rhythm. Treatment with quinidine is preceded by rest in bed and a full course of digitalis to relieve the heart failure. The susceptibility of the patient is first tested by a preliminary dose of 0.2 g., followed in two or three hours by a further 0.2 g. If there are no bad effects within twelve hours this is followed by the regular administration of 0.4 g. three to five times a day. If no benefit follows within three days, the treatment is considered unsuccessful and administration stopped. The best results are obtained in cases of recent development and the treatment is contraindicated where the myocardium is severely damaged. Quinidine sulphate is also of value in auricular flutter, as an alternative to digitalis, and in paroxysmal tachycardia.

In susceptible persons quinidine may produce untoward symptoms such as headache, nausea, dizziness, palpitations, etc.

The after-results of treatment with quinidine have been followed in two series of patients, one first treated in 1923-8 and the other in 1929-34; almost all have been followed up to December, 1934, or until fibrillation recurred. Quinidine restored normal rhythm in 64% of 135 cases. In 34% it is still maintained after an average period of nearly 4 years. In 30% it was restored, but fibrillation recurred after an average period of two years. In 36% quinidine failed to restore normal rhythm, or did so for such a short time that it was of no practical importance. Of the earlier series, 25% still maintain normal rhythm after nine years, and 39% of the later series after two years. Quinidine is therefore an effective and often a lasting treatment for auricular fibrillation; its success depends on the careful selection of suitable patients. The ordinary patient seen in hospital is quite unsuitable, the risk is too great, and if fibrillation is arrested it generally returns too soon. Satisfactory results are obtained by paying attention to three main criteria: the absence of congestive failure, of a greatly enlarged heart, or of a long history of fibrillation.—M. Campbell and F. W. Gordon, *Quart. J. Med.*, April, 1936, 224.

It is undesirable to attempt to restore a normal rhythm in established fibrillation by quinidine when (1) there has been any evidence of emboli, (2) there is severe valvular disease, (3) the heart, by an X-ray, is found to be grossly enlarged, and (4) there has been previous congestive heart failure.—A. H. Gosse, *Practitioner*, 1/1938, 343.

There is evidence that quinidine and strychnine sulphate have a synergistic action. Normal cardiac rhythm was re-established in 33 out of 41 cases for periods varying from 4 months to two years, by the administration of 5 gr. of quinidine sulphate every three hours and $\frac{3}{16}$ or $\frac{1}{16}$ gr. of strychnine sulphate three times daily.—H. L. Smith and E. W. Boland, *J. Amer. med. Ass.*, ii/1939, 1017.

HYPERTHYROIDISM. For the cardiac complications of hyperthyroidism quinidine sulphate is considered superior to digitalis.—*Prescriber*, 1927, 172.

MALARIA. Observations on the treatment of malaria in 1047 cases, from 1930 to 1934, in Louisiana. Treatment consisted in the administration of quinidine sulphate in 2 10-grain doses for 2 days, night and morning, and 1 10-grain dose at night for 3 more days. The course is repeated only if there is a clinical relapse or the blood smear becomes positive. This course has been found effective in curing about 60% of malignant tertian and 75% tertian malaria; it relieves the acute symptoms of both quickly, is safe to use in cases of pregnancy, and may be tried in haematuria and in cases of quinine idiosyncrasy.—J. P. Sanders, *Amer. J. trop. Med.*, 1935, 651

PAROXYSMAL TACHYCARDIA. *Digitalis* rarely appears to have any beneficial effects in paroxysmal tachycardia. Quinidine sulphate is the drug of choice, but it does not uniformly give the desired results. It often diminishes the frequency and the duration of the attacks and occasionally causes their cessation. The drug must be given for long periods, and is therefore undesirable when the paroxysms occur only rarely. The dosage must be individualised, the average dose being between 16 and 20 gr. daily.—F. A. Willius, *Proc. Mayo Clin.*, 1935, 763.

Quinidine sulphate the only therapeutic measure and successful in many cases. Dosage high—as much as 120 gr. daily.—M. B. Strauss, *per Med. Annu.*, 1931, 51.

Tabellæ Quinidinæ Sulphatis (*B.P.C.*) contain 3 gr. (0.2 g.).

Quinicardine (*Nativelle, Paris; Wilcox, Jozeau, London*). Quinidine sulphate in gelatin-coated tablets containing 0.2 g.

Quinidinæ Sulphas Acidus. $C_{10}H_{14}O_2N_2 \cdot H_2SO_4 \cdot 4H_2O = 494.3$.

Colourless crystals, soluble 1 in 8 in water.

Cinchonidina. $C_{19}H_{22}ON_2 = 294.2$.

In short, colourless prisms or leaflets, with m.p. 202.5° . Soluble about 1 in 4000 of water, and about 1 in 20 of alcohol. It does not give the thalleioquin reaction, and its solution in sulphuric acid is not fluorescent. Closely resembles quinine in its action.

Uses. Cinchonidine and its salts are less efficacious in the treatment of malaria than quinine or quinidine, and their administration is apt to give rise to epileptiform convulsions. The sulphate is said to be of value, in frequently repeated doses of 5 gr., in rheumatism and neuralgia. The salicylate has been similarly employed, and has also been given for the prevention and treatment of influenza.

Cinchonidinæ Dihydrochloridum. *Syn.* CINCHONIDINÆ HYDROCHLORIDUM ACIDUM. $C_{19}H_{22}ON_2 \cdot 2HCl = 367.1$.

Dose.—1 to 8 grains (0.06 to 0.5 g.).

Crystals readily soluble in water. Convenient for preparing solutions for injection.

Cinchonidinæ Hydrochloridum. $C_{19}H_{22}ON_2 \cdot HCl \cdot H_2O = 348.7$.

Dose.—1 to 10 grains (0.06 to 0.6 g.).

Colourless crystals, soluble 1 in 30 in water.

Cinchonidinæ Salicylas. $C_{19}H_{22}ON_2 \cdot C_6H_4(OH)COOH = 432.2$.

Dose.—1 to 10 grains (0.06 to 0.6 g.).

Cinchonidinæ Sulphas (*B.P.C.*). $(C_{19}H_{22}ON_2)_2 \cdot H_2SO_4 \cdot 7H_2O = 812.6$.

Dose.—1 to 10 grains (0.06 to 0.6 g.).

In silky white needles from mother liquor of quinine sulphate.

Soluble 1 in 60 of alcohol, 1 in 100 of water (more so with a little acid).

Cinchonina. $C_{19}H_{22}ON_2 = 294.2$.

Dose.—1 to 10 grains (0.06 to 0.6 g.).

White crystals, tasteless at first, becoming bitter. Soluble 1 in 150 of alcohol 90%, and 1 in 500 of ether; almost insoluble in water (about 1 in 4000).

Uses. Cinchonine and its salts have a similar anti-malarial and anti-periodic action to quinine, but, like cinchonidine, they may cause convulsions when given in large doses. The salt most frequently employed is the dihydrochloride, which is given intramuscularly in malarial relapses and the treatment of malignant tertian malaria, especially in patients in whom quinine causes sickness. It should be remembered that since it is more rapidly absorbed than quinine, large doses given intramuscularly may cause cinchonism.

Cinchoninæ Dihydrochloridum. *Syn.* CINCHONINE ACID HYDROCHLORIDE. $C_{19}H_{22}ON_2 \cdot 2HCl = 367 \cdot 1$.

Dose.—5 to 15 grains (0·3 to 1 g.) by intramuscular injection.

White crystalline powder. Soluble 1 in 0·6 of water, 1 in 6 of alcohol and 1 in 115 of chloroform.

Cinchoninæ Hydrochloridum (B.P.C.). $C_{19}H_{22}ON_2 \cdot HCl \cdot 2H_2O = 366 \cdot 7$.

Dose.—1 to 10 grains (0·06 to 0·6 g.), or more.

In white acicular crystals. Soluble 1 in 20 of water and 1 in 2 of alcohol 90% and 1 in 300 of ether.

Cinchoninæ Sulphas. $(C_{19}H_{22}ON_2)_2 \cdot H_2SO_4 \cdot 2H_2O = 722 \cdot 5$.

Dose.—1 to 10 grains or more.

In hard, colourless, short rhombic prisms with a vitreous lustre. Soluble 1 in 70 of cold water, 1 in 10 of alcohol 90%.

QUININA

B.P.C., Fr. Cx., U.S.P. XI, F.E. VIII.

$C_{20}H_{24}O_2N_2 \cdot 3H_2O = 378 \cdot 3$. *P. Ned. V* is anhydrous.

Dose.—1 to 10 grains (0·06 to 0·6 g.). *U.S.P. XI* average dose 15 grains.

A white, minutely crystalline, flaky powder. Loses 1 molecule of water at ordinary temperatures. When anhydrous has m.p. 174° .

Soluble. Slightly, 1 in about 1500, in water, 1 in 4 of ether, about 1 in 1 of alcohol 90%, and 1 in 3 of chloroform. Its solution in dilute sulphuric acid is fluorescent, lævorotatory, and gives, with bromine water and ammonia, a green colour due to thalleioquin.

Toxic Effects. The larger therapeutic doses of quinine may give rise to a number of toxic effects (cinchonism). These include ringing in the ears with partial deafness, headache, giddiness, epistaxis and often skin rashes. In susceptible patients these symptoms may follow quite small doses. Very large doses result in deafness and blindness, with death from failure of the heart and respiration.

Death from 48 5-grain quinine bisulphate tablets.—H. M. Raven, *Brit. med. J.*, ii/1927, 59.

Fatal poisoning in child of 2½ following ingestion of 26 5-grain tablets (sugar coated) of quinine sulphate.—S. G. Willmott, *Lancet*, ii/1931, 1133.

Quinine is often used in Greece for purposes of suicide. Doses of 10 g. may not give rise to serious intoxication, but doses of 20 g. and more have often proved fatal.—per *Brit. med. J.*, i/1935, 1130.

Death of a woman following the taking of 16 quinine pills, containing a total of 6·08 g. of quinine sulphate, to procure abortion.—C. K. Vartan and J. Discombe, *Brit. med. J.*, i/1940, 525.

Uses. Internally is a bitter stomachic useful in atonic dyspepsia and as a tonic in convalescence and debility. It was formerly used as an antipyretic in fevers, its action in reducing temperature being due to diminished heat production; it has largely been replaced for this purpose by the synthetic antipyretics. It is also given in neuralgia, catarrh and hay-fever. Externally, a paste of quinine in a non-greasy base is of value for preventing burns due to ultraviolet radiation. Aqueous solutions of 0·5 to 1·5% of

soluble salt are used in eye lotions for the treatment of corneal ulcerations, and the 1% solution is useful as a spray in hay-fever.

Pessaries containing 3 gr. of the hydrochloride in oil of theobroma basis are used as a contraceptive.

Moderate doses of quinine stimulate, and high doses depress the contractions and tone of the uterus, the stimulant action increasing with the excitability of the uterus in the later stages of pregnancy, and it may be used clinically to intensify weak labour pains. A dose of 5 gr. daily during the last three or four weeks of pregnancy is said to act both as a general and a uterine tonic, and has been advocated as a preventive of uterine inertia. Pregnancy in malaria is not now regarded as a contraindication to the use of quinine.

Quinine is specific in the treatment of malaria, being particularly effective against the organism when spores are being formed. It should therefore be administered in a dose of 20 to 30 gr. about 3 hours before an attack is due, so that the concentration in the blood shall be a maximum when the spores are liberated, at which stage fever develops. Opinions differ as to its efficacy as a prophylactic against malaria, but it is now generally believed to protect at least a fair proportion of cases if taken in adequate dosage, e.g., 10 gr. daily.

DYSTONIA. Dystonia markedly improves under quinine therapy, employing doses of 15 to 30 gr. a day of quinine sulphate (in 5 gr. tablets). The treatment is of benefit even in cases of so-called spasmodic torticollis, or torsion spasm.—G. B. Hassin, *J. Amer. med. Ass.*, ii/1939, 12.

LABOUR. "MEDICINAL INDUCTION" (*Castor Oil and Quinine*). 2 oz. of castor oil is given and an hour afterwards $\frac{1}{2}$ oz. of a mixture containing quinine sulphate 10 gr., dilute sulphuric acid 10 m., glycerin 20 m., spirit of chloroform 5 m., and water to $\frac{1}{2}$ oz. 1 hour after, a simple enema is given. 2 hours later another dose of the mixture, also 3 hours later and again after 4 hours, the total amount of quinine given being 40 gr. Greater percentage of successes than with pituitary (posterior lobe) extract. Less danger with pituitary extract when preceded by quinine course. Quinine is definitely able to act upon a closed cervix.—K. V. Bailey, *Brit. med. J.*, i/1926, 18; *Lancet*, i/1926, 282.

In normal labour a small dose for 3 weeks prior to the date. Quinine sulphate $1\frac{1}{2}$ gr., dilute nitrohydrochloric acid 3 m., Syrup. Aurant. $\frac{1}{2}$ dr., water to 2 dr. Dose.—2 drachms with water thrice daily before meals. Two 8-oz. bottles will carry the patient over the 3 weeks.—D. A. Mitchell, *Brit. med. J.*, i/1930, 144.

By giving not more than 5 gr. a day in divided doses, commencing several weeks before the calculated date of parturition, labour is made shorter and easier, there is improved uterine tone (with no complications of irregular contraction), a definite diminution in susceptibility to infection, improvement of general health and more satisfactory puerperium.—W. M. Hewetson, *Brit. med. J.*, ii/1933, 170. Universally good results.—D. J. Gair Johnston, *ibid.*, 266. Value confirmed.—V. B. Green-Armytage, *ibid.*, 397.

In a series of 100 cases, quinine given in single nightly doses of 5 gr. in the last weeks of gestation, acted as a general tonic and stimulant, and the patients felt well and were often improved. No evidence of foetal toxicity or increased foetal morbidity, and little risk of premature labour. The effect on duration of labour is doubtful. Clinically the pains seem improved, but compared with a control series there was no significant difference. Inertia not eliminated.—F. W. Buddes, *Brit. med. J.*, i/1934, 1159; see also D. A. Mitchell, *ibid.*, ii/1934, 86.

Combined premedication, drug induction, and artificial rupture of the membranes is a reliable method of inducing labour. Labour so induced lasts no longer and does not show a higher percentage of complications. Primigravidae and multigravidae with a history of defective uterine action in previous labours, receive $1\frac{1}{2}$ gr. of quinine sulphate three times daily during the last three weeks for which the pregnancy is allowed to continue; primigravidae are admitted to

hospital 5 days before the anticipated date of artificial rupture of the membranes and multigravidæ 3 days before. At 6 a.m. 1 ounce of castor oil, at 10 a.m., 2 p.m. and 6 p.m. quinine sulphate powder 10 gr., and at 5 p.m. a simple enema and a hot bath are administered to primigravidæ on the day after admission (second day) and repeated on the fourth day; to multigravidæ they were given on the second day.—E. C. Wise, *Brit. med. J.*, i/1939, 665.

MALARIA. A comprehensive test was undertaken with British troops resident in highly malarious stations in the Punjab, for the purpose of reducing the harmful effect of the autumn malarial outbreaks among the men. During the three years' duration of the test there was a uniformly lower malarial rate throughout among those taking prophylactic quinine, although it was only given for two periods of 3 weeks, with an interval of 10 days between them, in doses of 10 gr. of the sulphate daily, with the exception of Saturdays, when a purge was taken.—T. Young, *J. R.A.M.C.*, Aug., 1933; 90; *ibid.*, Apr., 1934, 269.

In the Italo-Ethiopian campaign of 1935-36, with an army of 500,000 men, there were only 1241 admissions for primary malaria and 1093 admissions for relapses, with 23 deaths from pernicious forms, including blackwater fever, and this in spite of the fact that zones of operation were badly malarial. From the beginning of the campaign quinine prophylaxis was insisted on; every soldier received three tablets a day of quinine sulphate or bihydrochloride each containing 3 gr., and care was taken to see that they took them.—A. Castellani, *Lancet*, ii/1939, 1048.

In the tropics, where malignant tertian infections are much more common, most authorities recommend a daily dosage of at least 30 gr., on account of the dangers of the development of pernicious symptoms. Although in our investigations it was found that doses of less than 30 gr. daily would have a considerable curative effect, at least as far as clinical manifestations are concerned, a daily dosage of 30 gr. is considered to be the optimum, consistent with (radical) curative action and the avoidance of harm and excessive discomfort to the patient. This dose seems to be that most usually recommended for the treatment of acute attacks in the tropics, irrespective of the kind of infection. In our work the cure rate in malignant tertian malaria, treated with quinine in doses of 20 gr., was less than half that with 30 gr. doses, given over an equal period.—J. A. Sinton, *Quart. Bull. Hlth Org. L.o.N.*, 1935, 661.

Treatment of Malarial Relapses.

The best for old cases was a system carried out by M. Harrison in an investigation of treatment under direction of Sir Ronald Ross. It was used on 49 chronic cases, mostly of benign tertian. Only 10.2% relapsed. Fever was reduced in 12 to 24 hours, and no asexual parasites could be found after 48 hours.

Patient to remain in bed 12 days (this period may be reduced) and to receive intramuscularly in each deltoid muscle 15 gr. of dihydrochloride daily with 10 gr. of quinine hydrochloride in Mixture No. 1 (*infra*) thrice daily, totalling 60 grains of quinine daily for the 12 days. Patient is then allowed up and receives for three days Mixture No. 2 four times a day (60 gr. of quinine daily by the mouth). Patient is then put on Mixture No. 3 four times daily for 14 days (20 gr. of quinine daily). Light work allowed.

[P1-S1] **Anticachexia Mixture No. 1.** For a dose after food:—

Quinine hydrochloride 10 gr., tincture of ferric chloride 5 m., solution of strychnine hydrochloride 5 m., acid solution of arsenic 5 m., dilute nitrohydrochloric acid 5 m., magnesium sulphate $\frac{1}{2}$ dr., syrup of tolu $\frac{1}{2}$ dr., glycerin 10 m., water to 1 oz.

[P1-S1] **Anticachexia Mixture No. 2.**

As No. 1, but add quinine hydrochloride 5 gr. and dilute nitrohydrochloric acid 5 m. to the dose.

[P1-S1] **Anticachexia Mixture No. 3.**

As No. 1, but reduce the quinine hydrochloride 5 gr. and dilute nitrohydrochloric acid 5 m. in each dose.

For references to the use of quinine salts by injection, see the respective salts.

Cremor Quininae (B.V.H.). Stearic acid 2 oz. (Apoth.), sodium carbonate 131 gr., liquid paraffin 144 m., quinine 240 gr., distilled water to 20 oz. (Apoth.).

Oleatum Quininae (B.P.C.). 25% w/w of quinine in oleic acid

Quininae Acetylsalicylas (B.P.C.).

$C_{26}H_{34}O_{12}N_2, C_6H_4(COOH)O \cdot OC \cdot CH_3 = 504.3$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

A white, crystalline powder containing about 64% of anhydrous quinine. M.p. 157°.

Soluble 1 in 330 of water, 1 in 50 of alcohol 90%, 1 in 7 of chloroform; insoluble in ether. Immediately decomposed by acids and alkalis. Antipyretic and analgesic; used similarly to quinine salicylate.

[P1-S1] **Quininae Arsenas** (B.P.C.). $(C_{20}H_{24}O_2N_2)_2 \cdot H_3AsO_4 \cdot 8H_2O = 934.5$.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.004 to 0.008 g.).

White silky needles soluble in cold water. Contains 69% of anhydrous quinine. Owing to the small dosage of quinine possible, its action is that of arsenic. It is employed as an antiperiodic in malarial conditions.

[P1-S1] **Kinectine** (Mouneyrat, Villeneuve-la-Garenne; Anglo-French Drug Co., London). Hectine with quinine hydrochloride (i.e., benzosulpho-*p*-amino-phenylarsonate of quinine). *Dose.*—3 tablets a day for 3 days and then 2 tablets every other day to a total of 18 tablets. Hay fever, coryza, influenza, malaria.

Quininae Benzoas (B.P.C.). $C_{20}H_{24}O_2N_2 \cdot C_6H_5 \cdot COOH = 446.3$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White crystals with alkaline reaction, containing 72 to 75% of anhydrous quinine. Soluble 1 in 350 of water. Has the general properties of quinine salts, but is seldom used in medicine.

Quininae Bisulphas (B.P., U.S.P. XI). *Syn.* QUININÆ SULPHAS ACIDUS, NEUTRAL QUININE SULPHATE (Fr. Cx., P. Ital. V and F.E. VIII). $C_{20}H_{24}O_2N_2 \cdot H_2SO_4 \cdot 7H_2O = 548.4$.

Dose.—1 to 10 grains (0.06 to 0.6 g.). U.S.P. XI average dose 15 grains. F.E. gives max. dose *per diem* 2 g.

Transparent or opaque needles containing about 59% of anhydrous quinine.

Soluble 1 in 10 of water and 1 in 23 of alcohol 90%.

Uses. Has the general properties of quinine and is preferable to quinine sulphate for the preparation of tablets, but is less suitable than the acid hydrochloride for injections, since its solution decomposes on heating. It is suitable for preparing eye lotions. In purulent ophthalmia, hypopyon and keratitis, drops containing 3 gr. with 12 gr. of boric acid per oz. are useful, and 3 gr. per oz. of water has a specific action on ophthalmic diphtheria. The 1 in 2000 solution may be used as an irrigation in cystitis.

Quinine is of value in ophthalmology on account of its astringent, bactericidal and anæsthetic properties, and because it inhibits scar-tissue formation. It may be used either in the form of a 2 to 4% quinine bisulphate ointment or in a 2% solution, and may be used with success in interstitial keratitis, trachoma, corneal opacities, vernal catarrh and phlyctenular conjunctivitis.—J. W. Robinson, *Brit. med. J. Epit.*, ii/1937, 47.

[P1-S1] **Quininae Cacodylas**. $C_{20}H_{24}O_2N_2 \cdot (CH_3)_2AsO \cdot OH = 462.2$.

Dose.—*Per os* and hypodermically $\frac{1}{2}$ to 1 grain (0.016 to 0.06 g.). Larger doses are sometimes given.

White acicular crystals soluble in water. This salt has been suggested for intravenous use in malaria, $7\frac{1}{2}$ grains (0.5 g.) in 20 ml. It has approximately the same toxicity as quinine dihydrochloride and dihydrobromide.

Quininae Camphoras. $(C_{20}H_{24}O_2N_2)_2 \cdot C_9H_7 \cdot (COOH)_2 = 848.5$.

Dose.—1 to 10 grains. An insoluble powder.

Transpulmin (Camden Chemical Co., London). Solution of basic quinine and camphor in volatile oils. *Dose.*—1 to 2 ml. intramuscularly per day for from 7 to 21 days. Influenza, bronchitis, broncho-pneumonia, etc.

Quininae Citras (B.P.C.).

$(C_{20}H_{24}O_2N_2)_2 \cdot C_6H_4 \cdot OH(COOH)_2 \cdot 7\frac{1}{2}H_2O = 1300$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Soluble 1 in 900. It has, therefore, little taste. Given suspended in mixture. Contains about 74.5% of anhydrous quinine.

Ferri et Quininæ Citras (B.P., P. Dan.).

Dose.—5 to 15 grains (0.3 to 1 g.). 15 gr. contains about 2 gr. of iron and $2\frac{1}{2}$ gr. of quinine.

It may be given in solution, or in pills with simple syrup or mucilage of acacia (not in excess, as, unless made very hard, they lose shape). Alcohol 60% with glycerin 5% is also a suitable excipient. Greenish-yellow deliquescent scales with bitter chalybeate taste. Contains about 13% of Fe and 15% (P. Dan. 10%) of anhydrous quinine. Largely used as a general tonic.

Soluble 2 in 1 of water.

Incompatible with tannin and alkalis, also with phosphoric acid (ferric phosphate may be thrown out) unless considerably diluted prior to mixing.

Vinum Ferri et Quininæ (B.P.C.). *Dose.*—1 to 4 drachms (4 to 16 ml.). Contains 1 grain of iron and quinine citrate per drachm of sherry-type wine. [P.] **Sirop Neurotonique.**

Dose.—2 to 3 drachms (8 to 12 ml.) in a little water after meals. Iron and quinine citrate 0.50, strychnine nitrate 0.01, liquid extract of kola 5.0, sodium glycerophosphate 5.0. Dissolve with slight heat in syrup of orange, *q.s.* to 100.

Quininæ Dihydrobromidum (B.P.C.). *Syn.* QUININÆ HYDROBROMIDUM ACIDUM. (Fr. Cx. "Neutral").

$C_{20}H_{24}O_2N_2 \cdot 2HBr \cdot 3H_2O = 540.1$.

Dose.—1 to 10 grains (0.06 to 0.6 g.). Hypodermically, 3 to 5 grains (0.2 to 0.3 g.).

In yellowish rectangular prismatic crystals, or in powder. Contains about 60% of anhydrous quinine.

Soluble 1 in 7 of water; very soluble in alcohol, but insoluble in ether. It is well adapted for hypodermic injection. It is non-irritating. The additional hydrobromic radical tends to prevent quinism.

Quininæ Dihydrochloridum (B.P., U.S.P. XI, P. Helv. V). *Syn.* QUININÆ HYDROCHLORIDUM ACIDUM, QUININE DI- OR BI-HYDROCHLORIDE. $C_{20}H_{24}O_2N_2 \cdot 2HCl = 397.1$. Fr. Cx., P. Ital. V and F.E. VIII term this "neutral" quinine hydrochloride.

Crystallised from alcohol, the salt contains alcohol and water of crystallisation. Left exposed to the air, this loses its alcohol and the salt changes to one with $2\frac{1}{2}$ molecules of water, becoming at the same time opaque. This was formerly official in Fr. Cx.

Dose.—1 to 10 grains (0.06 to 0.6 g.). By intravenous and intramuscular injection, 5 to 10 grains (0.3 to 0.6 g.). U.S.P. XI average dose 15 grains. F.E. VIII has max. daily dose 2 g.

A white powder containing 81.6% of quinine.

Soluble 1 in 0.6 of water, 1 in 12 of alcohol 90%.

It should not be administered parenterally in a concentration exceeding 1 gr. per ml. To prepare sterile solutions colourless quinine acid hydrochloride is dissolved in freshly distilled water and the solution filtered through a Berkefeld filter. It is filled into ampoules and sterilised by boiling once in a water-bath for half an hour. Such a solution should keep for a considerable time, because the drug tends to be self-sterilising.—O. Turner, *Trans. R. Soc. trop. Med. Hyg.*, 1940, 34, 111.

Uses. This is the most suitable salt for the preparation of solutions for injection. Although quinine is best administered by

mouth in the great majority of cases, intramuscular or intravenous injections are a valuable procedure in acute cases of pernicious malaria, especially when accompanied by constant vomiting or symptoms suggestive of cerebral involvement. Subcutaneous injections are seldom employed, since they are liable to be followed by fibrous induration.

INTRAMUSCULAR INJECTIONS. It is preferable to use a dilute solution, *e.g.*, 0.5 to 0.6 g. in 3 or 4 ml. of normal saline, sterilised by boiling and cooled before injection. The best site for injection is in the gluteus muscle, $1\frac{1}{2}$ to 2 inches below the crest of the ileum, avoiding the line of the sciatic nerve, since infiltration of the tissues in the neighbourhood of the large nerve trunk may cause serious and permanent damage. The injection should be given with the strictest asepsis, since the drug causes a localised necrosis, and lack of aseptic precautions may cause infection of the necrotic area resulting in abscess formation and possibly even tetanus. The injections should not be given in the same place every day, and they should be stopped and quinine given by the oral route as soon as the paroxysms have been controlled.

INTRAVENOUS INJECTIONS. These may be given when rapid action is required, as in cerebral malaria. The dose is usually 0.6 g. dissolved in 10 ml. of normal saline. The injection should be given slowly (at least ten minutes being allowed) with the patient in a recumbent position, and with the strictest aseptic precautions. Alternatively, the injection may be made with a gravity apparatus, using 0.6 g. dissolved in 100 ml. of normal saline. A single intravenous injection, repeated if necessary on the following day, generally clears the condition sufficiently to allow of the resumption of oral administration. Care must be taken to ensure that the injection does not infiltrate the walls of the vein or the subcutaneous tissue, or sloughing and fibrosis may result. The injection causes a rapid fall of blood pressure and affects the respiratory centre, and a careful watch must therefore be kept on the patient's heart, pulse and respiration. It should be employed with special precaution in the presence of organic disease of the heart, albuminuria, severe jaundice, marked anæmia, or debility, and idiosyncrasy to quinine.

In addition to their use in malaria, intravenous injections of quinine were at one time advocated in the treatment of pneumonia and puerperal septicæmia, but their use in these conditions has now been largely abandoned. Excellent results are said to have been obtained in the treatment of paroxysmal tachycardia by intravenous injections, in doses up to $7\frac{1}{2}$ grains, the attack ceasing abruptly while the injection is being given.

Intramuscular injections condemned in ordinary cases of malaria, but intravenous injections (quinine dihydrochloride 0.6 g. in 5 ml. physiological saline) recommended in serious cases of malignant tertian associated with persistent vomiting or threatened coma.—S. P. James, *Brit. med. J.*, ii/1933, 929.

Oral method the only method of administering cinchona alkaloids, though rarely in grave cases, *e.g.*, cerebral malaria, quinine base should be injected

intravenously.—H. W. Acton and R. N. Chopra, *Indian J. med. Res.*, Oct., 1924, 251; see also J. Macqueen, *Lancet*, i/1927, 1289.

Intramuscular injections given in large numbers without tetanus being caused (as result of muscle fibre necrosis). Pain does not occur unless some solution gets into the subcutaneous tissues. However, intravenous injections are more rapid and painless. 0.6 g. in 10 ml. water.—M. S. Nawaz Ahmadi, *Brit. med. J.*, ii/1930, 621.

Lotio Quininae Hydrochloridi (R.L.O.H.). Quinine dihydrochloride 4 gr., sterilised water to 1 oz. For corneal ulcers.

[D·P1·81] "**Old English**" Fever Powder. Quinine dihydrochloride 3 gr., arsenious acid $\frac{3}{16}$ gr., compound soap pill 1 gr., calomel $\frac{1}{8}$ gr. 3 times daily in a cachet. Malaria well treated. The following [D·P1·81] daily dose made up in the form of a pill recommended as prophylactic:—Quinine dihydrochloride $1\frac{1}{2}$ gr., arsenious acid $\frac{1}{16}$ gr., compound soap pill $\frac{1}{8}$ gr., calomel $\frac{1}{8}$ gr.

Quininae Disalicyclosalicylas (B.P.C.). *Syn. and Prop. Name.* QUININÆ BISALICYCLOSALICYLAS, QUINISAN (*Howards, Ilford*).
 $C_{26}H_{24}O_2N_2 \cdot 2C_6H_4(COOH) \cdot O \cdot CO \cdot C_6H_4(OH) = 840.4$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White microcrystalline powder with slightly bitter taste. Contains about 39% of anhydrous quinine. For influenza, coryza, tonsillitis, neuralgia, etc.

Quininae et Aethylis Carbonas (B.P., U.S.P. XI, Fr. Cx., etc.). *Prop. Name.* EUQUININE (*Bayer Products, London*).
 $C_{20}H_{23}O_2N_2 \cdot CO_2 \cdot C_2H_5 = 396.2$.

Dose.— $1\frac{1}{2}$ to 15 grains (0.1 to 1 g.) in cachet. *F.E. VIII* gives max. *per diem* 1 drachm approx.

White needle crystals, m.p. 90° to 92° (*B.P. Add. I* not below 90°), with little taste.

Soluble sparingly in water, more so by addition of dilute acid; soluble 1 in 2 of alcohol 90%, 1 in 10 of ether, 1 in 1 of chloroform.

Useful as an almost tasteless form of quinine, especially for children. Whooping cough has been treated with it; it is sometimes useful in lessening the severity and frequency of the spasms.

Chininum Carbonicum (Fr. Cx., P. Ital. V, P. Ned. V). *Syn. and Prop. Name.* QUININE CARBONATE, ARISTOQUININE, ARISTOCHIN (*Bayer Products, London*).
 $CO(C_{20}H_{23}O_2N_2)_2 = 674.4$.

Dose.—1 to 10 grains (0.06 to 0.6 g.) according to age.

A white tasteless powder. Obtained by heating quinine with phenyl carbonate. Insoluble in water. Used in malaria, typhoid, influenza and pertussis as a tasteless substitute for quinine. Incompatible with acids and alkalis.

Quininae et Ureae Hydrochloridum (B.P.C., U.S.P. XI). *Syn.* QUININÆ HYDROCHLORO-CARBAMIDUM, UREA-QUININE.
 $C_{20}H_{24}O_2N_2 \cdot HCl, CO(NH_2)_2, HCl, 5H_2O = 547.3$.

Dose.— $\frac{1}{2}$ to 15 grains (0.03 to 1 g.), by injection. *U.S.P. XI* average hypodermic dose (once daily) 15 grains.

In small prisms, soluble 1 in about 1 of water. Contains about 59% of anhydrous quinine.

Uses. Mainly used as a local anæsthetic in doses of 3 to 5 ml. of 0.5 to 1% solution, especially for rectal operations where post-operative pain is severe, since its anæsthetic effect may last for several hours or even days. For internal hæmorrhoids the 5% solution is used, using a few minims for each pile, or the whole area may be treated by submucous injection. The method should

not be employed for external, sloughing or strangulated hæmorrhoids, or where there is local infection of the ano-rectal region. Suppositories (5 gr.) and ointment (20%) are also of value in hæmorrhoids and other painful conditions of the rectum. The injection of 4 m. of the 5% solution, repeated if necessary at 2 to 3-day intervals, has been used in anal fissure. For local application strong solutions (10 to 20%) must be used to ensure passage through the mucous membrane, and have been found of value in tonsillitis and painful throat affections.

Deep intramuscular injection of 5 ml. of 1% solution is useful in lumbago, sciatica and neuritis.

EXOPHTHALMIC GOITRE and thyroid enlargement treated by injections of 4 to 8 ml. of a 4% solution of quinine and urea hydrochloride into the thyroid. After a few treatments the goitre becomes smaller and when it is one-third of original size the treatment can be stopped, as the shrinking will continue until no tumour is perceptible. The drug is believed to act through its necrotic action on the parenchyma of the gland.—H. G. Loughran, per *Prescriber*, 1927, 173.

HÆMORRHOIDS. The injection is to be given between the vein and the mucous membrane of the rectum, and not in the vein itself. It is seldom necessary to give more than 3 ml. at one sitting. Injections given at weekly intervals, 6 to 8 being the average number required.—C. Howard, *Lancet*, i/1929, 20.

Sloughing after 5% injection in hæmorrhoids. Never inject an external pile or a prolapsed pile without first reducing it and never inject a pile that is already sclerosed.—*Lancet*, i/1930, 1027.

HYDROCELE. The injection treatment of hydrocele is favourably reported upon on all sides, the best sclerosing agent being quinine and urea hydrochloride, 3 to 5 ml. The hydrocele is tapped; after washing out the sac with more saline the solution is introduced into the hydrocele sac. The scrotum is then massaged. Although the fluid in the sac reaccumulates, within 3 or 4 weeks the exudate is generally absorbed.—H. Bailey, *Med. Annu.*, 1935, 429.

WOUNDS. For wounds which are to heal by granulation, quinine urea hydrochloride 1 in 600 should be liberally injected as a prophylactic against pain.—R. E. Farr, *Lancet*, ii/1929, 1199.

Quininae Formas ("Basic" in France). *Syn. and Prop. Name.* QUINIFORM, CHINIFORM (*Chinosolfabrik, Hamburg; C. Zimmermann, London*).

$C_{20}H_{24}O_2N_2 \cdot H \cdot COOH \cdot H_2O = 388.2$.

Dose.—1 to 5 grains (0.06 to 0.3 g.). Subcutaneously, 1 to 3 grains. (Stated not to be painful.)

White crystals, m.p. about 126°.

Quininae Formas Acidus ("Neutral" in France).

$C_{20}H_{24}O_2N_2 \cdot (H \cdot COOH)_2 = 416.2$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Long white needles; m.p. 95°.

Quininae Hydriodidum (B.P.C.). *Syn.* QUININE IODIDE.

$C_{20}H_{24}O_2N_2 \cdot HI = 452.1$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Pale yellow crystals slightly soluble in cold water, readily in hot water and in alcohol. Contains about 72% of anhydrous quinine. Has been used in chronic rheumatism.

Quininae Dihydriodidum. *Syn.* QUININÆ HYDRIODIDUM ACIDUM.

$C_{20}H_{24}O_2N_2 \cdot 2HI \cdot 5H_2O = 670.2$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Pale yellow crystals or scales, soluble 1 in 20 of water.

Quininae et Urethani Hydrochloridum.

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.).

Employed hypodermically, as it is non-irritating.

Obtained by heating quinine hydrochloride 3 with urethane 15 and water 3 parts.

Uses. This is employed mainly by injection as a sclerosing agent in varicose veins, varicocele, hæmorrhoids and nævi. It is said to be less painful than sodium salicylate and safer than sodium morrhuate.

Injectio Quininæ et Urethani (B.P.C.).

Dose.—75 minims (5 ml.), by intravenous injection.

Quinine hydrochloride 13·33% *w/v* and urethane 6·67% *w/v* in water. *Fr. Cx.* has 40% and 20% respectively.

ANGIOMA OF THE LOWER LIP treated by 14 injections over 6 months, commencing with 0·5 and increasing to 1 ml. Injections through sound skin near margin of tumour. Treatment painless.—Graham, *J. R.A.M.C.*, April, 1930.

HÆMORRHOIDS treated with quinine hydrochloride 0·8 g., urethane 0·4 g. in normal saline 2 ml.—Bellot, *Lancet*, i/1929, 1072.

Good results by injection of 3 to 5 ml. of 5% solution perivenously (into the submucous tissue round the piles), repeating the injection at weekly intervals on opposite sides.—A. H. Douthwaite, *The Injection Treatment of Varicose Veins* (H. K. Lewis), 5th Edn., 1929.

HYDROCELE OF THE TUNICA VAGINALIS treated by injection of quinine-urethane solution 2 ml. without pain or discomfort.—F. C. Pybus, *Brit. med. J.*, i/1930, 239.

NÆVI cured by injection of a minim of quinine and urethane solution into 4 or 5 different places in the nævus, repeated two or three times at fortnightly intervals.—G. B. Dowling, *Lancet*, ii/1929, 1251; *Med. Annu.*, 1931, 324.

Cavernous nævi involving the left breast and the buttock, in a girl aged 9 months, successfully treated by this method. Excision should be relegated to the past.—A. P. Bertwistle, *Lancet*, i/1934, 22.

A 20% solution of quinine dihydrochloride and urethane diluted with an equal part of 2% procaine hydrochloride (with adrenaline), was found a painless and effective sclerosing solution for vascular birthmarks in infants. From 0·1 to 0·2 ml. is injected at a time, the needle being so directed that the solution is initially injected superficially throughout the mass. Immediate blanching of the area occurs about the needle point, the needle is then advanced and the next injection placed so that its area of blanching is contiguous with the previous one. Multiple areas are thus injected until the entire lesion has been mottled with areas of blanching. 44 hemangiomas were thus treated in 30 infants varying from 2 weeks to 3 years, all with excellent ultimate results and without systemic reactions.—H. W. Kæssler, *J. Amer. med. Ass.*, i/1938, 1644.

VARICOCELE successfully treated by quinine-urethane injection (Douthwaite's formula)—one injection of 1 ml.—H. M. Hanschell, *Brit. med. J.*, ii/1928, 915.

Quinine and Urethane Injection Treatment of Varicose Veins.

The injection contains quinine hydrochloride 4 g., urethane 2 g. in distilled water 30 ml. (Injectio Quininæ et Urethani B.P.C.). The solution can be boiled and is strongly antiseptic. It crystallises out when cool but redissolves on immersing in hot water for a few seconds. The syringe should be warmed before filling with the solution.

Contraindications: Deep thrombosis, acute phlebitis, intra-abdominal tumours, cardiovascular disease, skin diseases, pregnancy. The injection should not be given during menstruation.

Initial Injection $\frac{1}{2}$ ml., and subsequently 2 to 3 ml. Injections may be given with the patient sitting or lying down—in the latter case, a pneumatic tourniquet is applied to the middle of the thigh

before the patient lies down. Clean the skin with ether and introduce needle of syringe not quite filled with solution into the lowest segment of the vein, the skin overlying the vein being drawn aside before introducing the needle. Withdraw the piston slightly and allow blood to flow into the barrel before any fluid is introduced. Inject $\frac{1}{4}$ to $\frac{1}{2}$ ml. according to size of vein and hold needle in position for 30 seconds before withdrawal. Press a pledget of wool on puncture and repeat the process 4 inches up the limb. When the total number of injections has been given, clean with ether and seal punctures with collodion dressings. Sitzings are given at weekly intervals, 6 sittings usually sufficing. Injections may be successfully given, without fear, in the region of the saphenous opening.

Injections of 2 ml. can generally be relied on to thrombose 5 to 6 inches of a vein. Injections are needed at approximately 4 to 5 inches along the course of a vein. In this way the whole saphenous tract may be treated to within about 4 inches of the saphenous opening.

After-effects. Patients should be told that small and thin-walled veins will swell up rapidly to four times their original size. The swelling passes off in a few hours and is of no importance. Sensations of fullness, aching or tenderness sometimes occur lasting three or four days; a feeling of contraction of the leg, one month after obliteration of the internal saphenous vein, passes off in a few weeks. Œdema of foot and leg occurs in about 2% of cases from 5 to 7 days after injection, persisting for some two weeks. Itching of the overlying skin (following treatment by any sclerosing solution) is relieved by application of ichthammol and Lassar's paste.

Quinine-urethane solutions appear to be the most certain in their thrombosing action; with the empty-vein technique and small doses they are extremely efficient. Quinine-urethane solutions have the additional advantage of being painless during injection.—R. T. Payne, *Brit. med. J.*, i/1936, 878.

The solution is not painless and can excite allergy, and personal idiosyncrasy is a danger. In busy clinics the patients seem to faint rather frequently and the women patients often have very violent uterine colic on the way home and premature menstruation next day.—A. Dickson Wright, *Brit. med. J.*, i/1940, 665.

Giemsa's Injection contains quinine hydrochloride 10 g., urethane 5 g., water 18 ml. The volume of the product is 30 ml., so that 1.5 ml. of solution contains 0.5 g.

Solutio Quininae et Urethani (for varicose veins) (*St. T.H.*).

Dose.—5 ml. intravenously.

Quinine hydrochloride 5% and urethane 2½% in distilled water.

Chinethan (*Richter, London*). A quinine and urethane preparation for injection. **Dose.**—2 ml. daily for three days intramuscularly, or 1 ml. once or twice weekly intravenously. Intramuscularly for malaria, pneumonia, influenza, etc., intravenously for varicose veins.

Varixol (*Evans, Sons, Lescher & Webb, Liverpool*). Quinine and urethane solution for the injection treatment of varicose veins.

Quininae Hydrobromidum (*B.P.C.*). (*P. Belg. IV, Fr. Cx. and P. Ital. V* term this "basic" quinine hydrobromide, and have 1 H₂O.)

Syn. QUININE BROMIDE. C₂₀H₂₄O₂N₂.HBr.2H₂O = 441.2.

Dose.—1 to 10 grains (0.06 to 0.6 g.) or more.

White acicular crystals, soluble 1 in 55 of water, 1 in 0.7 of alcohol 90%. Contains not less than 73% of anhydrous quinine.

Uses. Quinine is given with an excess of hydrobromic acid to lessen the cinchonism sometimes caused by large doses. The sedative action is useful in neuralgia and acute rheumatism. In exophthalmic goitre $2\frac{1}{2}$ gr. doses thrice daily are said to have given good results. Tropical abscess has been treated by aspiration and injecting into the cavity a 1% solution.

Quininæ Hydrochloridum (*B.P., P. Helv. V, etc.*). *F.E.* VIII, *P. Belg. IV* and *Fr. Cx.* term this "basic" quinine hydrochloride. *Syn.* QUININE HYDROCHLORATE.

$C_{20}H_{24}O_2N_2 \cdot HCl \cdot 2H_2O = 396.7$.

Dose.—1 to 10 grains (0.06 to 0.6 g.). *F.E.* has max. daily dose 2 g.

Contains about 82% of anhydrous quinine. Efflorescent in warm air.

Soluble 1 in 32 of water, 1 in 2 of 90% alcohol, about 1 in 1 of chloroform, but insoluble in acetone. Quinine hydrochloride 2 with phenazone 1 will dissolve in 4 of water.

Incomparable. Similar to quinine sulphate.

Uses. Quinine hydrochloride is more soluble and more readily absorbed than quinine sulphate, and is less irritating to the gastric mucosa. It is employed similarly to the sulphate in malaria and may also be used by injection, though for this purpose the dihydrochloride is more usually employed.

For the paroxysmal headache or neuralgia so common after malaria the following mixture is recommended:—Quinine hydrochloride 3 gr., tincture of cimicifuga 5 m., caffeine citrate 2 gr., spirit of chloroform 10 m., compound infusion of orange to 1 oz., twice daily.

In acute tonsillitis, quinine hydrochloride internally and as mouth-wash is useful; also with dilute nitric acid in cachectic cases of vesicular stomatitis. In conjunction with urethane, quinine hydrochloride is extensively used in the injection treatment of varicose veins, *see* p. 881.

LOCAL ANÆSTHESIA IN TONSILLECTOMY. Quinine hydrochloride $\frac{1}{2}$ gr. in 2 dr. of water is said to be superior to 0.2% cocaine (5 ml.). A small amount of 20% cocaine is first applied.

MYOTONIA. From $2\frac{1}{2}$ to 5, 10, or 15 gr. of quinine hydrochloride two or three times a day by mouth consistently eliminates myotonus as a disturbing symptom.—*F. Kennedy* and *A. Wolf, J. Amer. med. Ass., i/1938, 198.*

Collyrium Quininæ Hydrochloridi (*B.P.C.*). 0.5% *w/v*.

[*P*] **Mistura Quininæ et Magnesii Sulphatis** (*L.H.*). Quinine hydrochloride 1 gr., magnesium sulphate 30 gr., dilute hydrochloric acid 1 m., solution of arsenic 3 m., solution of strychnine hydrochloride 3 m., water to 1 oz. For use during treatment of stomatitis and gingivitis.

Nebula Quininæ. Quinine hydrochloride 10 gr., glycerin and rose water to 1 oz.

Pessus Quininæ Hydrochloridi contains 3 gr. (0.2 g.) in 30 gr. of oil of theobroma. A valuable remedy for leucorrhœa. Also used as a contraceptive. †

Contraceptive action of pessaries with cocoa butter basis probably largely due to mechanical action, i.e., the covering of the cervix with a thin film impeding the ingress of the spermatozoa.—*Lancet*, ii/1931, 258.

At the B.M.A. Cent. Meeting, 1932 (Sect. of Dermat. and Vener. Dis.) several speakers quoted cases of dermatitis, due to quinine idiosyncrasy, following the use of quinine pessaries.—*Lancet*, ii/1932, 399.

Now that substances are available which are not only more spermicidal but also free from any harmful and remote effects on the users, it would seem that the time has come to abandon the use of quinine for contraceptive purposes.—*Lancet*, ii/1935, 1133.

Rendell's Quinine Pessaries (*W. J. Rendell, London*). Pessaries weigh 36.6 gr. and contain 3.5% of quinine, equivalent to 2.16 gr. of quinine acid sulphate.

For further references to contraceptives, see under *Acidum Lacticum*, *Chloramina*, *Potassii Hydroxyquinolini Sulphas* and *Hexyl-resorcinol*.

[D-P1-81] **Pulvis Quininae, Arseni, Hydrargyri et Ipecacuanhae Compositus**.

Quinine hydrochloride 5 to 7 gr., arsenious acid $\frac{1}{10}$ to $\frac{1}{4}$ gr., Dover's powder 8 to 4 gr., calomel $\frac{1}{10}$ to $\frac{1}{4}$ gr. In a cachet; one to be taken at 11 a.m. and another at bedtime. In chronic malaria with enlarged spleen.

Solutum Chinini Compositum (*Fr. Cx.*).

Quinine hydrochloride 3 g., phenazone 2 g., boiled and cooled distilled water to 10 ml. Special instructions as to sterilisation are provided.

Tinctura Quininae (*B.P.C.*). *Dose*.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Quinine hydrochloride 1, tincture of orange 50. A very agreeable form of taking small doses of quinine.

Vinum Quininae (*B.P.C.*). *Dose*.— $\frac{1}{2}$ to 1 ounce (16 to 30 ml.).

Contains 1 gr. of quinine hydrochloride dissolved in 1 oz. of orange wine.

The Customs and Excise Commissioners allow the sale of quinine wine without licence if:—(a) It is prepared in accordance with the B.P.C.; (b) Sales are made only by duly qualified chemists and druggists; and (c) It is labelled to show that it is to be used as a medicine. The word "Dose" should appear on the label in bold type. This should not exceed the B.P.C. dose, but the Board do not object to the use instead of the words "one or two tablespoonfuls," or "half a wineglassful."

Solvochin (*Camden Chemical Co., London*). Water-soluble quinine ("quinine-hydrate-phenazone-basic quinine-hydrochloride"). *Dose*.—In pneumonia, 2 ml. daily on 3 successive days, intramuscularly; in malaria and obstetrics (to promote uterine contraction), 1 or 2 intramuscular injections of 2 ml. daily.

Solvochin-Calcium (*Camden Chemical Co., London*). A preparation of Solvochin with calcium glutamate, one 5 ml. ampoule containing 250 mg. of quinine as hydrochloride and 72 mg. of calcium. In pneumococcal pneumonia. *Dose*.—One ampoule (5 ml.) once or twice daily by intragastral injection.

Quinine Hypophosphis (*B.P.C.*). $C_{20}H_{24}O_2N_2 \cdot H_2PO_2 \cdot 2H_2O = 426.3$.

A white crystalline or amorphous powder, soluble 1 in 24 of water and 1 in 40 of alcohol 90%. Contains about 75% of anhydrous quinine.

Quinine Lactas (*B.P.C.*). $C_{20}H_{24}O_2N_2 \cdot CH_3 \cdot CHO \cdot COOH = 414.3$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

A crystalline or granular white powder, soluble 1 in 6 of water. Said to be well tolerated; is suitable for hypodermic injection. Contains not less than 72% of anhydrous quinine.

A 1% solution has been used as an injection in gonorrhœa.

VARICOSE VEINS. Preferable to the hydrochloride which is apt to cause severe reactions. Employed as a 10 or 15% solution, also as a saturated solution

(16-6%) on 170 patients, with good results. It is self-sterilising in solutions above 1% and solutions keep well. The dose for each injection varies from 0.25 to as much as 3 ml. in large veins.—J. W. Riddoch, *Lancet*, ii/1934, 1101.

Quininæ Phosphas (B.P.C.). ($C_{20}H_{24}O_2N_2$)₂·2H₃PO₄·6H₂O = 1277.0.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

In acicular crystals like the sulphate, but harder and denser. Contains about 75% of anhydrous quinine. Soluble 1 in 850 of water and 1 in 110 of alcohol 90%.

Quininæ Salicylas (B.P.C., F.E. VIII, P. Ital. V).

$C_{20}H_{24}O_2N_2$ ·C₆H₄(OH)·COOH·H₂O = 480.3.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

White crystals, sparingly soluble in water, and about 1 in 24 of alcohol 90%. Incompatible with mineral acids—salicylic acid may crystallise out. Contains about 69% of anhydrous quinine. Should be given in cachets, or pills made with syrup of glucose, or as quinine salicylate mixture. Given to abort the common cold, in influenza and in neuralgia, rheumatism and sciatica.

Mistura Quininæ Salicylatis (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains ammoniated solution of quinine 30 m., sodium salicylate 10 gr., and potassium citrate 10 gr. in glycerin and compound infusion of gentian to 1 oz.

Quininæ Sulphas (B.P.). (Termed "BASIC" QUININE SULPHATE in *Fr. Cx.*, *P. Ital. V.* and *F.E. VIII.*).

($C_{20}H_{24}O_2N_2$)₂·H₂SO₄·7 $\frac{1}{2}$ H₂O = 881.6. Water content varies among the National Pharmacopœias. *P. Jap.*, F.E. VIII, P. Ital. V, *P. Ned. V* and *P.G. VI*, 8H₂O; *P. Belg.*, 7H₂O; *U.S.P. XI*, *Fr. Cx.* and *P. Helv. V*, 2H₂O; *P. Dan.*, 7 to 8 H₂O.

Dose.—1 to 10 grains (0.06 to 0.6 g.). *U.S.P. XI* average dose 15 grains. *F.E. VIII* gives max. daily dose 2 g.

White silky crystals containing about 75% of anhydrous quinine.

Soluble 1 in 800 of cold water, 1 in about 65 of alcohol 90%, 1 in 40 of glycerin.

It is prescribed in pill, cachet, tablet or mixture—if in mixture 1 m. of dilute sulphuric acid per gr. of sulphate will render soluble (with fluorescence).

Incompatible with alkalis and alkaline carbonates, also incompatible with Liquor Ammonii Acetatis (unless distinctly acid in reaction), iodides and astringent infusions containing tannin.

Uses. Quinine sulphate has the general properties of quinine and is the most commonly used of the salts. Large doses are given in malaria and intermittent fevers and smaller doses in continued fevers and neuralgia, and to improve the appetite. A mixture frequently employed in hospitals is 5 to 10 gr. of quinine sulphate with 5 to 10 m. of dilute sulphuric acid in an ounce of water; this is more rapidly absorbed than powder or tablets. For external use 0.5% solutions may be employed as a spray in hay fever and a 0.2% solution is of value in corneal ulcer.

MYOTONIA. By giving 0.6 g. of quinine sulphate by mouth three or four times daily patients with myotonia atrophica can be kept free from the symptoms of myotonia. Smaller doses are ineffective and the treatment must be continued almost indefinitely.—Kolb, Harvey and Whitehill, per *Brit. med. J.*, ii/1938, 77.

Capsulæ Quininae Ammoniatæ (B.P.C.). *Dose.*—1 capsule. Contain quinine sulphate and ammonium bicarbonate approximately equivalent to 1 dr. of ammoniated solution of quinine.

Capsulæ Quininae Ammoniatæ et Cinnamomi (B.P.C.).

Dose.—1 capsule.

Similar to the preceding but containing also $\frac{1}{2}$ m. of oil of cinnamon.

Capsulæ Quininae et Cinnamomi (B.P.C.). *Dose.*—1 capsule.

Quinine sulphate 1 gr., oil of cinnamon 1 m.

Collunarium Quininae. Quinine sulphate 1, water 1000.

Used in hay-fever. If a stronger solution be required, use the acid sulphate or hydrochloride of quinine; avoid excess of acid.

Elixir Quininae Ammoniatum et Cinnamomi (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A flavoured preparation of approximately the same strength as ammoniated solution of quinine and containing also oil of cinnamon. When using this formula the volume of syrup of orange should be reduced to 7 fluid ounces.

Liquor Quininae Ammoniatæ (B.P.). *Syn.* TINCTURA QUININÆ AMMONIATA. *Dose.*— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Quinine sulphate 2% and dilute solution of ammonia 10%, in alcohol (60%). The quinine precipitates on adding to water; mucilage of tragacanth will suspend the precipitate. With syrup of orange it is palatable, and bears dilution better; it remains bright if mixed with aerated water. Should be kept in the dark, or it will become discoloured.

Ammoniated Quinine Tablets are prepared, each equivalent in quinine sulphate to 1 drachm of the preceding solution, but the ammonia content is variable.

Mistura Chlori cum Quinina (Burney Yeo).

To potassium chlorate, in powder, 30 gr., in a 12-ounce bottle, add hydrochloric acid 60 m.; cork and shake well to liberate chlorine; absorb this by gradually adding, and shaking after each addition, distilled water *q.s.* to 11 oz.; add quinine sulphate 24 gr. (or 36 gr. if ordered), syrup of orange 1 oz. *Dose.*—1 ounce (30 ml.) every 2, 3, or 4 hours for typhoid; it quickly cleanses the tongue.

Mist. Ferri et Quin. (N.I.F.). Quinine sulphate 1 gr., solution of ferric chloride 10 m., dilute hydrochloric acid 1 m., chloroform water to $\frac{1}{2}$ oz.

Mistura Quininae Ammoniatæ (St. M. H.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Ammoniated solution of quinine 1 dr., dilute solution of ammonium acetate 2 dr., sodium nitrite 1 gr., mucilage of tragacanth 1 dr., chloroform water to 1 oz.

[P1] **Mistura Quininae Composita (L.H.).** *Syn.* BROADBENT'S MIXTURE.

Ammoniated solution of quinine 1 dr., strong solution of ammonium acetate 15 m., camphorated tincture of opium $\frac{1}{2}$ dr., ammonium carbonate 2 gr., tragacanth $\frac{1}{2}$ gr., peppermint water to $\frac{1}{2}$ oz.

Mistura Quininae Effervescent.

Quinine has a reputation in colds, but it is best given in effervescent mixtures. The following prescription is useful:—

Mixture A.—Quinine sulphate 2½ gr., citric acid 10 gr., water to $\frac{1}{2}$ oz.

Mixture B.—Potassium bicarbonate 10 gr., ammonium carbonate 2½ gr., syrup of orange 1 dr., water to 1 oz.

One tablespoonful of mixture (A) with two of mixture (B) in effervescence thrice daily.

[P1] **Mist. Quin. et Gelsem. (N.I.F.).** Quinine sulphate 1½ gr., potassium bromide 7½ gr., dilute hydrobromic acid 7½ m., tincture of gelsemium 7½ m., chloroform water to $\frac{1}{2}$ oz.

Mist. Quin. Sulph. (N.I.F.). Quinine sulphate 1½ gr., dilute hydrobromic acid 10 m., concentrated infusion of orange 7½ m., chloroform water to $\frac{1}{2}$ oz.

[D-P1-81] Pilula Quininae, Hydrargyri et Opii.

Quinine sulphate 1½ gr., grey powder 1 gr., opium ½ gr., quassia extract q.s., thrice daily after food. In syphilis quinine is useful before or after a course of mercury.

Pilulae Quininae Sulphatis (B.P.C.). Dose.—1 to 4 pills. 2 gr.

[P1] Rhinitis Tablets (Parke, Davis, London). Powdered camphor ½ gr., quinine sulphate ½ gr., fluid extract of belladonna root ¼ m. in each tablet. Dose.—1 to 2 every two hours.

Quininae Tannas (B.P., P. Helv. V, P.G. VI, P. Ned. V).

Dose.—1½ to 15 grains (0.1 to 1 g.).

An amorphous yellowish-white powder, obtained by the decomposition of the sulphate with a solution of tannin. Contains from 30 to 35% of anhydrous quinine.

Soluble slightly in water and about 1 in 3 of alcohol 90%.

Being almost tasteless it is recommended for children, to be given in milk, but the slow dissociation in the intestines may be a disadvantage.

Quininae Valerianas (B.P.C.). (Termed "basic" in *Fr. Cx.* and *P. Ital. V*). $C_{20}H_{24}O_2N_2 \cdot C_6H_5 \cdot COOH, H_2O = 444.3$.

Dose.—1 to 3 grains (0.06 to 0.2 g.).

White crystals, or powder with slight valerianic odour. Contains not less than 71% of anhydrous quinine.

Soluble 1 in 120 of water, 1 in 2 of alcohol 90%.

Pilulae Ferri Valerianatis Compositae (B.P.C.). *Syn. PILULAE TRIUM VALERIANATUM.*

Dose.—1 or 2 pills. Contain 1 gr. each of the valerianates of iron, quinine and zinc. For nervous headache and hysteria. Have been found of value in paroxysmal sneezing.

Cinchona Febrifuge.

Originally this product consisted of the mixed alkaloids from *C. succirubra*. Owing to the cultivation of other species and of hybrids yielding more quinine, cinchona febrifuge has become a very variable product. For analyses of different samples, see J. A. Goodson and T. A. Henry, *Quart. J. Pharm.*, 1930, 238.

The following formula is said to be superior to any other in prophylaxis and superior to quinine in chronic cases of malarial fever as a remedial measure: Powdered cinchona febrifuge 10 gr., citric acid 20 gr., magnesium sulphate 20 gr., spirit of anise 10 m., syrup to ½ oz. Dose.—½ ounce 2 hours after meals.

In recent years *C. Ledgeriana* has been encouraged (to increase quinine production) at the expense of the other alkaloids. Recent samples of cinchona febrifuge suggest they have been made from *C. Ledgeriana* after the extraction of the quinine, and they contained greater amounts of amorphous alkaloids and quinidine. Although it is believed that cinchona alkaloids have equal anti-malarial action, it is important to have a definite standard.—*Brit. med. J.*, i/1930, 27.

Cinchona febrifuge has never attained any great popularity in India, and its consumption is on the decline.—*Brit. med. J.*, i/1933, 923.

Quinetum (B.P.C.).

Dose.—1 to 10 grains (0.06 to 0.6 g.).

As defined by the Malaria Commission of the League of Nations in 1931, it consists of a mixture of equal parts of quinine, cinchonidine and cinchonine, thus corresponding approximately to the

relative proportions of these alkaloids in the total alkaloids of red cinchona bark. It is more constant in composition than cinchona febrifuge and is given by mouth in the treatment of benign and malignant tertian malaria.

Totaquina (B.P.).

Dose.—1 to 10 grains (0.06 to 0.6 g.).

A nearly white, pale yellowish-grey, or pale brown powder consisting of a mixture of alkaloids. It contains not less than 70% of crystallisable cinchona alkaloids, of which not less than one-fifth is quinine.

Soluble almost completely in warm alcohol 95% and in chloroform; partially soluble in ether, benzene and light petroleum; almost insoluble in water.

Field trials carried out under the auspices of the Health Organisation of the League of Nations in Rumania, Nanking, Kuala Lumpur, and other places, show that totaquina acts like quinine as a potent remedy in all forms of malaria. As this was not a carefully controlled experiment, however, it is not possible to decide from it whether totaquina is a little better than quinine or not quite so good. Two types of totaquina were used in the tests, Type I, made direct from the bark of *C. succirubra*, and Type II, made from residues of quinine extraction and adjusted to the Malaria Commission's standard specification. The observations made at the different centres were not sufficiently precise and unanimous to warrant a final decision on the relative merits of the different samples.—E. J. Pampana and William Fletcher, *Quart. Bull. Hlth Org., L. o. N.*, Sept., 1934.

The Malaria Commission, as a result of these experiments and Dr. Fletcher's Report, considered that "Totaquina seems able to fulfil the purpose for which it was intended, since, having regard to its efficacy—equal to or only slightly less than that of quinine—facility of preparation and cost price, its use would enable malaria treatment to be extended over a wider field."—*Quart. Bull. Hlth Org., L. o. N.*, Sept., 1934.

Adult male prisoners in Lahore who were suffering from malaria were treated with quinine and totaquina, types I and II, in strict rotation, according to the method recommended by the League of Nations. In benign and malignant tertian malaria there was no distinct difference in efficacy between quinine and the two types of totaquina in causing the disappearance of parasites and fever. The evidence as to toxicity was not very reliable. It failed to show any significant difference in toxicity between quinine and the two types of totaquina.—E. P. Hicks and S. D. Chand, *Indian med. Gaz.*, 1935, 579.

From clinical tests, using an experimental batch of Philippine totaquina in doses of 0.6 g. three times daily, it is concluded that the combination is about equal to quinine sulphate in its therapeutic effect. It does not destroy the crescents of subtertian malaria, being similar in this respect to quinine and Atebrin, but schizonts and gametocytes of benign tertian disappear in two to three days. Addition of Plasmoquine to the treatment clears the blood of crescents. No untoward effects were observed.—Marañon, Perez and Russell, *Philipp. J. Sci.*, 1935, 56, 231.

The treatment of a large series of cases of benign and malignant tertian malaria with totaquina II and with quinine has shown that these two drugs are about equal in clinical value. It proved to be no more toxic, while its cost is about half that of quinine hydrochloride and three-quarters that of quinine

sulphate. Totaquina is thus an effective anti-malarial remedy and can be safely substituted for quinine with a consequent considerable saving in expenditure.—A. N. Kingsbury, *Rep. Inst. med. Res., F.M.S., 1937, 4.*

Pamaquina. *Syn. and Prop. Names.* BEPROCHIN, PLASMOCHIN, PLASMOQUINE (Bayer Products, London), PREQUINE (Pharmaceutical Specialities (May & Baker) Ltd., London).

$C_{19}H_{29}ON_3 = 315.45.$

Dose.— $\frac{1}{8}$ grain (0.01 g.).

Pamaquin is a synthetic antimalarial substance consisting of N-(ω -diethylamino- α -methylbutylamino)-6-methoxyquinoline. It occurs as a pale yellow, granular powder.

Insoluble in water; readily soluble in alcohol.

Uses. Pamaquin is used either alone or, more frequently, in combination with quinine (or mepacrine hydrochloride, *q.v.*). Its antimalarial action is the reverse of quinine in that it acts more powerfully on the gametocytes than on the schizonts. It is most effective in benign tertian and quartan malaria, but is less efficient than quinine in subtertian infection. A combination of the two drugs is therefore the ideal procedure, and a dosage of 0.01 g. of pamaquin and 0.125 g. of quinine three times daily for a week is usually effective in curing tertian and quartan malaria, and relapses are said not to occur so frequently as with quinine. Owing to its action in destroying the gametocytes of all types of malaria it is of particular value as a prophylactic and it reduces the danger of conveying infection. The use of pamaquin is especially indicated in quinine idiosyncrasy, in blackwater fever, and in malaria in pregnancy. The drug is usually well tolerated, especially by children, but large doses may give rise to cyanosis, epigastric pains and methæmoglobinuria. It is best taken after meals, and it is advisable not to exceed a dose of 0.06 g. daily.

Plasmoquine assists malariologists as follows: (1) In minute doses given to gametocyte carriers prevents infection of mosquitoes. (2) In dose of 0.06 g. spread over a week it removes gametocytes from the blood. (3) In somewhat larger doses it prevents infection after injection of sporozoites. (4) In 2 treatments (0.06 g. over a week) it prevents relapses, reduces number of carriers, and so reduces number of infections.

Badly infected estates in Ceylon in which antilarval measures were impossible kept practically free from malaria for more than two years by anti-gametocyte dosing with Plasmoquine.—Lt.-Col. W. W. Clemesha, *Lancet*, 1/1932, 750.

There is no satisfactory drug in existence which, taken in therapeutic doses, will prevent contraction of malaria after bites from infected mosquitoes. Plasmoquine in maximum therapeutic doses can be tolerated for 8 days or more and has the same effect as a true causal prophylactic should have, but as the prophylactic dose is too near the toxic dose to be safely taken for more than a few days it is of little value in the prevention of malaria. Plasmoquine, either alone or in combination with quinine, is not recommended for the treatment of malaria. Small doses (0.02 g.) have little or no curative action on asexual forms of the malarial parasites and daily doses of 0.06 to 0.08 g. may cause cyanosis, fatigue, profuse perspiration, or cardiac symptoms.—Col. S. P. James, Health Organisation of the League of Nations, *Brit. med. J.*, ii/1933, 928.

It is admitted that, with a daily dosage of 0.06 g. or over, toxic symptoms are of common occurrence, but with the smaller doses which are in common use for the routine treatment of malaria, *e.g.*, 0.015 g., severe toxic complications are of comparatively rare occurrence. Unable to agree with the findings of the Malaria Commission that the combined quinine and Plasmoquine treatment for benign tertian malaria is "of doubtful value." If one is to condemn the use of

this valuable drug, Plasmoquine, because of a relatively small number of cases of serious results often due to improper individual dosage or supervision, one should equally condemn many of the new arsenical preparations used in the treatment of syphilis and other diseases.—J. A. Sinton, *Quart. Bull. Hith Org., L.o.N.*, 1935, 657.

The prophylactic value of quinine rather doubted by Army experts; evidence in favour of Plasmoquine obtained, but lower doses ineffective and toxicity of higher doses led to doubts as to use on large scale. As a therapeutic agent, however, it established its position during 1932, the average relapse rate during 1927-31 being 277 per 1000 and for 1932 in Plasmoquine-treated patients 20 to 47 per 1000.—Army Health Rept. 1932, *Brit. med. J.*, i/1934, 253.

Quino-Plasmoquine (*Bayer Products, London*). *Syn.* QUINO-BEPROCHIN.

A preparation of Plasmoquine and quinine sulphate, in tablets containing Plasmoquine 0.01 g. and quinine sulphate 0.3 g.

Uses. The insufficient action of Plasmoquine on the ring forms and schizonts of subtertian malaria led to the use of this combination, which has now largely replaced the use of Plasmoquine alone. For the treatment of all types of malaria, especially subtertian, from 3 to 4 tablets are given daily and a complete cure may be expected within 2 or 3 weeks.

Plasmoquine Compound (*Bayer Products, London*). This is a similar combination to Quino-Plasmoquine, but with a smaller dosage of quinine (tablets contain 0.01 g. Plasmoquine and 0.125 g. quinine sulphate). It is used similarly to Quino-Plasmoquine.

Mepacrinæ Hydrochloridum (*B.P. Add. III*).

Syn. and Prop. Names. ATABRIN, CHINACRIN, ERION, ATEBRIN (*Bayer Products, London*), QUINACRINE (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

$C_{23}H_{30}ON_3Cl, 2HCl, 2H_2O = 508.7$.

Dose.— $\frac{1}{2}$ to $1\frac{1}{2}$ grains (0.05 to 0.1 g.). (*B.P. Add. III* gives the metric dose incorrectly as 0.05 to 1.0 g.).

The dihydrochloride of 2-chloro-5-(ω -diethylamino- α -methylbutylamino)-7-methoxyacridine, prepared synthetically. It is a yellow, crystalline powder with a bitter taste.

Soluble 1 in about 30 of water, giving a neutral solution; also soluble in alcohol.

Stability in Solution. Aqueous solutions undergo hydrolysis especially when heated. The cyclical component, 2-methoxy-6-chloroacridone, is precipitated as a yellow crystalline powder. Injections should be given as soon as possible after preparation, and aqueous solutions for oral administration should be given not later than 12 hours after preparation.—F. Mietzsch, H. Mauss and G. Hecht, *Indian med. Gaz.*, 1936, 521.

Uses. Mepacrine hydrochloride has a specific parasitotropic action in malaria. It affects both the gametocytes and the schizonts in tertian and quartan malaria, but acts only on schizonts in subtertian malaria, in which condition it is best given in association with pamaquin. The advantages claimed for mepacrine hydrochloride are that its action is prompt, it is pleasant to take, its toxicity is low, and relapses are rare. It is well tolerated by children and pregnant women and is of value in blackwater fever and quinine idiosyncrasy. Most cases of malaria are cured within a week, and a daily dose of 0.1 g. is stated to be more effective in keeping infected persons free from fever than a daily dose of 5 gr.

of quinine. In ordinary therapeutic doses it does not usually give rise to toxic symptoms, but with comparatively large doses there may be epigastric pain, mild diarrhoea, and a yellow discoloration of the skin and conjunctiva. The discoloration, which disappears within a week or two, is not due to jaundice but to delayed excretion of the drug through the skin.

In a daily dose of 1 tablet (0.1 g.) is effective as a clinical prophylactic but cannot ordinarily be used for the purpose as even this small dose quickly colours the skin yellow. It is, however, as efficient as quinine in the control of malarial paroxysms, and in cases with severe vomiting or other malignant symptoms, may be given intravenously or intramuscularly, a suitable dose intravenously being 0.3 g. in 5 ml. normal saline.—Col. S. P. James, Health Organisation of the League of Nations, *Brit. med. J.*, ii/1933, 928.

Signs of toxicity observed in Europeans were headache in one case and abdominal pain (responding to diet and alkalis) in 12% of cases. A combination of Atebrin and Plasmoquine more toxic than Atebrin alone and should never be used in the febrile stage of subtertian malaria. Relapse rate reduced from 60 to 43%, and treatment beyond 5 days probably does not lessen tendency to relapse, 1.5 g. being the optimum adult dose.—P. D. Johnson, *Brit. med. J.*, i/1934, 473. See also E. J. R. MacMahon, *ibid.*, 477.

In subtertian malaria it is necessary to give a 5-days course of Plasmoquine in addition. Results so favourable that Atebrin and not quinine is now the drug in ordinary use for the treatment of malaria on estates served by the Malacca Agricultural Medical Board (Straits Settlements).—A. L. Hoops, *Brit. med. J.*, i/1933, 993.

To-day it is justifiable to regard Atebrin as an anti-schizont remedy the value of which has been established in practice and with which a successful course of treatment can be carried out in a remarkably short space of time.—F. M. Peter, *Trans. R. Soc. trop. Med. Hyg.*, 1935, 50.

Atebrin is the best drug available for the controlled treatment of all types of malaria in Malaya, where effective oral administration is preferable to injection.—A. L. Hoops, *Trans. R. Soc. trop. Med. Hyg.*, 1935, 249.

Mass treatment with Atebrin was given to labour forces on several malarial areas in Malaya. Atebrin was given in varying doses for periods up to four months without any apparent ill-effects and without upsetting the labour forces. No serious toxic effects such as mental symptoms were seen amongst the many thousands of coolies treated. A certain number of cases of colic occurred—approximately 3%.—R. B. Wallace, *J. trop. Med. (Hyg.)*, 1936, 39.

As the result of an investigation carried out over the past three years, the Malaria Research Division of the F.M.S. reports that the smallest effective quantity of Atebrin for the control of clinical malaria in adults is 0.3 g. given as a single dose at weekly intervals.—A. N. Kingsbury, *Rep. Inst. med. Res., F.M.S.*, 1937, 4.

Atebrin Psychosis. Earliest symptoms are mental exhilaration and insomnia controlled only by drastic sedatives. This is soon followed by unrest and continuous and uncontrollable verbosity which progresses until the patient is walking the floor and almost shrieking, the language being coherent and usually an elaboration of some recent experience. The patient lashes out at surrounding objects or at those attempting restraint. This condition merges into a somnolent delirium. On regaining consciousness there is mental confusion with complete disorientation. This may clear up in a few days or become chronic.—C. C. Turner, *per Trop. Dis. Bull.*, 1937, 151.

Comparison of Atebrin and Quinine for Prophylaxis.—Observations were made for varying periods up to one year on 1253 individuals on two malarious plantations in Selangor, Federated Malay States, the predominant parasites on the estates being, respectively, *P. vivax* and *P. falciparum*. One group received 0.2 g. of Atebrin on each of two successive days each week, another group received 0.4 g. of quinine dihydrochloride daily (the dosage quoted is that for adults), and a third group as a control received a coloured tablet. Prophylactic treatment, both with Atebrin and with quinine, effected a marked reduction in the number of attacks, the Atebrin being somewhat more potent than the quinine. When administration of the drugs was suspended there was a rapid return of the clinical signs of malaria, and it was suggested that this post-prophylaxis malaria was due to the reappearance of infections which had been clinically

and histologically hidden during treatment, the action of the drugs being, in effect, to prolong the incubation period. While the complete safety of prolonged Atebrin administration was not definitely proved, it appeared that the risks are not of a high order.—J. W. Field, J. C. Niven and E. P. Hodgkin, *Bull. Hlth Org. L.o.N.*, 1937, 236.

LAMBLLIA INFECTIONS. The good therapeutic results obtained in the treatment of lamblia infections of the intestine by the oral administration of Atebrin have been verified by a number of workers. The dosage consists of 0.1 g. three times daily only, if necessary, after food for five days. It may also be employed as a vaginal douche to get rid of *Trichomonas vaginalis*.—N. H. Fairley, *Practitioner*, ii/1939, 500.

Atebrin has a specific action in the eradication of giardia infections. Abstracts of numerous papers to this effect.—*Trop. Dis. Bull.*, 1940, 377.

ORIENTAL SORE. Solution of Atebrin injected into the skin round oriental sores rapidly destroys the parasites and cures the disease. The dose administered at one sitting commences at 0.05 to 0.1 g. in 1 or 2 ml. of distilled water, and is increased at subsequent sittings to 0.3 g. In some cases only a single injection is required to bring about a cure.—F. Flarer, *Trop. Dis. Bull.*, 1939, 454.

Mepacrinæ Methanosulphonas (B.P. Add. III).

Prop. Names. ATEBRIN MUSONAT (Bayer Products, London), QUINACRINE SOLUBLE (Pharmaceutical Specialities (May & Baker) Ltd., London). $C_{23}H_{30}ON_3Cl, 2CH_3SO_3H = 591.9$.

Dose.— $\frac{3}{4}$ to $1\frac{1}{2}$ grains (0.05 to 0.1 g.), by intramuscular injection.

The dimethanesulphonate of mepacrine, a yellow crystalline substance with a bitter taste.

Soluble 1 in 3 of water and 1 in 36 of alcohol 95%.

Uses. As for mepacrine hydrochloride, but is especially indicated where there is an abnormally large invasion of parasites and severe complications. It is best given intramuscularly, but if given intravenously the single dose of 0.1 g. should not be exceeded and the injection should be given very slowly. This dose should be dissolved, when required for use, in 3 ml. of sterile distilled water. Solutions must not be heated or stored for any length of time.

Death following intramuscular injection. It seems difficult to be certain beforehand whether a patient will react badly to Atebrin, and also difficult to increase its excretion once a full therapeutic dose has been injected.—P. B. Fernando and E. M. Wijerama, *Lancet*, ii/1935, 1056.

Among adults, pregnant women have been found particularly liable to collapse after injections. Convulsions due to malaria were of frequent occurrence among children in the early stages of the epidemic. Convulsions occurring a few minutes or hours after an Atebrin injection and attributed to the Atebrin injection have occurred in both children and adults. They were always fatal.—R. Briercliffe, Report on the Malaria Epidemic in Ceylon, per *Lancet*, ii/1935, 1078.

Two intramuscular injections of 0.375 g. at an interval of 24 hours brought the temperature down in the majority of cases and caused disappearance of the asexual stages of the parasites (whether *P. vivax* or *P. falciparum*) as a rule within 3 days. Ill-nourished children are likely to collapse shortly after the injection, with vomiting, giddiness and fainting. Unable to arrive at the conclusion that treatment with Atebrin Musonate is in any way superior to that of quinine as regards immediate effects, though the injections are painless.—S. Somasundram, *Trans. R. Soc. trop. Med. Hyg.*, 1935, 104.

Owing to the very slow excretion or destruction of Atebrin in the body it seems unnecessary to exceed for intravenous injection the dose of 0.1 g., for an adult. The margin of safety is probably not great and intravenous injection should be resorted to only in emergency. The injections should be made very slowly and timed to take several minutes for completion. The total injection over a period of twenty-four hours should not exceed 0.3 g.

Untoward effects of Atebrin appear to include: gasping or accelerated respiration, circulatory failure, collapse, vomiting, possibly rise of temperature,

psychoses, loss of appetite and of weight, abdominal pain, headache, diarrhoea, yellowed sclera, rather persistent yellowing of the skin.

In view of the very slow excretion or destruction of the drug in the body, it is reasonable to consider that a course of treatment with it should not be repeated within a period of, say, eight weeks, and that the drug should be taken under supervision of a physician.—W. T. Dawson, W. Gingrich, and E. D. Hollar, *Amer. J. trop. Med.*, 1935, 15, 515.

There were no toxic symptoms following intravenous or intramuscular injection in 34 cases, and inadvertent escape of the solution into the subcutaneous tissues caused no inflammation. As far as can be judged from a small series of cases, Atebrin Musonate is better given intramuscularly, and three daily doses or possibly four appear to be adequate. It may be necessary to revise this opinion if it is found that larger doses can be safely given intravenously. The cost of three intramuscular doses of Atebrin Musonate, 0.375 g. each, is four times that of 1 ounce of quinine or of a course of 15 tablets of Atebrin dihydrochloride. Atebrin Musonate would thus be uneconomical for routine use in natives, but the slight inconvenience involved and lack of all unpleasant toxic symptoms, make it a strong rival to quinine and oral Atebrin for patients able to bear the expense.—J. A. Carman and R. P. Cormack, *Trans. R. Soc. trop. Med. Hyg.*, Jan., 1936, 395.

Atebrin Compound ("ATEPE") (*Bayer Products, London*). Tablets containing 0.1 g. of Atebrin and 0.005 g. of Plasmoquine, the dose for adults being 3 tablets daily for 5 to 7 days, and as a prophylactic 4 tablets per week.

Certuna (*Bayer Products, London*). Dimethyl-amino-oxyquinolyl-amino-butane. A preparation with a specific action on the crescents of *Plasmodium falciparum* (subtertian malaria), for use either alone or in combination with Atebrin. It is available in tablets of 0.02 g. *Dose*.—For the treatment of the malarial attack Certuna should be combined with Atebrin, the Atebrin doses of 0.3 g. given for 5 to 7 days being supplemented by daily doses of 0.03 to 0.06 g. Certuna, which can be given at once or divided into three separate doses. Administration for three consecutive days gives good results, but the doses may be continued for 6 to 7 days. Prophylactically, a dose of 0.06 g. Certuna exerts a sufficient damaging effect on the crescents.

Of value as a gametocide in malignant tertian malaria. In doses of 0.02 g. daily for 5 days it produced no toxic signs. In severe cases it is recommended to give injections of 0.3 g. of Atebrin followed by oral Atebrin (0.1 g. thrice daily) for 4 days or more. When temperature has dropped to normal and there are crescents in the blood give 0.01 g. Certuna with 0.1 g. Atebrin thrice daily. When crescents are numerous 0.02 g. of Certuna may be given. Crescents cease to flagellate on the second day of administration, and disappear in from 4 to 7 days.—P. Muhlen, *Dtsch. med. Wschr.*, i/1938, 295.

Therapeutically inferior to Plasmoquine in malignant tertian malaria, but has marked gametocidal powers.—W. Kikuth, *Klin. Wschr.*, 1938, 17, 524.

Cupreæ Cortex. The bark of *Remijia pedunculata* and other species. Contains the alkaloid cupreine, $C_{18}H_{22}O_2N_2 = 312.2$, which is allied to quinine, and also about 2 to 3% of quinine. Cupreine salts have been employed similarly to the salts of quinine. It can be converted into quinine by treating with sodium in methyl alcohol solution and heating the solution with methyl iodide.

Ethylhydrocupreina. *Syn. and Prop. Name.* OPTOCHIN (*Howards, Ilford*), NUMOQUIN. $C_{21}H_{28}O_2N_2 = 340.2$.

Dose.—4 grains (0.25 g.). This dose is given every five hours, day and night, for three days only, and five ounces of milk is given with every dose. For children the dose is very much less; e.g., for a 2-year old child, one-seventh the adult dose.

A minutely crystalline powder with bitter taste, prepared synthetically from quinine by hydrogenation, demethylation to hydrocupreine and subsequent ethylation.

Almost *insoluble* in water, soluble in alcohol, ether, chloroform and dilute acids.

Uses. Has a very potent bactericidal action against all types of pneumococcus, and is employed in the treatment of pneumonia, treatment being commenced immediately on diagnosis. In spite of its undoubted pneumococcicidal action, the fact that the therapeutic dose is so near the toxic dose necessitates extreme care in its administration and limits its usefulness, though it has been widely employed on the Continent and in America. If auditory or visual disturbances develop during treatment it should be immediately suspended. It is important to note that *only the base* is employed in pneumonia, the hydrochloride being too toxic for internal use.

Amaurosis following ingestion of a total of 58 grains of ethylhydrocupreine over 3 days.—B. Alvis, *J. Amer. med. Ass.*, ii/1929, 1253.

An average mortality of 25% for bronchopneumonia in children contrasted with a consecutive series of 44 cases treated with Optochin without a single death.—*Brit. med. J.*, i/1933, 968.

Æthylhydrocupreinae Hydrochloridum (*B.P.C.*, *P. Helv. V.*, *P. Ned. V.*). *Prop. Name.* OPTOCHIN HYDROCHLORIDE (*Howards, Ilford*). $C_{22}H_{28}O_2N_2.HCl = 376.7$.

A white crystalline powder soluble in water about 1 in 4.

Uses. This is not now employed internally, since its too rapid absorption is liable to give rise to grave visual disturbances. It is used locally in 1 or 2% solution in eye affections especially in pneumococcal infections and as a prophylactic against infection in laceration of the cornea. Its use is at first painful, but anaesthesia is produced in 2 to 30 seconds.

Ulcus corneae serpens has been treated with a 1% ointment (made with the base) or a 1% or 2% solution. A pad of sterile wool or gauze is soaked in the solution and then left on the ulcer for 5 or 10 minutes. After this the 1% solution is *instilled* into the eye every hour or so during the day, or the ointment applied 5 to 6 times *per diem*. *Note.*—Solutions should be freshly prepared. They decrease in efficiency after 3 or 4 days.

In gonorrhoeal conjunctivitis and photophobia accompanying eczematous conjunctivitis, scrofular ophthalmia, and keratitis, has also proved useful.

PNEUMOCOCCAL CONJUNCTIVITIS. Used in a 1% solution, it rapidly frees the conjunctival sac of infection, but its use over long periods is not to be recommended as it sometimes has a deleterious effect on the cornea.—R. H. B. Barrow, *Med. Pr.*, ii/1936, 550.

Octylhydrocupreinae Dihydrochloridum is the *isooctyl* compound. A 0.5 to 1% solution has been used as a disinfectant for wounds.

Peganum (*B.P.C.*). The dried seeds of *P. Harmala* (*Rutaceae*). Contains the alkaloids harmaline and harmine. Banisterine from *Banisteria Caapi* is an alkaloid identical, chemically and pharmacologically, with harmine.

These alkaloids, and their derivatives, harmol and harmalol, have been employed in the symptomatic treatment of parkinsonism, but are stated to be of less value than hyoscine.

The alkaloid of *Banisteria Caapi* was compared directly with that of *Peganum harmala*, which is harmine, by analysis, preparation of derivatives, ultraviolet absorption spectra, and biological experiments. They are undoubtedly identical, and therefore the previously proposed names of telepathine, yajeine and banisterine for the same alkaloid should be dismissed. In mice and rabbits a limited detoxication of harmine by Sodium Amytal has been demonstrated.—A. L. Chen and K. K. Chen, *Quart. J. Pharm.*, 1939, 30.

Picrorhiza (B.P.C.). *Dose*.—10 to 60 grains (0.6 to 4 g.). The dried rhizome of *P. Kurroa* (Scrophulariaceæ). Tonic, antiperiodic, aperient. This and *Amphicome Emodi* are called Kaur.

Extractum Picrorhizæ Liquidum. *Dose*.—15 to 60 minims. 1 in 1 of alcohol 60%.

Tinctura Picrorhizæ. *Dose*.— $\frac{1}{2}$ to 1 drachm. 1 in 4 of alcohol 45%.

RESORCINOL

B.P., U.S.P. XI, P. Helv. V, etc.

Syn. RESORCINUM (*Fr. Cx.*), RESORCIN, *m*-DIHYDROXYBENZENE.

Dose.—1 to 5 grains (0.06 to 0.3 g.). *U.S.P. XI* average dose 2 grains. *Fr. Cx.* has max. single dose 8 gr.

White crystalline plates or powder, melting at 110° to 111°, and easily volatilised. Preserve from light.

Soluble 1 in 1 of water, 1 in 1 of alcohol 90%, 1 in 20 of olive oil, 1 in 1 of ether, 1 in 1 of glycerin; very slightly soluble in chloroform, carbon disulphide and benzene.

Incompatible with spirit of nitrous ether and caustic alkalis.

Uses. Resorcinol was formerly used internally as an antipyretic, but the action is too short to be useful and there is a danger of the formation of methæmoglobin. It has a marked antiseptic action and is employed externally in solution or as ointment in the treatment of various skin diseases. A 1 in 4 solution in glycerin is excellent for removing epidermic scales in chronic skin diseases and for eliminating scurf of the scalp, and a 2% ointment is of value in the scaly stage of eczema and in sycosis barbæ. Stimulating hair lotions, such as Spiritus Resorcinolis, are beneficial in the treatment of dandruff and alopecia, but they should not be used on fair hair, and before use it is important to free the hair from soap and alkali to avoid discoloration. Epithelioma and rodent ulcer have been treated with ointments and plaster up to 30% strength, and it may be applied locally to condylomata and mucous patches. It should be remembered, however, that resorcinol is dangerous when applied over large surfaces, especially when used in strong preparations.

A 5% solution may be injected into the bladder, without causing any irritation, in inflammatory affections of this organ, likewise in vesical catarrh after gonorrhœa; 5 to 10% solution is of service also in syphilitic sores. A 1% solution is useful as an eye lotion in conjunctivitis.

Gargarisma Resorcini (*P.E.H.C.*).

Resorcinol 15 grains, glycerin 1 dr., water to 1 oz.

Aurist. Resorcinol. (*N.I.F.*). Resorcinol 5 gr., industrial methylated spirit 6 dr., water to 1 oz.

[P1] **Lotio Excitans** (*St. G. H.*). Resorcinol 5 gr., mercuric chloride $\frac{1}{2}$ gr., glacial acetic acid 3 m., chloral hydrate 10 gr., tincture of cantharides 20 m., alcohol 60% to 1 oz. For the scalp.

[P2] **Lotio Resorcinolis Composita** (*Mid. H.*). Resorcinol 5 gr., mercuric chloride $\frac{1}{2}$ gr., castor oil 15 m., tincture of quillaia $7\frac{1}{2}$ m., spirit of rosemary 30 m., mucilage of tragacanth 15 m., water to 1 oz. A stimulating application for pityriasis of the scalp. *St. M. H.* has resorcinol 10 gr., industrial methylated spirit 1 dr., water to 1 oz.

[P1] **Lotio Resorcinolis Pilocarpinae et Cantharidini.**

Resorcinol 80 gr., pilocarpine hydrochloride 15 gr., solution of cantharidin $1\frac{1}{2}$ oz., tincture of capsicum 4 dr., spirit of camphor 6 dr., castor oil 10 to 60 m., oil of lavender 30 m., alcohol 90% to 8 oz. A useful stimulating lotion in alopecia prematura for use after exfoliative treatment.

Pasta Resorcinolis (*B.P.C.*). *Syn.* LASSAR'S STRONGER RESORCIN PASTE.

Resorcinol, zinc oxide and starch, of each about 20% with liquid paraffin.

Pasta Resorcinolis Mitis (*B.P.C.*). *Syn.* LASSAR'S MILD RESORCIN PASTE.

Resorcinol about 10%, zinc oxide and starch, of each about 25%, with liquid paraffin.

Spiritus Resorcinolis (*B.P.C.*). *Syn.* LOTIO RESORCINOLIS COMPOSITUS, SPIRITUS CAPILLARIS.

Resorcinol and castor oil of each 1 in 40 in Cologne spirit and alcohol.

Unguentum Resorcinolis (*B.P.C.*). $12\frac{1}{2}\%$ in glycerin, wool fat and white soft paraffin. *R.L.O.H.* has resorcinol 4 gr., yellow soft paraffin to 1 oz.

Unguentum Resorcinolis Compositum (*B.P.C.*). Resorcinol 4%, bismuth subnitrate 8%, with water, starch, zinc oxide, birch tar oil and potassium pyrosulphite in wool fat, ceresin and yellow soft paraffin.

Unguentum Resorcini Compositum (*St.J.H.*). *Syn.* IHLE'S PASTE.

Resorcinol, zinc oxide, starch, of each 22 gr. in soft paraffin to 480 gr.

Unguentum Resorcinolis et Acidi Salicylici. *Syn.* CASTELLANI'S OINTMENT. Resorcinol 60 gr., salicylic acid 10 gr., lanolin and soft paraffin to 1 oz.

The most popular remedy for Dhobie itch in Africa and Asia.

Unguentum Resorcinolis et Bismuthi Compositum (*B.P.C.*). Resorcinol and bismuth subchloride of each 8%, with water, zinc oxide, starch, birch tar oil, oil of cade, and wool fat.

Ruscoin (*Evans, Sons, Lescher & Webb, Liverpool*). Ointment containing resorcinol, oil of cade, zinc oxide, etc., in a lanolin base. Eczema, hæmorrhoids, etc.

Resorcinolis Monoacetat. *Syn. and Prop. Name.* RESORCIN MONOACETATE, EURESOL (*Knoll, London*).

A reddish-yellow, viscous liquid. Dissolves 10 to 30% in acetone, for use in acne, seborrhœa and sycosis. Euresol pro Capillis has perfume added.

Lotio Resorcinol Monoacetatis Compositum (*B.V.H.*). Solution of resorcinol monoacetate (1 in 2 in acetone) 2 dr., solution of formic acid (25%) 10 m., spirit of rosemary 1 dr., sodium taurocholate 2 gr., water to 6 oz.

Hexyl-Resorcinol (*B.P.C.*). *Syn.* 1 : 3-DIHYDROXY-4-HEXYLBENZENE, 4-*n*-HEXYLRESORCINOL. $C_6H_3(OH)_2 \cdot (CH_2)_5 \cdot CH_3 = 194.1$.

Dose.—2 to 10 grains (0.12 to 0.6 g.) thrice daily.

Patents. The manufacture of hexyl-resorcinol and allied compounds is covered by a number of British patents dating from 1923, owned by American manufacturers. In 1927 they were the subject of an action in the Courts. Details in 19th Edn., p. 753.

Stable white crystals with pungent odour and astringent taste, m.p. not below 66°.

Soluble 1 in 2000 of water, readily in ether, chloroform and alcohol and in oils.

Uses. A germicide, especially for gram-positive organisms, the phenol coefficient ranging from 46 to 52. Its power is retained in both acid and alkaline urine even in high dilution. Given by the mouth, the compound is secreted in the urine at a rate producing continuous action in the urinary tract. Gelatin capsules containing 0.15 g. in 25% olive oil solution are taken *immediately after* each meal thrice daily, 3 to 4 being taken on each occasion. Chronic *B. coli* infections and *Staphylococcus* infections have been treated with it; it acts best in early cases. Pyelitis and cystitis caused by organisms other than *B. coli* are cleared up in a few weeks. *B. coli* infections require, on the average, about as many months. It has now been largely superseded in the treatment of urinary tract infections by mandelic acid or sulphonamide therapy.

Hexyl-resorcinol is an effective anthelmintic for roundworms, hookworms and threadworms. The dose is 0.5 g. for a child and 1 g. for an adult, given in hard gelatin capsules first thing in the morning on an empty stomach. No food is taken for four or five hours, and a purge of magnesium sulphate is given the following morning.

Externally, a solution of hexyl-resorcinol 1 in a mixture of glycerin 300 and water 700 is used as a disinfectant for the skin and mucous membrane.

ROUNDWORM. Possibly the most effective substance known against ascaris, well over 90% being removed in over 1000 cases. Its disadvantages are that it combines with protein and is relatively ineffective if taken when food is present in the stomach or intestines, that it causes a certain amount of irritation in the stomach, and that the crystals, unless protected in some way, may cause local "burns" of the mucous membrane of the mouth—it is best given in sugar-coated pills, with instructions that they should not be chewed.—F. D. Lamson and co-workers, *J. Amer. med. Ass.*, ii/1932, 294.

HOOKWORM. No attempt has been traced at evaluation of hexyl-resorcinol through deworming. The drug has hitherto caused no deaths. Relative success depends on starvation, rigorous to a degree required for no other anthelmintic. Encapsulation of the drug shifts to the invisible stomach the ugly necrosis it causes, but aesthetic gain need be no more than a decent shrouding of pathological damage. Hope of its usefulness on a mass scale is slight.—C. Lane, *Lancet*, i/1935, 1463.

THREADWORM. Santonin is unsatisfactory. Better results are obtained with hexyl-resorcinol administered as an enema in a 1 in 2000 solution immediately after an evacuation brought about by an ordinary soap and water enema. A quart of the solution is given to adults and as much as can be retained to children. The minimum routine necessary to bring about cure consists in the administration of an enema every other night at bedtime over a period of at least three to four weeks. There is no satisfactory alternative to the enema.—W. H. Wright *et al.*, *Publ. Hlth Rep.*, Wash., 1939, 2005.

Emulso Hexyl-Resorcini (Gt. Orm. H.). (Dose for 1 year old child.) Hexyl-resorcinol 1 gr., olive oil 10 m., acacia 2½ gr., chloroform water to 1 drachm.

Caprokol (*British Drug Houses, London; Sharp & Dohme, London*) is a solution of hexyl-resorcinol in olive oil. In capsules containing 0.15 g. of hexyl-resorcinol or as a 2½% solution.

Hexylresorcinol Solution S.T. 37 (*Sharp & Dohme, London*). A solution of hexyl-resorcinol of low surface tension (37 dynes per sq. cm.) and high bactericidal activity. Used undiluted for cuts, infected wounds, abscesses, etc., and diluted with 1 to 3 parts of water as a mouthwash or gargle.

Lubisan (*Bayer Products, London*). Resorcin-monoethyl-etherdiethyl-carbonate in perles containing 0.15 g. For oxyuriasis in children. *Dose*.—2 to 6 perles daily. A granulate is prepared for administration to infants who cannot swallow.

Permfoam (*Gilmont Products, London*). Foaming contraceptive consisting of two jellies kept separate in a double tube until required for use. One jelly is acid, containing citric acid, boric acid and saponin in a non-greasy base. The second jelly contains sodium bicarbonate with hexylresorcinol as spermicide and egg albumen as foam stabiliser.

Prentif Suppositories (*Prentif Ltd., London*). Contraceptive suppositories in which hexyl-resorcinol is the spermicidal ingredient in an acid gelatin base of pH 2.2. **Prensols** are the same, but smaller, for use with a cervical cap.

Heptylresorcinol. *Syn. and Prop. Name.* 2-4 DIHYDROXY-PHENYL-*n*-HEPTANE, DIHYDRANOL (*Sharp & Dohme, London*).

Dose.—5 to 15 grains (0.3 to 1 g.) usually given in hard gelatin capsules containing 0.15 g. in olive oil.

A powerful germicidal substance possessing selective action against the putrefactive flora of the intestinal tract. It has also been employed as an anthelmintic and in amoebiasis.

RHEUM

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

Syn. RHEI RHIZOMA.

Dose.—3 to 15 grains (0.2 to 1 g.).

The rhizome (*U.S.P. XI*, rhizome and roots), partially decorticated and dried, of *Rheum palmatum* and other species of *Rheum* (*Polygonaceæ*), except *R. rhaponticum*, grown in China and Tibet and known in commerce as Shensi, Canton or high-dried rhubarb.

Uses. Rhubarb is employed as a stomachic in atonic dyspepsia and as a laxative. It is useful in diarrhoea, since the tannin present exerts an astringent action after purgation has affected removal of irritant substances. It is not advisable, however, for continued use in chronic constipation.

A mixture consisting of compound rhubarb powder 1 oz., and chloroform water to 2 oz., causes rapid disappearance of symptoms in bacillary dysentery in children, but is of no use in adults. (*Dose*.—1 teaspoonful every 2 hours for a child of two years.) Acute bacillary dysentery in adults has been effectively treated by half a teaspoonful of powdered rhubarb in cachets every 1, 2, or 3 hours.

Extractum Rhei (*B.P.C.*).

Dose.—2 to 8 grains (0.12 to 0.5 g.).

A dry extract prepared with alcohol 60%.

Extractum Rhei (U.S.P. XI). *Average dose*.—8 grains (0.5 g.).
1 g. represents 2 g. of rhubarb.

Extractum Rhei Liquidum (B.P.C.).

Dose.—10 to 30 minims (0.6 to 2 ml.). 1 in 1.

Infusum Rhei Concentratum (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in $2\frac{1}{2}$.

Is 8 times the strength of the fresh infusion.

Infusum Rhei Recens (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

Liquor Rhei Dulcis (B.P.C.). *Syn.* ELIXIR RHEI.

Dose.—1 to 3 drachms (4 to 12 ml.).

A flavoured preparation containing 25% v/v of liquid extract of rhubarb.

Mist. Gent. c. Rho (N.I.F.). Sodium bicarbonate 10 gr., concentrated infusion of rhubarb 15 m., concentrated compound infusion of gentian 15 m., peppermint water to $\frac{1}{2}$ oz.

Mist. Rhei Ammon. c. Soda (N.I.F.). Powdered rhubarb 4 gr., sodium bicarbonate 15 gr., ammonium carbonate 3 gr., peppermint water to $\frac{1}{2}$ oz.

Mist. Rhei Co. (N.I.F.). Powdered rhubarb 3 gr., light magnesium carbonate 10 gr., powdered ginger 4 gr., sodium bicarbonate 10 gr., chloroform water to $\frac{1}{2}$ oz.

Mistura Rhei et Cascaræ (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains rhubarb 4 gr., sodium bicarbonate 12 gr., liquid extract of cascara sagrada 20 m., with liquid extract of liquorice, syrup of ginger and oil of peppermint in chloroform water to 1 oz.

Mistura Rhei et Sodii Bicarbonatis (B.P.C.). *Syn.* MISTURA RHEI COMPOSITA, MISTURA RHEI ET SODÆ.

Dose.— $\frac{1}{2}$ to 1 ounce (10 to 30 ml.).

Similar to the preceding mixture but contains no cascara.

Pilula Rhei Composita (B.P.).

Dose.—4 to 8 grains (0.25 to 0.5 g.). Contains rhubarb 25%, aloes, myrrh, hard soap, oil of peppermint and syrup of liquid glucose.

Pilulæ ex Franck. *Syn.* PILDORAS DE FRANCK (F.E. VIII).

Powdered rhubarb 1 g., powdered aloes 4.5 g., powdered jalap 4.5 g. Mix with a sufficient quantity of syrup and make 100 pills. *Dose*.—1 to 3 pills.

Pulvis Rhei Compositus (B.P.). *Syn.* GREGORY'S POWDER.

Dose.—10 to 60 grains (0.6 to 4 g.).

Rhubarb 25%, with heavy and light magnesium carbonates, and ginger.

Syrupus Rhei (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Liquid extract of rhubarb about 1 in 14, with oil of coriander, in syrup.

Syrupus Rhei Aromaticus (U.S.P. XI). *Average dose*.— $2\frac{1}{2}$ drachms (10 ml.). Aromatic tincture of rhubarb 15, potassium carbonate 0.1, in syrup to 100.

Tabellæ Rhei et Sodii Bicarbonatis (B.P.C.). *Syn.* RHUBARB AND SODA TABLETS.

Dose.—1 or 2 tablets.

Contain rhubarb 3 gr., sodium bicarbonate $1\frac{1}{2}$ gr., and ginger $\frac{1}{2}$ gr.

Tinctura Rhei Aromatica (U.S.P. XI). *Average dose*.—60 minims (4 ml.).

Rhubarb 20, cinnamon 4, clove 4, nutmeg 2, with glycerin, alcohol and water to produce 100.

Tinctura Rhei Composita (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Rhubarb 1 in 10 with cardamom and coriander in a glycerin and alcohol 45% menstruum.

Sarsa (B.P.C., U.S.P. XI, P. Helv. V, Fr. C.). *Syn.* SARSA-PARILLA.

The dried roots and rootlets of *Smilax ornata* (Liliaceæ). *U.S.P.* includes also other species of *Smilax* and *S. medica*. Was formerly used in chronic rheumatism, skin affections and syphilis, but is of doubtful therapeutic value. It is mainly used in the form of decoctions in so-called "blood purifiers."

PSORIASIS. Sarsaparilla has unquestionable merits, but treatment must be persistent, the average period of administration being 60 days. In 19 cases, 9 were cured and 5 improved. The remaining 5 were failures. The most rapid cure was obtained in a fortnight.—H. Ritter, *Dtsch. med. Wschr.*, 1936, 1629.

Decoctum Sarsæ Compositum (B.P.C.).

Dose.—2 to 8 ounces (60 to 240 ml.).

Sarsaparilla 1 in 8, with sassafras root, guaiacum wood, mezereon, liquorice and water.

Decoctum Sarsæ Compositum Concentratum (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 ounce (8 to 30 ml.). Is eight times the strength of the preceding decoction.

Decoctum Zittmanni Fortius. *Dose.*—3 to 6 ounces.

Sarsaparilla (cut small) 200, water 5200, maintain at 35° to 40° for 24 hours, then add potash alum 10, calomel 8, precipitated cinnaabar 2. Heat on a water-bath for three hours and add bruised anise and fennel of each 10, senna leaves (cut small) 50, liquorice root (cut small) 20. Continue heating for 15 minutes, strain and press, passing sufficient water through the marc to make up to 5000.

Decoctum Zittmanni Mitius. *Dose.*—3 to 6 ounces.

Sarsaparilla 100, water 5200, lemon peel, cassia bark, cardamom and liquorice of each 6. Proceed as in making the stronger decoction.

Both these preparations have been used in syphilis and wasting diseases.

Fluidextractum Sarsaparillæ (U.S.P. XI).

Average dose.—30 minims (2 ml.).

1 ml. represents 1 g. of sarsaparilla.

Syrupus Sarsaparillæ Compositus (U.S.P. XI).

Average dose.— $\frac{1}{2}$ ounce (15 ml.). Fluidextract of sarsaparilla 20%, with fluidextract of liquorice, oils of sassafras and anise, methyl salicylate, alcohol and syrup.

Hemidesmus (B.P.C.), syn. INDIAN SARSAPARILLA, is the dried root of *H. indicus* (Asclepiadaceæ), and is used in India as a substitute for sarsaparilla.

Taraxacum (B.P.C., P. Helv. V). *Syn.* DANDELION ROOT.

The fresh or dried root of *Taraxacum officinale* (Compositæ). A mildly laxative bitter, and stated to have a choleric action (*i.e.*, causing an increased secretion of bile by the liver).

Extractum Taraxaci (B.P.C.).

Dose.—5 to 15 grains (0.3 to 1 g.). A soft extract from the juice of the fresh root.

Extractum Taraxaci Liquidum (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). 1 in 1.

The following method of preparation is recommended. Moisten the drug with alcohol 30%, pack in a percolator and macerate for four days. Percolate slowly reserving the first 850 ml. Press the marc, mix the pressings with the remainder of the percolate, and evaporate the mixture to a soft extract. Dissolve the latter in the reserved portion of the percolate, adjust to volume with alcohol 30%, allow to stand for 14 days and filter.—H. D. Botwal, *Pharm. J.*, 1/1938, 461.

Succus Taraxaci (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

The juice from the fresh root preserved with alcohol.

SACCHARINUM

B.P.C., U.S.P. XI, P. Helv. V, P. Ned. V, Fr. Cx.

Syn. and Prop. Name. GLUSIDUM, GLUSIDE, *o*-BENZOIC SULPHINIDE, BENZOSULPHINIDUM, SAXIN (*Burroughs Wellcome, London*).

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.) or more. *U.S.P. XI* average dose $\frac{1}{2}$ grain.

A white, intensely sweet, crystalline powder. Its aqueous solution has an acid reaction; it forms crystalline, sweet salts with alkaloids and metallic bases. Solutions of alkalis and their carbonates dissolve it, forming compounds.

Soluble 1 in 400 of water, 1 in 38 of alcohol 90%, 1 in 100 of ether, and about 1 in 50 of glycerin; slightly soluble in chloroform, oils, fats and acetone.

Uses. Saccharin is used as a sweetening agent and as a substitute for sugar in diabetes, obesity, and generally where the use of sugar is undesirable. It is more commonly employed in the form of soluble saccharin. As a sweetening agent to replace sugar the average proportion used is about 1 in 10,000, or about $\frac{1}{10}$ gr. in each fluid ounce.

Saccharin (insoluble) is sold in sweetening powers 300, 450 and 550—the above remarks refer to “550.”

The most recent pharmacological, toxicological and clinical investigations have confirmed the fact that saccharin is a completely harmless substitute for sugar even when used continuously. $1\frac{1}{2}$ to 3 grains of saccharin are sufficient to replace the whole of the sugar required by an adult for daily sweetening, *i.e.*, 50 to 57 g. As much as 5 g. daily of saccharin has been taken for a fortnight without untoward effects.—H. Staub and R. Staehelin, *Med. Pr.*, ii/1936, 419.

Elixir Saccharini (*B.P.C.*). *Syn.* ELIXIR GLUSIDI.

Dose.—5 to 20 minims (0.3 to 1.2 ml.).

Saccharin 1 in 20 dissolved with sodium bicarbonate in alcohol and water. 1% added to mixtures for flavouring.

Tabellæ Saccharini (*B.P.C.*) contain $\frac{1}{2}$ gr. (0.02 g.) of soluble saccharin.

Saccharinum Solubile (*B.P., U.S.P. XI, P.G. VI, P. Helv. V, P. Dan.*). *Syn.* GLUSIDUM SOLUBILE.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.).

The sodium derivative of saccharin, of which it contains about 90%. Occurs as a white crystalline or granular powder.

Soluble 1 in $1\frac{1}{2}$ of water at 25°, 1 in 50 of alcohol 90% at 25°. As a sweetening agent, 1 in 2000 or 2 gr. to an 8-oz. mixture is sufficient.

Dulcin. *Syn.* *p*-PHENETOLCARBAMIDE (*P.G. VI*).

Dose.—Tablets are made containing $\frac{1}{2}$ grain (0.05 g.).

White crystalline powder, m.p. 172° to 174°. Slightly soluble in water, readily in alcohol. Used as a substitute for sugar, and stated to be innocuous.

SANTONINUM

(with ARECA and CHENOPODIUM, etc.)

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

Dose.—1 to 3 grains (0.06 to 0.2 g.). *U.S.P. XI* average dose 1 grain. *Fr. Cx.* has max. single dose $1\frac{1}{2}$ grains, max. during 24 hours 5 grains approx. In determining the dose for a child it is a good rule to give $\frac{1}{8}$ gr. for every year of age. Owing to the possibility of idiosyncrasy, the first dose should not exceed 1 grain for a child, or 3 grains for an adult. It is advisable not to give santonin on an empty stomach.

A neutral crystalline principle. The inner anhydride, or lactone, of santoninic acid, obtained from santonica. M.p. 171° to 174° . Should be protected from light, otherwise it turns yellow (*see* Golden Santonin).

Soluble 1 in 50 of alcohol 90%, 1 in 3 of boiling alcohol 90%, 1 in $2\frac{1}{2}$ of chloroform, 1 in 140 of ether, 1 in 200 of castor oil; also soluble in other oils and in caustic soda solution. Insoluble in water.

Antidotes. Empty stomach by emetic or stomach tube. Give purgative dose of calomel. Demulcent drinks, but *not* oils or fats. Chloral hydrate by rectum for convulsions. Stimulants. Artificial respiration if necessary.

In children, 0.08 g. has produced serious poisoning, and two such doses have been fatal.—*J. Amer. med. Ass.*, ii/1935, 1212.

Uses. It is an anthelmintic for round-worms (*Ascarides*) and thread-worms (*Oxyures*), but is ineffective against tape-worm (*Tænia*). It colours the urine orange if acid, or purplish red if alkaline, and in too large a dose may cause objects to appear of a green or yellow colour. The usual custom is to give the santonin in powder on 2 or 3 nights, following by castor oil or a saline purge in the morning. The flow of bile is particularly useful in making the worm let go its hold. Given in powder, the drug is not absorbed and is non-toxic. It is often given with calomel or compound powder of scammony, the subsequent administration of a purge being then unnecessary.

Confectio Santonini Composita (P.E.H.C.). Santonin 1 gr., ginger 1 gr., jalap 3 gr., sulphur 4 gr., confection of senna 51 gr. For a child 2 to 5 years.

Tabellæ Santonini (B.P.C.) contain 1 gr. (0.06 g.), in chocolate basis.

Tabellæ Santonini et Hydrargyri Subchloridi (B.P.C.).
Syn. TABELLÆ SANTONINI COMPOSITÆ.

Dose.—1 or 2 tablets.

Contain santonin 1 gr. and mercurous chloride 1 gr.

Tabellæ Santonini et Scammonia Compositæ (B.P.C.).

Dose.—1 tablet.

Contain santonin $1\frac{1}{2}$ gr., compound powder of scammony 2 gr.,

and mercurous chloride $\frac{1}{2}$ gr. **Pulvis Santonini Compositus** (*Gt. Orm. H.*) has the same composition. A saline should be given next morning.

Trochisci Santonini (*B.P.C.*) contain 1 gr.

Golden Santonia. *Syn.* CHROMO-SANTONIN.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

A modification of ordinary santonin formed by exposure to sunlight, and stated to be of value in sprue and dysentery.

Sodii Santoninas. $\text{NaC}_{11}\text{H}_{19}\text{O}_4 \cdot 3\frac{1}{2}\text{H}_2\text{O} = 349.2$.

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.) for adults. White crystals. Should in preference be given in salol-coated pills or tablets. Has been used as anthelmintic.

Santonica (*B.P.C.*). *Syn.* SEMEN CONTRA (*P. Helv. V*), SEMEN CINÆ, WORMSEED, FLORES CINÆ (*P.G. VI, P. Dgn.*).

The dried unexpanded flower heads of *Artemisia cina* (*Compositæ*). Contains 2 to 3.5% of santonin. Has been administered as a decoction or infusion for round-worms and thread-worms. *Fr. Cx.* includes *A. maritima*.

Santonin from Scottish-grown *Artemisia maritima*; 0.81% found.—J. Coutts, *Pharm. J.*, ii/1929, 603.

The examination of true and false santonicas.—T. E. Wallis and E. J. Mowat, *Pharm. J.*, ii/1925, 149.

Two new crystalline principles isolated from Indian species of *Artemisia*.—*Pharm. J.*, i/1935, 3.

Absinthium (*B.P.C., P. Helv. V, Fr. Cx.*). *Syn.* WORMWOOD.

The dried leaves and tops of *Artemisia Absinthium* (*Compositæ*). The active ingredient is the oil (0.3%). It is used as a tonic and digestive. Infusion 1 in 20.

Dose.—1 to 2 ounces. The oil is contained in the drink absinthe. Other essential oils, e.g., anise, coriander, fennel, peppermint, hyssop, angelica and melissa are stated to be additional constituents.

Tinctura Absinthii (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 ml.). 1 in 10.

Areca (*B.P.C., Fr. Cx.*). *Syn.* SEMEN ARECÆ (*P.G. VI, P. Helv. V*), BETEL NUT.

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 g.).

The dried ripe seeds of *Areca Catechu* (*Palmacæ*). Contains several alkaloids, the most active being the liquid alkaloid arecoline (about 0.1%), $\text{C}_8\text{H}_{13}\text{NO}_2 = 155.1$.

Uses. Areca nut has been used for a long time in India and China as an anthelmintic, but recent work has thrown considerable doubt on its value. While it has undoubtedly an irritant action on the gut and produces purgation, it does not expel worms. As a vermifuge for tape-worm in dogs it is given in doses of 2 gr. per lb. bodyweight. The nut is also widely used in the East as a masticatory, owing to its sialogogue properties.

Arecolinæ Hydrobromidum (*P.G. VI, Fr. Cx., etc.*).

$\text{C}_8\text{H}_{13}\text{O}_2\text{N} \cdot \text{HBr} = 236.0$.

Dose.—*P. Helv. V* gives max. single dose $\frac{1}{10}$ gr., max. in 24 hours $\frac{1}{10}$ grain approx.; *Fr. Cx.* has $\frac{1}{15}$ and $\frac{1}{10}$ grain respectively.

White needles soluble in water and boiling alcohol.

Its physiological action resembles that of physostigmine and pilocarpine. It is sialagogue and diaphoretic and causes constriction of the pupil and slowing of the heart. A 1% solution has been used as a miotic but action is of short duration. It is given hypodermically as a cathartic in veterinary medicine, the dose for horses

being about 1 grain; also given orally in doses of $\frac{1}{16}$ to $\frac{1}{2}$ grain as a tænicide for dogs after a preliminary period of fasting.

Buteæ Semen (B.P.C.).

Dose.—10 to 20 grains (0.6 to 1.2 g.).

The seeds of *Butea frondosa* (Leguminosæ). Contains moodooga oil. Anthelmintic like santonin. Administered as **Pulvis Buteæ Seminum**, the integuments being removed by soaking in water, the seeds then being dried and powdered.

Chenopodium (B.P.C.). Syn. AMERICAN WORMSEED.

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 g.).

The fruit of *C. ambrosioides* var. *anthelminticum* (Chenopodiaceæ). Contains 1% of volatile oil containing about 70% of ascaridole. Is a vermifuge for round-worms and hook-worms, but the volatile oil is now generally preferred.

Oleum Chenopodii (B.P., U.S.P. XI, P. Helv. V). Syn. OIL OF AMERICAN WORMSEED.

Dose.—3 to 15 minims (0.2 to 1 ml.). *U.S.P. XI* average dose 15 minims. *P. Ned.* has max. daily dose 22 minims.

The oil distilled with steam from the fresh flowering and fruiting plants of *Chenopodium ambrosioides* var. *anthelminticum*. Contains not less than 65% *w/w* of ascaridole, $C_{10}H_{16}O_2$. *U.S.P. XI* requires 60 to 80% of an acetic acid soluble fraction.

Antidotes. A purgative should be given, followed by an enema; alcohol should be withheld and warmth applied to the body. Respiratory and cardiac stimulants should be given.

Uses. Oil of chenopodium is an effective anthelmintic, especially against round-worms and hook-worms, but it has little or no action on large tape-worms. The drug does not kill the worms but only paralyses them, and they must be expelled by a purgative. For the treatment of hook-worms the drug is best given in the morning, in doses of 10 to 15 m. in capsules or on sugar, at 7, 8, and 9 a.m.; some authorities prefer to give two doses of 20 m. with an interval of two hours between the doses. The last dose should be followed within two or three hours by a purgative dose of castor oil or magnesium sulphate. For children, one drop of oil of chenopodium for each year of age is given on sugar. A more effective treatment for hook-worms consists in the administration of a mixture of 1 volume of oil of chenopodium with 2 volumes of carbon tetrachloride, and this is given in a dose of $1\frac{1}{2}$ m. for each year of age up to a maximum of 25 m.; the total amount is divided into two doses, given one hour apart and followed by a purgative. The treatment requires weekly repetition until the fæces are free from ova.

For the treatment of round-worms in children a dose of 5 to 10 m. on sugar is given two or three times daily for two days, followed by a purge. The treatment should be repeated after ten days or a fortnight.

Oil of chenopodium should be given with caution and in small doses when disorders of the heart and kidneys are present. It is contraindicated in chronic nephritis and organic disease of the heart, and in the presence of hepatic or gastro-intestinal disorder.

Even with therapeutic doses, minor toxic effects such as dizziness, nausea, tinnitus, and temporary deafness, frequently occur, and cumulative effects may be produced by small doses given several days apart. Children are more susceptible to the effects of the oil than adults, and it is better to use some other anthelmintic in children under 5 or 6 years of age, and in very old and debilitated subjects.

Oil of chenopodium has no stability. When in greatest vogue its active principle, ascaridole, was still undetermined. This is deadly to man and worm, the respective lethal doses lie near one another, and its reported percentage in the oil has varied from 33 to 98. Further, the size of drops varies with different droppers, and there has been catastrophic confusion between 45 drops on the International Dropper (or 2.2 ml.) and 45 minims (or 3 ml.). Numerous deaths have followed the latter, apparently none the former, which at a percentage of 66 implies 0.8 ml. of ascaridole. To give the oil without knowledge of its ascaridole content is indefensible—but customary. Many tons of thousands of doses have been reported, in few has its ascaridole content been known, and in none of these has deworming been the method of measurement. In other words, I find no acceptable published evidence of its efficiency against hookworms.—C. Lane, *Lancet*, i/1935, 1461.

Ascaridole. $C_{10}H_{16}O_2 = 168.23$. The separated active principle of oil of chenopodium. *Dose*.—Adults, 12 to 20 minims (max. 30 minims). To be given in three portions at intervals of 1 hour. Children $\frac{1}{2}$ to $\frac{1}{4}$ minims for a child of 2 years, increasing by $\frac{1}{4}$ minim for every year of age up to 12, then by 1 minim per year up to adult age. May be administered on sugar or in any suitable vehicle. Castor oil or magnesium sulphate should be given after the last dose.

Bedermin (*Bayer Products, London*). A combination of ascaridole and carbon tetrachloride in the proportion of 1 to 6. An anthelmintic for use against ankyllostoma and ascari. Supplied in solution and capsules.

Cucurbita (*B.P.C., P. Helv. V*). *Syn.* CUCURBITÆ SEMINA PRÆPARATA, MELON PUMPKIN SEEDS, PEPO.

Dose.—3 to 4 ounces, bruised, with water or milk to one pint. The fresh ripe seeds of *C. maxima* (Cucurbitaceæ), deprived of testa and tegmen, and not more than a month old. Anthelmintic; give first a saline purge and afterwards castor oil.

Although no active principles have been found, it is of undoubted value as a rænicide, the therapeutic activity being probably due to the mechanical action of the sharp edges of the bruised seeds.

Cusso (*B.P.C.*). *Syn.* KOUSSO.

Dose.— $\frac{1}{2}$ to 1 ounce (8 to 16 g.) made into an infusion.

The dried panicles of fertilised pistillate flowers of *Brayera anthelmintica* (Rosaceæ). Contains the yellow amorphous body, kosotoxin. Anthelmintic, especially for tape-worm. Administered as an infusion (1 in 16), the dose being preceded by the administration thrice daily of 1 drachm doses of sodium bicarbonate, and by a saline purge, being taken on an empty stomach. Its use is contraindicated in pregnancy, debility, and in cardiac and renal disease.

Embellia (*B.P.C.*).

Dose.—1 to 4 drachms (4 to 16 g.). Dried fruit of *E. ribes* and *E. robusta* (Myrsinaceæ). Has been advocated as an anthelmintic for hook-worms, round-worms and tape-worms, but is of doubtful value.

SAPONES

Sapo Animalis (*B.P., Fr. Cx.*). *Syn.* CURD SOAP.

Curd soap is made by heating purified animal fat with water. It consists mainly of sodium stearate.

Sparingly *soluble* in cold water, completely soluble in hot water, almost completely soluble in alcohol 90%.

[P1-S1-S3] **Emplastrum Saponis Fuscum** (B.P.C.). *Syn.* EMPLASTRUM CERATI SAPONIS. Curd soap, yellow beeswax, olive oil, lead monoxide and vinegar. The machine-made plaster is usually spread with three to four ounces of mass per yard of bleached glazed calico.

Linimentum Saponis Camphoratum (B.P.C.). *Syn.* SOLID OPODELDOC. A solid liniment containing curd soap, camphor, oils of thyme and rosemary, dilute solution of ammonia and alcohol.

Sapo Durus (B.P. *Add. III*, U.S.P. *XI Supp. II*). *Syn.* CASTILE SOAP.

Hard soap is prepared by saponifying a suitable vegetable oil or oils, or their fatty acids, with sodium hydroxide. Coconut oil or palm kernel oil, or their fatty acids, must not be used.

Soluble in water and alcohol.

[P1-S1-S3] **Emplastrum Saponis** (B.P.C.). Hard soap, colophony and plaster of lead. Is less adhesive than plaster of colophony. The machine spread plaster is usually prepared with not less than $3\frac{1}{2}$ oz. of mass per yard of bleached glazed calico.

[D-P1-S1] **Pilulæ Saponis cum Opio** (B.P.C.). *Syn.* PILULÆ SAPONIS COMPOSITÆ, COMPOUND SOAP PILLS.

Each pill contains $\frac{3}{8}$ gr. of powdered opium and about 1 gr. of hard soap. *Dose.*—1 or 2 pills.

Sapo Kalinus (B.P.C., P.G. *VI*, P. *Helv. V*). *Syn.* LINSEED OIL SOAP.

Potash soap is made by heating linseed oil with potassium hydroxide.

Soluble about 1 in 4 of water, 1 in 1 of alcohol 90%.

Sapo Amygdalinus (F.E. *VIII*). *Syn.* SAPO MEDICINALIS (Fr. *Cx.*). Made from almond oil and sodium hydroxide. **Sapo Medicatus** (P.G. *VI*, P. *Dan.*, P. *Helv. V*) is made from lard and olive oil.

Spiritus Saponis Kalini (B.P.C.). *Syn.* SPIRITUS SAPONIS KALINI (HEBRA). An alcoholic solution of potash soap, perfumed with oil of lavender.

Liquid Soap Formula. Oleic acid 35, S.V.R. 25, potassium hydroxide 7, distilled water 7, oil of lavender 0.2, light petroleum to 100. Mix the oleic acid with the alcohol, slowly add a solution of the potassium hydroxide in the water, then the oil of lavender and part of the solvent. Adjust the pH until neutral to phenolphthalein with oleic acid and make up to volume with light petroleum.—H. Finemore, *Aust. J. Pharm.*, 1938, 19.

Sapo Mollis (B.P. *Add. III*). *Syn.* SAPO VIRIDIS.

Soft soap is prepared by saponifying a suitable vegetable oil or oils, or their fatty acids, with potassium or sodium hydroxide. Coconut oil or palm kernel oil, or their fatty acids, must not be used. It contains the glycerin formed during saponification.

Soluble in water and alcohol.

Sapo Mollis (U.S.P. *XI*). Made from linseed oil and a mixture of potassium and sodium hydroxides, with additional glycerin.

Enema Saponis (B.P.C.). *Dose.*—20 ounces (600 ml.). 5% w/v.

Linimentum Saponis (B.P.). Soft soap 4, camphor 2, oil of rosemary 0.75, distilled water 8.5, alcohol 90% to 50.

Linimentum Saponis Mollis (U.S.P. *XI*). 65% of soft soap and 2% of oil of lavender in alcohol.

Liquor Saponis Æthereus (B.P.C.). *Syn.* ETHER SOAP, SOLUTIO SAPONIS ÆTHEREÆ.

A solution containing about 40 to 50% of potassium oleate in alcohol and ether.

[P1] **Liquor Saponis Antisepticus** (B.P.C.) is the same solution with the addition of 0.05% w/v of mercuric iodide and potassium iodide.

Spiritus Saponatus (B.P.C.). 65% w/v of soft soap in alcohol.

Synol Soap (Johnson & Johnson, Slough). A liquid soap containing 2½% of cresol.

Sodii Oleas. *Prop. Name.* EUNATROL (Zimmer, Frankfurt; Coates & Cooper, London).

$\text{CH}_3(\text{CH}_2)_7\text{CH} : \text{CH}(\text{CH}_2)_7\text{COONa} = 304.3$.

Dose.—2 to 10 grains (0.12 to 0.6 g.).

It has been used as a cholagogue and to dissolve gall-stones. Carcinoma has been treated with sodium oleate on the theory (Shaw-Mackenzie) that sodium oleate and various tissue extracts act as co-enzymes; 20 gr. of sodium oleate daily are given, in pill form for a year and 30 injections of 10 ml. of sodium oleate solution—beginning with ½% and increasing to 5%. Subcutaneous injections of 1 to 3 ml. of a 0.8% solution are said to have been found of benefit in cancer of the breast.

Sodii Stearas (U.S.P. XI) is a mixture of the stearate ($\text{NaC}_{17}\text{H}_{35}\text{O}_2$) and palmitate ($\text{NaC}_{15}\text{H}_{31}\text{O}_2$). A white powder soapy to the touch. Slowly soluble in cold water or alcohol, readily in hot. Sodium stearate cream (*Fr. Cx.*) consists of freshly prepared sodium stearate in glycerin and water.

Saponinum (B.P.C.). *Syn.* QUILLAIC ACID, QUILLAIN.

A colloidal glycoside or mixture of glycosides obtained from quillaia bark. An intensely irritating and sternutatory powder. Aqueous solutions froth readily when shaken. Has hæmolytic action on blood. Is used as an emulsifying agent for oils in external applications and as a foam stabiliser in contraceptive tablets.

Saponins, various, described.—J. G. Driver and A. G. Trease, *Pharm. J.*, i/1927, 623.

Usual views as to hæmolytic action of saponins when taken orally are contradicted. A man can take as a single daily dose as much as 4 g. without any damage resulting, since it does not pass through the intestinal walls and is decomposed by digestive enzymes.—L. Kofler, *Apothekerztg.*, 1933, 702.

Sulphonated Fatty Alcohols. The so-called "sulphonated fatty alcohols," as supplied in commerce, consist of the sodium salts of the sulphuric acid esters of the fatty or higher aliphatic monohydric alcohols. In other words they are sodium alkyl sulphates, and a more correct description would be sulphated fatty alcohols. They are prepared by the action of sulphuric or chlorosulphonic acid on the higher alcohols under carefully controlled conditions, with subsequent neutralisation with a sodium salt. As the higher alcohols, with the exception of cetyl alcohol, do not occur naturally either in the free or combined condition, they are obtained by the catalytic hydrogenation of the higher fatty acids. The chief sources of the latter are fixed oils and fats which, on hydrolysis, give mixtures of these acids which are never separated in commerce but are submitted directly to hydrogenation. Hence, the higher aliphatic alcohols consist of mixtures, the composition of which depends upon the source of the fixed oil or fat used to obtain the acid. The commonest alcohols used are "lauryl alcohol," obtained from coconut oil and consisting mainly of lauryl alcohol, $\text{C}_{12}\text{H}_{25}\text{OH}$, mixed with homologues with smaller and larger numbers of carbon atoms; "stearyl alcohol," a mixture

of stearyl alcohol, $C_{18}H_{37}OH$, and cetyl alcohol, $C_{16}H_{33}OH$, obtained from commercial stearic acid; "oleyl alcohol," obtained by the hydrogenation of olein; and cetyl alcohol, obtained directly from natural sources, such as spermaceti. Other synthetic compounds are available, containing sulphonic groups, more complex in structure than the foregoing. These include Igepon "A," the sulphonated ethyl ester of oleic acid, and Igepon "T," a sulphonated amide of oleic acid.

Properties. The use of sulphonated fatty alcohols overcomes many of the difficulties encountered in the use of soaps. They are all white powders, soluble in water, with wetting-out, cleansing and detergent properties superior to those of soap, and they maintain their detergent powers in neutral, slightly acid or alkaline solution. The solubility of their calcium and magnesium salts is sufficiently great to avoid the formation of an objectionable precipitate when used with hard water, this property rendering them eminently suitable for use in cleansing materials before dyeing. Although they have not the smooth lubricating "feel" of soap suds they possess the softening properties of soap to a marked degree. The sulphonated fatty alcohols show a gradual alteration in properties as the number of carbon atoms in the molecule is increased. The lower members derived from alcohols possessing round about twelve carbon atoms, have the best wetting-out and penetrating properties, whereas the higher members have better detergent powers. The lower members, however, are less likely to precipitate with calcium salts. The sulphonated fatty alcohol made from oleyl alcohol, an unsaturated alcohol, has special properties, being both a good detergent and a good wetting-out agent.

Uses. Sulphonated fatty alcohols find extensive use in many and varied industries. Pharmaceutical applications are increasing rapidly, and include the preparation of soapless shampoo powders, toilet preparations, tooth pastes and powders. Included in cosmetics they greatly assist the removal of make-up or dirt. In the dyeing industry sulphonated fatty alcohols are used as cleansers before dyeing and they are also added to the dye-bath itself to ensure even penetration. Their powers of increasing penetration are also put to good use in the leather industry to assist the wetting of leather by water or the penetration of wet leather by oil. Sulphonated fatty alcohols are used in varnishes and paints to increase the spreading power, in adhesives to increase adhesion, and for many other purposes.

The preparation, properties and uses of sulphonated alcohols are described, and formulæ are suggested for a soapless shampoo powder, a shampoo powder containing soap and a sulphonated alcohol, and a foam bath.—N. Evers, *Pharm. J.*, i/1938, 826.

Sulphonated Lorol (Ronsheim & Moore, London) consists of the sodium salt of sulphated lauryl alcohol, $C_{12}H_{25}O-SO_3Na$, containing smaller proportions of sulphated analogous acids. Several grades of the material are available, including liquid, paste and powder. **Sulphonated Lorol L.Z.** is a special grade for use in soapless and/or acid dentifrices.

Anti-misting Compound. Sodium oleyl sulphate 18%, titanium dioxide 27%, alcohol 33%, water 22%, all by weight. The preparation is made by grinding the ingredients together to form a liquid of uniform consistence. A surface treated by spreading the material evenly with a soft cloth should dry and be capable of being lightly polished by a soft dry cloth in three minutes.—Air Ministry Specification (D.T.D. 338, H.M.S.O.), per *Pharm. J.*, i/1940, 105.

Sodii Sulphoricinas. *Syn.* TURKEY RED OIL, ALIZARINE OIL.

Sodium sulphuricinate is the sodium salt of sulphonated castor oil, obtained by adding sulphuric acid to castor oil, and treating the product with sodium hydroxide. It is a yellow or yellowish red viscous liquid, with a faint odour, giving a clear solution when diluted with an equal volume of water, and a stable emulsion with nine times its volume of water.

Uses. Sodium sulphuricinate and other true sulphonated oils have not found a very extensive use in pharmacy. They are not as effective detergents as the sulphonated fatty alcohols, but they are sometimes used in soapless shampoos and permanent waving lotions to increase the wetting power. Sodium sulphuricinate is used as a constituent of perfume sprays, in hand cleansers, motor soaps, etc. It finds its most extensive use in the dyeing industry as a fixing agent and as an emulsifying agent. It was particularly used for the treatment of cotton to be dyed with turkey red or alizarine. A concentrated solution of sodium sulphuricinate will dissolve iodine, resorcinol and naphthalene, forming antiseptic solutions. It has been used as a glycerin substitute.

The following formulæ for ointment bases have been found useful: (a) Lanette wax S.X. 10, avocado pear oil 10, turkey red oil 10, lanolin 10, water 30, benzoated lard 30. This is all but completely absorbed. (b) Turkey red oil 5, water 10, Eucerin 85, which leaves a greasy surface, and (c) coconut oil soap 10, hydrous wool fat 10, coconut oil 20, turkey red oil 10, P.M.B. 333 5, stearyl alcohol 5, white soft paraffin 40.—Bamber, *Brit. J. Derm. & Syph.*, 1940, 52, 21.

[P2] **Phenol Sodio-Sulphuricinate.** A mixture of phenol 1, and sodium sulphuricinate 4. A thick syrup miscible with water. 20 to 50% solution has been used for papilloma and tuberculosis of larynx and for ozæna.

Pharyngo-keratosis (mycosis) has been treated with 10% solution, also 10% solution of salicylic acid in the sulphuricinate.

Triethanolamina (B.P.C.). *Syn.* TRIETHYLOLAMINE.

A colourless, almost odourless, syrupy liquid with strongly alkaline reaction, which darkens on exposure to air. Consists chiefly of trihydroxytriethylamine, $(\text{CH}_2\cdot\text{CH}_2\cdot\text{OH})_3\text{N}$, with small proportions of the di- and monohydroxy compounds. Forms crystalline salts with mineral acids; the hydrochloride has m.p. 173° to 174° .

Miscible with water and alcohol 90%; soluble in chloroform; less soluble in benzene and ether.

Is a useful emulsifying agent for preparations for external use when used in conjunction with oleic or stearic acid, with which the corresponding salts are formed. Also used as a solvent for casein, shellac and dyes.

Triethanolaminæ Stearas. The triethanolamine salt of stearic acid. A yellowish-brown solid, soluble in water. Used as an emulsifying agent instead of ordinary soaps for oils and fats.

Useful in toilet preparations to avoid alkalinity of sodium and potassium soaps, and in the manufacture of creams and polishes.

Monoethanolaminæ Oleas.

$C_{17}H_{33}COOH \cdot NH_2 \cdot CH_2 \cdot CH_2OH = 343.54$.

The monoethanolamine salt of oleic acid, occurring as a colourless, deliquescent solid. It is used as a 5% solution containing 25% of glycerin or 2% of benzyl alcohol for the injection treatment of varicose veins in doses of 1 to 2 ml. at each site, with a maximum of 6 ml. altogether on one occasion. The doses should be repeated at weekly intervals.

Monoethanolamine oleate is the most satisfactory of the sclerosing agents. Morrhuate and quinine urethane solutions have their contraindications, while salicylates tend to be painful. None of these disadvantages attends the use of the oleate solution, and as it is only slightly irritant to the perivenous tissues, ulceration is not likely to occur if a little escapes through the puncture into the vein.—L. Rogers, *Brit. med. J.*, ii/1939, 385.

Ethamolin (*Glaxo Laboratories, London*). Aqueous solution of ethanolamine oleate 5%, with benzyl alcohol 2%, supplied in 2 ml. ampoules and 15 and 30 ml. bottles for the injection treatment of varicose veins.

E.O.B.A. Sclerosant (*Wyleys, Coventry*). A 5% solution of monoethanolamine oleate with benzyl alcohol 2%, supplied in 15 ml. and 50 ml. rubber-capped bottles and in 2 ml. ampoules.

Monolate (*Abbott Laboratories, London*). Monoethanolamine oleate 5%, in ampoules. For injection treatment of varicose veins.

Moramin (*Allen & Hanburys, London*). A 5% preparation of ethanolamine morrhuate, for the injection treatment of varicose veins, issued in 20 ml. vials. Dose.—1 to 2 ml. at each site, with a max. of 6 ml. on any one occasion.

Trisopropanolamina. $N(C_3H_7OH)_3 = 159.27$.

A colourless, pasty, semicrystalline mass with a slight odour and a bitter taste; m.p. 46° .

Readily **soluble** in water, alcohol, acetone, ether and chloroform. It is used in the preparation of Sobisminol Mass (*q.v.*).

A mixture of di-, tri- and mono-isopropanolamines containing about 43% each of the di- and tri-, and about 10% of the mono- substance, possessed greater emulsifying powers for pharmaceutical and cosmetic preparations than tri-isopropanolamine alone. In addition, salts of this mixture were softer and lighter than the salts of either tri- or mono-isopropanolamine.—G. W. Fiero, *J. Amer. pharm. Ass.*, 1939, 1036.

Quillaia (*B.P., P. Helv. V, Fr. Cx.*). *Syn.* PANAMA BARK, SOAP BARK.

Dose.—1 to 3 grains (0.06 to 0.2 g.).

The dried inner part of the bark of *Quillaja Saponaria* and other species (*Rosaceæ*). Contains quillaic acid, $C_{19}H_{30}O_{10} = 418.3$, and sapotoxin, $C_{17}H_{28}O_{10} = 408.2$, closely allied to saponin. Has a sweetish but acrid after-taste and possesses emulsifying properties, causing frothing in water in which it has been macerated. Its lather kills pediculi of scalp. Soap bark has been used as an expectorant in bronchitis; is contraindicated in inflammation of the intestines or stomach, or ulcerated condition of the mucous membrane. The powdered bark is a powerful sternutatory.

Extractum Quillaie Liquidum (*B.P.C.*). 1 in 1.

Tinctura Quillaie (*B.P.*).

1 in 20 of alcohol 45%. Five minims of this will emulsify 1 drachm of fixed oil.

SCILLA

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

Syn. SCILLÆ BULBUS (I.A.), WHITE SQUILL.

Dose.—1 to 3 grains (0.06 to 0.2 g.). *Fr. Cx.* has max. single dose $7\frac{1}{2}$ grains; max. in 24 hours 15 grains.

The bulb of *Urginea Scilla* (Liliaceæ) (*U. maritima* U.S.P. XI) with membranous outer scales removed, cut into slices and dried.

As a war emergency measure, when Squill is prescribed, or demanded, Indian Squill may be dispensed or prescribed.

Antidotes. Treat as for poisoning by digitalis, see p. 480.

Uses. Squill closely resembles digitalis in its action, but is a more powerful gastro-intestinal irritant and a more energetic diuretic. Because of its irritant properties it is seldom given alone, but is frequently combined with digitalis in the treatment of heart disease or as a diuretic. A favourite diuretic pill is composed of 1 gr. each of powdered digitalis, squill, and pill of mercury. Squill also has an expectorant action. It is too irritating to the bronchial mucous membrane for use in acute bronchitis, but is of value in chronic bronchitis when the secretion is scanty. The use of squill is contraindicated in Bright's disease.

The powdered drug, and extracts made from it, have been largely used as rat poisons and are said to be very efficacious; the red variety is usually preferred for this purpose.

Red Squill. Red squill has a similar content of cardiac glycosides to white squill, as shown by Wokes and Willimott (*Quart. J. Pharm.*, 1934, 565). It has in addition constituents which are toxic for rats, and is therefore used as a rat poison. These are not wholly absent from white squill. Wokes and Willimott (*loc. cit.*) found that when they prepared a dried powder from the two varieties, the dose of the red squill necessary to kill half the rats was 1.0 to 1.5 g. per kg., whereas the dose of the white squill was ten times as great. These doses were given by mouth.

The rat-poisoning substances appear to be present in significant amounts in the red squills only.—F. R. Winton, *J. Pharmacol.*, June, 1927, 137.

Liquid extract of red squill is efficacious. Add to bread and milk. Comparatively harmless to larger animals, advocated by Min. of Agriculture.—*Pharm. J.*, ii/1927, 524.

Acetum Scillæ (B.P., U.S.P. XI).

Dose.—10 to 30 minims (0.6 to 2 ml.).

Squill 10% w/v macerated in dilute acetic acid.

Extractum Scillæ Liquidum (B.P.C.).

Dose.—1 to 3 minims (0.06 to 0.2 ml.). 1 in 1.

Extractum Scillæ (Fr. Cx.). *Max. single dose.*—0.2 g. A soft extract prepared with alcohol 60%.

Linctus Scillæ (B.P.C.). *Syn. LINCTUS, SIMPLE LINCTUS.*

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Oxymel of squill 1 in 4 with mucilage of tragacanth, glycerin, emulsion of chloroform and syrup.

Linct. Simplex (N.I.F.). *Dose.*—1 drachm (4 ml.).

Oxymel of squill, syrup of tolu and glycerin, equal parts.

[P1] **Mist. Expect. Nig. (N.I.F.).** Ammonium carbonate $3\frac{1}{2}$ gr., liquid extract of squill 2 m., camphorated tincture of opium 15 m., syrup of tolu 15 m., solution of burnt sugar $7\frac{1}{2}$ m., chloroform water to $\frac{1}{2}$ oz.

Oxymel Scillæ (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains equivalent of 5% *w/v* of squill in acetic acid, honey, and distilled water.

Mist. Oxymellis (N.I.F.). Oxymel of squill 30 m., liquid extract of ipecacuanha $\frac{1}{2}$ m., glycerin 20 m., dilute sulphuric acid 4 m., solution of bordeaux B 2 $\frac{1}{2}$ m., water to $\frac{1}{2}$ oz.

[P1] **Mist. Scillæ Co. (N.I.F.).** Oxymel of squill 30 m., camphorated tincture of opium 15 m., liquid extract of ipecacuanha $\frac{1}{2}$ m., water to $\frac{1}{2}$ oz.

Pillule Scillæ Compositæ (B.P.C.).

Dose.—1 or 2 pills.

Contain squill 1 gr., ginger $\frac{1}{2}$ gr., ammoniacum $\frac{1}{2}$ gr., and hard soap about $\frac{1}{2}$ gr.

Syrupus Scillæ (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Contains 45% *v/v* of vinegar of squill.

Syrupus Scillæ (U.S.P. XI). *Average dose.*—30 minims (2 ml.).

Vinegar of squill 45, sucrose 80 in water to 100.

Tinctura Scillæ (B.P.).

Dose.—5 to 30 minims (0.3 to 2 ml.).

Contains equivalent of 10% *w/v* of squill.

Tinctura Scillæ (U.S.P. XI). *Average dose.*—15 minims (1 ml.).

Strength 1 in 10.

Scillaren (Sandoz, London; Brooks & Warburton, London). Preparations of the total glycosides of squill. *Dose.*—2 tablets (ea. 0.0008 g.) or 40 drops of solution (0.0008 g. per ml.) 3 or 4 times daily; in urgent cases intravenously not more than 1 ampoule (1 ml. = 0.0005 g.) per day. Valvular lesions, œdema of cardiac origin, chronic myocarditis and "weak heart."

Urginea (B.P.C.). Syn. INDIAN SQUILL.

Dose.—1 to 3 grains (0.06 to 0.2 g.).

The bulb of *U. indica* with membranous outer scales removed, cut into slices and dried.

Uses. As for squill. As a war emergency measure (1941) it may be dispensed or supplied when squill is prescribed or demanded.

SENEGA

B.P., P. Helv. V, Fr. Cx.

Dose.—6 to 12 grains (0.4 to 0.8 g.).

The dried root of *Polygala Senega* (Polygalaceæ) containing glycosidal saponins, senegin and polygalic acid, and a fixed oil.

Senega is a reflex expectorant and is employed, usually with other expectorants, such as ipecacuanha and squill, in bronchitis.

Polygalitol, an anhydride of mannitol and isomeric with styracitol has now been isolated from the fresh flowering plants and also from the dried roots of *Polygala Senega* as a white crystalline powder. It has a sweet taste, but does not reduce Fehlings solution.—C. J. Carr and J. C. Krantz, *J. Amer. pharm. Ass.*, 1938, 21, 318.

Extractum Senegæ Liquidum (B.P.).

Dose.—5 to 15 minims (0.3 to 1 ml.).

1 in 1 of alcohol 60%, rendered faintly alkaline with ammonia.

Infusum Senegæ Concentratum (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 3 ml.).

1 in $2\frac{1}{2}$ of alcohol 25%, rendered faintly alkaline with ammonia.

Infusum Senegæ Recens (B.P.).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 20.

Tisane de Polygala (Fr. Cx.). 1 in 100 of boiling water; infuse $\frac{1}{2}$ hour.

Mist. Seneg. Ammon. (N.I.F.). *Syn.* MIST. IPECAC. CO.

Ammonium carbonate 3 gr., tincture of ipecacuanha 5 m., liquid extract of squill 2 m., liquid extract of senega 6 m., water to $\frac{1}{2}$ oz.

Tinctura Senegæ (B.P.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Liquid extract of senega 1 in 5, with alcohol 60%.

Cocillana. *Syn.* GUAPI BARK.

Dose.—8 to 15 grains (0.5 to 1 g.).

The bark of a South American plant, *Guarea Rusbyi* (Meliaceæ), stated to equal ipecacuanha in expectorant properties and to be, in addition, tonic and laxative.

[P1] Syrup. Cocillanæ Co. (D.T.F.).

Liquid extract of cocillana (1 in 1, with alcohol 60%) 16 m., liquid extract of euphorbia 40 m., liquid extract of squill 4 m., liquid extract of senega 4 m., potassium antimonytartrate $\frac{1}{2}$ gr., codeine phosphate 2 gr., water 60 m., menthol $\frac{1}{4}$ gr., spirit of chloroform 40 m., glycerin 160 m., syrup to 2 oz.

[P1] Cosylan (Syrup Cocillana Compound) (Parke, Davis, London). Expecto-
rant combination, containing per oz.: tincture of cocillana 40 m., tincture of
euphorbia 120 m., syrup of wild lettuce 120 m., fluid extract of squill 2 m.,
fluid extract of senega 2 m., potassium antimonytartrate $\frac{1}{2}$ gr., cascarn 8 gr.,
ethylmorphine hydrochloride $\frac{1}{2}$ gr., menthol $\frac{1}{16}$ gr. *Dose.*— $\frac{1}{2}$ to 1 drachm
3 or 4 times daily.

**Prunus Serotina (B.P., U.S.P. XI). *Syn.* PRUNI VIRGINIANÆ
CORTEX, WILD CHERRY BARK.**

Dose.—15 to 30 grains (1 to 2 g.).

The bark of *Prunus serotina* (Rosaceæ). Contains prunasin and a cyanogenetic enzyme, and may yield from 0.075 to 0.16% of HCN. Used for relief of cough in phthisis, bronchitis, etc.

**[P1] Syrupus Pruni Serotinæ (B.P.). *Syn.* SYRUPUS PRUNI VIR-
GINIANÆ, SYRUP OF WILD CHERRY.**

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

A solution of sucrose in an aqueous glycerin percolate, containing the equivalent of 15% w/v of the bark. It is reported that a preparation made by percolation with water only is lighter, contains less tannin and has less tendency to deposit.

[P1] Syrupus Pruni Virginianæ (U.S.P. XI). *Average dose.*—2 $\frac{1}{2}$ drachms.
Wild cherry bark 15, sucrose 80, glycerin 5, alcohol 2, water to 100.

**[P1] Tinctura Pruni Serotinæ (B.P.C.). *Syn.* TINCTURA PRUNI
VIRGINIANÆ.**

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Stillingia (B.P.C.). *Syn.* QUEEN'S ROOT, YAW ROOT.

Dose.— $\frac{1}{2}$ to 1 drachm (1 to 2 g.).

The dried root of *Stillingia sylvatica* (Euphorbiaceæ). Contains volatile oil. Large doses emetic, cathartic; small doses sialagogue and expectorant.

SENNÆ

Sennæ Folium (B.P.). *Syn.* SENNA (U.S.P. XI).

Dose.—10 to 30 grains (0·6 to 2 g.).

The dried leaflets of *Cassia acutifolia* (Alexandrian) or *C. angustifolia* (East Indian or Tinnevely) (Leguminosæ). *P. Helv. V* and *P. Dan.* recognise *C. angustifolia* only. Contains aloëmodin, kempferol, isorhamnetin, etc.

Uses. Senna is a safe, useful purgative for simple constipation, but owing to its tendency to gripe it is usually given with carminatives. Confection of senna is a suitable laxative for children and delicate persons, and is especially valuable in hæmorrhoids. Preparations made from the fruit are said to be less griping than those from the leaf, and infusion of senna pods is a popular and harmless purgative for regular use.

Confectio Sennæ (B.P.). *Syn.* LENITIVE ELECTUARY.

Dose.—1 to 2 drachms (4 to 8 g.).

Contains senna 10% with coriander, figs, tamarind, cassia, prunes, extract of liquorice, sugar and water. The use of coriander oil instead of the fruit has been suggested.

Confectio Sennæ Composita (C.X.H.). Powdered jalap 3 gr., senna leaf 3 gr., sublimed sulphur 3 gr., black treacle to 60 gr.

Confectio Sennæ et Sulphuris (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 g.).

Equal parts of confection of senna and confection of sulphur.

Fluidextractum Sennæ (U.S.P. XI). *Average dose.*—30 minims (2 ml.). 1 ml. represents 1 g. of senna leaf.

Syrupus Sennæ (U.S.P. XI). *Average dose.*—2 drachms (8 ml.).

Fluidextract of senna 25, oil of coriander 0·5, sucrose 63·5 in water to 100.

Tinctura Sennæ Composita (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.) for repeated administration; 2 to 4 drachms (8 to 16 ml.) for a single administration.

Senna leaf 1 in 5, with caraway and coriander.

Sennæ Fructus (B.P., P. Helv. V). *Syn.* SENNA POD.

Dose.—10 to 30 grains (0·6 to 2 g.); corresponding to about 4 to 12 pods.

The dried ripe fruits of either Alexandrian or Tinnevely senna.

P. Dan. recognises *C. angustifolia* only. These are stronger than the leaves and preparations made without crushing the seeds are believed to be less griping than those from the leaf.

Elisir Sennæ (B.P.C.). *Syn.* LIQUOR SENNÆ LEGUMINORUM DULCIS.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A flavoured preparation containing 50% v/v of liquid extract of senna.

Extractum Sennæ Liquidum (B.P.).

Dose.—10 to 30 minims (0·6 to 2 ml.).

1 in 1, by maceration in chloroform water, evaporation, and addition of alcohol.

Infusum Sennæ Concentratum (B.P.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

1 in 1 $\frac{1}{2}$ by percolation with alcohol 20% and addition of 1 in 12 $\frac{1}{2}$ of strong tincture of ginger.

Infusum Sennæ Recens (B.P.).

Dose.— $\frac{1}{2}$ to 2 ounces (15 to 60 ml.).

Senna 1 in 10 and ginger 1 in 200.

Mistura Sennæ Composita (B.P.). *Syn.* BLACK DRAUGHT.

Dose.—1 to 2 ounces (30 to 60 ml.).

Magnesium sulphate 1 in 4 with liquid extract of liquorice, compound tincture of cardamom, aromatic spirit of ammonia and infusion of senna.

Syrupus Sennæ (B.P.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Liquid extract of senna 25% v/v with oil of coriander, sucrose and water.

Lixen (Allen & Hanburys, London). Elixir of senna pods. 1 drachm = 10 large senna pods. Also in lozenges and pastilles.

Baptisia (B.P.C.). *Syn.* WILD INDIGO ROOT.

The dried root of *B. tinctoria* (Leguminosæ). Has laxative properties and has been given as a decoction.

Tinctura Baptisiz (B.P.C.). 1 in 10. Occasionally added to mouth-washes for its saponin content.

Baptisin. *Dose.*—1 to 5 grains. An extractive from baptisia; in small doses laxative, in large doses cathartic. The mother tincture of baptisia (homœopathic) has a reputation for treatment of boils.

Ficus (B.P.C.). *Syn.* FIG, CARICA (*P. Helv. V*).

The dried fruit of *F. Carica* (Moracæ), a mild laxative.

Syrupus Ficorum (B.P.C.).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Is prepared by dissolving sucrose in an aqueous decoction.

Syrupus Ficorum Compositus (B.P.C.). *Syn.* SYRUPUS FICORUM AROMATICUS.

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Contains compound tincture of rhubarb, liquid extract of senna, elixir of cascara sagrada and syrup of figs.

Ficin. The sap of the fig tree, used by the natives of S. America for the treatment of intestinal parasites, has recently been investigated as an anthelmintic, and has been found to remove about 80% of *Trichuris*, as compared with the 20 or 25% removed by most other substances and the 40 or 50% removed by hexyl-resorcinol. The active principle is a proteolytic enzyme which digests the parasites. It is non-irritating and non-toxic if no lesion of the intestinal tract is present, in which case it causes dangerous erosion of the mucous membrane.—P. D. Lamson and co-workers, *J. Amer. med. Ass.*, ii/1932, 293.

Morus (B.P.C.). *Syn.* MÛRE (*Fr. Cx.*).

Mulberry is the fresh ripe fruit of *M. nigra* (Moracæ). Mulberry juice is slightly laxative and expectorant.

Syrupus Mori (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A solution of sucrose in mulberry juice.

Prunus (B.P.C.). Prune is the dried ripe fruit of *P. domestica* var. *Juliana* (Rosacæ). Has laxative properties.

Cerasus. Red cherry is the fruit of *Prunus Cerasus* var. *caproniana*.

Syrupus Cerasi (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

A solution of sucrose in red cherry juice. A flavouring and colouring agent.

Ribes Nigrum. The fresh ripe fruit of the black currant.

Syrupus Ribis Nigri (B.P.C.).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). A solution of sucrose in the juice expressed from a mixture of black currants and red cherries.

Ribes Rubrum. The fresh ripe fruit of the red currant.

Syrupus Ribis Rubri (B.P.C.). *Syn.* SIROP DE GROSEILLE (*Fr. Cx.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). A solution of sucrose in the juice expressed from a mixture of red currants and red cherries.

Tamarindus (B.P.). *Syn.* WEST INDIAN TAMARINDS.

The fruits of *Tamarindus indica* (Leguminosæ) freed from the brittle outer part of the pericarp and preserved with sugar. Occurs as a reddish-brown moist sugary mass. Contains tartaric acid, potassium acid tartrate and about 30% of sugar. Is also imported pressed into a solid mass as pulp (*Pulpa Tamarindi cruda*, *P. Helv. V*). A mild laxative.

SINAPIS NIGRA

B.P.C., Fr. Cx.

Syn. SEMEN SINAPIS (*P. Helv. V, F.E. VIII, P. Ital. V, P. Belg. IV*).

Black mustard is the dried ripe seeds of *Brassica sinapoides* (Cruciferae). *U.S.P. XI* allows *B. sinapoides* also *B. juncea* and varieties of these species.

They contain the glycoside, sinigrin, and the enzyme, myrosin, which interact in the presence of water to yield allyl isothiocyanate (0.6 to 1%).

(*SINAPIS ALBA* is obtained from *B. alba*. It yields no allyl isothiocyanate. *BATH MUSTARD* is powdered mustard from which the seed coats have not been completely removed. *MUSTARD BRAN* consists usually of the seed coats of black mustard. *MUSTARD FLOUR* consists of powdered black and white seeds from which the seed coats have been largely removed).

Uses. As an emetic a tablespoonful in half a pint of warm water. In small doses is a stomachic and appetiser. Externally, a counter-irritant when applied as a poultice, or added to hot water and used as a foot-bath. It may blister tender skins.

Balneum Sinapis (B.P.C.). Contains 12 oz. of bath mustard per 30 gallons.

Cataplasma Sinapis (B.P.C.). Mustard flour 2% in linseed poultice.

Emplastrum Sinapis (U.S.P. XI). A spread plaster on paper, cloth or other material, prepared with oil-free black mustard and rubber solution; each sq. cm. contains at least 0.025 g. of the mustard. It should be applied after moistening with tepid water. *Charta Sinapisata (P. Helv. V)* contains 0.03% of C_2H_5NCS . Is also official in *P. Dan.*

Oleum Sinapis Expressum (B.P.C.). *Syn.* BLACK MUSTARD OIL.

Obtained by expression from black mustard seeds; the average content is about 26%. A brownish-yellow or greenish-brown oil used as a mild rubefacient. *WHITE MUSTARD SEED OIL*, from the seeds of *B. alba*, is used for lubricating and for burning.

Oleum Sinapis Volatile (B.P.C., U.S.P. XI, P. Helv. V). *Syn.* ALLYL ISOETHIOCYANATE, ESSENCE OF MUSTARD (*Fr. Cx.*).

Dose.—No dose given in *B.P.C.* *U.S.P. XI* has average dose $\frac{1}{8}$ minim.

Consists chiefly of allyl isothiocyanate, C_2H_5NCS , and may be prepared synthetically or distilled from black mustard seeds after expression of the fixed oil and maceration in tepid water to allow

interaction between the glycoside, sinigrin (potassium myronate), and the enzyme, myrosin.

α -Naphthyl isothiocyanate (C_8H_7NCS) is a white, crystalline substance, m.p. 55.5° , b.p. 142° , slightly soluble in water, but soluble in kerosene up to 12%. It has a slight odour and is non-staining, and is loosely called mustard oil. Alone it is not sufficiently poisonous to flies for an insecticide, but mixed with pyrethrum it has a satisfactory toxic action. It is said that the addition of 1% of α -naphthyl isothiocyanate to an insecticide allows the elimination of about 60% of the pyrethrum whilst maintaining the desired toxic effect.—per *Pharm. J.*, i/1940, 41.

Linimentum Sinapis (B.P.C.).

Volatile oil of mustard 3.5% in a castor oil, camphor and alcohol mixture.

Spiritus Sinapis (P.G. VI). Volatile oil of mustard 1, alcohol (90%) 49.

Thiosinamina (B.P.C., Fr. Cx.). *Syn.* RHODALLIN, ALLYL-THIOUREA, ALLYL-SULPHOCARBAMIDE. $CS(NH_2)NHC_3H_5 = 116.1$.

Dose.—Internally, $\frac{1}{2}$ grain gradually increased to $1\frac{1}{2}$ grains (0.03 to 0.1 g.) (with caution—in capsule or alcoholic solution). Hypodermically 1 to $1\frac{1}{2}$ grains as *Injectio Thiosinaminæ et Sodii Salicylatis*.

White crystals, usually with a slight garlic-like odour, and having a bitter taste. M.p. 72° to 74° . May be obtained by the interaction of volatile oil of mustard, alcohol and ammonia solution.

Soluble 1 in 17 of water, about 1 in 2 of alcohol 90%, and in ether. Readily soluble in solutions of borax, urethane, benzoates, cinnamates, etc.

Uses. To some extent internally, but chiefly by injection (*vide infra*) with sodium salicylate, for absorbing fibrous and scar tissue. Has been used for keloid and in scleroderma. It sometimes gives rise to toxic effects, such as nausea, vomiting, headache, and fever. In ophthalmology it has been used in corneal opacity, corneal scars, choroiditis and other conditions.

TINNITUS AURIUM has been treated by 5% aqueous solution hypodermically with improvement, dose being increased from 6 to 35 m., also a 10% solution and a 20% glycerin solution. Should be tried before operating on the middle ear or labyrinth for this trouble.

PERICARDIAL ADHESIONS have been treated by 3-gr. doses in 80 m. of water every other day in the flanks for 30 days.

Injectio Thiosinaminæ et Sodii Salicylatis (B.P.C.).

Dose.—8 to 15 minims (0.5 to 1 g.).

Contains 10% *w/v* of thiosinamine dissolved with aid of sodium salicylate in diluted glycerin.

Uses. For relaxing scar tissue, in strictures of the gullet, urethra and rectum, in stenosis of the pylorus, rheumatoid arthritis, Dupuytren's contraction and eye affections (corneal infiltrations). It should be injected in the neighbourhood of the tissues to be absorbed, and the injections continued for several months. Massage and stretching or the use of bougies in appropriate cases may be of value. Also in middle-ear disease and for tinnitus (but the "remote action" in such is doubtful), and in pleural adhesions, injected locally or into the gluteal muscles once or twice weekly according to severity of case. It may be of value in arteriosclerosis and chronic rheumatism.

Cicatricine (*Martindale, London*). Injection of thiosinamine and phenazone containing per ml. 3 gr. of thiosinamine, 5 gr. of phenazone and $\frac{1}{10}$ gr. of benzamine lactate. A non-toxic, non-irritating injection for the treatment of cicatricial tissue.

Fibrolysin (*Merck, Darmstadt; Martindale, London*). Thiosinamine sodium salicylate. Supplied in ampoules (2 ml.), suppositories (0.3 g.) and lymph tubes (for the eye). *Dose*.—1 ampoule intragluteally every 2nd or 3rd day, 1 suppository at night, or 1 to 3 drops into the eye thrice daily.

Thiosinaminæ et Æthylis Iodidum. *Syn. and Prop. Name.* THIODIN, TIODINE (*Cognet, Paris; Roberts, London*). $\text{CS}(\text{NH}_2\text{C}_2\text{H}_5\text{I})\text{NHC}_3\text{H}_5 = 272.1$.

Dose.—1 to 4 grains (0.06 to 0.25 g.) daily by mouth; 3 to 6 grains (0.2 to 0.4 g.) three times weekly by injection.

Prepared by heating thiosinamine and ethyl iodide under a reflux condenser. Forms white crystals melting at about 70°.

Soluble 1 in 10 of water and 1 in 1 of alcohol 90%.

Used for the same purposes as thiosinamine, also given internally in intractable rheumatoid arthritis. Skin rashes may follow its oral administration. A saline draught should be given each morning during administration; alcohol and red meat should be avoided, and plenty of water drunk.

ACTINOMYCOSIS. 5 cases treated hypodermically with rapid and complete success.—T. G. Moorhead, *Brit. med. J.*, i/1929, 419.

Iodolysin (*Allen & Hanburys, London*). A similar preparation, stated to contain 43% thiosinamine and 47% of I. Iodolysin solution for oral use, 30 m. containing 2 gr. Iodolysin; also Injection (hypodermic) 15 m. containing 2 gr. Ointment and Pigment are also prepared. To soften cicatrices and promote absorption of fibrous tissue. Of value in rheumatoid arthritis.

Armoracia (*B.P.C.*). Horseradish is the fresh root of *Cochlearia Armoracia* (*Cruciferae*). Contains sinigrin (potassium myronate) and the enzyme myrosin, which react in the presence of water to give allyl isothiocyanate. The infusion, 1 in 20, has been given as a stimulant.

Spiritus Armoraciæ Compositus (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 ml.).

A distilled spirit representing 1 in 8 of horseradish. Administered as a carminative.

Mezereum (*B.P.C., P. Helv. V*). *Syn.* MEZEREON.

Dose.—8 grains (0.5 g.). The dried bark of *Daphne Mezereum* (*Thymelæaceæ*) and other species. Contains an acrid resin and a bitter glycoside (daphnin). At one time had a reputation as an alternative in syphilis, chronic rheumatism, etc., but is now seldom given internally except as an ingredient of compound decoction of sarsaparilla. Externally it has been employed as a stimulant and vesicant.

SODIUM

Na = 22.997.

Notes on other sodium salts are included under the corresponding acids (see Index).

Liquor Sodii Æthylatis (*B.P.C.*).

A 1 in 20 solution of sodium in dehydrated alcohol, the latter being cooled by a stream of cold water; contains 18% of $\text{C}_2\text{H}_5\text{ONa}$. Rapidly becomes brown.

Uses. A powerful caustic and has been used for the treatment of nævi, warts and lupus; also in hypertrichosis. It should always

be used in alcoholic solution and applied with a glass rod on 2 or 3 successive days. No water should be allowed to touch the part.

Liquor Sodii Methylatis.

Is prepared on lines similar to the above, employing methyl instead of ethyl alcohol.

Sodii Bicarbonas (*B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.*). *Syn.* SODII CARBONAS ACIDUS, SAL DE VICHY (*F.E. VIII*). $\text{NaHCO}_3 = 84.00$.

Dose.—15 to 60 grains (1 to 4 g.). *U.S.P. XI* average dose 15 grains.

Occurs in small white crystals or powder. 20 parts are neutralised by 17 of citric or 18 of tartaric acid.

Soluble 1 in 11 of water; insoluble in alcohol 90%. A 1.35% *w/v* solution is isotonic with blood.

Solutions for *intravenous infection* should be prepared by adding sodium bicarbonate aseptically to cold, freshly prepared sterilised water and shaking to dissolve.—O. Turner, *Trans. R. Soc. trop. Med. Hyg.*, 1940, 34, 112.

Incompatible with acids and acid salts, and with metallic and alkaloidal salts. Bismuth, magnesium and lithium benzoates and salicylates are incompatible with sodium bicarbonate. It is also incompatible with aspirin.

Uses. Sodium bicarbonate is mainly used as an antacid. In particular it gives prompt relief in simple hyperchlorhydria, flatulent dyspepsia and heartburn. An objection to its use, however, is that the initial reduction of gastric secretion is followed by an increased acidity due to the evolution of carbon dioxide, and it is now more usual to give it in association with other antacids and bismuth. In order to inhibit excessive secretion in the stomach and to stimulate appetite it is given with bitter stomachics, such as gentian or rhubarb, thirty minutes before meals. In acidosis, especially that associated with diabetes, its use either by the mouth, or intravenously in 5% solution (500 ml. in 30 minutes), is of great value. Large doses (up to 7 g. daily) may also be employed to render the urine alkaline in the treatment of infections of the urinary tract, such as pyelitis and cystitis, and in acute nephritis, and alkalinisation by sodium bicarbonate, either orally or intravenously, to the limit of toleration, is said to be of great value in blackwater fever. In the cyclical vomiting of children and in the toxæmia of pregnancy, large doses given in association with dextrose are of great value.

Sodium bicarbonate is also employed for its action in dissolving mucus, and it may be used as a mouth wash or gargle (1 to 4%), or as a liquefying expectorant, in all kinds of catarrhal conditions, *e.g.*, bronchial catarrh and bronchitis; in gastric catarrh and dilatation, lavage with a 1% solution is an efficient treatment.

Applied locally to the skin, weak solutions (1 in 150) relieve the irritation of urticaria, eczema and dermatitis, and a 2% solution in water is used as an eye lotion. The use of lotions or eye ointments containing sodium bicarbonate are especially recommended for the treatment of burns of the eye due to contamination by mustard gas.

Sodium bicarbonate is particularly unsatisfactory as an antacid. It is soluble in water (the ideal antacid should be insoluble); it is irritating in high concentrations; after an initial neutralisation of hydrochloric acid it causes a secondary rise in acidity to heights not previously reached; in fact it is now recognised to be the most potent stimulus to acid production known, apart from histamine. It has the further disadvantage of causing an evolution of carbon dioxide and a rise in intragastric tension, which may prove dangerous in the presence of an ulcer. It is rapidly absorbed and when used in large doses, or over long periods, may give rise to alkalosis, especially when there is hepatic or renal insufficiency. It should not be used as an antacid in the treatment of peptic ulcer, though an occasional dose for the relief of pain of exceptional severity may be necessary.—T. L. Hardy, *Practitioner*, i/1937, 436.

BLACKWATER FEVER. Sodium bicarbonate intravenously, 10 to 20 ounces of strength 150 gr. to the pint curtails duration of attack, prevents blockage of kidney tubules, and avoids suppression of urine.—W. E. Cooke and H. Willoughby, *Lancet*, i/1929, 334.

Sodium bicarbonate orally and the citrates or lemonade. Sodium bicarbonate 10 g., glucose 10 g., given in 1000 ml. initially and large amounts (up to 21 g. in 24 hours) repeatedly during treatment. Quinine could be taken when the urine was kept alkaline.—C. C. Chesterman, *Lancet*, i/1929, 1355. See also C. P. Downison, *ibid*, i/1929, 47.

DIABETIC COMA. In two cases of diabetic coma with severe acidosis, in which insulin treatment did not rapidly bring about the expected improvement, intravenous injection of 2 litres of an isotonic solution (1.3%) of sodium bicarbonate immediately relieved the coma. It is generally necessary to determine the plasma-bicarbonate values several times during the first 24 hours.—E. Kirk, *Lancet*, i/1939, 505.

ECZEMA. Obstinate cases cured by daily bath of 2 lb. of sodium bicarbonate to 20 gallons of water, with change of linen and an ounce of magnesium hydrate twice daily. A case of 13 years' standing cleared up in 3 days.—S. A. Leader, *Brit. med. J.*, ii/1931, 323.

Eye Ointment for Gas Poisoning. The following ointment should be instilled at once. Sodium bicarbonate 3%, distilled water 10%, wool fat 10%, soft paraffin to 100%. After 24 hours it should be replaced by 10% boric acid ointment. The patient can apply the ointment by pulling down the lower lid, laying the ointment (preferably supplied in tubes) along the lower fornix, looking down and then closing the eye. The eyes should be kept bandaged.—R. L. Rea, *Brit. med. J.*, ii/1939, 883.

Eye salve to combat the effect of gas:—Sodium biborate (impalpable powder) 1 part; purified sodium bicarbonate 2 parts, distilled water and lanolin of each 10 parts, white Vaseline to 100 parts.—Gemeinhardt, per *J. Amer. pharm. Ass.*, 1938, 322.

Balneum Effervescens (B.P.C.). Sodium bicarbonate 16 oz. and sodium acid sulphate 8 oz. per 30-gallon bath.

Balneum Effervescens cum Chlorido (B.P.C.) is the same with the addition of sodium chloride 48 oz. and calcium chloride 8 oz.

Bain dit de Vichy.

Sodium bicarbonate 500 g., dissolve in the bath at time of use.

Collyrium Sodii Bicarbonatis (B.P.C.). 2% w/v.

Gargarisma Sodii Bicarbonatis (B.P.C.). 5% w/v.

Gutta Sodii Bicarbonatis (T.H.). Sodium bicarbonate 15 gr., phenol 1 gr., glycerin 2 dr., water to $\frac{1}{2}$ oz. For softening wax in the ear before syringing.

Factory Eye Drops No. 2. Sodium bicarbonate 15 gr., water to 1 oz.

Mistura Sodii Bicarbonatis Aromatica (B.P.C.).

Syn. MISTURA CARMINATIVA.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains sodium bicarbonate 10 gr. per oz. with aromatic spirit of ammonia, compound tincture of cardamom, glycerin and dill water.

Mist. Carminat. (N.I.F.). Sodium bicarbonate 10 gr., light magnesium carbonate 5 gr., aromatic tincture of cardamom 5 m., water to $\frac{1}{2}$ oz.

Mistura Carminativa (*Gt. Orm. H.*). (Dose for 1 year old child.)

Sodium bicarbonate $1\frac{1}{2}$ gr., aromatic spirit of ammonia $1\frac{1}{2}$ m., glycerin 5 m., peppermint water to 1 dr.

Nebula Alkalina (*T.H.*). Sodium bicarbonate 15 gr., borax 15 gr., phenol 4 gr., glycerin 45 m., water 1 oz. **Dobell's Solution** is approx. half this strength.

Nebula Alkalina Composita (*B.P.C.*).

Sodium bicarbonate and borax of each 1.5% *w/v*, and phenol 0.75% *w/v*, in glycerin and water.

Pulv. Antacid. (*N.I.F.*). *Average dose.*—30 grains.

Sodium bicarbonate, heavy magnesium carbonate and chalk, of each 320 grains, oil of peppermint 2 m.

Sodii Citro-Tartras Effervescens (*B.P.C.*).

Dose.—1 to 2 drachms (4 to 8 g.).

Effervescent granules containing sodium bicarbonate, citric and tartaric acids.

Solvellæ Nasal. Alk. (*N.I.F.*). *Syn. TAB. NASAL ALK.* Sodium bicarbonate 5 gr., thymol $\frac{3}{16}$ gr., borax 5 gr. 1 to be dissolved in 4 tablespoonfuls of warm water.

Tabellæ Sodii Bicarbonatis Compositæ (*B.P.C.*).

Syn. SODA MINT TABLETS. *Dose.*—1 to 4 tablets.

Contain sodium bicarbonate 5 gr., ammonium bicarbonate $\frac{1}{2}$ gr., saccharin and oil of peppermint.

The formulæ for compound sodium bicarbonate and compound ginger tablets are impracticable owing to the volatility of the ammonium bicarbonate, the omission of which is recommended. In addition it is suggested that the names "soda mint" and "ginger mint" should be reserved for those tablets which it has been the custom of the trade to supply, consisting of sodium bicarbonate and oil of peppermint for soda mints, with the addition of oleo-resin of ginger for ginger mints.—H. Burlinson, *Quart. J. Pharm.*, 1938, 518.

Two samples of the tablets were not made in accordance with the *B.P.C.* formula. These are further instances of the unfortunate confusion arising from the fact that the name "soda mint" has been applied to tablets made up to different formulæ. It is surely not impossible to arrange that a specific name should always connote the same mixture of ingredients and to ensure that a customer will always be supplied with the same article whenever he makes his purchase.—H. H. Bagnall, per *Analyst*, 1939, 878.

Tabellæ Zingiberis Compositæ (*B.P.C.*). *Syn. GINGER MINT TABLETS.* *Dose.*—1 or 2 tablets.

Sodium bicarbonate 5 gr., oleoresin of ginger $\frac{1}{16}$ gr., ammonium bicarbonate, saccharin and oil of peppermint.

Sodii Carbonas (*B.P., P. Helv. V, Fr. Cx., etc.*).

$\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O} = 286.2$.

Dose.—5 to 15 grains (0.3 to 1 g.).

Rhombic crystals efflorescing in air.

Soluble 1 in 2 of water, 1 in 1 of glycerin; insoluble in alcohol 90%.

Uses. Employed in the preparation of alkaline baths for use in scaly skin diseases. A lotion, 2 gr. to the ounce, relieves eczema. 1% is used as mouth wash or nasal douche. Instruments are boiled in a 1% solution to sterilise and to prevent rusting.

Balneum Alkalinum (*B.P.C.*) contains 5 oz. of sodium carbonate per 30 gallons.

Liquor Sodii Carbonatis (*R.L.O.H.*).

To sterilise instruments: sodium carbonate 1 oz., sterile water to 80 oz. Boil Graefe knives $\frac{1}{2}$ minute, other instruments 3 minutes.

Sodii Carbonas Exsiccatus (*B.P., P. Helv. V, Fr. Cx.*).
 $\text{Na}_2\text{CO}_3 = 106.0$.

Dose.—2 to 5 grains (0.12 to 0.3 g.).

Approximately 106 of the exsiccated salt are obtained from 286 of the crystals.

Sodii Carbonas Monohydratus (*U.S.P. XI, P. Helv. V*).
 $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O} = 124.0$. *U.S.P. XI* average dose 4 grains. Is known in commerce as concentrated "crystal soda," and used as a bath salt and water softener. It occurs in small silky crystals.

Sodii Sesquicarbonas. $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$. In silky crystals or as a white powder. Is sometimes used in the preparation of bath salts.

Sodii Chloras (*B.P.C., Fr. Cx., F.E. VIII*). $\text{NaClO}_3 = 106.5$.
Dose.—5 to 10 grains (0.3 to 0.6 g.).

Caution. Not to be rubbed with combustible substances. Colourless crystals or crystalline powder with saline taste.

Soluble 1 in less than 2 parts of water, about 1 in 100 of alcohol 90%, and 1 in 5 of glycerin.

It closely resembles potassium chlorate in its properties, and is used in stomatitis, sore throat, etc., in the form of a gargle or lozenge. It is used in some non-poisonous weed-killers.

Sodium chlorate is a highly effective weed-killer, a 1% solution being sufficiently strong. Its toxic action, which begins after absorption by the plant, remains in the ground for several months. Precautions should be taken against using wooden stirrers, etc., in preparing the solution, since such material, saturated with sodium chlorate solution and allowed to dry, becomes highly inflammable.—*Pharm. J.*, i/1938, 381.

Sodii Hydroxidum (*B.P., U.S.P. XI, P. Helv. V, P. Dan.*).
Syn. SODA CAUSTICA. $\text{NaOH} = 40.00$.

[P2] "Sodium hydroxide."

[S3] "Sodium hydroxide—in substances containing less than twelve per cent. of sodium hydroxide."

[S6] "Sodium hydroxide—specify proportion as the proportion of sodium monoxide (Na_2O) which the preparation would be calculated to contain on the assumption that the sodium hydroxide in the preparation had been wholly converted into sodium monoxide."

[S7] Sodium hydroxide and articles containing it must be labelled "Caution. This substance is caustic."

In fused masses, moulded sticks or white scales, containing not less than 95% of total alkali calculated as NaOH . It has similar properties to those of potassium hydroxide.

Soluble 1 in 1 of water, with the evolution of much heat; also soluble in alcohol and glycerin.

Antidotes. Treat as for poisoning by ammonia, *see* p. 180.

Eight cases of poisoning (4 suicides) in Cyprus during 1933 with 6 fatalities. The fatal dose varied from 5 to 60 grammes. It is largely used for domestic washing purposes.—S. G. Willimott and M. Gosden, *Brit. med. J.*, i/1934, 1022. *See also Lancet*, ii/1933, 413.

Sodii Nitris (*B.P., U.S.P. XI, Fr. Cx., P. Helv. V*).
 $\text{NaNO}_2 = 69.0$.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.).

Is obtained by reduction of sodium nitrate by fusing it with lead.

In white or slightly yellow deliquescent, crystalline granules, with a cooling saline taste.

Soluble 1 in $1\frac{1}{2}$ of water, 1 in 50 of alcohol 90%.

Antidotes. Treat as for poisoning by amyl nitrite, *see* p. 160.

Deaths of three members of one family at Middlesbrough 2 hours after consuming sodium nitrite used in error for salt. The first fatal case of nitrite poisoning in this country.—*Pharm. J.*, ii/1936, 214. *See also Lancet*, ii/1936, 1153.

Uses. Has a vasodilator action similar to that of amyl nitrite, but is slower and much more prolonged (1 to 2 hours). Tolerance tends to be established and dosage should be intermittent. Raised arterial tension when dangerous is well treated by $\frac{1}{2}$ -grain doses, gradually increased to 4 or 5 grains. Attacks of asthma may be warded off by sodium nitrite $\frac{1}{2}$ gr. with sodium iodide 3 gr. taken (*e.g.* in a tablet) every 2 or 3 hours. A 2-gr. dose of sodium nitrite with 3 gr. of sodium iodide has been advocated for paroxysmal pain due to aortic insufficiency.

It does not fulfil the requirements of the treatment of arterial hypertension in that it has no constant and sustained action, does not act by dilating the arterioles all over the constricted areas, may give rise to unpleasant symptoms and side-effects, does not maintain the normal functions of the heart and kidneys, and may depress renal activity.—S. Weiss and L. B. Ellis, *per Brit. med. J. Epit.*, ii/1933, 72.

RETROBULAR NEURITIS. Eight out of 9 cases received benefit, shown by increased visual acuity and by diminution of scotomata, from intravenous injections of 10% sodium nitrite, in doses ranging from 0.04 to 0.1 g. injected daily over a period of about a week.—W. F. Duggan, *per Med. Pr.*, ii/1936, 539.

TOBACCO AMBLYOPIA. 24 cases of tobacco amblyopia without optic atrophy received from 6 to 10 intravenous injections of sodium nitrite (100 mg.), which were given daily when possible. Two patients were not improved and one was not adequately treated. The remaining 21 attained vision of 20/30, or better, in one or both eyes in an average time of 18.4 days, and 12 attained vision of 20/20 in an average time of 30 days. Five of the patients smoked during the period of treatment, and the average time during which they obtained vision of 20/30, or better, was 36 days. For the 16 patients that abstained from smoking the average time for the same improvement was 12 days, and 10 of the patients attained this result within 7 days. Daily injections were found most effective, and patients who had used both alcohol and tobacco improved more rapidly than those who had used only tobacco. The treatment is based on the hypothesis that tobacco amblyopia is due primarily to a vascular spasm in the visual pathway.—W. F. Duggan, *Arch. Ophthalm.*, 1935, 13, 1059. (*See also* acetylcholine.)

Pulvis Sodii Nitritus Compositus.—Brunton.

Sodium nitrite $\frac{1}{2}$ to 2 gr., potassium nitrate 10 to 20 gr., and sometimes potassium bicarbonate 10 gr.—in a tumbler of water every morning to reduce blood pressure.

P1] Tabellæ Sodii Nitritus Compositæ (B.P.C.).

Dose.—1 or 2.

Sodium nitrite $\frac{1}{2}$ gr., diluted erythrityl tetranitrate $\frac{1}{2}$ gr., ammonium hippurate 1 gr.

Liquor Æthylis Nitritus (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 drachm (1 to 4 ml.). Should be directed to be added to a small quantity of water at the time of taking.

A solution of ethyl nitrite, 2.5 to 3% *w/w* (equivalent to 2 to 2.5% *w/v*) in a mixture of dehydrated alcohol and glycerin.

Spiritus Ætheris Nitrosi (B.P.).*Syn.* SWEET SPIRIT OF NITRE.*Dose.*—15 to 60 minims (1 to 4 ml.).

An alcoholic solution containing ethyl nitrite (1.25 to 2.5% w/v), aldehyde and other substances.

Any loss of strength in this is generally due to volatilisation of the ethyl nitrite alone. Only direct sunlight has any effect in inducing decomposition, and this can be prevented by storing in amber bottles with greased stoppers.—R. Wright, *Pharm. J.*, i/1926, 256.

Incompatible with potassium iodide, also with phenazone unless previously neutralised with sodium bicarbonate; also incompatible with salicylates and ferrous sulphate.

Uses. Diaphoretic, diuretic, and stimulant. Relieves the spasm and pain of asthma, dysmenorrhœa, angina pectoris; also the pain of the passage of renal calculi and gall-stones.

Spiritus Æthylis Nitritus (U.S.P. XI). *Average dose.*—30 minims (2 ml.). An alcoholic solution containing 3.5 to 4.5% w/w of C_2H_5ONO .

STRAMONIUM

B.P., U.S.P. XI, Fr. Cx., P. Helv. V, etc.

[P1] "*Alkaloids, the following; their salts, simple or complex:—atropine; hyoscyne; hyoscyamine; solanaceous alkaloids not otherwise included in this List.*"

[S1] "*Alkaloids, the following; their salts, simple or complex:—Atropine except substances containing less than 0.15% of atropine; hyoscyne except substances containing less than 0.15% of hyoscyne; hyoscyamine except substances containing less than 0.15% of hyoscyamine; solanaceous alkaloids not otherwise included in this Schedule, except substances containing less than 0.15% of solanaceous alkaloids calculated as hyoscyamine.*"

[S3] "*Alkaloids—Solanaceous alkaloids—in stramonium contained in preparations for the relief of asthma in the form of cigarettes, smoking mixtures or fumigants.*"

[S6] "*Alkaloids—Solanaceous alkaloids not otherwise included in the Poisons List—specify proportion as the proportion of any one of the solanaceous alkaloids that the preparation would be calculated to contain on the assumption that all the solanaceous alkaloids in the preparation were that alkaloid.*"

Dose.— $\frac{1}{2}$ to 3 grains (0.03 to 0.2 g.); 3 grains contains about $\frac{1}{15}$ gr. of alkaloids. *U.S.P. XI* average dose $1\frac{1}{2}$ grains, *Fr. Cx.* and *P. Helv. V* have max. single dose approx: 5 grains, max. in 24 hours approx. 15 grains.

Dried leaves and flowering tops of *Datura Stramonium* (*syn.* THORNAPPLE) and of *D. tatula* (*Solanaceæ*) containing not less than 0.25% of alkaloids calculated as hyoscyamine. The principal alkaloid is hyoscyamine, with possibly hyoscyne and a little atropine.

A key for distinguishing various species of *Datura*.—H. A. Timmerman, *Pharm. J.*, i/1927, 574.

Antidotes. Treat as for poisoning by atropine, see p. 237.

Uses. Its action is similar to that of belladonna leaf, and it may be employed for the same purposes. Its properties are those of the alkaloid hyoscyamine. It is employed in asthma to relieve the spasm of the bronchial tubes. The leaf is smoked in cigarettes and is an ingredient of powders intended to be burnt for the relief of asthma. It is a useful and convenient drug for the symptomatic treatment of post-encephalitic parkinsonism and it may be taken without interruption over long periods without harmful effect.

CHRONIC ENCEPHALITIC PARKINSONISM. Results equal to those from hyoscine hypodermically are obtained by giving stramonium extract *per os* in dose of 0.25 g. to 1 g. or more thrice daily, the average dose being 0.75 g. No actual curative effect is possible. Palliative treatment essential. 80 cases were on the extract for 6 months. Many were in a satisfactory condition on 0.5 g. thrice daily. One or two were getting more than 1 g., the largest dose being 1.375 g. thrice daily. It is evident that the doses of tincture hitherto used by others for the purpose were far too small.—C. Worster-Drought and T. R. Hill, *Lancet*, i/1930, 1225.

45 to 60 minims of B.P. tincture thrice daily increases ability to perform rapid movements. Mental condition improved. May be continued for long period.—E. A. Carmichael, per *Prescriber*, 1929, 224.

If there is interruption of the treatment for even a short time it is necessary to resume with small doses and work up to the maximum (0.25 g. *t.d.s.*).—W. S. Hall, *Lancet*, i/1934, 595.

Marked improvement in the muscular rigidity of post-encephalitic parkinsonism follows the administration of large doses of stramonium combined with pilocarpine to relieve dryness of the mouth. No effect on the tremors. Give 15 m. of Tinct. Stramonii in $\frac{1}{2}$ oz. of water on waking, after lunch and tea; if the stiffness causes disturbed nights, give another dose at bedtime. All doses of the dilution are increased by 1 drachm on alternate days until the patient complains of dryness of the mouth. Pilocarpine nitrate $\frac{1}{2}$ gr. is then added to the latest dose of stramonium, and the dose is prescribed in $\frac{1}{2}$ oz. of water. 1 drachm is again added to each of the doses on alternate days until sufficient relief is obtained or toxic effects (commonly slight paralysis of accommodation) are observed. Finally a prescription is given for the full dose of stramonium (generally at least 60 m.) and pilocarpine nitrate in a single $\frac{1}{2}$ oz. of water.—A. F. Hurst, *Pharm. J.*, ii/1934, 704.

Pilocarpine is not essential; it may be omitted, and that dose of stramonium alone administered which has been found best suited to the needs of the patient.

—H. Stott, *Indian med. Gaz.*, 1935, 620.

[P1-S1] **Extractum Stramonii (B.P.C.).**

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

A soft extract containing 1% of alkaloids.

In spasmodic asthma the extract is found better than the tincture. Sufficient should be given to be slightly toxic. Most patients show toxic effects on taking $\frac{3}{4}$ grain in 24 hours.

[P1-S1] **Extractum Stramonii (U.S.P. XI).** **Average Dose.**— $\frac{1}{2}$ grain (0.02 g.)

In two forms, pilular and powdered extract, containing 1% of alkaloids

[P1] **Extractum Stramonii Liquidum (B.P. Add. I).**

Dose.— $\frac{1}{4}$ to 3 minims (0.03 to 0.2 ml.).

Adjusted to contain 0.25% of alkaloids; 3 minims contains about $\frac{1}{15}$ grain.

[P1-S1] **Extractum Stramonii Siccum (B.P. Add. I).**

Dose.— $\frac{1}{4}$ to 1 grain (0.015 to 0.06 g.). In post-encephalitic and similar conditions, 1 to 8 grains (0.06 to 0.5 g.).

A dry granular extract prepared with alcohol 95%. Contains 1% of alkaloids.

[P1] **Tinctura Stramonii** (*B.P. Add. I*).

Dose.—5 to 30 minims (0.3 to 2 ml.); 30 minims contains about $\frac{1}{12}$ gr. of alkaloids.

Prepared by dilution of the liquid extract 1 in 10 with alcohol 45%. It is approximately half the strength of the *B.P.* '14 tincture.

[P1] **Tinctura Stramonii** (*U.S.P. XI*). *Average dose*.—12 minims (0.75 ml.). 1 in 10 and standardised to contain 0.025% of alkaloids.

[P1] **Unguentum Stramonii** (*B.P.C.*) contains 10% of extract of stramonium.

[P1-S1] **Stramonii Semen** (*B.P.C., P. Helv. V*). *Syn.* THORNAPPLE SEED. The seeds of *Datura Stramonium*, containing an average of 0.2% of alkaloids.

[P1-S1] **Daturæ Folium** (*B.P.C.*). The dried leaves of *Datura Metel* (from India) and of *D. innoxia* (from Mexico and India, and cultivated in England) (*Solanaceæ*). Contains about 0.25 to 0.55% of hyoscyne, with traces only of hyoscyamine and atropine. Used in India for the same purposes as stramonium.

[P1-S1] **Daturæ Semen** (*B.P.C.*). The dried seeds of *D. Metel*, containing about 0.2% of hyoscyne.

[P1] **Tinctura Daturæ Seminis**. *Dose*.—5 to 15 minims (0.3 to 1 ml.). Sedative for asthmatic cough.

[P1-S1] **Daturine**, *dose*— $\frac{1}{100}$ to $\frac{1}{50}$ grain (0.0005 to 0.001 g.), is a mixture of alkaloids from *Datura Stramonium* consisting chiefly of hyoscyamine with some atropine. Occurs in white crystals slightly soluble in water, freely soluble in alcohol 90%, chloroform and ether. Occasionally used as a mydriatic.

STROPHANTHUS

B.P., F.E. VIII, P. Ital. V, P. Helv. V, etc.

Syn. STROPHANTHI SEMINA.

[P1] "*Strophanthus; glycosides of strophanthus.*"

"Ouabain."

[S1] "*Strophanthus, glycosides of.*"

"Ouabain."

[S6] "*Strophanthus, glycosides of—specify proportion as the amount of Standard Tincture of Strophanthus as defined in the British Pharmacopœia which possesses the same activity as a specified quantity of the preparation when assayed by the method described in the said Pharmacopœia.*"

Dose.—No dose is given in *B.P.*

The dried ripe seeds of *Strophanthus Kombé* (*Apocynaceæ*) freed from the awns, of a fawn colour, and covered with hairs. Some foreign pharmacopœias also recognise *S. hispidus* and *S. gratus*.

Antidotes. Treat as for poisoning by digitalis, see p. 480.

Uses. As a cardiac tonic and diuretic. Resembles digitalis in effects but acts far more promptly. It is stated that the tincture acts in from $\frac{1}{2}$ to 1 hour, while digitalis tincture takes from 24 to 48 hours, but it is a more dangerous drug to use, since it is easily absorbed. Occasionally of service where digitalis has failed or is not tolerated. Especially valuable in mitral stenosis, but unsuitable in aortic disease. It is non-cumulative and is a better diuretic than digitalis because, while it accelerates the circulation, it does not readily constrict the renal vessels.

[P1-S1] **Extractum Strophanthi** (B.P.C.).

Dose.— $\frac{1}{4}$ to 1 grain (0.016 to 0.06 g.).

A dry extract mixed with lactose, so that 2 parts of extract in powder = 1 part of seeds.

[P1-S1] **Tinctura Strophanthi** (B.P.).

Dose.—2 to 5 minims (0.12 to 0.3 ml.).

Prepared by percolation, with 70% alcohol, of seeds defatted with light petroleum. The strength is adjusted to be equivalent to that of a 0.42% w/v solution of international standard ouabain or of a 0.33% w/v solution of anhydrous ouabain, the comparison being made by the frog method.

P. Ital. V, F.E. VIII, P. Belg. IV, Fr. Cx., and I.A. have 1 in 10. *Fr. Cx.* has max. single dose about 8 minims; max. during 24 hours about 25 minims.

[P1-S1] **Strophanthinum** (B.P., U.S.P. XI). *Syn.* KOMBÉ STROPHANTHIN, K-STROPHANTHIN.

Dose.—By intramuscular or intravenous injection, $\frac{1}{16}$ to $\frac{1}{8}$ grain (0.00025 to 0.001 g.). *U.S.P. XI* average daily dose, intravenously $\frac{1}{16}$ grain. It is irritating at the site of injection.

A mixture of glycosides from strophanthus, adjusted by admixture with lactose so as to possess 40% (*U.S.P. XI* 40 to 60%) of the activity of anhydrous ouabain.

Solubility. The undiluted mixture of glycosides is moderately soluble in water and in alcohol 90%, less soluble in dehydrated alcohol, sparingly soluble in chloroform, almost insoluble in ether, benzene and light petroleum.

Contraindicated where there is a high blood pressure and marked arteriosclerosis, and in those with acute or chronic nephritis or granular kidney.

Uses. Strophanthin is usually preferred for intramuscular or intravenous injection to obtain rapid digitalisation in extreme heart failure or when digitalisation by the mouth is impracticable. It is absorbed more rapidly than digitalis and is non-cumulative, but it is an extremely powerful poison and should be used with great caution, especially in cases with myocardial degeneration and coronary sclerosis. If a digitalis preparation has been given during the previous 14 days the dose of strophanthin is best given in fractions several hours apart. Since the effect of a single dose of strophanthin has almost entirely disappeared within 48 hours, the injections may be repeated every other day if required.

There is no degree and no phase of cardiac insufficiency from the beginning of the disease—often difficult to gauge—to the stage of extreme abnormality in the distribution of blood, along with its accompaniments, which does not respond to the intravenous administration of strophanthin. Only the compensated heart on the one hand or the dying heart on the other not yet responds or no longer responds to this treatment. The prognosis of cardiac insufficiency has entirely changed since the possibility has arisen through the use of strophanthin not only of enlarging the field in which treatment with digitalis is indicated, but also of making success in the treatment of certain cases more assured. The heroic treatment of heart failure with calomel and digitalis by mouth is now replaced by one which involves the administration of mersalyl, and so supplements the effect of strophanthin in this disease. The appropriate combination of both remedies, not simultaneously or on the same day even, but one after the other on different days, makes possible the removal of oedema of the severest degree as well as that of very long standing.—A. Fraenkel, *Lancet*, ii/1935, 1104.

Strophanthin is a convenient, effective, cheap and safe drug for rapid reduction of the heart rate when digitalisation by the mouth is impracticable. Reduction in the heart rate is usually obtained in 5 to 15 minutes, and vomiting is rare. Over 200 doses of strophanthin, 1.0 gr. intravenously, were given to 33 patients, of whom 29 had auricular fibrillation. Patients who are febrile require larger doses. The dose of 1.0 gr. can be repeated in one hour if necessary, but should not be repeated until the lowering of the pulse-rate has ceased.—H. E. Rykert and J. H. Hepburn, *Canad. med. Ass. J.*, i/1936, 281.

ANGINA PECTORIS. Strophanthin intravenously, given before serious hypertrophic changes in the heart have set in, is of value. The average daily dose is 0.25 mg. and 0.2 mg. is often sufficient. A satisfactory procedure is to give 0.1 to 0.15 mg. on the first day, 0.2 mg. on the second day, and 0.3 mg. on the third day, and to continue a course of injections for four to six weeks. High dosage, sometimes as much as 1 mg. in 24 hours, distributed over four to six injections, is particularly desirable in cases of recent infarct of the myocardium. A follow-up study of 32 patients treated on these lines showed that 26 had been completely or almost completely relieved, and that some had continued to remain fit in spite of heavy physical work.—H. Plugge and E. Birk, *Dtsch. med. Wschr.*, i/1937, 427.

[P1-S1] **Kombetin** (*Boehringer, Mannheim; Coates & Cooper, London*). Glycoside from *Strophanthus Kombé*. Ampoules of 1 ml. = 0.0005 g. or 0.00025 g. Dose.—Initially 0.00025 g. intravenously; 0.0005 g. as average dose in 24 hours.

[P1-S1] **Strophanthone Dilute** (*Parke, Davis, London*). Preparation of *Strophanthus Kombé* seed in ampoules for hypodermic or intravenous administration. 1 ml. represents the activity of 0.12 ml. of tincture of strophanthus, B.P.

Dose.—Hypodermically, 1 ml. initially, subsequently as required. Intravenously, 0.5 ml.

[P1-S1] **Strophosid** (*Sandoz, London*). A new glycoside, K-strophanthosid, isolated from the seeds of *Strophanthus Kombé* in a crystalline state. Supplied in ampoules; 1 ml. = 0.0005 g. of K-strophanthosid. Dose.—0.4 to 1 ml. intravenously. In grave acute cardiac weakness, in cardiac weakness with a slow pulse, in overstrain of the heart, in the end stages of decompensation in valvular insufficiency and hypertonia, in cardiac weakness without hypertrophy and in some forms of myocardial degeneration, e.g., in diphtheria.

[P1-S1] **Ouabainum** (*Fr. Cx.*). Syn. G-STROPHANTHIN, STROPHANTHINUM (*P.G. VI, P. Dan.*). $C_{30}H_{46}O_{12} \cdot 9H_2O = 760.5$.

Dose.— $\frac{1}{200}$ to $\frac{1}{100}$ grain (0.00025 to 0.001 g.), by injection. P.G. VI max. single dose $\frac{1}{100}$ grain; max. daily dose $\frac{1}{20}$ grain.

Obtained from *S. gratus* seeds, also present in wood of *Acokanthera Schimperi* (Apocynaceæ). Is about twice as toxic as K-strophanthin, and is used as an international standard for control of the standard preparation of strophanthin which is used for the biological assay of strophanthin and strophanthus preparations.

[P1-S1] **Ouabaine** *Arnaud (Laboratory Nativelle, London)*. Crystalline ouabaine obtained from *S. gratus*. Supplied in tablets (5 mg.); 2% solution for oral use (50 drops = 20 mg.); ampoules for intravenous injection (1 ml. = 0.25 mg.); ampoules for intramuscular injection (2 ml. = 0.5 mg.).

[P1-81] **Natibaine** (*Laboratory Nativelle, London*). 1 in 1000 glycerin alcohol solution of $\frac{1}{2}$ Nativelle's Digitaline and $\frac{1}{2}$ Ouabaine Arnaud, 15 drops containing $\frac{1}{100}$ gr. of the former, and $\frac{1}{100}$ gr. of the latter. *Dose*.—15 to 50 drops (according to the degree of cardiac insufficiency) for the first five of each 10 or 15 days, given in a small quantity of water on an empty stomach before rising, or at bedtime; when the daily dose is 30 drops or more it should be divided into two parts. The combination provides both a rapid and a prolonged action in myocarditis with arrhythmia and ventricular dilatation, in complete arrhythmia and arterial hypertension with tendency to tachycardia.

STRYCHNINA

B.P.C., Fr. Cx., F.E. VIII, etc.

[P1] "*Alkaloids, the following; their salts, simple or complex:—Strychnine.*"

[81] "*Alkaloids, the following; their salts, simple or complex:—Strychnine except substances containing less than 0.2 per cent. of strychnine.*"

Rule 15 of the Poisons Rules, 1935, prohibits the sale or supply of strychnine (or its salts) except in certain circumstances, see page 1007.

Dose.— $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.002 to 0.008 g.). *Fr. Cx.* has max. single dose $\frac{1}{16}$ grain; max. during 24 hours $\frac{1}{4}$ grain approx.

The alkaloid obtained from *nux vomica*, St. Ignatius' beans (*g.v.*), and the seeds of other species of *Strychnos*. In characteristic colourless crystals.

Soluble 1 in 7000 of water, about 1 in 400 of alcohol 60%, 1 in 150 of alcohol 90%, 1 in 350 of dehydrated alcohol, 1 in 6 of chloroform, nearly insoluble in ether.

Precipitation by Iodides. As long as the maximum dose of either strychnine or an iodide is prescribed in half a fluid ounce, the precipitation of strychnine hydriodide is not likely to occur. It will, however, occur if maximum doses of both are present.—*Pharm. J.*, i/1939, 190.

Antidotes. If patient is seen at once, empty stomach by emetics or stomach tube, but if tetanic symptoms have already set in, first give chloroform as anæsthetic and then use the stomach tube with a solution of 60 gr. of potassium permanganate in 2 gallons of water. Give medicinal charcoal, stirred up in water, freely.

(Some authorities say that emetics and the stomach tube must not be used or fatal convulsions may be caused. Give potassium permanganate in 10 gr. doses, or medicinal charcoal.)

Keep patient lying down and quiet, fully under chloroform if necessary. If convulsions persist, give potassium bromide 4 dr., and chloral hydrate 30 gr., repeating every hour if necessary. Soluble barbitone, soluble phenobarbitone or sodium Amytal intravenously considered of value. Saline with dextrose infusion. Artificial respiration and inhalations of oxygen with 7% carbon dioxide.

6 gr. of strychnine hydrochloride taken for suicidal purposes; patient given 30 gr. of zinc sulphate within 20 minutes, chloroform anaesthesia and $\frac{1}{2}$ gr. morphine hypodermically. He became cyanosed, was given amyl nitrite, gastric lavage with potassium permanganate solution, some left in stomach. Later morphine and atropine given, chloral hydrate and potassium bromide by rectum, more morphine and atropine. Anaesthesia maintained, amyl nitrite repeated, also chloral and bromide. Oxygen with carbon dioxide administered for $\frac{1}{2}$ hour. Spasms diminished, cyanosis lessened, respiration improved, patient drank water, slept, vomited and was discharged well next day. Severe asphyxia was not relieved by chloroform anaesthesia with morphine until amyl nitrite also given.—*Brit. med. J.*, i/1936, 363.

Poisoning in U.S.A. caused 546 deaths from 1926 to 1928, compared with 11 for England and Wales for 1930 to 1931. One-third of the accidental poison deaths occur in children under 5 years of age, due to the popularity of "tonic" tablets containing strychnine.—*Brit. med. J.*, ii/1932, 159.

Recovery of a man aged 60 after taking 15 g. in water. An hour and a half later he was given 0.5 g. of sodium Amytal intravenously and was relaxed and sound asleep within 15 minutes.—*R. E. Priest, J. Amer. med. Ass.*, i/1938, 1440.

Uses. Given orally, strychnine acts as a bitter stomachic and as a stimulant to the central nervous system, and is of value in dyspepsia and chronic gastritis and as a general tonic in anaemia and convalescence. As a stimulant to the central nervous system it has been widely used in almost every form of paralysis, and as long as distinct anatomical lesions of the central nervous axis are absent it may be of benefit, but when the paralysis is due to an inflammatory process it is better avoided. As a circulatory stimulant and vaso-constrictor it is of value in a wide variety of conditions, such as surgical shock, cardiac failure, collapse from hæmorrhage, poisoning by depressants, such as ether or chloroform, and in the acute stage of severe infectious diseases, such as diphtheria; in these conditions it is given in doses up to $\frac{1}{10}$ gr. by hypodermic injection. As a respiratory stimulant it may be used by the mouth, in combination with expectorants, in chronic bronchitis or emphysema, or it may be given by injection in frequently repeated doses in severe bronchitis and pneumonia. Its stimulant action on the respiratory centre is especially valuable in narcotic poisoning, e.g., by opium or chloral; in barbiturate poisoning it is given in doses as high as $\frac{1}{2}$ gr. without toxic effect. Strychnine has also been found useful in toxic amblyopia (especially that due to nicotine poisoning) and amaurosis.

DIPHTHERIA. There is still a small group of cases in which serum, though administered early and in sufficient dosage, appears to fail. All patients with really severe diphtheria should be given strychnine in large doses, i.e., subcutaneously to the amount of 1 mg. per kg. of bodyweight in every 24 hours. For practical purposes the total amount required on this formula is divided by 8 to give the dose administered every three hours, which is held to be the best interval. As a rule the maximum dose is not given at once; at first it is halved and the maximum is slowly reached in three or four days. In really desperate cases doses even as high as 1.5 to 2 mg. per kg. have been given. The treatment is continued for a fortnight and signs of intolerance must be carefully looked for. Tolerance is actually much greater than has been previously imagined, and is fortunately greatest in children and in states of collapse. As the earlier signs of intolerance (headache and vertigo) are subjective, small children need special attention. If increased reflexes and a positive Chvostek appear, the treatment must be temporarily abandoned, but may be resumed later. In the presence of such signs of poisoning as clonic contractions or strychnine tetany, chloroform must be administered at once to prevent asphyxia.—*Faisseau et al., Pr. méd.*, 1936, 1241.

[P1-S1] Ferri et Strychninæ Citras (B.P.C.).

Dose.—1 to 3 grains (0.06 to 0.2 g.).

In deliquescent green scales, freely soluble in cold water. It contains 1% of strychnine, and about 13% of Fe.

[P1-S1] Ferri, Quininæ et Strychninæ Citras (B.P.C.).

Dose.—2 to 5 grains (0.12 to 0.3 g.).

Similar to the former, with about 15% of quinine. In deliquescent scales, soluble 1 in 2 of water.

[P1-S1] Strychninæ Arsenas. $C_{21}H_{22}O_2N_2, H_3AsO_4, \frac{1}{2}H_2O = 485.1$.

Dose.— $\frac{1}{15}$ to $\frac{1}{10}$ grain (0.001 to 0.004 g.).

In small white acicular crystals containing 68.7% of strychnine, soluble 1 in 14 of water. Has been used in phthisis by hypodermic injection.

[P1-S1] Strychninæ Hydrochloridum (B.P.).

$C_{21}H_{22}O_2N_2, HCl, 2H_2O = 406.7$.

Dose.— $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.002 to 0.008 g.).

Small trimetric prisms, soluble 1 in about 40 of water, 1 in about 80 of alcohol 90%; insoluble in ether.

A 1% w/v solution is strongly hypotonic; 0.079 g. of sodium chloride or 0.442 g. dextrose to every 10 ml. renders it isotonic.

[P1-S1] Injectio Strychninæ (B.P.C.).

Dose.—5 to 10 minims (0.3 to 0.6 ml.), by hypodermic injection.

Contains 0.75% w/v of strychnine hydrochloride; 10 minims contains about $\frac{1}{15}$ grain.

[P1-S1] Liquor Strychninæ Hydrochloridi (B.P.).

Dose.—3 to 12 minims (0.2 to 0.8 ml.); 12 minims contains about $\frac{1}{8}$ gr. of strychnine hydrochloride.

Strychnine hydrochloride 1, alcohol (90%) 25, water to 100.

Incompatible with alkalis, e.g., sodium bicarbonate, sal volatile, bromides and iodides.

It is safer to prescribe tincture of nux vomica in preference to solution of strychnine hydrochloride when there is danger of incompatibility.

[P1] Mist. Acid. c. Strych. (N.I.F.). Dilute hydrochloric acid 10 m., solution of strychnine hydrochloride 3 m., chloroform water to $\frac{1}{2}$ oz.

[P1-S1] Strychninæ Nitras (B.P.C., U.S.P. XI, P.G. VI, P. Belg. IV, P. Hung., P. Helv. V, P. Dan., P. Ital. V, F.E. VIII).

$C_{21}H_{22}O_2N_2, HNO_3 = 397.2$.

Dose.— $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.002 to 0.008 g.). *P. Helv. V* and *P. Hung.* give max. single dose $\frac{1}{8}$ grain; max. in 24 hours $\frac{1}{4}$ grain. *P.G. VI* gives half these amounts; *F.E. VIII* $\frac{1}{80}$ and $\frac{1}{15}$ grain respectively. *U.S.P. XI* average dose $\frac{1}{30}$ grain.

Colourless needles, soluble 1 in 60 of water (1 in 45 at 25°—*U.S.P. XI*), 1 in 120 of alcohol 90%.

Injections varying from $\frac{1}{15}$ to 1 gr. hypodermically have been employed with success in the treatment of snake bite.

[P1-S1] Injectio Strychninæ, Arseni Iodidi et Quininæ. Strychnine nitrate 1 gr., arsenic triiodide 2 gr., quinine lactate 1 dr., distilled water to 3 oz.

Dose.—Up to 1 drachm hypodermically for adults.

Specific to reduce temperature in influenza attacks and almost any grave affection. Also prophylactic, e.g., in malaria.

GG*

[P1-81] **Strychninæ Sulphas** (B.P.C., U.S.P. XI, Fr. Cx., F.E. VIII, P. Ital. V). $(C_{21}H_{22}O_2N_2)_2 \cdot H_2SO_4 \cdot 5H_2O = 856.5$.

Dose.— $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.002 to 0.008 g.). Fr. Cx. has max. single dose $\frac{1}{10}$ grain; max. during 24 hours $\frac{1}{4}$ grain approx. F.E. VIII $\frac{1}{80}$ and $\frac{1}{12}$ grain respectively. U.S.P. XI average dose $\frac{1}{30}$ grain.

The neutral salt is in prismatic crystals, **soluble** 1 in 62 of water and 1 in 135 of alcohol 90%. M. p. 200°. It contains $5\frac{1}{2}H_2O$, i.e., there is usually a loss on drying of 11.44% approx.

[P1-81] Granules de Sulphate de Strychnine (Fr. Cx.) contain 1 mg. in each granule.

[P1-81] **Strychninæ Sulphas Acidus**. Syn. HULLE'S SOLUBLE STRYCHNINE. $C_{21}H_{22}O_2N_2 \cdot H_2SO_4 \cdot 2H_2O = 468.3$.

Dose.— $\frac{1}{32}$ to $\frac{1}{16}$ grain (0.001 to 0.004 g.). In white silky acicular crystals with a slightly acid reaction, **soluble** 1 in 42 of water.

[P1-81] **Strychninæ Valerianas**.

A non-crystallisable salt supplied in aqueous solution equivalent to 25% of the base. Dose.— $\frac{1}{32}$ minim to $\frac{1}{16}$ minim ($=\frac{1}{128}$ to $\frac{1}{64}$ grain of the base). A useful nerve tonic.

Brucine. $C_{23}H_{26}O_4N_2 \cdot 4H_2O = 466.3$.

[P1] "Alkaloids, the following; their salts, simple or complex:—**Brucine**."

[81] "Alkaloids, the following; their salts, simple or complex:—**Brucine** except substances containing less than 0.2 per cent. of **brucine**."

Dose.— $\frac{1}{16}$ to $\frac{1}{8}$ grain. An alkaloid from *Strychnos Nux Vomica* seeds—small white acicular crystals, with bitter taste.

Very **soluble** in alcohol and chloroform. Its salts are **soluble** in water. It is said to possess only $\frac{1}{12}$ of the physiological power of strychnine.

[P1-81] **Curara** (B.P.C.). Syn. CURARE, OURARI, URARI, WOURARA, WOURALI.

[P1] "Alkaloids, the following; their salts, simple or complex:—**Curarine**."

[81] "Alkaloids, the following; their salts, simple or complex:—**Curarine**."

Dose.— $\frac{1}{32}$ to $\frac{1}{8}$ grain (0.003 to 0.03 g.) subcutaneously.

Curare, the South American Indian arrow poison, is an extract derived from the bark of various species of South American *Strychnos*. Commercial "calabash" curare is derived from *S. toxifera*; "pot" curare from *S. Castelnaei* together with *Cocculus toxiferus* (Menispermaceæ), while "tube" curare is from unknown plants. It is a blackish-brown dry extract, with bitter taste; contains some resin, but is nearly all **soluble** in water.

Uses. The chief effect of curare is to paralyse the voluntary movement by blocking the passage of impulses from the peripheral nerves to the muscles. The respiratory muscles are last affected, and death takes place from asphyxia. Curare has been used in the treatment of tetanus in conjunction with antitoxin, and

paraldehyde or bromethol *per rectum*. It is given subcutaneously (it is inactive orally) in a dose of 0.03 g., usually repeated at six-hourly intervals. Its use is best reserved for severe cases.

Given intramuscularly or intravenously in doses between 10 and 40 mg., which have to be carefully adjusted to the individual patient, it quickly relaxes the hypertonic muscles in spastic-paralytic and dystonic conditions. The effect is rapid, but soon starts to diminish, though it may be noticeable after two days. For therapeutic purposes the drug has to be given at least three times a week. Administration may be accompanied by transient unpleasant effects, such as giddiness, diplopia and mild confusion. For the maximum benefit to be obtained, simple orthopedic operations may be required, and continuous training of the muscles should run parallel with the administration of the drug.—M. S. Burman, *Arch. Neurol. Psychiat.*, 1939, 41, 307.

[P1-81] **Curarine.** $C_{19}H_{26}ON_2 = 298.2$.

The active principle of gourd curare, in yellowish powder soluble in water and in alcohol. This curare also contains curine, identical with beberine. Bamboo (tube) curare and pot curare contain allied alkaloids.

A case of tetanus successfully treated by curarine in conjunction with anti-tetanic serum intravenously. A sterile solution of curarine hydrochloride (free from curine) containing 1 mg. in 1 ml. was prepared freshly every few days and given subcutaneously; initial dose 0.1 mg. repeated 4-hourly, the size of dose and frequency of administration being slowly increased daily until 8 doses of 0.5 mg. were being given in 24 hours. In all, 48.1 mg. of curarine were given in 20 days.—J. S. Mitchell, *Lancet*, i/1935, 262.

Curarine treatment of tetanus should still be reserved for cases which are already very severe or in which, by the accepted criteria, the prognosis is very grave. The best method of giving it is by the intravenous drip, using curarine chloride in solution, 100 mg. of the solid to a pint of saline or glucose saline, and adjusting the inflow so as to deliver 0.25 mg. per kg. of bodyweight per hour to the patient, arranged so as to be equivalent to about 30 drops per minute in the dripper. A pint of solution lasts about 6½ hours. At first the solution is run in at 6 times its maintenance rate, so that 0.25 mg. per kg. is delivered in about 10 minutes; this should be sufficient for curarisation. During this period and for the first hour following administration at maintenance rate its effects should be closely watched, since a real danger of curarine treatment is the sudden onset of bronchial spasm. Animal experiments justify the administration of atropine 1½ to 2½ gr. hypodermically before and at 4-hour intervals during the period of curarisation, and a full dose of adrenaline if the spasm occurs. Curarine in its present form is unsuitable for treatment of cases of chronic rigidity, and is given in tetanus only as a means of removing muscular spasm—antitoxin is required as urgently as with any other treatment.—R. West, *Lancet*, i/1936, 12.

Erythrina. An alcoholic extract of the seeds of *Erythrina americana* (Leguminosæ) possesses a typical curare-action in amphibia, mammals and birds. The *Erythrina americana* is a shrub or tree, indigenous to Mexico and Vera Cruz; it bears brilliant red flowers and a many-seeded fruit with scarlet seeds. It was used by the Aztec Indians as a purgative, diuretic, sudorific and hypnotic. Erythrina is as potent as curare, but the duration of paralysis can be more easily controlled by carefully grading the dose. It is effective by hypodermic, intramuscular and intravenous injection, but not by gastric administration. It is a promising, comparatively easily available, and practical substitute for curare.—A. J. Lehman, *J. Pharmacol.*, 1937, 60, 69.

Ibogaine. $C_{17}H_{15}O_2N_2 = 306.6$. An alkaloid obtained from the Iboga (*syn.* aboua, bouete, or libolka) *Tabernanthe Iboga* (Acanthaceæ), a plant growing in West Africa, particularly the Congo. Said to have aphrodisiac and sustaining powers. Too large a dose may produce tetanus and convulsions. The plant has been tried in sleeping sickness. The base is soluble 1 in 28 of alcohol 95%, insoluble in water. It has been given in dose 0.005 g. (½ grain). **Ibogaine Hydrochloride** has been given in influenza, and in angina pectoris and other heart affections.

Mulra-Puama. This drug, which comes from Brazil, is said to be derived from *Liriosma ovata* (Olacaceæ). It has an irritating action and tonic aphrodisiac properties. Used in nervous disorders.

Picrotoxinum (B.P.C.). $C_{20}H_{34}O_{13} = 602.3$.

[P1] "*Picrotoxin*."

[S1] "*Picrotoxin*."

Dose.— $\frac{1}{1000}$ to $\frac{1}{25}$ grain (0.0006 to 0.0025 g.).

Colourless odourless crystals or microcrystalline powder extracted from *cocculus indicus*. M.p. about 200°.

Soluble 1 in 334 of water, 1 in 35 of boiling water, 1 in 13.5 of alcohol 90%, 1 in 10 of solution of potassium hydroxide, also soluble in organic solvents.

Antidotes. Empty stomach by emetic or stomach tube. Give medicinal charcoal stirred up in water. For convulsions, give potassium bromide 2 dr. and chloral hydrate 20 gr., repeated if necessary. Soluble barbitone, soluble phenobarbitone, or sodium Amytal intravenously. Keep patient lying down and warm.

Uses. It is a powerful convulsive poison, differing from strychnine in that it acts mainly on the medulla. Gives good results in checking night-sweats (does not, like atropine, cause dryness of the throat), also employed in epilepsy and chronic alcoholism: overdoses cause stupor, delirium and convulsions. It increases the secretion of the mucous and sweat glands. It may be given in pills, to be taken for 2 or 3 nights successively. The drug is slightly cumulative, and may thus be temporarily stopped with effects persisting. A pill of picrotoxin $\frac{1}{80}$ gr., atropine $\frac{1}{16}$ gr., with agaricin $\frac{1}{8}$ gr., is said to act even better than picrotoxin alone.

Its convulsant action is employed in the treatment of barbiturate poisoning, for which purpose a dose of from 1 to 10 mg. is given intramuscularly or intravenously; owing to its rapid excretion the injections need to be repeated at frequent intervals. It is also used similarly to leptazol in the convulsion treatment of schizophrenia, and is said to give rise to less unpleasant effects than other convulsant drugs.

BARBITURATE POISONING. To counteract the coma give 5 mg. of picrotoxin intravenously in 0.2% aqueous or normal saline solution. If no awakening effect is produced in 20 to 30 minutes give another 5 mg., followed, if necessary, after another 20 minutes by a further dose of 10 mg. Discontinue when twitches occur until the patient again becomes lethargic. Continue with smaller doses, 3 to 5 mg., until the patient emerges from coma. As much as 150 to 200 mg. over a period of 48 hours have been given.—W. S. Murphy *et al.*, *J. Lab. clin. Med.*, 1937, 22, 350. See also J. L. Lovibond, *Lancet*, ii/1939, 561.

Of four cases of barbiturate poisoning treated with picrotoxin one died and three recovered. One patient recovered after receiving 671 mg. of picrotoxin. The picrotoxin is best given intravenously in fractional doses (from 3 to 12 mg.), the size and interval depending on the degree of depression and the response of the patient. In the event of an accidental overdose of picrotoxin, resulting in convulsions which do not subside within one or two minutes, a slow intravenous injection of a suitable barbiturate will control them immediately, and such a barbiturate should always be on hand when picrotoxin is administered.—R. Kohn *et al.*, *J. Amer. med. Ass.*, ii/1938, 387.

In six cases of barbiturate poisoning treated by picrotoxin, a safe convenient method for the administration of picrotoxin was used. Effective treatment of

barbiturate poisoning emphasised the following procedure: (a) gastric lavage and purgation, (b) continuous oxygen, (c) the administration of picrotoxin intravenously (1 in 1000 solution at the rate of 1 ml. per minute) until the return of pupillary and corneal reflexes, (d) diuresis by parenteral fluids and intravenous sucrose, and (e) the administration of dextrose to prevent acidosis.—W. J. Bleckivenn and M. G. Masten, *J. Amer. med. Ass.*, ii/1938, 504.

The experimental basis for its efficacy in barbiturate poisoning is fairly strong. In addition to the customary supportive measures, the general practice is to use doses of from 1 to 10 mg. of picrotoxin intramuscularly or intravenously at intervals of 30 minutes, until signs of stimulation occur, and to maintain this state by appropriate repetition of similar or smaller doses as long as indicated by the state of depression.—Report of the Council of Pharmacy and Chemistry, *J. Amer. med. Ass.*, i/1939, 431.

Animal experiments show that picrotoxin rapidly disappears from the blood. There is a rapid fall in blood picrotoxin occurring immediately after injections and levelling off after about 20 minutes. This is probably due to the taking up of picrotoxin by the tissues. At the end of two hours the quantities of picrotoxin were practically negligible. This means that when picrotoxin is used in the treatment of barbiturate poisoning, frequent administration is necessary in order to maintain effective concentrations.—D. M. Duff and J. M. Dille, *J. Pharmacol.*, 1939, 67, 353.

Intravenous injections of 10 ml. of a 1 in 1000 solution gave recovery in four out of 5 cases of collapse due to barbiturates.—S. W. Gillman, *Lancet*, i/1940, 598.

SCHIZOPHRENIA. Out of a series of 38 cases, 18 either had a full recovery or were socially recovered. The drug was injected intravenously in dosage determined for each individual patient; the convulsions produced were not preceded by the interval of acute terror often noted with other convulsant drugs.—A. A. Low et al., per *J. Amer. pharm. Ass., pharm. Abstr.*, 1940, 40.

Picrotoxin is very much slower in action and is almost free from the unpleasantness sometimes associated with Cardiazol and Triazol, and it would seem the most suitable convulsant yet used in the shock treatment of certain mental illnesses. It was administered by intravenous injection in 22 cases, the initial dose being 4 ml. of a 0.3% aqueous solution, increased when necessary by increments of 0.5 ml., the total number of injections being gauged by the clinical response.—J. S. Horsley, *Med. Pr.*, i/1940, 70.

[P1-S1] **Cocculus Indicus (B.P.C.).** *Syn.* LEVANT BERRIES.

The fruit of *Anamirta paniculata* (Menispermaceæ), containing 1.0 to 1.5% of picrotoxin. Has been used as an ointment for pediculi (1 in 60) also as tincture (1 in 10) and liquid extract (1 in 1).

Yohimba (B.P.C.).

[P1] "Alkaloids, the following; their salts, simple or complex:—Yohimba, alkaloids of."

[S1] "Alkaloids, the following; their salts, simple or complex:—Yohimba, alkaloids of."

[S6] "Alkaloids—Yohimba, alkaloids of—specify proportion as the proportion of any one alkaloid of yohimba that the preparation would be calculated to contain on the assumption that all the alkaloids of yohimba in the preparation were that alkaloid."

The bark of *Pausinystalia yohimba* (Rubiaceæ), containing 0.3 to 1.5% of alkaloids, chiefly yohimbine.

[P1-S1] **Yohimbinae Hydrochloridum (B.P.C., Fr. Cx., P. Helv. V).** $C_{21}H_{26}O_3N_2 \cdot HCl = 390.7$.

Dose.— $\frac{1}{10}$ to $\frac{1}{2}$ grain (0.003 to 0.008 g.), in pills or by hypodermic injection. *Fr. Cx.* has *max. single dose* about $\frac{1}{2}$ grain; *max. in 24 hours* $\frac{1}{2}$ grain.

White odourless crystalline powder with bitter taste. M.p. about 300°.

Soluble 1 in 100 of water, more soluble in hot water and in alcohol 90%.

Uses. Aphrodisiac, increasing the pelvic reflexes. A few drops of a solution $\frac{1}{2}$ to 1% strength act as an anæsthetic when applied to the cornea.

[P1-S1] **Yohimbina.** *Syn. and Prop. Name.* CORYNINA, APHRODINE (C. Zimmermann, London). In white crystals soluble in organic solvents; m.p. 234°.

[P1-S1] **Juvenin** (Bayer Products, London). Yohimbine methylarsinate and strychnine methylarsinate. *Dose.*—1 tablet (0.1 g.) thrice daily or 1 ml. subcutaneously every second day. For sexual neurasthenia.

[P1-S1] **Menolysin** (Coates & Cooper, London). Yohimbine hydrochloride in tablets (0.005 g.) and ampoules for subcutaneous injection (0.05 g. in 1 ml.). In dysmenorrhœa and amenorrhœa.

[P1-S1] **Tonicamps** (Paines & Byrne, London). Ampoules of 1 ml. containing strychnine and yohimbine monomethylarsenate. Asthenia and sexual impotence.

SULPHANILAMIDUM

(with SULPHAPYRIDINE and SULPHATHIAZOLE)

Syn. and Prop. Names. SULFANILAMIDUM (U.S.P. XI Supp. II), SULPHONAMIDUM, SULPHONAMIDUM-P, AMBESID (Richter, London), COLSULANYDE (Crookes Laboratories), P.A.B.S. (Hewlett & Sons, London), PRONTOSIL ALBUM (Bayer Products, London), RUBIAZOL-A (Roussel Laboratories, London), STREPTOCIDE (Evans, Sons, Lescher & Webb, Liverpool).

[P1], [S1] and [S4] "*Para-aminobenzenesulphonamide; its salts; derivatives of para-aminobenzenesulphonamide having any of the hydrogen atoms of the para-amino group or of the sulphonamide group substituted by another radical; their salts.*"

Dose.—In cases of serious infection in *adults* 15 grains (1 g.) every four hours for 48 hours followed by from $7\frac{1}{2}$ to 10 grains (0.5 to 0.66 g.) every four hours thereafter. It is usually advisable to continue dosage for a few days after clinical recovery in order to avoid a relapse. *Infants* will tolerate from one-third to one-half the adult dose, and *children* from one half to three quarters. U.S.P. XI Supp. II has average daily dose 45 grains (3 g.). (For further details as to dosage and technique of administration see **USES**).

Dosage of sulphanilamide derivatives for children. A method of estimating the concentration in the blood and a table of suggested dosages at various ages.—M. Hynes, *Lancet*, i/1940, 261.

Sulphanilamide is *p*-aminobenzenesulphonamide or *p*-aminophenylsulphonamide, prepared by the action of ammonia on the chlorsulphone obtained by treating acetanilide with chlorsulphonic acid, followed by hydrolysis. It occurs as a white, crystalline powder, odourless, but with a slightly bitter taste. M.p. 165.5°.

Introduction. Sulphanilamide was first synthesised by Gelmo in 1909, but it was not until 1935 that Domagk showed that an azo dye containing a sulphanilamide nucleus prevented the development of streptococcal septicaemia in mice. This substance, originally marketed under the trade name Prontosil, but later called Prontosil Rubrum, was highly efficacious in experimental and clinical infections, but possessed the disadvantages of low solubility with some toxicity. Subsequently it was shown that it was the sulphanilamide nucleus that was responsible for the streptococcicidal activity of Prontosil Rubrum, and that it was less toxic than the azo dye. At first sulphanilamide was considered specific for hæmolytic streptococci, but later work has shown that it is of value in the treatment of a number of other infections including meningococcal, gonococcal and urinary tract (*B. coli*) infections.

Soluble 1 in 125 of cold water, but very soluble in hot water; also soluble 1 in 37 of alcohol 95%, 1 in 5 of acetone, and in glycerin and hydrochloric acid; slightly soluble in benzene, chloroform and ether.

Preparation for injection of aqueous solutions of *p*-aminobenzenesulphonamide may be accomplished by using solutions of readily soluble quinine salts, such as the glutamate, or of quinine salts containing known dissolution promoters for quinine, such as urethane, as solvents. This process is patented.—per *Brit. chem. Abstr.* (B), 1939, 884.

Toxic Effects. Sulphanilamide, in common with all the other members of the sulphonamide group, is liable to give rise to unpleasant reactions. These vary in their severity according to the dosage, length of administration, and the idiosyncrasy of the patient. The majority of patients during administration suffer from mild toxic reactions, such as malaise, headache, nausea, vomiting, abdominal pains, depression, tinnitus, loss of taste, dizziness, and disturbances of vision. These reactions are more likely to occur if the patient is ambulatory, and patients receiving the drug should be warned against driving motor-cars, piloting aeroplanes, or doing heavy or dangerous work during treatment. Practically all patients develop some degree of cyanosis, though this may be confined in most cases to the lips, ears, and nail beds. Though somewhat alarming, it is not in itself a serious complication unless it is of a progressive character and is accompanied by other symptoms, such as sickness, shallow breathing and mental distress, and it may be successfully controlled in the majority of cases by the administration of methylene blue in pill form, in a dose of 1 or 2 gr. three times daily. The condition is thought to be due to methæmoglobinæmia or sulphæmoglobinæmia, though both of these conditions have been detected spectroscopically in patients showing no clinical cyanosis. A rise of temperature due to the use of the drug, and occurring between the fifth and tenth day of treatment, is a not uncommon toxic reaction, and skin rashes of markedly varying types are also met with fairly frequently.

Many of these minor reactions are dependent for their occurrence, or their severity, on the patient's idiosyncrasy. Thus, certain susceptible individuals may develop a cutaneous sensitivity, associated with porphyrinuria, when exposed to sunlight during sulphanilamide therapy, and wherever possible it is advisable for all patients receiving sulphanilamide to keep out of the sun and to avoid ultra-violet irradiation. Acidosis may also occur in certain individuals, though the routine administration of sodium bicarbonate generally prevents this complication. The concurrent use of ascorbic acid, 0.5 g. daily by injection, or of nicotinic acid, 50 mg. by the mouth three times daily, reduces the incidence of unpleasant symptoms and clears up the mental apathy so often present during treatment.

In addition to these minor toxic effects, sulphanilamide therapy may give rise on occasion to more severe complications. These are, fortunately, comparatively rare, and are usually (though not always) the result of large dosage or prolonged administration. Thus, acute hæmolytic anæmia may occur during the third to fifth day of treatment, and granulocytopenia may occur at any time during the course of administration. Cases of toxic hepatitis have also been recorded with some fatalities.

It is of the utmost importance, in the case of prolonged treatment, to keep a careful watch on the blood picture; patients who have had treatment with the drug for ten days should have white cell counts done every three or four days, since there are no other clinical signs of granulocytopenia, apart from a deterioration of the general condition and continued fever.

In order to avoid the onset of sulphæmoglobinæmia, the use of sulphur-containing foods, and of purgatives, particularly saline purgatives, during sulphanilamide treatment should be avoided, though liquid paraffin is permissible. Similarly, the use of phenacetin, amidopyrine, gold salts, and organic arsenical preparations, should also be avoided.

As sulphanilamide is excreted more slowly in patients with impaired renal function, it should be given with caution in all cases of renal insufficiency.

Clinical References to Toxic Effects.

ANÆMIA. Anæmia and agranulocytosis during sulphanilamide therapy.—G. H. Jennings and G. Southwell-Sander, *Lancet*, ii/1937, 898.

Three cases of acute hæmolytic anæmia developed during treatment of infections with large doses of sulphonamide. Two patients did not react to small doses of the drug given after they had recovered; the anæmia was therefore different from that resulting from idiosyncrasy and resembled that due to phenylhydrazine. In each case recovery was rapid after the medication was stopped and transfusions of citrated blood had been given.—A. M. Harvey and C. A. Janeway, *J. Amer. med. Ass.*, ii/1937, 12.

A case of anæmia with acute hæmolysis and hæmoglobinuria, following the use of sulphanilamide in a child of one year.—S. E. Kohn, *J. Amer. med. Ass.*, ii/1937, 1005.

Twenty-one cases of acute anæmia occurred in a series of 522 patients treated with the drug, the incidence being higher in children than adults. The earliest signs of the anæmia appeared between 24 and 72 hours after the onset of treatment, the maximum anæmia occurring usually on the fifth day. There were no

deaths. The anaemia is treated by the immediate withdrawal of sulphanilamide, the forcing of fluids, and blood transfusions. It is important that the haemoglobin should be watched carefully during the first week of sulphanilamide therapy.—W. B. Wood, *J. Amer. med. Ass.*, ii/1938, 1916.

CYANOSIS. The commonest toxic effect of the sulphonamide compounds, apart from such minor ones as nausea and depression, is cyanosis. The mechanism by which this cyanosis is produced is not fully understood, but methaemoglobinemia is regarded as one of the causes. Methylene blue has been shown greatly to accelerate the reversion of methaemoglobin to haemoglobin in poisoning by various aniline derivatives, and its effect in methaemoglobinemia due to sulphanilamide is dramatic, the cyanosis disappearing within half an hour when a dose of 1 to 2 mg. of the dye per kilo bodyweight is given intravenously. Though a single dose gives only temporary relief, the methaemoglobin level can be kept low by continuing administration of the dye by the mouth, or prevented from ever rising unduly if methylene blue is given together with sulphanilamide from the start of treatment. The dye itself is believed to be harmless in the doses required, and there is no indication that it interferes in any way with the therapeutic action of sulphanilamide.—A. F. Hartmann, A. M. Perley and H. L. Barnett, per *Lancet*, i/1939, 403.

The practitioner is advised, if cyanosis appears, to adopt the following plan. (1) Administer methylene blue in pill form in a dose of 1 or 2 gr. thrice daily. (2) Continue the use of the sulphonamide preparation when clinically advisable, provided the patient is making progress apart from the cyanosis. (3) If cyanosis deepens, but no complaint is made, use Rubiazol in place of the sulphonamide previously employed: the dose should be 0.2 or 0.4 g. every four hours in adults. (4) When cyanosis progresses and sickness, lassitude, shallow breathing and mental distress appear, stop all sulphonamide preparations and have a spectroscopic examination of the blood carried out.—W. R. Snodgrass, *Practitioner*, i/1940, 22.

DRUG FEVER. In a series of 134 cases of various infectious conditions treated with sulphanilamide, a specific febrile reaction was encountered in 21 cases, which was accompanied by a rash in 9 cases. The average duration of the fever was from two to four days, with a definite prolongation in cases in which the drug was continued through the first few days of the reaction. In two cases, however, fever subsided in spite of the continued administration of the drug. Hepatitis with jaundice and stupor was present with the febrile response in one case.—P. O. Hageman and F. G. Blake, *J. Amer. med. Ass.*, ii/1937, 642.

ENCEPHALOMYELITIS. Two cases of encephalomyelitis, following the administration of sulphanilamide, one of which ended fatally. The total doses were small, 14 g. and 8 g. There is evidence that patients suffering from certain illnesses, including acute rheumatic fever and lupus erythematosus, are especially liable to develop toxic manifestations after taking sulphanilamide.—J. H. Fisher and J. R. Gilmour, *Lancet*, ii/1939, 301.

GRANULOCYTOPENIA. Granulocytopenia may occur after or during treatment with the sulphanilamide group of drugs. It has a high mortality rate. Routine leucocyte counts are not necessary in all patients receiving the drugs, but frequent blood examination should be made on all cases showing an atypical response to treatment. The duration of treatment is probably a more important factor than the total dosage of the drug. Details of ten cases of granulocytopenia following use.—F. D. Johnston, *Lancet*, ii/1938, 1044.

Serial leucocyte counts performed on 50 ambulant patients receiving 21 g. of sulphanilamide in 14 days, showed that in 46% of cases there was a transient polymorph leucopenia, and in 44% a monocytosis. These changes were usually found between the 7th and 20th day after administration of the drug.—C. J. C. Britton and J. Howkins, *Lancet*, ii/1938, 718.

Fatal granulocytopenia, following sulphanilamide therapy.—S. Berg *et al.*, *J. Amer. med. Ass.*, i/1938, 370. Another fatal case.—W. F. Schwartz, *ibid.*, 368; see also *ibid.*, i/1939, 823.

HEPATITIS. Five cases of toxic hepatitis due to sulphanilamide therapy.—C. F. Garvin, *J. Amer. med. Ass.*, ii/1938, 2283.

Death from acute yellow atrophy of the liver, following self-medication with sulphanilamide for gonorrhoeal urethritis.—E. W. Clive, *J. Amer. med. Ass.*, ii/1938, 2384.

METHAEMOGLOBINÆMIA. Methaemoglobinemia, resulting from sulphanilamide may be successfully combated by injections of methylene blue. In two children a

single injection of 1 mg. of methylene blue per kilo bodyweight reduced the methæmoglobin from 20% of the total pigment to less than 3% of the total in 45 minutes in one and from 18% to less than 3% in the other. The methylene blue has a catalytic action, accelerating the conversion of methæmoglobin to hæmoglobin.—W. B. Wendel, *J. Amer. med. Ass.*, ii/1937, 1216.

OPTIC NEURITIS. Toxic optic neuritis, in a girl of 16, resulting from treatment with sulphanilamide.—P. C. Bucy, *J. Amer. med. Ass.*, ii/1937, 1007.

PORPHYRINURIA. The available evidence would suggest that a certain degree of blood cell destruction is caused by sulphanilamide in the doses employed, but it is felt that the disturbance in pigment metabolism (porphyria) is not to be explained by this fact alone. A more deep-seated effect upon the hæmopoietic system is suspected, analogous possibly in some ways to the toxic action of lead.—C. Rimington and A. W. Hemmings, *Lancet*, i/1938, 770.

Unpleasant symptoms and porphyria decreased on administration of nicotinic acid in doses of 50 mg. three times a day. The most definite clinical change observed was a clearing of mental apathy so often present with the ingestion of sulphanilamide.—A. P. McGinty *et al.*, per *J. Amer. med. Ass.* i/1939, 1996.

SKIN ERUPTIONS. Two cases of toxic erythema, following use of sulphanilamide.—M. H. Goodman and C. S. Levy, *J. Amer. med. Ass.*, ii/1937, 1009.

Purpuric and scarlatiniform eruption, following the taking of a 5 gr. tablet.—I. L. Schonberg, *J. Amer. med. Ass.*, ii/1937, 1035.

A peculiar eruption induced by sulphanilamide and sunlight was produced experimentally in one patient, giving conclusive evidence that sulphanilamide was the photosensitising agent.—E. G. Ballenger *et al.*, *J. Amer. med. Ass.* ii/1937, 1057.

Cutaneous eruptions are more likely to occur in patients receiving large doses of sulphanilamide when they are exposed to constant rays of the sun. Details of four patients who developed skin eruptions.—J. G. Menville and J. J. Archinard, *J. Amer. med. Ass.*, ii/1937, 1008; L. J. Frank, *ibid.*, 1011; M. Salvin, *ibid.*, 1038.

Experience indicates that the presence of certain concentrations of sulphanilamide in the skin of susceptible individuals may contribute to a state of photosensitivity, and for this reason patients who are under treatment with this drug should be shielded from direct exposure to the rays of the sun.—L. A. Brunsting, *Proc. Mayo Clin.*, 1937, 614.

Sulphanilamide therapy may result in several distinct types of toxic dermatosis. The first and most common type is exposure to sunlight. In this type the level of sulphanilamide in the blood is not abnormally high, nor is there ordinarily a sensitivity to the drug. The second type is that in which definite sensitivity to the drug occurs, resulting in a sensitisation dermatitis. The patient cannot tolerate further sulphanilamide in any dose. The third type of dermatitis is that resulting from poor toleration of, or saturation with, sulphanilamide and presenting the typical picture of toxic dermatosis. The patient can tolerate further sulphanilamide therapy, providing excretory functions are normally resumed and the dosage is properly modified. There is no known sensitivity to the drug in these cases.—J. W. Tedder, *Arch. Derm. Syph.*, 1939, 224.

SULPHÆMOGLOBINÆMIA is a commoner consequence of sulphanilamide treatment than has hitherto been recognised, and is dangerous to anæmic subjects. Regular spectroscopic examination of the blood of all patients receiving sulphanilamide is therefore advocated. Details of eight cases of sulphæmoglobinæmia.—G. Discombe, *Lancet*, i/1937, 626.

Administration of magnesium sulphate simultaneously with, or during the two or three days preceding the administration of sulphanilamide, gives rise in most persons to sulphæmoglobinæmia. The formation of sulphæmoglobin takes place very rapidly, even after small doses of the drug. In the absence of sulphates large doses of the drug are tolerated, but in a considerable proportion of persons doses of 12 to 24 grammes per day result in methæmoglobinæmia. The removal of sulphæmoglobin from the blood is much slower than removal of methæmoglobin. The former has been detected 6 weeks after administration of sulphanilamide ceased. The latter disappears in about 24 hours. In sulphæmoglobinæmia oxygen is of little value, and blood transfusion is indicated.—J. P. J. Paton and J. C. Eaton, *Lancet*, i/1937, 1159.

While there is a good reason for avoiding sulphæmoglobinæmia, certain dietary restrictions seem to be based on a misconception. Thus it has never been shown that eggs in the diet promote the formation of sulphæmoglobin when the intestine

is normal, and the same applies to many other foods containing sulphur, many of which, such as cheese, contain more than eggs. When purgatives are given, however, the fluid contents of the small intestine are hurried into the colon, and it is the bacterial decomposition which takes place in these liquid faeces that produces the sulphides. Certain drugs, of which phenacetin is the most used, predispose to the formation of methæmoglobin and, if even small quantities of sulphides are present, of sulphæmoglobin. To sum up, therefore, when giving sulphanilamide and similar substances, purging and phenacetin should be avoided, but there is no reason why the patient should not have as normal a mixed diet as his condition allows.—*Lancet*, i/1940, 972.

Pharmacology. Sulphanilamide has a relatively low toxicity for animals and is almost entirely inactive pharmacologically. Large doses produce no alteration in blood pressure or on the action of the heart, and the smooth muscle of the uterus and intestine does not respond to the drug. On the whole it may be said to be well tolerated by tissues and organs.

Sulphanilamide given by the mouth is absorbed very rapidly, concentration in the blood being maximal in from three to four hours, followed by a gradual reduction in concentration, reaching zero in about 24 hours. It is absorbed entirely from the small intestine and not from the stomach. Neither subcutaneous nor intravenous injection increases the concentration in the blood and oral administration is the method of choice owing to its efficiency and simplicity, though the subcutaneous route has certain definite indications. The drug is very readily diffusible and rapidly finds its way, in almost equal concentrations, into all the secretions and tissues of the body (except bone and fat), including the salivary glands, the pancreas, the gall-bladder, the pleura, and the cerebrospinal spaces. In the cerebrospinal fluid the concentration is parallel with, and only slightly lower than in, the blood; indeed, the concentration of the drug in all parts attains a peak and diminishes *pari passu* with the concentration in the blood.

Excretion commences very shortly after administration; it begins within forty-five minutes, and the greater part is excreted within 24 hours. Excretion is almost entirely *via* the urine, partly as the free base and partly as the inactive acetyl compound. The excretion is dependent on the urinary flow and not on the blood concentration; it is, therefore, possible to wash out the drug by increased diuresis in the case of toxic symptoms occurring. It is important to note that the rate of excretion is slower in patients with renal damage.

To obtain the best therapeutic effect it is necessary to maintain a constant concentration of the drug in the blood, which is usually achieved by four-hourly administration. A blood concentration of 10 mg. per 100 ml. is necessary for the treatment of severe infections, and this may be obtained by a dosage of 1 g. per 20 lb. of bodyweight, or approximately 7 g. for a ten-stone man. Children and infants tolerate comparatively larger doses (*viz.*, from one-third to one-half the adult dose).

The mode of action of sulphanilamide still remains in dispute. It has been shown to have bactericidal action under certain conditions *in vitro*, this action being more marked in the presence

of blood or serum, and it has also been shown to exert a bacteriostatic effect *in vivo* in low dilutions and a bactericidal action in larger quantities. It is generally conceded, however, that this bactericidal action is too feeble to support the idea of a direct antiseptic action (though there is some evidence that the drug may be converted in the body into another product with much greater antibacterial activity). In view of the fact that it does not stimulate leucocytosis or phagocytosis, it is also improbable that it acts by directly fortifying the natural defence mechanisms of the body. It is suggested, however, on experimental evidence, that by rendering the blood and other tissue fluids unfavourable as media for the proper metabolism and active growth of susceptible bacteria it prevents the invasion of the tissues by these organisms, reduces the production of toxic substances, and thus assists the antibacterial mechanism of the body to effect recovery from the infection.

Pharmacological experiments show that sulphanilamide has almost no action on smooth muscle, heart or blood pressure. When very large doses are given to rabbits or cats it produces nervous symptoms somewhat resembling decerebrate rigidity.—Frank Hawking, *Lancet*, ii/1937, 1019.

In the dog, after administration of the drug, sulphanilamide is present in approximately equal concentrations in the various tissues with the exception of bone and fat. The distribution ratio, *i.e.*, the ratio of the concentration of the drug in the whole organism to the concentration in the blood, appears to be higher in man than in the dog. Simultaneous determinations of sulphanilamide in the blood and spinal fluid of man during several hours administration of the drug show that the concentration in the spinal fluid is parallel to and slightly lower than that of the blood.—E. K. Marshall, *J. Pharmacol.*, 1937, 61, 196.

The effectiveness of sulphanilamide therapy is related to the type of lesion. The function of the micro-organism, which is strikingly depressed by sulphanilamide, is its capacity to invade tissue. The effect of the drug on bacterial invasiveness seems to be influenced by the amount of debris present in the lesion. Sulphanilamide should be considered an agent which supplements, and in no way supplants, antibacterial immunity.—J. S. Lockwood, *J. Amer. med. Ass.*, ii/1938, 2259.

Free sulphanilamide is excreted in human breast milk in concentrations closely corresponding to the values present in the blood stream. A nursing baby cannot receive an adequate therapeutic dose through the milk of the mother receiving an average clinical dose.—H. L. Stewart and J. P. Pratt, *J. Amer. med. Ass.*, ii/1938, 1456.

It would seem that the amounts of sulphanilamide or acetylsulphanilamide excreted in human milk when therapeutic doses are given to the lactating mother, is not ordinarily harmful to the normal nursing infants.—S. S. Pinto, *J. Amer. med. Ass.*, ii/1938, 1914.

Sulphanilamide drugs do not stimulate leucocytic or phagocytic activity; they do not affect the speed of production or the quantity and quality of specific immune bodies; they are not instantly active and there is a quantitative relationship between the effective dose of the drug and the number of bacteria affected; they are active on highly virulent organisms, but inactive on "rough" organisms; they are not simple germicides, and they probably act by neutralisation of some metabolic function or enzymatic activity.—J. McIntosh and L. E. H. Whitby, *Lancet*, i/1939, 432.

In practice there are certain essentials which must be remembered in sulphonamide chemotherapy: (1) If the infecting microbe is insensitive to the drug no good can result. (2) Local administration has little hope of success. (3) If the infected dead material is present, elimination of the infection is not to be expected. (4) Bacteria in abscesses are little likely to be directly affected. (5) Administration of the sulphonamide drugs should render safe the excision of a wound infected with *streptococcus pyogenes*. (6) Valuable adjuvants to sulphonamide therapy in the treatment of septic wounds are (a) drainage of the infected walls of the

wound, (b) increase of immunity, especially by vaccines.—A. Fleming, *Proc. R. Soc. Med.*, 1940, 33, 136.

Pharmacology of the sulphanilamide group of drugs.—G. A. H. Buttle, *Brit. med. J.*, ii/1939, 269.

In the presence of the sulphonamide compounds, even in dilutions as great as 1 in 100,000, the pellicle formation on the surface of culture media, characteristic of the growth of *B. subtilis*, is inhibited, though there is no retarding influence on the rate of growth of the bacteria. The degree of inhibition of pellicle formation is known to be strictly parallel with the degree of inhibition of spore formation, and the inhibition and ultimate suppression of sporulation is indicative of sub-normal bacterial metabolism, showing that the bacteria are living in an asthenic state. This anti-bacterial activity of the sulphonamides may be designated "bacteriasthenicizing" activity.—M. Mandelbaum, *Nature, Lond.*, i/1941, 266.

Uses. Sulphanilamide was originally introduced into medicine for the treatment of streptococcal infections, especially those due to hæmolytic streptococci, and infections of this type still remain among its chief indications. Thus, it may be considered practically specific in the treatment of erysipelas, and its value has been established in puerperal sepsis, streptococcal septicæmia, tonsillitis, otitis media and mastoiditis, Ludwig's angina, cellulitis, lymphangitis, empyema, streptococcal arthritis and streptococcal peritonitis, and in scarlet fever in conjunction with antitoxin. It has proved dramatically successful in streptococcal meningitis, a condition which was hitherto almost invariably fatal. In streptococcal infections other than those due to *Str. hæmolyticus* it is of little value.

In addition to its value in streptococcal infections it has been used with marked success in a wide variety of conditions due to other infecting organisms. In meningococcal meningitis, for example, it has reduced the mortality rate from 30 to 50% to less than 10%. In the treatment of urinary tract infections, especially those due to *B. coli* or *B. proteus*, it gives results comparable with those obtained in streptococcal infections. It is remarkably effective against gonorrhœa and its complications, but the earlier enthusiasm for its use in these conditions has somewhat abated owing to the high relapse rate and the difficulty of ascertaining cure; nevertheless it still remains a valuable therapeutic weapon against gonococcal infections. In chancroid it may be regarded as a specific.

Gas gangrene due to *Cl. welchii* responds well to treatment with sulphanilamide, and recent work indicates its value, both orally and by local application, in the prophylactic treatment of infected wounds.

Sulphanilamide has also been employed in numerous other conditions with a varying measure of success, including actinomycosis, colds, endocarditis, gingivitis and other oral infections, malaria, measles, rheumatic fever, staphylococcal skin infections, trachoma, typhoid, and undulant fever.

It has been found of little value in pneumococcal infections, sulphapyridine (*q.v.*) being the drug of choice in these conditions.

References to the More Important Uses of Sulphanilamide

In view of the vast amount of work which has been done during recent years on sulphanilamide it is impossible to give anything

approaching an exhaustive abstract review of this subject. It is hoped, however, that the numerous carefully selected abstracts contained in the following pages and taken from the more important papers which have appeared in this country and America, will prove sufficiently representative to convey an adequate appreciation of the use of this drug in the wide variety of diseases for which it has been advocated. Owing to the variations in dosage and technique of administration necessary to achieve the best results in different diseases, it has been thought desirable to preface the more important indications by a brief summary giving the essential details.

ERYSIPELAS. The efficacy of sulphanilamide as compared with other forms of therapy (e.g., ultra-violet light and scarlet fever antitoxin), may be gauged from the marked curtailment of the duration of spread of the rash, of the duration of the primary pyrexia, and of the duration of the toxæmia. There is usually a favourable response within 48 hours and a complete subsidence of symptoms within 10 to 14 days. It is best given in a dose of 1 g. at four-hourly intervals until the cessation of the primary pyrexia, and then in a dose of 0.75 to 1 g. three times daily until final cure is determined. To achieve the best results it is important to start administration before the third day of the disease. The drug may also be employed successfully in children, young babies being given 0.08 g. three or four times daily, older infants 0.15 g. two or three times daily, and older children 0.3 g. two or three times daily, the dose being reduced, but continued for a few days, after the fall of the temperature.

Prontosil is of undoubted value in the treatment of erysipelas. It is best administered by mouth in repeated doses in order to maintain the requisite concentration. It may be expected to produce a favourable result in about 48 hours, i.e., when about 60 gr. have been ingested. No obviously untoward results followed this dosage or mode of therapy. The drug ought to be persisted in for about a week.—G. E. Breen and I. Taylor, *Lancet*, i/1937, 1334.

A series of 312 cases was treated under controlled conditions with (a) ultra-violet light, (b) Prontosil, (c) ultra-violet light and Prontosil, or (d) scarlet fever antitoxin. The average case dosage of Prontosil was 5 g., and the average duration of Prontosil treatment two days (during the acute stage only). Those cases receiving Prontosil showed better results in respect of (i) curtailment of the duration of the spread of the local lesion, (ii) the duration of primary pyrexia, (iii) the duration of toxæmia.—W. R. Snodgrass and T. Anderson, *Brit. med. J.*, ii/1937, 101.

It also reduced the incidence of complications and diminished the tendency to recurrence. An effective method of treatment is to give 1 g. of sulphanilamide by mouth at four-hourly intervals until the cessation of primary pyrexia, and thereafter 0.75 g. thrice daily until final cure is determined.—W. R. Snodgrass and T. Anderson, *Brit. med. J.*, ii/1937, 1156.

A comparison of treatment by sulphamido-chrysoidine (Prontosil Rubrum), sulphanilamide (Streptocide), and benzylsulphanilamide (Proseptasine), in a controlled series of 242 cases. It was concluded that benzylsulphanilamide is not the drug of choice in the treatment of erysipelas, and that in this respect there is little to choose between sulphamido-chrysoidine and sulphanilamide. The dosage of the former should be 1.5 g. every 4 hours (9 g. daily) until the cure is established, then 1 g. three times daily for a further 14 days; and of the latter 1 g. every 4 hours (6 g. daily) until cure is established, and then 1 g. three times daily for a further 14 days.—W. R. Snodgrass *et al.*, *Brit. med. J.*, ii/1938, 399.

In a series of 162 patients treated with sulphanilamide the fatality rate was 2.46%; in 1193 cases treated during the years 1929 to 1933 the fatality rate was

13.4%. Sulphanilamide is the most effective form of therapy thus far used in the treatment of erysipelas.—A. L. Hoyne *et al.*, *J. Amer. med. Ass.*, ii/1939, 2279.

The effect of sulphanilamide on the course of facial erysipelas was studied in 42 cases, and compared with 43 similar cases treated previously by other methods. The drug was found to shorten the course of the illness and to decrease its extent and severity if it is administered before the third day of the disease, but it has little effect after this interval. Complications occurred frequently in the treated cases, but less often in those treated early. Recurrences and relapses occurred among the treated cases as often as among the untreated group.—L. A. Rantz and C. S. Keefer, *New Engl. J. Med.*, ii/1939, 809.

Adequate chemotherapy cures erysipelas in practically all cases within three or four days, the three preparations which have been most extensively used being Prontosil Rubrum, Rubiazol, and sulphanilamide.—T. Anderson, *Lancet*, ii/1939, 257.

GAS GANGRENE. Good results have been obtained from the use of 1 g. four-hourly for two or three days. (For prophylactic use see WOUNDS.)

Dramatically successful results in three cases. Conservative surgical principles should be combined with the use of sulphanilamide.—H. R. Bohlman, *J. Amer. med. Ass.*, ii/1937, 254.

Experimental evidence shows that bacteriostasis is the only demonstrable factor in the process which leads to the control of *Cl. welchii* infection in mice treated with sulphanilamide. Observations in experimental streptococcal infections in mice treated with sulphanilamide also indicate that bacteriostasis plays a role in the control of this type of infection.—E. A. Bliss and P. H. Long, *J. Amer. med. Ass.*, ii/1937, 1524.

In experimental infections in mice with *Cl. welchii* Type A, serum treatment was found better than sulphanilamide or sulphapyridine. In *Cl. septique* infection the best results were obtained when sulphapyridine was combined with serum, large doses of the drug being given immediately after infection and serum up to 24 hours later. In *Cl. adenomatis* infection neither sulphanilamide nor sulphapyridine appears to have any influence.—D. Stephenson and H. E. Ross, *Brit. med. J.*, i/1940, 471.

The results obtained with sulphanilamide in cases of gas gangrene due to *Cl. welchii* have been so good that the extensive amputations commonly necessary in the last war for this condition may be largely avoided.—G. A. H. Buttle, *Lancet*, i/1940, 890.

GONORRHOEA. Considerable difference of opinion exists as to the best scheme of dosage, the best time to commence treatment, and the value of adjuvant treatment. It would appear advisable, however, to begin with fairly large doses, *e.g.*, 4 to 5 g. daily, in divided doses at four-hourly intervals for a few days, followed by 3 g. daily for a further week. Many workers are of the opinion that the institution of sulphanilamide treatment should be delayed until the 8th or 10th day of the disease, thus first enabling the tissues to develop a natural resistance to the infection, while others advocate the concurrent use of vaccine treatment with the same object in view. Auxiliary treatment by local irrigation may be advantageous in some cases. (More recently the use of sulphapyridine has tended to supplant the use of sulphanilamide in gonococcal infections.)

Treatment with sulphanilamide and Prontosil Soluble, combined with irrigations, proved efficient in 90 out of 100 cases, acute and chronic. In favourable cases of acute gonorrhoea cure is obtainable in about 15 days. Cases which do not answer to Prontosil therapy within 18 days are not likely to react at all.—C. H. Andrewes *et al.*, *Lancet*, ii/1937, 893.

Twenty-six out of 30 females and 91 out of 104 males affected with gonorrhoea were cured within 15 days by a course of treatment consisting solely of the oral administration of sulphanilamide and large quantities of fluids, the total dosage

of sulphanilamide given to each patient being 620 gr. during the period. No complications occurred.—H. Orr, *Canad. med. Ass. J.*, ii/1937, 364.

A series of 113 males and 101 females were treated for gonorrhœa. Of the males 68 were clinically cured in a fortnight, and a further 11 after a second course of sulphanilamide, a total of 70% in four weeks. Of the females 49 were free of symptoms in a fortnight, and a total of 66% within four weeks. The dosage used was 4.5 g. per day for the first few days, followed by 3 g. per day for six days. The complicated case responds as rapidly to sulphanilamide as the less advanced. —K. L. Evans, *Med. Pr.*, i/1938, 269.

It is better in all cases to wait until the attack has lasted for three weeks before starting treatment with any of these remedies.—L. W. Harrison, *Brit. med. J.*, ii/1938, 91.

Experience of 491 male cases and 142 female cases shows that the best results with sulphanilamide treatment in gonorrhœa can be obtained only by a specialised technique of administration (details of which are given). With this optimum technique (which includes vaccine treatment and the administration of sulphanilamide not before eight days from the commencement of symptoms), a permanent cure can be expected in 80% of male patients with one course of three weeks treatment (increased to over 90% with additional courses). Under optimum conditions the disease in women appears to react equally well to the drug.—A. J. Cokkinis and G. L. M. McElligott, *Lancet*, ii/1938, 355.

After the ordinary lavage treatment of gonorrhœa a normal spermatozoon count is the rule, but after sulphanilamide treatment only 39% of cases had a normal count. Cases with a very low spermatozoon count are found in 0.4% of patients treated by the ordinary method, but after sulphanilamide treatment 30% had a low count, verging on a state of azoospermia. This alteration in 50% of cases was still present after three months. In only one case was amelioration seen three months after cessation of treatment.—Jaubert and Motz, per *Lancet*, ii/1938, 1436.

An analysis of 1268 male and 210 female cases of gonorrhœa, whose chemotherapy was completed from 6 months to 2 years previously, showed that of cases with sulphonamide compounds (sulphanilamide, sulphapyridine or Uleron), and which have passed tests of cure about 20% relapse subsequently. The fact that half of these late relapses occurred more than three months after apparently complete cure, throws doubt on the reliability of certain published statistics of results obtained with sulphapyridine and other sulphonamide compounds.—A. J. Cokkinis and G. L. M. McElligott, *Brit. med. J.*, ii/1939, 1080.

Treatment of 1625 cases. Of unprecedented efficacy in the cure of gonorrhœa and its complications in the male.—B. Silver and M. Elliott, *J. Amer. med. Ass.*, i/1939, 723.

Confirmation of increased relapse rates in gonorrhœa, following treatment with sulphanilamide.—*Brit. med. J.*, ii/1939, 1204.

The use of sulphanilamide in gonorrhœa has thrown a deep cloud of uncertainty over the older tests of cure, and no matter how carefully these tests are carried out, some infected persons are almost sure to be passed back into sexual activity. Complement fixation tests are of little aid in the pronouncement of cure. Therefore, every patient should be warned against coitus without the use of a condom for some weeks after supposed cure.—P. S. Pelouze, *J. Amer. med. Ass.*, i/1940, 1878.

MENINGOCOCCAL MENINGITIS. The introduction of the sulphonamides has revolutionised the treatment of cerebrospinal fever and has radically improved the prognosis. Although sulphanilamide was the first in the field and has proved markedly successful, sulphapyridine (*q.v.*) is now considered the drug of first choice, since it is not only effective in the treatment of meningococcal and streptococcal infections, but is unique in its action in pneumococcal infection, and this is an advantage, since early administration is essential and the practitioner can rarely make a more precise diagnosis at the bedside than that the patient is suffering from a purulent meningitis. A scheme of treatment applicable either to sulphanilamide or sulphapyridine is therefore included under the latter drug.

Satisfactory clinical response in every one of 6 cases. A routine administration of sulphanilamide applicable in any of the severe coccic infections is as follows. (1) An initial subcutaneous injection of a large dose of the saturated (0.8%) solution is given in amounts approximating 0.05 g. per kg. (2) The drug is given by mouth every four hours day and night. (3) The dosage is graduated downward from an upper limit of 1 g. every four hours, depending on the size and age of the patient and the severity of the infection. (4) The drug is continued, in reduced dosage, for about ten days after symptoms and laboratory readings have returned to normal. (5) Sodium bicarbonate is given grain for grain with sulphanilamide to combat acidosis. (6) Magnesium or sodium sulphate is not given.—L. J. Willien, *J. Amer. med. Ass.*, i/1938, 630.

Sulphanilamide was used in the treatment of 10 cases. The response to treatment was good in all the patients and seemed quite comparable to that obtained with the specific antiserum.—F. F. Schwenker, *J. Amer. med. Ass.*, i/1937, 1407.

In view of the results so far obtained it seems reasonable to suggest that a patient with cerebrospinal fever should be given a dose of one of the sulphonamide products as soon as possible after diagnosis.—*Rep. med. Offr. Minist. Hlth, Lond.*, 1938.

Twelve cases in children under 4 years treated with intrathecal and intramuscular injections of 0.8% sulphanilamide solution. The amount injected into the spinal canal was from 5 to 30 ml., according to the amount of spinal fluid withdrawn; the amount injected was less than the amount withdrawn. The intramuscular doses were from 35 to 150 ml., according to the weight of the patients. Of the 12 treated, 3 died (25%), the average fatality rate in the hospital for the previous six years, for children under 4, being 70%.—A. Eldahl, *Lancet*, i/1938, 712.

Ten children suffering from meningococcal meningitis were treated with sulphanilamide, and the cerebrospinal fluid became sterile in all cases. Four of the patients were less than a year old, and one of these died. All the 6 patients over a year old recovered.—T. Crawford and G. B. Fleming, *Lancet*, i/1938, 987.

Sulphanilamide therapy has changed the treatment of meningococcal meningitis from a difficult to a relatively simple matter. It is effective in Group II as well as in Group I infections. High initial dosage is advocated. The sulphanilamide level in the cerebrospinal fluid should preferably reach 5 mg. per 100 ml. in 24 hours and be maintained at this level for three days. Early cyanosis is not an indication for reducing dosage. The treatment is probably effective only in the acute stage. Clinical and experimental evidence so far is in favour of combined serum and drug therapy, especially in severe cases. Serum should be given in one or two large doses intravenously or intraperitoneally. Drainage is seldom required apart from daily lumbar punctures for two or three days. Report on 113 cases.—H. S. Banks, *Lancet*, ii/1938, 7.

Chemotherapy has revolutionised treatment and radically improved the prognosis. Cure may, as a rule, be obtained at all ages, is rapid, and with the single exception of deafness, is rarely accompanied by permanent sequelæ. The two drugs of proved potency, sulphanilamide and sulphapyridine, give equally good results when used in correct dosage. The dosage of sulphanilamide should be high, near the limit of tolerance, e.g., 9 g. a day for an adult, for 2½ to 3 days, and then very gradually reduced over the next 6 days. It should seldom be required and has little effect after the ninth day of treatment. Infants tolerate easily 3 g. a day for the first three days. The dosage of sulphapyridine should be similar but, since it is a more active drug, lower dosage is often effective. Serum is now unnecessary, even as an adjunct to chemotherapy.—H. S. Banks, *Lancet*, i/1940, 42.

In the Anglo-Egyptian Sudan the mortality of epidemic meningococcal meningitis often reaches 90%, but physicians working under the most adverse conditions have recently obtained by chemotherapy a survival rate of 90%.—F. G. Hobson, *Practitioner*, i/1940, 25.

PUERPERAL SEPSIS. Puerperal sepsis was among the first of the streptococcal infections treated by sulphanilamide, and the encouraging results obtained in early clinical trials were later substantiated by numerous workers. A dosage of from 3 to 5 g. daily is given until the temperature falls, and for a few days after, though in severe infections much larger doses have been advocated.

Its prophylactic value has not been so clearly established, and it is not recommended as a routine treatment in all cases, but only where there is a suspected or known risk of infection by hæmolytic streptococci, in which case a dose of 1 g. three times daily is suggested, beginning at the commencement of labour and continuing for three or four days.

Curative.

The aniline derivatives (originally Prontosil, and later Streptocide) have been used at the isolation block of Queen Charlotte's Hospital since January 1936, and it is now a routine practice to employ one or other of these drugs in every case of hæmolytic streptococcal infection. In the doses in which they have been given their use appears to be free from serious danger, and has been followed by a very great reduction in the mortality rate for these infections. There is good reason to believe that the treatment, rather than a change in the virulence of the organism, is responsible for the improvement, and there is every reason to continue the employment of these drugs until their value or otherwise is firmly established.—G. F. Gibberd, *Brit. med. J.*, ii/1937, 695.

A series of 106 cases treated with an average stay in hospital of 19.7 days, compared with 31.3 days in 1935. Although the death rate was 8%, only three deaths could be regarded as due to straightforward sepsis.—L. Colebrook and A. W. Purdie, *Lancet*, ii/1937, 1237, 1291.

22 cases treated with Prontosil Album in doses of 3 to 14.4 g. daily, continuously until the temperature fell, and thereafter for a few days. One patient died, giving a mortality rate for the whole series of 1.4% as compared with an average of 17.4% for a five-year period in the same hospital. In the recovered cases the fall in temperature and the general improvement were rapid.—M. A. Foulis and J. B. Barr, *Brit. med. J.*, i/1937, 445.

Prophylactic.

An investigation as to the prophylactic value of Prontosil Album, 140 patients being given the drug, and 162 being left untreated as controls. The drug was given in the third stage of labour, in most cases shortly before delivery, a daily dose of 2.7 g. being continued for a week. Analysis of the results showed little difference in the morbidity rate in the two series, but the only four cases of severe infection occurred in the controls.—B. Williams, *Lancet*, ii/1937, 343.

In view of the animal experiments and the bactericidal tests of women under treatment by sulphapyridine and sulphanilamide, the use of these drugs is suggested as a protective measure in maternity cases (and sometimes also in surgical cases) where there is believed to be special risk of infection by hæmolytic streptococci. The suggested dosage is 1 g. of sulphanilamide or of sulphapyridine thrice daily, beginning as soon as labour starts and continuing for 3 or 4 days.—E. W. Hoare, *Lancet*, i/1939, 76.

UNDULANT FEVER. The value of sulphanilamide in this disease has now been clearly established, the fever usually abating within a week or less, instead of after the usual period of months. A dosage of 3 g. daily has been recommended.

Two cases successfully treated.—L. A. Richardson, *Lancet*, i/1938, 495. See also A. E. Francis, *ibid.*, 496.

Three cases treated with prompt clinical cure. The maximum dosage (in tablet form), according to present standards, appears to be necessary.—R. L. Stern and K. W. Blake, *J. Amer. med. Ass.*, i/1938, 1550.

The use of sulphanilamide would appear to be a valuable aid in the diagnosis and treatment of human brucellosis. Animal experimentation indicates that in Brucella infections sulphanilamide markedly increases opsonocytaphagic activity for Brucella organisms.—H. Welch, *J. Amer. med. Ass.*, ii/1938, 226.

Two cases promptly and permanently cured.—E. F. Trant and C. E. Logan, *J. Amer. med. Ass.*, ii/1938, 1092.

Since undulant fever in man is a self-limited disease with a very limited case-mortality, it is doubtful whether the ordinary patient should be exposed to the dangers accompanying intensive treatment with sulphanilamide. No fewer than 7 out of 28 guinea pigs infected with *Br. abortus*, and receiving sulphapyridine by the mouth, died of toxæmia, and since both sulphapyridine and sulphanil-

amide have to be given for some weeks in a dosage bordering on the toxic limit if they are to bring about cure in guinea pigs infected with *Brucella*, attention is drawn to the grave danger attending the use of these drugs for more than a few days at a time, and it would seem wise to reserve this form of therapy for cases of undulant fever which have resisted other forms of treatment.—G. S. Wilson and I. Maier, *Brit. med. J.*, i/1940, 47.

URINARY INFECTIONS. Sulphanilamide can be expected to produce a cure in the vast majority of cases of cystitis and pyelitis due to *B. coli*, and it has the advantages over mandelic acid therapy of ease of administration, tolerance by the stomach, and the fact that it can be used during the acute stages of the disease. A further point in its favour is that it is effective in an alkaline urine, so that it is markedly bactericidal in infections due to *B. proteus ammoniae*. It may also safely be used in patients with impaired renal function, a condition which militates against the efficiency of other urinary antiseptics. The dose commonly recommended is 2 g. daily in divided doses, continued for five to seven days.

A comparison of mandelic acid and sulphanilamide as urinary antiseptics showed that sulphanilamide, because of its ease of administration and tolerance by the stomach, is the drug of choice in the average case, and it has the added advantage that it can be used during the acute stage of the disease. Acting best in an alkaline urine, sulphanilamide should be extremely useful in treating infections of the *Proteus* type, though its striking ineffectiveness in the treatment of *Streptococcus faecalis* infections is a definite handicap. These two drugs, one acting only in an acid, and the other best in an alkaline medium, supplement each other, and should be used in the treatment of urinary infections, according to the type or types of organisms causing them.—H. F. Helmholz, *J. Amer. med. Ass.*, ii/1937, 1039.

Sulphonamide given orally produces a urine strongly bactericidal for the organisms usually found in urinary infections, with the exception of *Streptococcus faecalis*. It is excreted in the urine, partly in the free state and partly as an acetyl derivative. If 30 gr. is given daily, on the third day the urine contains per 100 ml. about 100 mg. of free sulphonamide and 90 mg. of the acetyl compound. The latter is more actively bactericidal than the free substance in equal concentration, and its effect is much stronger in an alkaline urine, so that it is markedly bactericidal in infections due to *Proteus ammoniae*.—H. F. Helmholz and A. E. Osterberg, *Proc. Mayo Clin.*, 1937, 377; see also E. N. Cook and H. A. Buchtel, *ibid.*, 381.

It is a more potent antiseptic than mandelic acid and is effective in an alkaline urine; a bactericidal urine will develop in the presence of marked renal insufficiency. Coccal infections respond better than bacillary infections. In prostatitis, urinary infection associated with prostatitis, and in gonorrhoea, it has proved greatly superior to other antiseptics.—H. A. Buchtel and E. N. Cook, *Proc. Mayo Clin.*, 1937, 444.

Administration of sulphanilamide in doses of 0.5 or 0.6 g. by the mouth 3 times a day for 5 to 7 days effected rapid disappearance of *B. coli* and pus cells from the urine, and remission of symptoms in 46 women with urinary tract infections. Its simplicity of administration and rapidity of action make it especially invaluable in pyelitis of pregnancy and in the pre-operative treatment of gynaecological patients.—M. Kenny *et al.*, *Lancet*, ii/1937, 125.

Sulphanilamide has the advantage of rendering the urine slightly alkaline and can be used during the acute stages of pyelitis and cystitis. It is directly bactericidal and is more active in an alkaline medium. The sulphonamide groups of drugs is indicated in mixed infections and in the presence of haemolytic streptococci and *B. proteus*.—H. Droller, *Brit. med. J.*, ii/1938, 657.

A very efficient drug for the treatment of cystitis and pyelitis. The organisms which respond most readily are *B. coli*, *B. proteus*, and staphylococci.—D. R. Mitchell *et al.*, *Canad. med. Ass. J.*, i/1939, 336.

With suitable indications and in the right hands, sulphanilamide is capable of producing brilliant results in the treatment of non-specific urinary infections. Failures may be due to lack of proper identification of the infecting organism, since there are wide differences in the susceptibility of organisms within the

urinary tract to the action of sulphanilamide.—A. L. Clark, *J. Amer. med. Ass.*, i/1939, 719.

Sulphanilamide gives brilliant results in urinary infections in dosage considerably smaller than that required in the more aggressive septicæmic states. The ingestion of reasonable quantities of fluid does not seem to mitigate the beneficial action of the drug, provided adequate urinary concentration is obtained. The following is a representative dosage scheme: Infant, 1 g. daily; child of 6, 2 g. daily; adult 4 to 6 g. daily.—T. H. Crozier, *Practitioner*, i/1940, 516.

WOUNDS. Apart from its specific use in the treatment of gas gangrene, sulphanilamide has recently been widely advocated for the prophylaxis of wound infections, and the War Office has recommended its routine use in the presence of all wounds likely to become the site of secondary coccal or gas gangrene infection. The recommended dose is 1.5 g. in solution, followed by 0.5 g. two hours later, and then 0.5 g. four-hourly for four days. Sulphanilamide applied locally has also been found of value, usually in conjunction with oral administration, in checking bacterial growth in wounds. For this purpose it may be employed either as a dusting powder, as a pack, as a thick suspension, or as an irrigation (using a 0.8% solution). Local application to be effective must be given as soon as possible after infliction of the wound, since its value is markedly less when infection is well established.

Oral Use.

Where conditions favourable to general infection have arisen, prophylactic use of the sulphanilamide group should be valuable. Where infection has been established, the best therapeutic effects are secured in acute, diffuse conditions without marked local tissue changes. Hence, these drugs are not likely to obviate operative procedures where focal lesions such as accumulation of pus or extensive necrosis of bone or other tissues have occurred. Accordingly, powerful anti-septics, which act when brought into close contact with the organism locally, and which are relatively harmless to the tissues, will continue to be required also in the treatment of many septic infections.—C. H. Browning, *Brit. med. J.*, ii/1939, 265.

A provisional memorandum (A.M.D. 7, Oct. 11th, 1939) on the use of sulphonamide derivatives in the prophylaxis and treatment of wound infections, issued by the War Office to officers of the R.A.M.C., recommends that these compounds should be given a trial in the field, and that all wounds which appear likely to become the site of secondary coccal or gas-gangrene infection should receive a prophylactic course at the earliest opportunity, to be extended if infection supervenes.—*Lancet*, ii/1939, 996; *Brit. med. J.*, ii/1939, 969.

The recommendations of the War Office for the prophylactic use of sulphanilamide in war wounds are in the main supported. It is recommended that the first dose should be 1.5 g. given in solution for rapid absorption, and that the succeeding 0.5 g. doses, starting 2 hours after the first dose, should be given four-hourly as intact tablets to prolong their effect. It is essential that the first dose be given as soon as possible after wounding, to combat the gas-gangrene organisms, and prophylaxis must be continued for at least four days. If several hours have elapsed before treatment begins the first few doses should be increased.—A. T. Fuller and G. V. James, *Lancet*, i/1940, 487.

Because of its availability, cheapness, and low toxicity, sulphanilamide should be used in most cases, sulphapyridine being reserved for chest wounds, and sulphathiazole for staphylococcal infections. A prophylactic course should be given in all patients with wounds severe enough to carry a risk of dangerous infection. A first dose of three crushed tablets of sulphanilamide (1.5 g.) is given with a cup of hot lemonade, a single tablet is given two hours later, and thereafter one tablet four-hourly up to the end of the fourth day, making 13.5 g. in all. After the first 24 hours a double dose may be given the last thing at night to allow eight hours uninterrupted sleep. The course should be continued after debridement, or begun if it is not already in operation. If infection has already appeared the above doses should be doubled. The chief danger of prolonged administration is leucopenia; a differential blood count on a blood smear should be made

at the end of the first week, and then every three days; a drop in polymorphs to less than 50% is an indication that the drug should be stopped.—W. H. Ogilvie *Practitioner*, ii/1940, 337.

Local Use.

Experiences of the fighting in France and Belgium (1940) have proved the value of sulphonamide as a local application for checking bacterial growth in wounds. The wound should be thoroughly dusted with sulphonamide powder (preferably with a hand-operated air-pump) as early as possible, and a single dose of 2 g. given by the mouth at the same time. There should be a second dusting after debridement if this is carried out many hours after the first treatment. When there is reason to fear late infections, this treatment should be followed up by administration of the drug by the mouth on the lines recommended in the War Office Memorandum of July 3rd, 1940.—L. Colebrook, *Lancet*, ii/1940, 113.

The best method of administering sulphanilamide for local use is by means of a thick suspension, prepared by adding 2 g. of powdered sulphanilamide to 100 ml. of a 0.8% solution of sulphanilamide in physiologic saline solution. This is the compound of choice when dealing with infections caused by *B. coli*, hæmolytic streptococci, *Cl. Welchii*, or *Neisseria intracellularis*, but for infections due to pneumococci or staphylococci, sulphathiazole or sulphapyridine are preferable. Local application should be carried out at least three times daily. When treating fractures or fracture wounds, the powdered substance is placed directly in the wound as a heavy dressing powder prior to the application of a cast. The treatment is of greater value for the prevention of an infection than in an already well established infection.—W. E. Herrell and A. E. Brown, *Proc. Mayo Clin.*, 1940, 611.

The irrigation of infected or potentially infectible wounds (especially following posterior resection or combined abdominoperineal resection for carcinoma of the rectum) by a solution of sulphanilamide has given satisfactory results. The solution employed is prepared by heating a physiologic solution of sodium chloride to the boiling point and adding sufficient sulphanilamide to make a saturated solution (0.8% is the limit of solubility). Irrigations are started after the posterior pack, inserted at the time of operation, has been removed. Flushing the cavity with hydrogen peroxide before irrigation with the solution of sulphanilamide was found to be a useful adjunct. The irrigations are done three times a day.—C. W. Mayo and J. M. Miller, *Proc. Mayo Clin.*, 1940, 609.

Local application has been advocated under two conditions, as a field dressing and as a pack after debridement. In the first case, powder, tablets, or cylinders of sulphanilamide are inserted well into the wound when the first field dressing is applied, and in the second the powdered drug is dusted thickly over the surface of the excised wound, which is then lightly sutured or packed with sterile gauze over the powder. In either case the largest amount that should be used is 15 g. (roughly three dessertspoonfuls of the powder). Sulphanilamide used locally at a time when the bacteria are still limited to the wound track attains its maximum concentration where it is most wanted. It is also absorbed and appears in the circulation in bacteriostatic quantities for about 48 hours. After this time oral administration should be started. Once infection is established in a wound the drug is less effective as a local application than when given by mouth.—W. H. Ogilvie, *Practitioner*, ii/1940, 337.

Miscellaneous References

ACTINOMYCOSIS. A remarkable recovery following the use of 1 g. thrice daily by mouth.—O. Walker, *Lancet*, i/1938, 1219.

A case successfully treated.—E. M. Miller and E. H. Fell, *J. Amer. med. Ass.*, i/1939, 731.

Three cases completely cured.—L. Dobson *et al.*, *J. Amer. med. Ass.*, i/1941, 272.

BACTERIAL ENDOCARDITIS. Sulphanilamide therapy had no effect on the general course of 13 cases of subacute bacterial endocarditis. The main beneficial effect was a fall in the number of bacteria in the blood stream. It did not prolong the life of the patients in this series, and there is some evidence that it may have actually shortened the time of survival.—H. H. Steele, *New Engl. J. Med.*, ii/1940, 1067.

Best results when combined with heparin therapy and hyperthermia. Review of 200 cases.—S. S. Lichtman and W. Bierman, *J. Amer. med. Ass.*, i/1941, 286.

BURNS. For serious burns the Ministry of Health recommends (after cleansing of the burn) a light dusting of sulphanilamide powder prior to application of coagulant or (in the treatment of burns on the face and hands) of Tulle Gras.—*Pharm. J.*, i/1941, 77.

CHANCEROID. 20 cases successfully treated. Each case received 5 ml. of Prontosil Soluble 5% injected deep-subcutaneously over the gluteus medius, and one or two further injections at 3-day intervals of 10 ml., with Prontosil Album by mouth in divided doses, 3 g. in 24 hours. There was rapid healing of ulcer without leaving the old precipitous-edge scar. After circumcision and extirpation of frenum there was never a sign of chancroid infection of the cut surfaces.—H. M. Hanschell, *Lancet*, i/1938, 886.

A rapid cure effected in every one of 10 cases, four of which had relapsed after Dmelcos vaccine intravenously. The good results of treatment appear to be permanent.—R. C. L. Batchelor and D. Lees, *Brit. med. J.*, i/1938, 1100.

A series of 45 cases successfully treated, treatment consisting of the administration of 80 gr. of the drug in divided doses for the first five days, and 40 gr. in divided doses for nine additional days. Without exception, the treated cases healed promptly at the end of two weeks.—B. A. Kornblith, *J. Amer. med. Ass.*, ii/1938, 523.

Treatment with sulphanilamide or sulphapyridine cures rapidly, a daily dose of 2 to 3 g. of the latter for 5 to 10 days is sufficient to produce a cure. Intravenous injections of Dmelcos vaccine may also be used, but this causes severe systemic upset.—Robert Lees, *Med. Pr.*, 1939, 615.

This drug is efficient even in resistant cases, and if carefully controlled can be used with gratifying results. The average time required for healing in a control group was 32 days, compared with an average of 15.7 days for the sulphanilamide-treated group.—W. F. Schwartz and H. E. Freeman, *J. Amer. med. Ass.*, i/1940, 986.

COLDS. Sulphonamide by the mouth is effective in cutting short primary infective colds of more than two days' duration, and virus colds in the stage of secondary infection. It has no action in the virus stage.—A. L. Yates, *Canad. med. Ass. J.*, ii/1939, 275.

GINGIVITIS. The obvious manifestations of acute gingivitis, whether localised or diffused, could be made to clear up completely in about a week by oral administration of sulphanilamide or sulphapyridine, 3 to 4 g. daily. The fœtor and the morning stain on the lips and teeth completely disappeared. The oedematous interdental papillæ shrank, and the large lymph glands observed in some cases subsided. But it was quite certain that one course of chemotherapy did not cure gingivitis, the condition relapsing a week or so afterwards. By giving further courses, however, and particularly by increasing the immunity response by vaccine therapy, the infection could be indefinitely delayed for 6 months or more.—A. J. Cokkinis, *Brit. med. J.*, ii/1939, 1158.

GONORRHOEAL ARTHRITIS. The end-results in 18 cases treated by sulphanilamide were more satisfactory, and took place in shorter periods of time, than occurs with other forms of therapy.—H. C. Coggeshall and W. Bauer, *New Engl. J. Med.*, i/1939, 85.

HÆMOLYTIC STREPTOCOCCAL MENINGITIS. The use of sulphanilamide in these cases has yielded the most revolutionary results. Prior to its use the case fatality was more than 95%; since its use the rate has been less than 20% in a group of 27 cases.—J. B. Neal, *J. Amer. med. Ass.*, ii/1938, 1353.

Recovery of a case of streptococcal meningitis after injection of Prontosil.—M. J. L. Frazer, *Brit. med. J.*, i/1937, 1022.

MALARIA. As a result of treatment of 80 unselected cases of acute malaria it was concluded that sulphanilamide is much less efficient than quinine, is more dangerous, and is much more costly.—J. C. Niven, *Trans. R. Soc. trop. Med.*, 1938, 32, 413.

Prontosil is not a practical addition to the therapeutic armament against malaria; it is much less efficient than quinine, is more dangerous and is much more costly.—J. C. Niven, *per Trop. dis. Bull.*, 1940, 134.

MEASLES. Sulphanilamide is of some value in shortening the duration of bronchopneumonia, but has little effect on the course of the other main complications of measles, with the possible exception of otitis media.—T. Anderson, *Brit. med. J.*, i/1939, 716.

ORAL INFECTIONS. Sulphanilamide has been packed into tooth sockets (2½ gr.

per socket) after extractions for pyorrhœa or periapical infection in more than 350 cases, with prompt bactericidal effect and no complications.—W. D. Lanier, *J. Amer. pharm. Ass., pharm. Abstr.*, 1939, 158.

OTITIS MEDIA. During the past year (1938) all cases of acute suppurative otitis media at the Royal Naval Hospital, Chatham, have been given, immediately on admission, "Colsulanyde," 1 drachm four-hourly by mouth, in addition to the usual treatment for acute ear, and during this period the ratio of acute mastoiditis to acute otitis media has been reduced from 22.7 to 4.5%. The sulphonamide group of drugs has a very real place in the treatment of acute suppurative otitis media.—V. G. Horan and S. G. French, *Brit. med. J.*, ii/1938, 942.

Sulphanilamide therapy should be continued until there is bacteriological as well as clinical evidence of complete subsidence of infection, and the laboratory studies required for its effective use necessitate hospitalisation of patients under treatment. The therapy should be reserved for the treatment of spreading or life-endangering streptococcal infections.—J. M. Converse, *J. Amer. med. Ass.*, ii/1939, 1383.

A series of 621 cases of acute suppurative otitis media treated with sulphanilamide over a period of two years. The incidence of mastoiditis was only 3.4% compared with 22.7% before the introduction of treatment with sulphanilamide. It is urged that all cases of suppurative otitis media should receive sulphanilamide or sulphapyridine. This will greatly reduce the incidence of mastoiditis and will allow a more conservative attitude to be adopted once mastoiditis develops.—V. G. Horan and S. G. French, *Lancet*, i/1940, 680.

RHEUMATIC FEVER. The prophylactic use of sulphanilamide may avert the risk of rheumatic fever, following tonsillitis. Thomas and France gave sulphanilamide continuously through two winters (15 to 20 gr. daily for seven months without ill effects) to 30 patients with a recent history of acute rheumatic fever. None had major attacks of acute rheumatic fever, or an acute β -hæmolytic streptococcal infection, while taking sulphanilamide. Of 30 control patients, 4 developed 5 major attacks during the same period, 1 was admitted to hospital with an acute streptococcal infection, and 3 had acute illnesses which might have been of a rheumatic character.—J. A. Glover, *Lancet*, i/1939, 465; see also C. B. Thomas *et al.*, *J. Amer. med. Ass.*, i/1941, 551.

SCARLET FEVER. In a series of strictly controlled cases of scarlet fever during the period July 1936 to May 1937, the administration of sulphonamide was found to have no significant effect upon the duration of the initial pyrexia, the incidence of toxæmia, or the incidence of complications.—J. C. Hogarth, *Brit. med. J.*, ii/1937, 1160.

Collected experience suggests that whereas the initial toxæmia of scarlet fever, as evidenced by pyrexia, malaise, vomiting and rash, are unaffected by the sulphonamide drugs, a combination of chemotherapy with antitoxin will give the best results. Although the most effective drugs appear to be sulphanilamide and sulphapyridine, Proseptasine and Soluseptasine are less toxic, and may with greater safety be given in larger doses over longer periods.—A. R. Thompson, *Practitioner*, i/1940, 54.

STAPHYLOCOCCAL INFECTIONS. In multiple skin lesions the drug has no effect but when the infection is a localised one, as in carbuncles, solitary boils, furuncles of the nose or external auditory meatus, styes or whitlows, the results are often astonishingly good. Boils, furuncles and whitlows generally heal in about three days, and carbuncles in about 7 to 10 days. Treatment must be started early, before necrosis has occurred, dosage being from 1.5 to 2 g. daily *per os*.—M. Marcus, *Brit. med. J.*, ii/1938, 92.

TONSILLITIS. It would not seem wise to give sulphonamide indiscriminately to child patients with uncomplicated tonsillitis. At the slightest sign of spread, however, to the ears, cervical glands, or lower respiratory tract, the drug should be given in full doses. If a throat swab shows that the organism present is the hæmolytic streptococcus, then one of the sulphanilamide preparations should be used. In the absence of bacteriological certainty, however, sulphapyridine should be chosen.—A. Moncrieff, *Practitioner*, ii/1939, 429.

In a series of 31 sulphanilamide-treated patients and 36 controls, this drug was found not to reduce the severity of the symptoms, shorten the period of incapacity, reduce the incidence of complications, or reduce the duration of the carrier state. In the average uncomplicated case of tonsillitis or pharyngitis, due to hæmolytic streptococci, the advisability of its routine use is questionable.—P. S. Rhoads and M. L. Afremow, *J. Amer. med. Ass.*, i/1940, 942.

TRACHOMA. Rapid improvement, both of subjective and objective symptoms, in 140 cases.—F. Loe, *J. Amer. med. Ass.*, ii/1938, 1371.

TYPHOID BACILLURIA. A case of typhoid pyelitis and bacilluria, which failed to respond to hexamine and ammonium mandelate, was treated with sulphanilamide. After five days' treatment culture was negative, but typhoid bacilluria returned when sulphanilamide treatment was discontinued. The urine became sterile after four further days' treatment, and after a course of sulphanilamide lasting fourteen days, there was no recurrence of bacilluria.—M. Barer, *Lancet*, ii/1937, 964.

ULCERS. Treatment of ulcers infected with streptococci with the following paste is recommended. Benzoic acid 0.2%, sulphanilamide 0.8%, glycerin 10%, powdered tragacanth 10%, in Ringer's solution.—B. Fantus and H. A. Dyniewicz, *J. Amer. pharm. Ass.*, 1939, 548.

VULVOVAGINITIS. In a series of 25 patients suffering from gonorrhœal vulvovaginitis, who were given sulphanilamide (after other treatments had failed), 7 were cured in an average of 17.3 days, and 9 in an average of 42.9 days; only two of the remaining 9 were cured by additional administration of sulphanilamide.—S. J. Hoffman *et al.*, *J. Amer. med. Ass.*, i/1938, 1541.

[P1.81.84] **Prontosil Rubrum** (Bayer Products, London). *Syn.* PRONTOSIL FLAVUM, SULPHAMIDOCHRYSOIDIN.

$(\text{NH}_2)_2 \cdot \text{C}_6\text{H}_3 \cdot \text{N} : \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{SO}_2 \cdot \text{NH}_2 = 291.3$.

Dose.— $7\frac{1}{2}$ to $22\frac{1}{2}$ grains (0.5 to 1.5 g.). The child's dose is one half and the infant's dose one-third of these quantities. Both Prontosil Rubrum and Prontosil Album can be given in treatment combined with injections of Prontosil Soluble. With clinical improvement the injections are abandoned, treatment continuing with tablets alone, the daily intake of which is gradually reduced. In moderately severe cases the dosage for combined treatment is as follows:—Prontosil Soluble solution (5%) 10 to 15 ml. per 24 hours with Prontosil Rubrum or Prontosil Album 0.5 to 1 g. thrice daily. In severe cases, the amount of Prontosil Soluble solution (5%) should be increased to 20 to 25 ml. per 24 hours.

Prontosil Rubrum consists of 4-sulphonamido-2 : 4-diaminoazobenzene. It is a red crystalline powder and is supplied both in powder and in tablets containing $7\frac{1}{2}$ grains (0.5 g.) for oral administration. This is the original product and was first marketed under the name Prontosil. Although to a great extent it has been superseded by sulphanilamide and other derivatives, some practitioners consider that its action is more reliable than that of sulphanilamide itself.

Almost **insoluble** in water; soluble about 1 in 7 of acetone; moderately soluble in alcohol and soluble about 1 in 11 of a mixture of equal parts of alcohol (95%) and acetone. Prontosil Rubrum also dissolves in dilute hydrochloric acid, forming a hydrochloride melting at 248° to 250° , and slightly soluble in cold, but easily soluble in hot water. The hydrochloride has also been used therapeutically.

Stains caused by Prontosil Rubrum on undyed linen articles can be removed by rinsing the article in a dilute aqueous solution of sodium thiosulphate. Woollen articles should be treated with acetone and then washed repeatedly in luke-warm water.

Uses. Prontosil Rubrum is used for similar purposes to sulphanilamide and with comparable results. In the body it is partly broken down to sulphanilamide and partly excreted unchanged,

but there is some evidence that its activity is not dependent on its sulphanilamide content. It is excreted more slowly than sulphanilamide and is stated to be less toxic.

Prontosil Rubrum is used as a local application in cases of boils, carbuncles, infected wounds and cavities, breast abscesses, cellulitis, tonsillitis, erysipelas, etc., in the form of lotion, ointment or powder. Lotions of from 1 to 10% strength may be prepared by dissolving the drug in a mixture of equal parts of alcohol and acetone containing 1% of glycerin. A suitable ointment consists of Prontosil Rubrum 5 parts, liquid paraffin 25 parts, and wool fat 10 parts. When used in the form of a powder, 1 part of Prontosil Rubrum may be diluted with 10 parts of lactose.

[P1-S1-S4] **Prontosil Soluble** (*Bayer Products, London*). *Syn.* PRONTOSIL-S, NEO-PRONTOSIL.

$C_{18}H_{14}O_{10}N_4S_2Na_2 = 588.5$.

Dose.—10 to 25 ml. of a 5% solution per 24 hours by intramuscular injection.

Prontosil Soluble is the disodium salt of 4'-sulphonamido-phenylazo-7-acetyl-amino-1-oxynaphthalene-3, 6-disulphonic acid, supplied in 5 and 10 ml. ampoules of 5% solution for intramuscular injection.

Soluble 1 in 25 of water, but insoluble in alcohol, acetone, chloroform and ether.

Uses. The solution of Prontosil Soluble is recommended for use in conjunction with oral administration of Prontosil Album or Prontosil Rubrum, except in urinary tract infections, erysipelas, mild conditions and prophylaxis, where oral therapy alone suffices. Suggested dosages for the combined treatment are given under Prontosil Rubrum. It is important that Prontosil Soluble be given only by the intramuscular route, since intravenous injection is not without risk and appears to be no quicker in effect.

Prontosil Soluble may be used with 20% glycerin as a paint for the mucous membrane, and it has been used alone as a paint and gargle. An isotonic solution for use in the eye, etc., may be prepared by diluting the 5% solution of Prontosil Soluble with an equal amount of sterile saline.

[P1-S1-S4] **Proseptasine** (M & B 125) (*Pharmaceutical Specialities (May & Baker) Ltd., London*). *Syn.* BENZYL-SULPHANILAMIDE. $C_6H_5 \cdot CH_2 \cdot NH \cdot C_6H_4 \cdot SO_2NH_2 = 262.32$.

Dose.—Prophylactic, 0.5 g. every four hours. In treatment of septicæmic conditions, 1 to 2 g. every four hours until the temperature has been reduced. Thereafter 0.5 g. every four hours for 4 days or longer. In scarlet fever and streptococcal tonsillitis the initial dosage is 1 g. every four hours for 48 hours, and thereafter 0.5 g. every four hours for 4 days or longer. Proseptasine can be combined with injections of Soluseptasine, when the modified dosage forms indicated under Soluseptasine should be followed. Children receive half to three-quarters and infants up to 2 years a quarter to a half of the adult dose.

Proseptasine is *p*-benzylaminobenzenesulphonamide, a white, odourless, tasteless powder. It is supplied in the form of tablets, each containing 0.5 g. for oral administration.

Slightly *soluble* in water (1 in 1000), but more soluble in alcohol, acetone and dioxane. Proseptasine crystallises from solutions in acetone and dioxane when they are diluted with water.

Uses. The indications for its use are similar to those for sulphanilamide, but it is stated to be much less toxic. Its solubility is low, hence no large amounts can be absorbed from the intestinal tract at any one time, and its activity in equal doses is lower than that of sulphanilamide.

MEASLES. There is evidence that Proseptasine is of value in reducing the incidence of complications due wholly or in part to secondary invasion by hæmolytic streptococci, the best results being obtained in pure streptococcal complications, such as otitis media.—J. C. Hogarth, *Brit. med. J.*, i/1939, 718.

STREPTOCOCCAL INFECTIONS. The administration of Proseptasine to scarlet fever patients reduced the number of patients having complications from 56% in the control series to 35%. In erysipelas the spread of the disease was arrested in 24 hours in all of 47 cases.—B. A. Peters and R. V. Havard, *Lancet*, i/1937, 1273.

[P1·81·84] **Soluseptasine** (M & B 137) (*Pharmaceutical Specialities* (May & Baker) Ltd., London). $C_{15}H_{16}O_6N_2S_3Na_2 = 494.5$.

Dose.—By intramuscular or subcutaneous injection, 5 ml. of a 5% solution every 4 to 6 hours, the maximum dose in 24 hours not exceeding 30 ml. For children, 3 ml. should be administered at each injection. By intravenous injection, an initial dose of 5 ml. of a 5% solution should be given to test the tolerance of the patient, followed some 4 hours later by a further injection of 10 to 20 ml. Injections should be administered slowly. The dose of 10 to 20 ml. may be given twice or even oftener in the course of 24 hours, if necessary. Injections of Soluseptasine may be combined with oral administration of Proseptasine. One or more daily injections of 5 ml. of 5% solution of Soluseptasine are supplemented by the ingestion of 0.5 to 1 g. of Proseptasine at four hourly intervals. In this combined treatment more than 4 g. of Proseptasine should not as a rule be given in the course of 24 hours. For children, 5 to 10 ml. of 5% Soluseptasine solution may be injected intravenously with a total of 20 ml. in 24 hours, supplemented by 0.5 g. of Proseptasine by mouth every four hours.

Soluseptasine is disodium-*p*-(γ -phenylpropylamino)-benzenesulphonamide- α,γ -disulphonate. It is a white crystalline powder, *soluble* in water to give an almost neutral solution.

Uses. Soluseptasine is used for similar purposes to Proseptasine and may be employed either alone or in conjunction with the latter. It is also supplied in the form of an ointment for use in varicose ulcers, skin infections, infected wounds, and as an adjuvant to oral or injection treatment in erysipelas and cellulitis; and in the form of a spray containing 10% of the active substance in glycerin for use as an application in infections of the ear, nose and throat.

[P1·81·84] **Uleron** (*Bayer Products, London*). *Syn.* DISEPTAL A. $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{N}(\text{CH}_3)_2 = 355\cdot42$.

Dose.— $7\frac{1}{2}$ to 15 grains (0·5 to 1 g.) thrice daily after meals. Children receive half and infants up to 2 years a quarter of the adult dose. If delayed onset of action points to some difficulty in absorption, it is advisable to administer the preparation with alkaline media, such as sodium bicarbonate or soda water, since Uleron is soluble in an excess of alkali.

Uleron consists of 4-(4'-aminobenzenesulphonamido)-benzenesulphondimethylamide, a colourless substance with a slightly bitter taste, issued in $7\frac{1}{2}$ grain (0·5 g.) tablets. Also available as an ointment (5%).

Soluble with difficulty in water; readily soluble in alkaline solvents such as dilute caustic soda; also soluble in alcohol and acetone.

Uses. This drug was first introduced in 1937 as the result of an endeavour to find a substance which would influence the largest number of diseases, apart from streptococcal infections. It was found particularly effective against gonococcal infections, and has been widely used in Germany in the treatment of gonorrhœa, both in males and females. In spite, however, of the early enthusiastic reports, it appears to suffer from certain disadvantages, namely, (1) that it is generally considered that treatment with the drug must be delayed until the second week of the disease, (2) that adjuvant therapy, in the shape of vaccines and irrigations, is advised, and (3) that unless the dosage and time schedule is strictly adhered to there is a danger of peripheral neuritis occurring. It has been found, moreover, that chronic cases respond better to the drug than acute cases.

The essential feature of Uleron therapy in gonorrhœa is that it must be carried out in the form of short courses, *i.e.*, it is administered for 3 to 4 days (at the most 5 days), after which an interval of at least 6 (preferably 8) days is allowed to elapse. A second course may then be given and, if necessary, after another interval, a third course. The total dose for each of these short courses must not exceed 12 g. (or exceptionally 15 g.). If gonococci are still found after these three courses other measures of treatment must be adopted.

Provided the dosage scheme outlined above is adhered to, the drug is usually well tolerated, and the minor toxic effects common to sulphonamide therapy are rarely encountered; if these should occur, however, the use of the drug must be suspended immediately and its further use withheld.

Polyneuritis in a man of 63, following administration of 16 g.—C. T. Valkenburg and G. A. K. von dem Borne, *Lancet*, ii/1938, 889.

GONORRHOEA. Uleron is definitely a most valuable adjuvant in the treatment of gonorrhœa, and when the optimum dosage is established a high percentage of cures should be possible within three weeks. Non-acute cases seem to respond more readily than acute cases.—D. F. Walsh, *Brit. med. J.*, ii/1938, 215.

Uleron does not exhibit marked efficacy in recent gonorrhœa, and it is usually recommended that treatment be delayed until the second week of the disease,

when sufficient time has elapsed for the tissue defences to be marshalled. Prior to the start of and during chemotherapy, gonococcal vaccines and local treatment are both advised. With this compound it is essential to limit treatment to short periods of four days only; the excretion of Uleron is slower than other sulphonamides. A second course of treatment is required in most cases after an interval of a week, and in some a third course may be necessary. Uleron has the marked disadvantage of causing peripheral neuritis if the short period schedule is not rigidly followed.—V. E. Lloyd, *Practitioner*, i/1940, 48.

[P1-81-84] **Albucid** (*Schering, London*). $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{NH}\cdot\text{COCH}_3 = 214\cdot2$.

Dose.—A single course of 1·5 g. (22½ grains) thrice daily for seven consecutive days is stated to be effective in the treatment of gonorrhœa. If necessary the course may be repeated after an interval of eight days. For women the dose is 1 g. (15 grains) thrice daily, and for children 0·5 g. (7½ grains) thrice daily.

Albucid is *p*-aminobenzenesulphonacetamide.

The compound is also effective in the treatment of coli or staphylococcal infections of the urinary tract, the dose being 2 tablets thrice daily.

[P1-81-84] **Ambesid-Solubile** (*Richter, London*).

$\text{COONa}\cdot(\text{CH}_3)_2\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{NH}_2 = 294\cdot3$.

Dose.—0·8 to 1·2 g. (12 to 18 grains) thrice daily. Max. adult daily dose 5 g. (75 grains). By injection an average daily dose of 2 to 10 ml. of a 10% *w/v* solution can be administered intramuscularly or intravenously.

Ambesid-Solubile is the sodium salt of succinyl-*p*-aminobenzenesulphonamide.

Advocated for the same purposes as sulphanilamide, but is stated to be more readily absorbed owing to its greater solubility.

[P1-81-84] **Syrup Ambesid** (*Richter, London*) contains 4 grains of Ambesid-Solubile in 2 fluid drachms.

[P1-81-84] **Rubiazol** (*Roussel Laboratories, London*).

$(\text{NH}_4)_2\cdot\text{C}_6\text{H}_4\cdot\text{COOH}\cdot\text{N}\cdot\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{NH}_2 = 335\cdot3$.

Dose.—Prophylactic, 0·2 to 0·4 g. every four hours, with a max. of 1·2 g. daily. Therapeutic, 0·2 to 0·4 g. every four hours, with a max. of 2·4 g. daily.

Rubiazol is 4'-sulphonamido-2:4-diamino-6-carboxyazobenzene, and differs from Prontosil Rubrum in that the latter does not carry the carboxyl group.

It is used similarly to sulphanilamide.

[P1-81-84] **Rubiazol Injectable** (*Roussel Laboratories, London*) is the disodium salt of 4'-sulphanamidophenyl azonaphthol-7-acetyl-amino-3, 6-disulphonic acid, issued in 5 ml. ampoules of a 5% solution for intramuscular injection.

[P1-81-84] **Sulphapyridinum**. *Syn. and Prop. Name*. 2-SULPHANILYL-AMINOPYRIDINE, N²-SULFANILYL-2-AMINOPYRIDINE, DAGE-NAN (M & B 693) (*Pharmaceutical Specialities (May & Baker) Ltd., London*). $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{NH}\cdot\text{C}_5\text{H}_4\text{N} = 249\cdot3$.

Dose.—8 to 60 grains (0·5 to 4 g.) orally. Where the drug is badly tolerated by oral administration, or where there is difficulty in employing it by this route, it may be given by intramuscular injection. For this purpose it is supplied in ampoules containing an oil suspension of 0·5 g., or the sodium salt may be employed (*see Sulphapyridinum Solubile*). For fuller details as to dosage in individual diseases see the section on USES.

Sulphapyridine is 2-(*p*-aminobenzenesulphonamido)-pyridine, and consists of a white, odourless, practically tasteless, crystalline substance. M.p. 190° to 193°.

Introduction. The success achieved by sulphanilamide as a chemotherapeutic agent stimulated the search for substances of similar basic structure capable of widening the comparatively limited field of usefulness of this class of drug. Sulphapyridine, synthesised by A. J. Ewins and M. A. Phillips in 1938, was the

first big advance in this direction, possessing, as it does, notable powers in combating the effects of pneumococci, organisms hitherto outside the effective province of the sulphonamides.

Soluble about 1 in 3000 of cold water, and about 1 in 100 of boiling water; soluble about 1 in 400 of alcohol 95%; also soluble in acetone. With strong bases or mineral acids it forms water-soluble salts.

Toxic Effects. The toxic effects resulting from the use of sulphapyridine are essentially the same as those described under sulphanilamide, though, in general, they do not occur with such frequency. Nausea and vomiting, however, are much commoner with sulphapyridine and are sometimes very severe; at the same time, the use of the drug should not necessarily be discontinued because of vomiting, which often occurs early in the treatment and may cease later. Cyanosis is usually less marked than with sulphanilamide, and sulphæmoglobinæmia is of rare occurrence. Generally, it may be said that patients on high dosage of sulphanilamide look ill, owing to cyanosis, and those on sulphapyridine feel ill, owing to depression and nausea.

Drug fever and dermatitis are less frequent, though, as with sulphanilamide, patients undergoing treatment should avoid exposure to sunshine or ultra-violet light.

Acute hæmolytic anæmia may occur in the first few days of treatment, and severe leucopenia, or even granulocytopenia, is not uncommon; some fatal cases of agranulocytosis have been recorded. As with sulphanilamide, it is important, in the case of prolonged treatment, to keep a watch on the blood picture, especially from the point of view of the white cell count.

Several instances of hæmaturia have been reported as a result of sulphapyridine therapy; the condition appears to be more likely to arise in children, and may be more common in warm climates. It is thought probable that the condition is associated with the formation in the renal tubules and pelvis of calculi consisting largely of acetylsulphapyridine, which occurs in sharp needles, causing damage to the renal tissues. In order to avoid this toxic manifestation, it is important to administer enough fluids during treatment to keep the patient's urinary output at or above the normal level, in order to lessen the chances of calculus formation.

As with sulphanilamide, the use of sulphur-containing foods and of saline purgatives should be avoided during treatment, as also the use of phenacetin, amidopyrine, gold salts, and organic arsenical preparations.

High dosage with sulphapyridine should be avoided in the presence of impaired renal function.

It has about one-fourth of the toxicity of sulphanilamide for rats and mice. It appears to have no effect in relatively large doses on blood, urine and general health, and caused no significant inhibition of growth. It does not produce porphyrinuria.—R. Wien, *Quart. J. Pharm.*, 1938, 217.

Severe skin and general reaction, following the administration of sulphapyridine and exposure to ultra-violet light. Patients should be expressly warned

of the danger of exposure to strong sunlight, or any form of artificial sunlight, while taking this treatment.—R. Hallam, *Brit. med. J.*, i/1939, 559.

It is suggested that the routine employment of methylene blue, in conditions calling for the prolonged administration of sulphapyridine, may be a useful measure in preventing cyanosis, though it has no effect in preventing or modifying the cyanosis of sulphæmoglobinæmia.—D. Campbell and T. N. Morgan, *Lancet*, ii/1939, 123.

Five cases of hæmaturia associated with its use in children, with one death. Children are probably more susceptible to renal complication in sulphapyridine medication, and more care should be taken during its administration in pediatric cases.—Y. F. Tsao, *J. Amer. med. Ass.*, ii/1939, 1316.

A case of agranulocytic angina, following administration in typhoid fever. Though apparently less toxic than sulphanilamide, it is still in certain circumstances not without danger to the leucopoietic system.—R. V. Coxon and J. R. Forbes, *Lancet*, ii/1938, 1412.

Agranulocytosis, following administration. Frequent blood examinations should be made on all cases where sulphapyridine is continued for more than a week and large doses are given.—M. E. Sutherland, *Lancet*, i/1939, 1208.

Agranulocytosis, following the use of sulphapyridine in pneumonia. Recovery.—B. Pringle *et al.*, *Brit. med. J.*, i/1940, 212.

Two patients had renal calculi after sulphapyridine treatment; one had only 11 g. of the drug and the other 555 g. Both patients had hæmaturia and one had also renal colic. Hæmaturia and other renal symptoms, after sulphapyridine administration, are caused by the deposition of sulphapyridine crystals and concretions in the kidneys and ureters. Frequent examinations of the urine, particularly for red blood cells, should be made during treatment, and the drug should be withheld or used cautiously if hæmaturia occurs, or if there is a diminished kidney function.—N. Plummer and F. McLellan, *J. Amer. med. Ass.*, i/1940, 943.

Pharmacology. The absorption of sulphapyridine from the gastro-intestinal tract is slower, less complete, and more variable than is that of sulphanilamide under the same conditions. The differences in absorption seem to be due to an individual response on the part of the patient. There are indications that with excessive dosage there is incomplete absorption.

Sulphapyridine resembles sulphanilamide in its ready penetration of all tissues and body fluids in a concentration not far removed from that of the blood, but unlike sulphanilamide it is usually present in higher concentration in the liver than in other tissues. The mode of excretion appears to resemble very closely that of sulphanilamide, though it is somewhat slower.

The mechanism of action of sulphapyridine is still in doubt. The most commonly accepted theory at present is that, like sulphanilamide, it hinders the growth and multiplication of sensitive bacteria, and thus assists the natural defensive mechanism of the body in destroying the invading organisms.

Uses. In general it may be said that whereas the outstanding characteristic of sulphanilamide from the clinical aspect is its effectiveness in the treatment of streptococcal infections, that of sulphapyridine is in the treatment of pneumococcal infections. Its value in pneumonia is now so well established as to be beyond question.

In addition to its striking successes in pneumococcal infections, however, it has also proved remarkably effective in infections due to gonococci and meningococci. In gonorrhœa it is stated to give at least as high a percentage of cures as sulphanilamide, with the

added advantage that the recommended period of delay in starting treatment with the latter drug is not considered necessary in the case of sulphapyridine. Other gonococcal infections in which sulphapyridine has been used with success include gonococcal ophthalmia, gonococcal urethritis, and gonococcal vulvo-vaginitis.

In the treatment of meningococcal meningitis it has now, in large measure, supplanted sulphanilamide, in spite of the latter's undoubted efficacy. It has one important advantage in comparison with sulphanilamide, namely, that it is not only as effective as the latter in the treatment of meningococcal meningitis, but is unique in its action on pneumococcal meningitis.

Other conditions which have responded well to sulphapyridine include chancroid, lymphogranuloma inguinale, granuloma venereum, trachoma, and typhoid. Although it is claimed to be effective in the treatment of *B. coli* infections of the urinary tract, it has not been so widely employed in this connection as sulphanilamide.

While it is not generally advocated in the treatment of staphylococcal infections, it has been used with good results in a few cases of staphylococcal urethritis and staphylococcal septicaemia.

References to the More Important Uses of Sulphapyridine

The remarks appearing under this heading in respect of sulphanilamide are equally applicable to sulphapyridine. Here again, the more important indications have been prefaced by a summary, giving details as to dosage and technique of administration.

GONORRHOEA. Sulphapyridine exerts its curative action at a very early stage in the disease. It is not, like sulphanilamide, dependent for its maximum effect on the development of specific immunity. In order to maintain a therapeutically effective concentration of the drug in the body fluids, it should be administered at four-hourly intervals throughout the day, the last dose being given at bedtime. Nausea and vomiting may be minimised or avoided by the concurrent administration of 5 gr. of sodium bicarbonate.

There is considerable variation among clinicians in the matter of dosage and length of administration; some favour an intensive dosage over a short period of three or four days, others a low dosage continued for two or three weeks. A more common practice is to use a moderate dosage, giving 4 g. on the first day, and continuing with 3 g. daily until from 15 to 20 g. have been given, and thereafter terminating administration altogether, or continuing with a daily dosage of 1.5 to 2 g. for a further week.

On the concurrent use of urethral irrigation (e.g., with 1 in 8000 potassium permanganate solution) opinion is still divided; it is strongly advised by some authors, while others consider it unnecessary or even undesirable.

On the other hand, the concurrent use of vaccines for the purpose of raising the patient's immunity is generally regarded as unnecessary with sulphapyridine, except perhaps in the

comparatively few cases which do not show a marked clinical response within the first five days of treatment.

In women the dosage of the drug is usually lower than in men, 2 g. daily being the customary amount advised.

In all cases, after apparent clinical cure has taken place, the patient should abstain from alcohol and from coitus for three or four weeks, and should be kept under observation for at least three months after all signs and symptoms have subsided.

From a series of 250 cases it is concluded that the results of treatment of acute gonorrhœa in male out-patients with sulphapyridine (either orally or by injection) are superior to those obtained with sulphanilamide or other sulphonamide drugs. The employment of the compound immediately upon diagnosis leads to the rapid cessation of the symptoms and the almost complete absence of complications due to the extension of the disease. An important property of sulphapyridine is that there is no necessity (as with sulphanilamide) to consider any delay in the commencement of the treatment to allow of antibody formation.—V. E. Lloyd, D. Erskine and A. G. Johnson, *Lancet*, ii/1938, 1160; see also E. E. Prebble, *ibid.*, 1163.

The most potent anti-gonococcal agent available at present (report on 102 cases). It can effect clinical cure within a week in the large majority of cases whether of short or long duration, and whether occurring in men or women. No irrigation or other adjuvant treatments are necessary. Toxic effects occur in less than one-third of the cases, but they are usually mild and require only a reduction of the dose. Vulvovaginitis also responds well.—R. C. L. Batchelor *et al.*, *Brit. med. J.*, i/1938, 1142.

Sulphapyridine (19 g. in seven days) was used in the treatment of 100 cases of acute gonorrhœa in males. Lavage of the anterior urethra with potassium permanganate for three weeks was also given. Delay in starting treatment is unnecessary and undesirable. The daily urethral smear did not show the granularity and loss of definition shown with sulphanilamide, but often the gonococci disappeared within 24 hours. Urethral discharge disappeared in 4.5 days on an average. About 45% of the patients complained of toxic effects, though these were less than those of sulphanilamide. Similar results were obtained with 101 cases at another Glasgow clinic.—J. G. McGregor-Robertson, *Lancet*, ii/1938, 1463.

The most effective therapeutic agent yet introduced in the treatment of gonorrhœa, but in face of failure to respond within a week, or of early relapse, persistence with sulphapyridine, even in repeated doses, has proved ineffective. In such circumstances resort should be made to some other form of therapy.—F. J. T. Bowie *et al.*, *Brit. med. J.*, i/1939, 711.

A very high percentage of cures can readily be obtained provided the drug is not withdrawn too early. A satisfactory scheme of dosage appears to be 3 g. daily for one week, followed by 1.5 g. daily for a further week. Patients appear to improve more satisfactorily when irrigations are used in addition. Cures can be obtained in 92.5% of early acute cases and in 82.1% of chronic cases in all grades of severity.—E. E. Prebble, *Brit. med. J.*, i/1940, 89.

Sulphanilamide and sulphapyridine are both potent drugs in the treatment of gonorrhœa, and give approximately the same percentage cure. Sulphapyridine is much easier to use, with a lower incidence of drug resistance and complications of gonorrhœa. There is a high rate of defaulters with both drugs.—R. C. L. Batchelor, *Brit. med. J.*, i/1940, 961.

MENINGOCOCCAL MENINGITIS. In this condition sulphapyridine is now universally recognised as the drug of choice, the two essentials for successful treatment being early administration and adequate dosage. Directly a clinical diagnosis is made, sulphapyridine therapy should be commenced without waiting for bacteriological confirmation, and without delaying until the patient has been admitted to hospital. The aim should be to maintain in the cerebrospinal fluid a concentration of the drug equal to 5 mg. per 100 ml. for three days, and a diminishing concentration for a

further five or six days. Large dosage in the first 48 hours is the most important factor.

The following scheme of dosage is recommended in the "Memorandum on Cerebro-spinal Fever" issued by the Ministry of Health in March, 1940 (*H.M.S.O. Memo. 234/Med.*). During the first $2\frac{1}{2}$ to 3 days the daily dosage is: for infants under 2 years, 3 g.; from two to five years, $4\frac{1}{2}$ g.; from five to ten years, 6 g.; from ten to fifteen years, $7\frac{1}{2}$ g.; fifteen years and over, 9 g. The drug should be given four-hourly night and day during the first few days and thereafter, if considered desirable, six-hourly. In adults, at the commencement of treatment, the first two single doses may be increased to a maximum of 2 g. each; thereafter the four-hourly doses should not exceed $1\frac{1}{2}$ g. each, or a total twentyfour-hour dose of 9 g. After the first $2\frac{1}{2}$ to 3 days the dose should be gradually reduced over the next four to five days, and the treatment should be completed in from 7 to 9 days. (This dosage scheme is applicable either to sulphanilamide or to sulphapyridine, though there is evidence that a somewhat lower dosage of sulphapyridine will often be successful.)

The drug is best given by the oral route, and if a dose is vomited, it should be repeated (e.g., in a suspension of mucilage of tragacanth). If vomiting continues it is a good plan to change to sulphanilamide. Alternatively, the drug may be given through a nasal or stomach tube, or sulphapyridine soluble may be given by deep intramuscular injection. From the commencement of treatment it is imperative to administer large quantities of fluids (3 to 4 pints daily). After an initial lumbar puncture for diagnosis, further puncture should not be done except to relieve pressure symptoms, and on alternate days to verify the effective action of chemotherapy. (Recommendations as to dosage and technique of administration, on similar lines to the foregoing, have also been issued by the War Office.)

It may be added that sulphapyridine has proved so successful in the treatment of this condition that the use of serum is now generally considered unnecessary, even as an adjuvant.

Proved a successful chemotherapeutic agent in the treatment of six cases of meningococcal meningitis. The dosage was empirical, but a routine administration was adopted, calculated to produce a high concentration of the drug in the body fluids within a few hours of the inception of treatment, and to maintain this concentration at a steady level. 1 gramme of the drug was given at 0, 2 and 4 hours, and subsequently at intervals of 4 hours; thereafter the dose was reduced as the clinical picture improved, but the interval was maintained. Toxic symptoms were unimportant.—F. J. Hobson and D. H. G. MacQuaide, *Lancet*, ii/1938, 1213.

Three cases of meningococcal cerebrospinal meningitis successfully treated with sulphapyridine (average total dose 29 g.) and daily lumbar puncture.—W. H. Osborn, *Brit. med. J.*, i/1939, 1281.

In 143 consecutive cases treated with sulphapyridine, the case mortality was 10%, compared with a usual case mortality (in the Sudan) of 68 to 80%. R. B. U. Somers, *Lancet*, i/1939, 921.

In a small series of cases (50) it was found that with sulphapyridine the mortality was 7%, whereas with serum or sulphanilamide it was over 60%. There was thus a significant difference between the results obtained with sulphanilamide and with sulphapyridine respectively.—E. A. Underwood, *Brit. med. J.*, i/1940, 757.

The dramatic success of chemotherapy in this disease is one of the high lights of modern medicine. No other infection responds so constantly and so dramatically to high dosage with sulphapyridine and sulphanilamide. The two essential points are early administration and adequate dosage during the first two or three days. As soon as the diagnosis is suspected on clinical grounds, a full dose of sulphapyridine should be given without waiting for confirmation by lumbar puncture.—*Brit. med. J.*, i/1940, 397.

Sulphapyridine appears to be a drug of exceptional therapeutic value in the treatment of cerebrospinal fever, but its value is probably greatest when combined with serum or antitoxin therapy.—J. H. Jordan *et al.*, *Brit. med. J.*, i/1940, 1005.

When adequate doses of sulphapyridine are given the disease can be effectively controlled without therapeutic lumbar puncture. On the first day a maximum total of 10 g. is given (2 g. on admission, 2 g. two-hourly for two doses, and 1 g. four-hourly); on the second day, 1 g. four-hourly; on the third day, 1 g. six-hourly; and thereafter 1 g. eight-hourly, the daily dosage being maintained at 3 g. until a total of 30 g. has been given, when a differential white count is taken. If all signs of meningeal irritation have not disappeared by then, and if the number and type of polymorphonuclear leucocytes are satisfactory, treatment is continued until the last trace of neck rigidity has disappeared.—D. Williams and D. Brinton, *Lancet*, ii/1940, 482.

PNEUMONIA. The early good reports as to the action of sulphapyridine in pneumonia have been fully confirmed by subsequent workers. According to Marriott (*Brit. med. J.*, ii/1939, 944), the principal points now established concerning the sulphapyridine treatment of lobar pneumonia are: (1) Average reduction in gross mortality is such that three patients out of four who would formerly have died may now live. (2) It is particularly valuable in severe cases with bacteraemia. (3) It is as effective in the elderly as in the young. (4) It is effective against pneumococci of all types. (5) Temperature falls by rapid lysis within 24 to 36 hours of sulphapyridine being started, irrespective of the day of the disease, and there is usually remarkable improvement in the general condition with uneventful recovery in most cases. (6) The incidence of empyema appears lessened, but clear pleural effusions are commoner. (7) Specific agglutinins against pneumococci develop within the fifth and twelfth day of the disease, as they do in untreated cases.

The dosage is determined by the severity of the infection, with the proviso that a high concentration (4 or 5 mg. per 100 ml.) of the drug be obtained in the blood stream as rapidly as possible by the administration of relatively large doses at frequent intervals. Severely ill patients, or those in whom the disease is well established, should be given 2 g. as an initial dose, followed by a further 2 g. in four hours, and then 1 g. four-hourly for 36 hours, except during sleep. Clinical improvement will generally be evident by this time, and the dosage may then be reduced to 0.5 g. four-hourly for another 24 or 36 hours, and then to 0.5 g. eight-hourly for two days, a total dosage of 20 g. being usually sufficient. In less severe cases, after an initial dose of 2 g. four-hourly, administration of 1 g. may be commenced. The drug is well tolerated by children, and the following dosages have been suggested both for lobar pneumonia and broncho-pneumonia: from 1 to 3 months, 0.125 g.; from six months to two years, 0.25 g.; at three years, 0.375 g.; and at five years, 0.5 g.; all doses given four-hourly. In severe

cases an initial double dose may be given if necessary, followed by the usual dose four-hourly until the temperature has become normal, after which a smaller dose should be given eight-hourly for two more days.

Treatment should always be continued for two days after the positive fall of temperature, as otherwise there may be a recurrence of the pneumonic process.

It is still open to question whether a type-specific serum should be used in addition to sulphapyridine, and there is a considerable body of evidence to show that the combination of the two may give better results. Administration of sulphapyridine should not, however, be allowed to wait on the typing of the pneumococci.

It should be noted that simultaneous administration of cough mixtures, other than simple linctus, is undesirable during sulphapyridine therapy.

In 100 cases of lobar pneumonia treated with sulphapyridine, the case mortality rate was 8%, compared with 27% in a control series observed at the same time.—G. M. Evans and N. F. Gaisford, *Lancet*, ii/1938, 14.

In every one of eight cases of lobar pneumonia, exhibition of the drug was followed by immediate fall of temperature and pulse-rate, and by improvement in the clinical condition, with subsequent uneventful course and rapid recovery. Serum and other forms of treatment were withheld. A suitable dose for the commencement of treatment in an adult appears to be 4 tablets (2 g.), followed by two tablets four-hourly for 20 hours, and thereafter by the same dose six-hourly. Administration of the drug should last at least 5 days, no matter how favourable the clinical condition. Children tolerate the drug well.—S. C. Dyke and G. C. K. Reid, *Lancet*, ii/1938, 1157.

In 50 cases treated by non-specific treatment there were 8 deaths, as compared with one death in 50 cases treated by sulphapyridine. The course of the disease was considerably modified by the drug, and the pyrexial period was reduced.—T. F. Anderson and R. M. Dowdeswell, *Lancet*, i/1939, 252.

A very effective and convenient drug in the treatment of pneumonia.—A. L. Agranat *et al.*, *Lancet*, i/1939, 309, 380.

Gave good results in the treatment of pneumococcal infections in infants and children.—H. L. Barnett *et al.*, *J. Amer. med. Ass.*, i/1939, 578.

An effective drug in the treatment of pneumonia. Report of 100 cases. A conspicuous effect is its ability to bring about, within 24 to 48 hours, a critical drop in temperature, followed by prompt clinical improvement.—H. F. Flippin *et al.*, *J. Amer. med. Ass.*, i/1939, 529.

Sulphapyridine therapy was carried out in 50 cases of pneumonia, with a mortality rate of 6%, as compared with mortality rates of 23% in a series of 30 control cases, and 12% in a series of 50 cases treated with specific anti-pneumococcus serum.—D. Graham *et al.*, *Canad. med. Ass. J.*, i/1939, 332.

A single dose of pneumococcus vaccine given to mice or rabbits profoundly affects the course of an experimental infection in these animals when treated with sulphapyridine, and a strong case is made out for the combined use of vaccine and sulphapyridine in all cases of pneumonia in man. Pneumococci in an infected animal treated with sulphapyridine, readily established a tolerance or fastness to the drug; thus, it is essential that the initial doses should be large and that the immunity should be raised to as high a degree as possible by any means, so that the destruction of the bacteria may be complete before they have established tolerance to the drug.—J. H. Maclean, K. B. Rogers and A. Fleming, *Lancet*, i/1939, 562.

Acquired tolerance of pneumococcus to sulphapyridine in the human being. It is desirable to increase the immunity at the same time that sulphapyridine is administered, so that if possible the infecting cocci can be destroyed before they have had time to acquire a tolerance to the drug.—R. W. Ross, *Lancet*, i/1939, 1207.

There is a good case for the use of pneumococcal vaccines in pneumonia in man in conjunction with sulphapyridine. If possible, the pneumococcus should be typed and a vaccine of the specific type administered, but if typing is not

possible, then a stock polyvalent vaccine can be administered at once, and the sooner the better.—A. Fleming, *Brit. med. J.*, ii/1939, 104.

Observations on 342 cases. The average dose administered to 284 patients of more than 10 years of age was 22 g. Excluding fatal cases, a rapid effect was produced in all cases except 5. The commonest complications were pleural effusion (18 cases) and otitis (9 cases).—O. Romcke and E. Vogt, *Lancet*, ii/1939, 778.

The excellent results in lobar pneumonia are paralleled in the less clearly defined pneumococcal chest infections, and results in bronchitis, bronchopneumonia and post-operative pneumonia are good.—H. L. Marriott, *Brit. med. J.*, ii/1939, 944.

Of considerable value in type II pneumococcus pneumonia. It has three disadvantages: (1) the definite lag in recovery, (2) the delay in resolution of the consolidation, (3) the gastric upset which sometimes necessitates stoppage of treatment.—T. Anderson *et al.*, *Lancet*, ii/1939, 776.

A series of 234 cases were treated, of whom 78 were controls (conservative treatment) with 21 deaths. 119 were treated with sulphapyridine alone, giving a case mortality of 6.7%; and 37 cases of either type I or type II treated with sulphapyridine, plus specific serum, with 3 deaths.—C. S. D. Don *et al.*, *Lancet*, i/1940, 311.

The best routine method of starting treatment is to give 4 tablets, *i.e.*, 2 g., immediately, and repeat at 4-hourly intervals for three or, in severe cases, 4 doses, and then to continue with 2 tablets 4-hourly till the temperature falls, following with a further one tablet 8-hourly for three doses. Giving a patient one tablet two or three times a day cannot be expected to modify the course of the disease appreciably, and certainly not to cause a fall of temperature in 24 hours.—W. F. Gamford, *Practitioner*, i/1940, 38.

An analysis of the clinical results of treatment with serum and sulphapyridine suggests that the combination of the two represents the optimum therapy in pneumococcal infections. The cases in which the combined therapy was most effective were bacteremic patients, particularly those over 50, those in whom treatment was started late in the disease, and the ones with blood cultures that yielded moderate or large number of pneumococci; patients in whom more than one lung was involved; most patients over 60 who had more than a mild infection; and pneumonias due to types II and III, and possibly V pneumococci, except the mild cases.—M. Finland *et al.*, *New Engl. J. Med.*, i/1940, 739.

Fourteen patients suffering from pneumococcal pneumonia, and who did not appear too ill on admission, were treated by *rectal* administration of sulphapyridine alone, and all recovered. The sulphapyridine was initially administered in 6 g. doses suspended in 3 ounces of water, with from 0.66 to 1 g. of sodium bicarbonate. After a cleansing enema this suspension was introduced as a retention enema. At 4-hourly intervals, 2 g. doses, and later 3 g. doses, were employed. It was found that three times the usual oral dose was required to produce adequate blood levels. The clinical response was slower than with the oral route, but was uniformly satisfactory. The average time required for the temperature to reach normal was 48 hours, as compared with 36 hours in those treated orally, and 12 hours in those treated intravenously. The same decrease in toxicity was also noted. Only one patient exhibited nausea and vomiting, and there was no evidence of rectal irritation. The rectal method is satisfactory and less disturbing for patients showing gastric irritability and not too seriously ill.—W. L. Whittemore *et al.*, *J. Amer. med. Ass.*, i/1940, 940.

Miscellaneous References

BACTERIAL ENDOCARDITIS. A case recorded of recovery, following administration of sulphapyridine. Three courses were given, using the oral method of administration for the first two, and the intramuscular route for the third. In the first course the patient had 12 g. in 5 days, in the second 6 g. in 2 days, and in the third 2 g. intramuscularly.—C. T. Andrews, *Brit. med. J.*, i/1940, 5.

CHANCROID. Treatment with sulphanilamide or sulphapyridine cures rapidly; a daily dose of 2 to 3 g. of the latter for 5 to 10 days is sufficient to produce a cure. Intravenous injections of Dmelcos vaccine may also be used, but this causes severe systemic upset.—Robert Lees, *Med. Pr.*, 1939, 615.

Complete healing in 45 cases in two weeks, with no recurrence in the next six months.—Kornblith, Jacoby and Wishengrad, *J. Amer. med. Ass.*, ii/1938, 523.

GONOCOCCAL OPHTHALMIA. Rapid cure of two cases.—A. M. Michie and M. H. Webster, *Lancet*, ii/1938, 373.

GONOCOCCAL URETHRITIS. Is undoubtedly superior to Prontosil Album and Uleron in the treatment of acute gonococcal urethritis in the male sex.—R. Marinkovitch, *Brit. med. J.*, i/1939, 317.

GONOCOCCAL VULVOVAGINITIS. The advantages of sulphapyridine over sulphanilamide are shown in the shorter duration of drug treatment and omission of local treatment to the urethra, vagina and rectum.—D. K. Brown, *Brit. med. J.*, i/1939, 321.

In this condition, occurring in little girls, sulphapyridine is of outstanding value. To effect the resolution of the acute inflammatory state in a few days, and to be able to dispense with the repeated daily local treatment in these children, is one of the major triumphs of modern chemotherapy.—V. E. Lloyd, *Practitioner*, i/1940, 49.

LYMPHOGRANULOMA INGUINALE. Uniformly successful in 12 cases treated with 5 to 6 0·5 g. tablets daily for 5 days, followed by an interval of 3 or 4 days and the course repeated.—K. V. Earle, *Lancet*, ii/1939, 1265.

PEMPHIGUS NEONATORUM. A case successfully treated in a child of two weeks.—A. J. Troup and R. M. White, *Lancet*, ii/1939, 1367.

PNEUMOCOCCAL SEPTICÆMIA. Prompt subsidence of symptoms, following use in a woman of 61.—S. C. Dyke, *Lancet*, ii/1938, 621.

STAPHYLOCOCCAL SEPTICÆMIA. A case successfully treated.—W. J. Fenton and F. Hodgkiss, *Lancet*, ii/1938, 667.

A case successfully treated.—E. J. O'Brien and C. J. McCarthy, *Lancet*, ii/1938, 1232. A second case.—J. Maxwell, *ibid.*, 1233.

TRACHOMA. Remarkable remissions of pathologic signs obtained in two cases of chronic trachoma, intractable to all other methods of treatment, and vision improved greatly in both cases. Sulphapyridine was prescribed 7½ gr. every 4 hours.—M. D. Spearman, *J. Amer. med. Ass.*, ii/1939, 1807.

Remarkable results may be expected from this treatment in many cases of bacterial conjunctivitis and blepharitis, especially when associated with trachoma.—A. F. MacCallan, *Brit. med. J.*, i/1940, 482.

TUBERCULOSIS. Sulphapyridine has a beneficial effect on certain cases of pulmonary tuberculosis. It inhibits the growth of pneumococci in the distressed areas and relieves unpleasant symptoms—malaise, night sweats, etc. Commence with one tablet (0·5 g.) four times a day after food for three days; then reduce to one tablet night and morning and later to one tablet daily.—J. Deeny, *Brit. med. J.*, i/1939, 696.

TYPHOID. 7 cases successfully treated.—E. H. R. Harries *et al.*, *Lancet* i/1939, 1321.

[P1·81·84] Sulphapyridinum Solubile.

Prop. Name. DAGENAN-SODIUM (M & B 693 SOLUBLE) (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

$\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\text{N}(\text{Na})\cdot\text{C}_6\text{H}_4\text{N}_2\cdot\text{H}_2\text{O} = 289\cdot3$.

Dose.—Soluble sulphapyridine is supplied in ampoules containing 1 g. in 3 ml. of solvent for intramuscular injection. It should be used only when oral therapy is impracticable, and the general directions as to dosage given under sulphapyridine should be followed, but it is advisable that not more than 4 to 6 injections should be given consecutively. The oral route of administration should be resumed as soon as possible. The salt has also been employed intravenously (*vide infra*):

The mono-hydrated sodium salt of sulphapyridine, occurring as a white, odourless, crystalline powder, melting with decomposition at 316·5° to 317°.

Soluble about 1 in 1·6 of water at 25°, the pH of a 1% solution being 10·4; slightly soluble in organic solvents.

Owing to its high alkalinity, intramuscular injection of this drug is apt to be painful and may even cause sloughing, while intravenous injection needs to be frequently repeated in order to maintain an adequate blood level. On the other hand, sulphapyridine itself dissolves to a greater extent in normal saline than in water, and to a still greater extent in a glucose solution. The largest amount dissolved in a series of experiments employing different solvents was 0.279 g. per 100 ml. in 0.85% saline, also containing 5% glucose. It is therefore possible to reduce by half the volume in which sulphapyridine must be contained if given by injection. 43 cases have been treated by this method, dissolving a standard dose of 2 g. of sulphapyridine in 1 litre of glucose-saline. Immediate effect can be secured by injecting the first dose intravenously, succeeding doses being given subcutaneously at 8 hour, and later at 12 hour, intervals. Satisfactory blood levels are maintained and the solution causes no local damage.—J. W. Haviland and F. G. Blake, *Amer. J. med. Sci.*, 1940, 199, 385.

Painless injection. A 1 ml. Record syringe, with a No. 2 serum needle, is filled with 1% Novocain; a weal is made intradermally and the needle is driven through this, injecting a little Novocain as it goes, until the needle is in the muscle, when 0.5 ml. of Novocain is injected. The syringe is then detached from the needle which is left in place. A 5 ml. Record syringe with a large needle is used for the sulphapyridine. The syringe is detached from the filling needle and attached to the needle in the patient and the drug injected. The empty 5 ml. syringe is detached from the needle and the former 1 ml. syringe containing about 0.5 ml. of 1% Novocain is re-attached. About 0.25 ml. of Novocain is injected to clear the needle, which is then withdrawn while the rest of the Novocain is injected into the track to prevent any of the sulphapyridine escaping up the track after the needle has been withdrawn. If this technique is followed the intense pain usually experienced by patients is entirely avoided.—H. J. McCurich, *Brit. med. J.*, ii/1939, 1205.

PNEUMONIA. Clinically, it is no more toxic than sulphapyridine, is rapidly absorbed and excreted, and is less likely to cause vomiting than sulphapyridine given orally. It is best given intramuscularly—4 to 6 injections of 3 ml. at 4-hourly intervals, which may be followed by smaller doses (1 g. four-hourly) of sulphapyridine orally, till the temperature falls.—W. F. Gaisford *et al.*, *Lancet*, ii/1939, 69.

For **intravenous injection** 2 g. of soluble sulphapyridine in 20 ml. of normal saline may be adopted as the standard initial dose, and this dose may be repeated in 4 to 6 hours. In 14 out of 18 cases the therapeutic effect was rapid, occurring within 6 to 12 hours. There was no local or systemic reaction and nausea occurred in only one case. The chief difficulty was in maintaining constant blood levels, with a consequent erratic course of recovery. In seriously ill patients it is desirable to give soluble sulphapyridine intravenously at first, and follow it immediately with sulphapyridine orally.—W. L. Whittemore *et al.*, *J. Amer. med. Ass.*, i/1940, 940.

Intravenous injections of a 5% solution of soluble sulphapyridine were given to 30 patients suffering from pneumococcal lobar pneumonia, a standard dose of 3.8 g. being adopted for adult patients. No untoward symptoms were noted, except vomiting during or immediately after the injection. The intravenous use is advantageous in that blood levels of from 5 to 8 mg. per 100 ml. can be attained with great speed and certainty, but it should be limited to cases in which oral administration is impossible, or does not suffice for successful therapy. Injections should be given slowly, at the rate of 5 ml. of the solution per minute, and care should be taken that none of the solution gets outside the vein, or a bad slough may result, since the solution is alkaline. This dose may be repeated at intervals of six to eight hours, though it is seldom necessary to give more than two injections. Sulphapyridine in doses of 1 g. every four hours should be started at the time of intravenous therapy. It is also employed in the treatment of patients with pneumonia not responding to therapy by the mouth. If on the day following sulphapyridine therapy by the mouth, the patient's temperature is not below 101°F. rectal, and the concentration of free sulphapyridine in the blood is below 4 mg. per 100 ml., a single dose of 0.06 g. of the sodium salt per Kg. of body-weight in 5% solution is given intravenously, and this results in a prompt return of temperature to normal.—E. K. Marshall and P. H. Long, *J. Amer. med. Ass.*, i/1939, 1671.

Successfully employed by **hypodermoclysis** in more than 50 cases of pneumonia and other conditions in which sulphapyridine was indicated, but in

which oral administration was difficult or impossible. The drug was given in from 0.3 to 0.7% solution in normal saline, the usual dose being 3 to 7 g. in one litre, repeated in 24 to 36 hours as the condition required, and injected into the thighs or under the breasts at the rate of from 200 to 300 ml. an hour. No local reactions were observed.—G. V. Taplin *et al.*, *J. Amer. med. Ass.*, i/1940, 1733.

PNEUMOCOCCAL MENINGITIS. A case of pneumococcal meningitis successfully treated by soluble sulphapyridine (previous fatality-rate in 39 cases 100%).—J. V. Cable, *Lancet*, ii/1939, 73.

The sodium salt is particularly valuable, and may be given in doses of 3 ml. four-hourly for from four to eight doses. After the intramuscular course is finished, oral treatment may be continued with two tablets four-hourly till the temperature is settled.—W. F. Gaisford, *Practitioner*, i/1940, 41.

[P1-S1-S4] **Sulphathiazolum.** *Prop. Names.* CIBA 3714 (*Ciba, Horsham*), THIAZAMIDE (M & B 760) (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

$\text{NH}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{SO}_2\text{NH} \cdot \text{C}_3\text{H}_2\text{NS} = 255.3$.

Dose.—15 to 60 grains (1 to 4 g.) (For further details as to dosage in individual diseases, see abstracts under USES.)

Sulphathiazole is 2-(*p*-aminobenzenesulphonamido)-thiazole, occurring as a white, crystalline powder, melting at 202°. It dissolves in mineral acids, forming crystalline salts which are slightly soluble in water, to give strongly acid solutions. The sodium salt, formed by substitution in the remaining hydrogen atom of the sulphonamide group, is a crystalline substance which is readily soluble in water, a 2% solution having a reaction of pH 9.6. It is used for the intramuscular injection of sulphathiazole.

Soluble about 1 in 2500 of water, about 1 in 200 of alcohol, and readily in hot acetone.

Sterilisation. Sulphathiazole solid heated at 150° for one hour is oxidised, with the formation of a purple colour. To sterilise, it should, therefore, be mixed with about 1% of water and autoclaved in a glass container at 115 lbs. pressure for thirty minutes. Solutions are stable to heat if alkaline and only slightly hydrolysed if acid.

Toxic Effects. These are similar to those encountered with the other sulphonamides, though there would appear to be some variation in the incidence. Thus, it is generally agreed that nausea, vomiting, mental depression and cyanosis are markedly less with sulphathiazole than with sulphanilamide or sulphapyridine, whereas drug fever and skin rashes (especially of the nodular type) are of more frequent occurrence. Haematuria may occur, but the incidence is lower than with sulphapyridine. There have so far been no reports of acute haemolytic anaemia or agranulocytosis, though the possibility of their occurrence is not ruled out. On the other hand, a few cases have been observed of injection of the sclera and conjunctiva, a toxic effect which would appear to be peculiar to sulphathiazole. Generally speaking, however, the indications are that sulphathiazole is less toxic than either sulphanilamide or sulphapyridine.

In rapidity of absorption and excretion it resembles sulphanilamide, and in this respect it has an advantage over sulphapyridine.

A further advantage which it possesses over the latter drug is the relatively moderate degree of conjugation to the acetyl derivative, and for this reason determination of total sulphathiazole blood concentrations is not so necessary, knowledge of the concentration of free sulphathiazole being adequate for practical purposes.

One important advantage of sulphathiazole over sulphapyridine is a much less tendency to cause nausea and vomiting; almost equally valuable is the absence of cyanosis. The only organ which appears liable to suffer is the kidney, diminished renal excretion and hæmaturia occurring in some patients, and crystals of the drug being sometimes found in the urine.—*Brit. med. J.*, i/1940, 1022.

Less toxic than sulphanilamide or sulphapyridine.—T. L. Pool and E. N. Cook, *Proc. Mayo Clin.*, i/1940, 113.

These compounds (sulphathiazole and sulphamethylthiazole) seem to produce less nausea and vomiting than sulphapyridine, but drug fever and drug rashes are quite common, and three cases have been observed of congestion of the conjunctiva and sclera with a generalised erythematous eruption; mild hæmaturia has been noted in several cases.—*J. Amer. med. Ass.*, i/1940, 870.

It is evident that sulphathiazole shows certain of the toxic effects described for other therapeutically active sulphonamide compounds. The toxic effects do not seem to offer any serious barrier to its use in treatment, and indeed in many ways toxicity appears to be less than that of sulphapyridine.—J. G. Reinhold *et al.*, *Amer. J. med. Sci.*, 1940, 199, 393.

Compared with sulphapyridine, its use is attended by conspicuously less vomiting, nausea and mental depression; other untoward reactions are less frequent and severe; and the problem of excessive acetylation is not encountered.—F. G. Blake, *New Engl. J. Med.*, ii/1940, 661.

Skin rashes, usually appearing from the fifth to ninth day, are present in 5% of persons treated with sulphathiazole as compared with 1.9% and 2% of those treated with sulphanilamide and sulphapyridine respectively.—Long *et al.*, *J. Amer. med. Ass.*, ii/1940, 364.

It causes less nausea and vomiting than sulphapyridine, but dermatitis occurred more frequently than with sulphanilamide and sulphapyridine.—W. W. Spink and A. E. Hansen, *J. Amer. med. Ass.*, ii/1940, 840.

Uses. Early experimental results gave reason to hope that sulphathiazole would prove as effective a therapeutic agent against staphylococci as sulphanilamide had proved against streptococci. Subsequent clinical trials would, however, seem to indicate that its value in this connection is not likely to be so great as was at first anticipated, possibly due to the difficulty in maintaining a sufficiently high blood concentration owing to the rapid absorption and elimination of the drug. On the other hand, from the few clinical trials conducted to date, there is evidence that it is at least as effective as sulphapyridine in pneumococcal and meningococcal infections, while possessing the advantage of lower toxicity. Good results have also been obtained from its employment in urinary tract infections, especially those associated with the presence of staphylococci and of *Streptococcus fecalis*, two types of urinary infection resistant to other sulphonamide treatment. It has so far not been used to any extent in gonorrhœa, but there is some evidence that the results obtained may be comparable with those of sulphapyridine.

Preliminary report of the Council on Pharmacy and Chemistry of the A.M.A. on sulphathiazole and sulphamethylthiazole. Experience to date leads to the belief that these compounds are about as effective as sulphapyridine in pneumococcal pneumonia in human beings and at least as effective in staphylococcal infections.—*J. Amer. med. Ass.*, i/1940, 870.

GONORRHOEA. Employed in 19 cases of acute gonorrhoea in males had a rapid initial therapeutic effect comparable to that of sulphapyridine. Not less than 4 g. daily for five days should be given.—V. E. Lloyd and D. Erskine, *Lancet*, ii/1940, 186.

MENINGOCOCCAL INFECTION. H. S. Banks treated 15 cases with sulphathiazole, and was impressed with the rapidity of the clinical improvement and the rapid way in which the cerebrospinal fluid cleared up, both bacteriologically and in respect of the cellular count.—*Brit. med. J.*, i/1940, 1033.

PNEUMONIA. Not enough is known yet to set up standards of dosage, but for adults suffering from pneumococcal pneumonia an initial dose of 4 g. of sulphathiazole has been given, followed at 4-hour intervals by doses of 1 g. With this dosage it has been noted that after the first 24 hours of medication the concentrations of sulphathiazole in the blood are frequently much lower than would be expected if sulphapyridine had been used, and in some cases it has been difficult to maintain adequate concentration of the drug, probably owing to its rapid absorption and excretion. In several cases a relapse of the pneumonia has been noted in association with these low concentrations of sulphathiazole.—*J. Amer. med. Ass.*, i/1940, 870.

Of 100 cases treated by sulphathiazole, those recovering promptly by crisis or rapid lysis with uneventful convalescence comprised 55% of the group; in 109 cases treated by sulphapyridine the figure was 55%; the number of cases relapsing were respectively one and four; and the number of deaths four and seven. The incidence of toxic drug reactions, which were relatively minor in severity, occurring in the sulphathiazole group, was about half that in the sulphapyridine group.—F. G. Blake, *New Engl. J. Med.*, ii/1940, 661.

In 33 cases of pneumococcal pneumonia sulphathiazole appeared to be as fully effective a therapeutic agent as sulphapyridine.—W. W. Spink and A. E. Hansen, *J. Amer. med. Ass.*, ii/1940, 840.

From a study of 109 patients with pneumonia, 55 of whom received sulphathiazole and 54 sulphapyridine, it was concluded that sulphathiazole is as efficient as sulphapyridine.—S. C. Wagoner and W. F. Hunting, *J. Amer. med. Ass.*, i/1941, 267.

STAPHYLOCOCCAL INFECTIONS. Sulphathiazole has little or no effect when there is a positive blood culture. It may be of value in cases where the septic focus has been removed or in localised lesions such as a carbuncle or cellulitis. All deaths resulting from staphylococcal infection are due to bacteraemia and thus this new remedy is not likely appreciably to lower the high death rate. The following dosage is recommended: a minimum of 2 g. at the start and 2 g. four-hourly until an average amount of 30 g. has been given, but in severe cases 2 g. should be given two-hourly, provided a differential white count is made at the end of the second day.—C. E. B. Butler, *Proc. R. Soc. Med.*, 1940, 33, 673.

In the treatment of severe staphylococcal infections the results so far do not support the optimistic reports from America.—C. E. B. Butler, *Brit. med. J.*, i/1940, 1032.

Neither sulphamethylthiazole nor sulphapyridine given by mouth affected the course of experimental staphylococcal lesions of the skin of mice.—A. Macdonald, *Lancet*, i/1940, 1157.

STAPHYLOCOCCAL SEPTICÆMIA. 15 consecutive cases were successfully treated with sulphathiazole.—W. W. Spink and A. E. Hansen, *J. Amer. med. Ass.*, ii/1940, 840.

URINARY INFECTIONS. The two compounds sulphathiazole and sulphamethylthiazole have definite bactericidal effect on the organisms found in urinary infection when given in the usual dosage by mouth. They differ from sulphanilamide and sulphapyridine in that they kill off strains of *Str. faecalis*. *Str. faecalis* and *Staph. aureus* are killed by these drugs in lower concentration in the urine than are the gram-negative bacilli.—H. F. Helmholz, *Proc. Mayo Clin.*, i/1940, 65.

A series of 50 unselected cases treated (35 with sulphamethylthiazole and 15 with sulphathiazole). The usual dosage was 1 g. (of either drug) administered four times daily. In some 65% of the patients sterile urine was produced. In every one of five patients with *Staph. aureus* as the infecting organism the urine became sterile and remained so. Of 7 patients with *Str. faecalis* infection 3 were cured (larger doses might have given better results).—T. L. Pool and E. N. Cook, *Proc. Mayo Clin.*, i/1940, 113.

It is a useful adjunct in the treatment of urinary tract infections, especially those due to staphylococci, *B. proteus*, β -haemolytic streptococci, and *B. coli*.—W. W. Spink and A. E. Hansen, *J. Amer. med. Ass.*, ii/1940, 840.

Sulphathiazole Snuff. 19 subjects, proved to be nasal carriers of staphylococci, were treated with a snuff consisting of 10 parts by weight of sulphathiazole with 90 parts of magnesium carbonate. The snuff was taken six times a day, 1 g. lasting for three to four days, thus involving the taking of approximately 0.03 g. of sulphathiazole per day. The results were very promising; several subjects showed a great reduction in staphylococci and in some these almost disappeared. It may prove of value as a prophylactic against bacterial infections of the upper respiratory tract.—M. E. Delafield, E. Straker and W. W. C. Topley, *Brit. med. J.*, i/1941, 145.

[P1-S1-84] **Sulphamethylthiazolum.** *Syn.* SULPHAMETHIAZOLE. $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{NH}\cdot\text{C}_2\text{H}_5\cdot\text{NHS}\cdot\text{CH}_3 = 269.3$.

Dose.—15 to 30 grains (1 to 2 g.).

Sulphamethylthiazole is 2-(*p*-aminobenzenesulphonamido)-4-methylthiazole, m.p. 237°. It is used similarly to sulphathiazole, but cases of peripheral neuritis have been reported as a result of treatment with this salt.

Sulphamethylthiazole experimentally appears to be more effective against *Staph. aureus* than sulphathiazole. There is also preliminary evidence that individuals may receive these preparations without experiencing some of the toxic manifestations of sulphanilamide and sulphapyridine. One patient who had lobar pneumonia, in which there was a mixed infection and in which no definite typing could be obtained, responded to sulphamethylthiazole in exactly the same manner as patients ordinarily do following sulphapyridine treatment. The recovery was rather striking in 48 hours, and the patient was treated for five days without a single evidence of gastro-intestinal irritation, whereas she previously had vomited at the onset of her illness without administration of any drug. In addition three cases are mentioned in which *Staph. aureus* was the offending organism and in which sulphamethylthiazole was used with promising clinical results. The dosage employed in the treatment described consists of two initial doses of 2 g. at a four-hourly interval, followed by 1 g. four-hourly, the concentrations of sulphamethylthiazole in the blood being determined by means of a modification of the Marshall test for sulphanilamide.—W. E. Herrell and A. E. Brown, *Proc. Mayo Clin.*, 1939, 753.

Sulphonamide E.O.S. $\text{NH}_2\cdot\text{SO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{CH}(\text{CH}_3)\cdot\text{SO}_2\cdot\text{Na} = 302.3$.

The sodium salt of the *N*-ethylsulphonate of sulphanilamide, prepared by heating sulphanilamide with a concentrated aqueous solution of sodium acetaldehyde-bisulphite. It is very soluble in water (solutions up to 40% can be prepared), and is far less toxic than, and largely free from, the unpleasant by-effects of sulphanilamide and other derivatives. It has a desired degree of stability, but is sufficiently readily hydrolysed in the body to exert a strong bactericidal effect. This was proved in trials upon rabbits, previously converted into "carriers" of typhoid and paratyphoid organisms, and also upon albino mice infected with hæmolytic streptococci productive of septicæmia and puerperal fever. Clinical trials have been successful especially in showing a relative freedom of toxicity. For example, young children and infants have shown a high degree of tolerance for the preparation. The relative non-toxicity suggests its use in lighter ailments such as common colds and as a general safe prophylactic.—A. G. Green and M. Coplans, *Chem. & Ind.*, 1940, 793.

Sulphadiazines. Two new heterocyclic derivatives of sulphanilamide, 2-sulphanilamidopyrimidine and 2-sulphanilamido-4-methylpyrimidine, which, in preliminary mouse tests, have shown greater chemotherapeutic activity than sulphapyridine or sulphathiazole, are reported. To avoid confusion the name sulphadiazines is suggested for these compounds.—R. O. Roblin *et al.*, *J. Amer. chem. Soc.*, 1940, 2002; see also Feinstone *et al.*, *Johns Hopk. Hosp. Bull.*, 1940, 67, 427.

Diaminosulphone. $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2 = 248.3$.

Diaminosulphone is 4:4'-diaminodiphenylsulphone and occurs in long, colourless, rectangular plates, m.p. 176°. It is sparingly soluble in cold water, but more soluble in hot water.

It is active in curing streptococcal infections in mice in doses of about one-hundredth of those required with sulphanilamide, but is 25 times as toxic. The

corresponding dinitro compound (dinitro-sulphone) is not so toxic to mice as sulphanilamide, and its antistreptococcal activity in mice is not inferior to that of the latter substance.—G. A. H. Buttle, *Lancet*, i/1937, 1331.

A comparison of the therapeutic activity of sulphanilamide, sulphathiazole and diaminosulphone with the activity of sulphapyridine against pneumococcus infection in mice, on the basis of the Median Survival Blood Concentrations, gave activity ratios of 0.43, 1.21 and 6.86 respectively.—J. T. Litchfield *et al.*, *J. Pharmacol.*, 1940, 69, 166.

SULPHONAL

B.P.

Syn. SULPHONMETHANUM (*P.G. VI, P. Helv. V, etc.*), DIETHYL-SULPHONEDIMETHYLMETHANE (*Fr. Cx.*).

[P1] "*Sulphonal; alkyl sulphonals.*"

[S1] "*Sulphonal; alkyl sulphonals.*"

[S4] "*Sulphonal; alkyl sulphonals.*"

Dose.—5 to 20 grains (0.3 to 1.2 g.), in cachets or suspended with mucilage. Should be finely powdered and followed by a draught of hot fluid. Unless in solution the dose should be given 1 to 2 hours or more before sleep is desired.

In colourless crystals or powder, tasteless and odourless. *M.p.* about 126°.

Soluble about 1 in 450 of water, 1 in 15 of boiling water, 1 in 80 of alcohol 90%, freely in hot alcohol, 1 in 90 of ether, 1 in 3 of chloroform.

Antidotes. Empty stomach by emetic or stomach tube. Keep patient lying down and warm, but keep him roused. Give sodium bicarbonate in dilute solution freely. Stimulants, *e.g.*, hot strong coffee, strychnine $\frac{1}{4}$ gr., or caffeine sodium benzoate 2 gr., hypodermically. Nikethamide, 5 to 15 ml. of 25% solution, intravenously. Dextrose intravenously. Artificial respiration and inhalations of oxygen with 7% carbon dioxide if necessary. Lumbar puncture and drainage, to remove the poison which has passed into the cerebrospinal fluid, may be required.

Uses. Sulphonal is an hypnotic and is used for producing prolonged sleep in psychiatric cases and in nervous insomnia, especially when chloral is contraindicated. It is slow in taking effect, and is best given in hot milk three to four hours before retiring. The sleep produced lasts from six to eight hours and the effect of the drug may be carried over to the next day, with vertigo, lassitude, drowsiness and depression. Since it is very slowly absorbed and excreted it is cumulative, and must not be used continuously. It does not produce tolerance but it may cause a habit, symptoms of which are a general lethargy, mental, moral and muscular weakness, loss of nutrition, and dyspepsia. It may sometimes give rise to skin eruptions and to the appearance of hæmatoporphyrin in the urine. Sulphonal has only feeble analgesic properties and is of no value in insomnia due to pain.

[P1.81.84] **Methylsulphonal** (*B.P.*, *P. Ned. V*, *P.G. VI*, *F.E. VIII*).
Syn. and Prop. Name. DIETHYLSULPHONEMETHYLETHYLMETHANE,
 SULFONETHYLMETHANUM (*U.S.P. XI*), METHYLSULFONALUM (*P.*
Belg. IV, *P. Helv. V*), TRIONAL (*Bayer Products, London*).
 $(\text{CH}_3)(\text{C}_2\text{H}_5)\text{C}(\text{SO}_2\cdot\text{C}_2\text{H}_5)_2 = 242.3$.

Dose.—5 to 20 grains (0.3 to 1.2 g.), in cachets, in a large cup of hot liquid. *P. Helv. V* max. single dose 15 grains, max. during 24 hours 30 grains. *U.S.P. XI* average dose 12 grains.

An oxidation product of mercaptol made by the condensation of methylethylketone with ethylmercaptan. In crystalline scales or microcrystalline powder, m.p. about 77°.

Soluble 1 in 320 of water, 1 in 12 of alcohol 90%, and in ether.

Antidotes. Treat as for poisoning by sulphonal, p. 973.

Uses. Has a stronger hypnotic action than that of sulphonal and produces sleep in half to one hour. Methylsulphonal is more effective in sleeplessness connected with neurasthenia and organic brain disease, but is useless in insomnia due to pain, and in morphine and cocaine habits. Toxic symptoms are the same as with sulphonal, but there is less likelihood of cumulative effect.

SULPHUR

S = 32.06.

Sulphur Præcipitatum (*B.P.*, *U.S.P. XI*, *Fr. Cx.*). *Syn.* MILK OF SULPHUR.

Dose.—15 to 60 grains (1 to 4 g.), in milk or treacle, or as confection of sulphur with or without confection of senna. *U.S.P. XI* average dose 1 dr.

A soft powder free from grittiness, obtained by boiling sublimed sulphur with calcium hydroxide and water and decomposing the resulting solution with hydrochloric acid. Under a microscope it is seen to consist entirely of amorphous particles with no associated crystals. M.p. about 115°, forming a mobile liquid which darkens and becomes viscid on heating to 160°.

Soluble almost completely in carbon disulphide, also soluble in benzene, ether, chloroform, light petroleum and oil of turpentine.

Uses. Internally it has no action on the stomach but a certain proportion administered is converted into alkali sulphides in the intestines with consequent mild laxative effect. Given internally it has been employed for skin affections, occasionally benefiting chronic eczema with much itching. Externally, sulphur is commonly used to cure scabies and for acne. Sweating of the feet has been treated by drachm doses thrice daily.

GONORRHOEA. 132 cases treated with intramuscular injection of a suspension containing precipitated sulphur 1, guaiacol 5, camphor 10, eucalyptol 20, in oil of sesame to 100, the dose gradually increasing from 0.5 ml. to 4 ml. The injections are given at intervals of 4 to 6 days. A rise of temperature usually occurred in from 6 to 8 hours passing off in 12 to 24 hours. The course of the

disease was considerably shortened in most cases of epididymitis, but treatment was less successful in prostatitis.—G. Guldberg, per *Brit. med. J. Epit.*, ii/1936, 14.

Balneum Sulphuris (B.P.C.). Contains freshly precipitated sulphur obtained from 5 oz. each of sodium thiosulphate and sodium acid sulphate per 30 gallons.

Confectio Sulphuris (B.P.).

Dose.—1 to 2 drachms (4 to 8 g.).

Contains 45% of precipitated sulphur with 11% of potassium acid tartrate, tragacanth, syrup, glycerin and tincture of orange.

Lotio Sulphuris (B.P.C.).

Precipitated sulphur 30 gr. in glycerin, alcohol, rose water and solution of calcium hydroxide to 1 oz.

Lotio Sulphuris (C.X.H.).

Precipitated sulphur 20 gr., glycerin 10 m., industrial methylated spirit 15 m., lime water 2 dr., water to 1 oz.

Lotio Sulphuris Composita (C.X.H.).

Precipitated sulphur 15 gr., zinc sulphate 15 gr., sulphurated potash 15 gr., water to 1 oz.

Lot. Sulphur. Co. (N.I.F.). Precipitated sulphur 2 dr., glycerin 80 m., tincture of quillaia 30 m., industrial methylated spirit $\frac{1}{2}$ oz., solution of calcium hydroxide to 8 oz.

Trochisci Sulphuris (B.P.C.).

Dose.—1 to 6.

Contain precipitated sulphur 5 gr. and potassium acid tartrate 1 gr. For skin and rheumatic affections.

Garrod's formula is 4 grains of precipitated sulphur with 1 gr. of potassium acid tartrate.

Unguentum Sulfuris (U.S.P. XI).

• Precipitated sulphur 15, wool fat 5, yellow wax 5, white petrolatum 75.

Azudine (Lilly, London). Precipitated sulphur 10%, phenol 1%, with camphor, menthol and balsam of Peru in an ointment base.

Sulphur Sublimatum (B.P., U.S.P. XI, Fr. Cx.). *Syn.* FLOWERS OF SULPHUR.

A slightly gritty powder. Under a microscope is seen to consist chiefly of rounded amorphous particles or aggregates occasionally associated with semi-crystalline masses.

Soluble almost completely in carbon disulphide, about 1 in 4 of petrol, benzene or toluene, about 1 in 70 of chloroform, 1 in 125 of almond oil, 1 in 200 of olive oil or cotton-seed oil, 1 in 70 of sesame oil. Insoluble in water or alcohol 90%.

Uses. Is used for the same purposes as precipitated sulphur, especially in ointments for skin affections and for scabies. Dusted between the toes it destroys the fungus producing epidermophytosis. A full dose of sulphur administered at night to patients before and while undergoing mercurial treatment for syphilis prevents mercurial stomatitis. A 1 or 2% solution of sulphur in olive oil administered by intramuscular injection is used for the production of artificial pyrexia in the treatment of general paralysis of the insane, various forms of arthritis and in dementia præcox. The initial dose is 0.5 ml., and injections are given on alternate days, increasing by 0.5 ml. up to a maximum of 5 ml. The aim is to reach a temperature of 104°F. gradually. A 1% aqueous suspension is also sometimes used.

CHRONIC NON-SPECIFIC ARTHRITIS. Treatment of 50 cases by intramuscular injection of Sulfosin, starting with 0.5 ml., after which further injections are given every 5 or 6 days in steadily increasing amounts up to (usually) 4 or 5 ml. After the third dose, massage, passive movement, and some form of heat therapy found useful between injections. Results show that considerable improvement may be expected in a proportion of patients in whom the changes are limited to the soft structures about the joint and are not permanent in nature, but less improvement when damage of a permanent kind is present. Treatment should not be given during the acute phase in elderly, feeble, emaciated, nervous or very obese patients, or in patients with active organic disease other than arthritis.—D. Krestin, *Brit. med. J.*, ii/1935, 1144.

Colsul (*Crookes Laboratories, London*). 1% solution of sulphur in vegetable oil; also a 1% aqueous colloidal suspension. *Dose*.— $\frac{1}{4}$ ml. initially increased at each injection by $\frac{1}{4}$ ml. to a maximum of 5 ml. or until a sufficient degree of pyrexia is obtained (10 to 12 ml. have been used).

Sulfosin (*Leo, Copenhagen; Bencard, London*). Solution of sulphur in oil for artificial fever therapy.

[P1] **Neo-Sulfosin** (*Leo, Copenhagen; Bencard, London*). Sublimed sulphur 0.5, guaiacol 0.5, camphor 1, Anæsthesin 4, almond oil to 100. Used for the same purpose as Sulfosin.

Sulphur Lotum (*U.S.P. XI, P. Helv. V*) is sublimed sulphur washed with ammoniated water.

Sulphur Nigrum was the name formerly applied to native Sicilian sulphur. It is now applied to the residuum from the subliming pots, or to sublimed sulphur mixed with charcoal. Is used in veterinary medicine.

Unguentum Picis et Sulphuris (*L.H.*). *Syn.* WILKINSON'S OINTMENT.

Sublimed sulphur 2 dr., tar 2 dr., potash soap 4 dr., benzoinated lard 4 dr., purified talc 1 dr.

Unguentum Sulphuris (*B.P.*).

Sublimed sulphur 10% in yellow simple ointment.

Scabies is treated by sulphur ointment after washing with soft soap. Use equal parts of the *B.P.* ointment and soft paraffin.

Unguentum Sulphuris Camphoratum (*B.P.C.*).

Sulphur 2% with phenol, resorcinol, camphor and solution of coal tar in lard and white soft paraffin.

Unguentum Sulphuris Compositum (*B.P.C.*).

Sublimed sulphur 15%, tar 15% and calcium carbonate 10%, in lard and soft soap.

[P1] **Unguentum Sulphuris cum Hydrargyro** (*U.C.H.*).

Sublimed sulphur 30, sublimed mercuric sulphide 2, ammoniated mercury 2, arachis oil 12, lard 54. Useful in skin diseases.

Unguentum Sulphuris et Resorcinolis (*B.P.C.*). Sulphur 4.5% and resorcinol 3% in yellow soft paraffin.

Unguentum Sulphuris et Zinci cum Kaolino. Sulphur 4, zinc oxide 3, kaolin 1, benzoinated lard 8. For sweating of the feet.

Sulphuris Chloridum (*B.P.C.*). *Syn.* SULPHUR MONOCHLORIDE. $S_2Cl_2 = 135.0$.

A reddish-yellow mobile fuming liquid with disagreeable penetrating odour. Decomposed by water or moist air, giving sulphur and hydrochloric and sulphurous acids.

Unguentum Sulphuris Hypochloritis (*B.P.C.*).

Sublimed sulphur 12% and sulphur chloride 2%, with oil of bitter almonds (*s.A.P.*), in lard. For scabies.

ACNE ROSACEA. Sulphur hypochlorite ointment (*B.P.C.*) is a very useful ointment in this condition, but it is a very strong application and may aggravate

the irritation, especially in the dry cases. The patients usually feel uncomfortable for the first 24 hours, but after that the ointment produces astonishingly quick and marked improvement. If it is still annoying the skin after three days it should be discontinued.—S. Thomson, *Med. Pr.*, ii/1939, 471.

Sulphuris Iodidum (B.P.C.). *Syn.* SULPHUR SUBIODIDE.

A greyish-black crystalline solid containing not less than 70% of I.

Unguentum Sulphuris Iodidi (B.P.C.). Sulphur iodide 4% in glycerin and simple ointment. Used in acne rosacea, tinea and other parasitic skin diseases.

Contramine (British Drug Houses, London). Diethyl-ammonium-di-ethyl-dithio-carbamate, $\text{SNH}_2(\text{C}_2\text{H}_5)_2\text{CSN}(\text{C}_2\text{H}_5)_2$, = 222.3.

Occurs as white crystals, soluble 1 in $2\frac{1}{2}$ of water, and available in ampoules of sterile solution for intramuscular injection. It is used in the chronic complications of gonorrhoea, including stricture, chronic epididymitis, conjunctivitis and iritis, and varied forms of chronic rheumatism.

Dose.—Intramuscularly $\frac{1}{2}$ grain (0.05 g.) to 4 grains (0.25 g.) in 1 to 2 ml. of cold sterilised water or saline. Must not be heated.

The usual initial dose (intramuscularly) is 0.125 g. in 1 ml.

Contramine Pessaries are prepared for use in chronic cervicitis and endometritis. Bougies and suppositories are also made.

Local application of Contramine solution may assist healing of chronic ulcers. In cases of sinuses in muscles, closure is often obtained by intramuscular injections around the lesion.

In severe cases of metal intoxication 0.125 g. may be injected intramuscularly every day till 6 or more doses have been given. In other cases 2 injections of 0.125 g. with a week's interval usually suffice.

Mesulphen. *Syn. and Prop. Names.* DIMETHYLTHIANTHRENE, MITIGAL (*Bayer Products, London*), SUDERMO (*Burroughs Wellcome, London*).

Dimethyl-diphenylene-disulphide, a liquid compound containing 25% of sulphur. It is a yellow, odourless, neutral oil, soluble in chloroform and acetone. For the treatment of skin diseases by local application.

Colloidal Sulphur.

Colloidal sulphur solution may be prepared by the decomposition of a mixture of sodium sulphide and sodium sulphite with acid in the presence of protective colloid.

For use in rheumatic and skin affections and wherever sulphur is indicated through excessive elimination.

RHEUMATOID ARTHRITIS. From a study of the clinical data it is concluded that the administration of colloidal sulphur, whether in small or large doses, does not alter the course of rheumatoid arthritis. Evidence is cited which proves that a primary disturbance of sulphur metabolism does not exist in patients with rheumatoid arthritis.—N. R. Abrams and W. Bauer, *New Engl. J. Med.*, i/1940, 541.

Colloidal Sulphur B.R.I. (British Drug Houses, London). A colloidal sulphur complex for administration by intramuscular or intravenous injection in the treatment of arthritis.

Sarcoptol (Anglo-French Drug Co., London). Colloidal sulphur compound for local application in seborrhoea, scabies, eczema, alopecia, etc.

Sulphuretted Hydrogen Poisoning.

Encountered in industries such as artificial silk works, chemical works, sewage works, etc.; it is stated that the maximum safe concentration for 6 hours may be taken as 1 in 20,000, but to avoid eye irritation and general lowering of health, it is advisable to keep it well below this.

Antidotes. Place patient in fresh air, apply artificial respiration and keep it up steadily. Inhalations of oxygen with 7% carbon dioxide. Give stimulants carefully; coffee by rectum if patient

cannot swallow. Iodised starch (5% iodine rubbed into starch with a little water and dried) has been suggested. Inhalation of chlorine recommended.

Colloidal Selenium.

Colloidal solutions of selenium have been advocated in the treatment of inoperable cancer.

For a full description of the selenide treatment of cancer, see A. T. Todd, *Brit. J. Surg.*, 1934, 619. See also A. T. Todd, *Med. Pr.*, Oct. 21, 1936 (supplement). See also *Lead Selenium Colloid*, p. 858.

Radio-Active Selenide (*British Drug Houses, London*). *Syn. R.A.S.* A feebly radio-active preparation, made by combining certain radium residues with selenium, for use in the treatment of cancer by the Bristol Royal Infirmary methods.

Collôid Sulphur-Selenium, B.R.I. (*British Drug Houses, London*). *Syn. SSE.* A double colloid of sulphur and selenium for use in conjunction with R.A.S.

The report of an investigation by the Medical Committee of the Royal Cancer Hospital on the treatment of 70 cases of cancer between October, 1934, and August, 1935, with colloidal selenium. Of the 70 cases treated, 41 have died, 21 are still under treatment, 7 have refused further treatment, and 1 who received merely prophylactic treatment is still without evidence of recurrence. Of the 41 cases which died, in 37 the treatment appeared to have no effect whatever, and in 4 there was transient alleviation of pain. Of the 21 cases still alive, in 3 the growth appears stationary, in 2 there was temporary diminution not maintained, in 10 there was definite alleviation of pain and improvement of the general condition, and in 6 the period of observation was too short for results to be shown.—*Lancet*, i/1936, 1198.

The dosages of colloid were far too low, and chemical alteration occurred during injection; the X-ray dosage was standardised, and, with the low dosage of colloid, must have been almost inoperative. A comparison of the method described with the original should have shown such discrepancies that to call it an independent test is far from the truth.—A. T. Todd, *Lancet*, i/1936, 1262.

Colloidal Tellurium, B.R.I. (*British Drug Houses, London*). A colloidal preparation of tellurium for administration by injection in the treatment of chronic rheumatism.

SUPPOSITORIA

Suppositories are medicated masses intended for anal administration. They are usually conical at one end, the other end being flat so that the suppository is retained more easily by the sphincter muscle after insertion. It is customary to employ moulds which hold 1 g. (15 gr.) or 2 g. (30 gr.) of oil of theobroma. Unless otherwise specified, the 15-gr. size is supplied.

The bases employed for suppositories are oil of theobroma, glycerin suppository mass and occasionally freshly prepared soap, as in glycerin soap suppositories. It is essential that the melting-point of any suppository mass shall be between 30° and 35°. Oil of theobroma is usually employed unless the prescriber otherwise directs, and when the suppositories are prepared by melting and moulding, care should be taken not to overheat this base since, as with many other substances, overheating will cause a lowering of the solidifying-point and subsequent difficulty in setting. Because of this it is preferable to use powdered or shredded oil of theobroma. Certain medicaments such as phenol, chloral hydrate and resorcinol cause an appreciable lowering of the melting-point of oil of theobroma when warmed with it. In

preparing such suppositories, the melting-point may be brought back to normal by incorporating a little white wax. This addition may be avoided, except in the case of suppositories containing volatile oils, by using the minimum amount of heat.

Glycerin suppository mass has a limited use as a base because its gelatin content renders it incompatible with certain medicaments, particularly tannins. Ichthammol will occasionally form a water-insoluble mass which does not melt below body temperature. A 1 g. (15 gr.) mould will hold 1.2 g. (18 gr.) of glycerin suppository mass. If the large proportion of glycerin present in the mass is not desired, the following basis is a good substitute: Gelatin 10 g., water 40 ml.; soak, dissolve with gentle heat, add glycerin 15 g., and evaporate on a water-bath until the mass weighs 25 g.

Suppository Mass for Hot Climates.

Oil of theobroma is generally used, and it is customary to incorporate varying quantities of white wax according to the prevailing temperatures. 5 to 15% is commonly employed. Different samples of both oil of theobroma and white wax may each have different melting-points, so that variation will occur in mixtures. Using an oil of theobroma with m.p. 33-89° and white wax with m.p. 61°, the melting-points of mixtures are as follows:—

<i>White Wax.</i>		<i>Melting Point.</i>	
2½	32.6°
4.5	33.06°
10	39.44°
15	46.11°
20	50.00°

Suppositories should be sent out in partitioned boxes lined with waxed paper, and, when made with glycerin suppository mass, they should be slightly greased with oil. When they contain volatile and hygroscopic ingredients, or when intended for export to tropical climates, they should be wrapped separately in tinfoil.

In tropical countries the use of hardening agents such as beeswax is not recommended, since the transition temperature becomes too close to the temperature at which the mixture softens sufficiently to mould suppositories. In temperate climates hardening agents may be satisfactory, but for the extemporaneous dispensing of suppositories in the tropics they are useless. Hydrogenated palm kernel oil, m.p. 40° to 42°, is suitable for use as a base, and in cases where it is too soft owing to a high temperature, or where the melting-point is lowered by soluble medicaments, it may be hardened by the addition of hydrogenated soya bean oil, m.p. 56°, or beeswax. For general use in Malaya in suppositories containing no soluble medicament the addition of 5% of hardened soya bean oil is satisfactory, but if fat soluble substances are present the amount of hardening agent must be increased. It is recommended that the formulæ in the *B.P.* and *B.P.C.* should be modified, since they are of no assistance in the present form to dispensers in warm countries.—A. F. Caldwell, *Quart. J. Pharm.*, 1939, 680.

Buginaria. Bougies are medicated pencils intended for insertion into the urethra, nostrils or ears. They are prepared in the same way as suppositories but differ in shape, resembling a pointed rod.

Urethral Bougies are usually in two sizes: (a) 2 inches and weighing 15 gr., or (b) 4 inches and weighing 40 gr. If the size is not specified by the prescriber, it is usual to supply the smaller size. Metal moulds can be obtained to give these sizes.

The basis may be either gelato-glycerin or oil of theobroma. A suitable gelato-glycerin base may be prepared from the following formula:—Gelatin 32.5 g., glycerin and water of each 40 ml. Incorporate and evaporate to 100 g. Bougies made with this basis are directed to be dipped in warm water prior to insertion. When prepared with theobroma basis, bougies may be made by other methods than moulding. Thus the medicament may be incorporated in the basis by massing in a pill mortar, afterwards piping the mass on a pill machine and shaping one end with the fingers. If this method is adopted it may be advisable to incorporate about 5 to 10% of wool fat. Lubricated glass tubing of suitable diameter may be used as a bougie mould, the melted mass being sucked up into it, allowed to solidify, then pushed out with a glass rod and cut to the correct length, one end being subsequently pointed. Urethral bougies are sometimes known as *cereoli*.

Nasal Bougies are usually made with a gelato-glycerin basis. They are 1 inch long and weigh about 10 grains.

Aural Bougies are made with an oil of theobroma basis unless otherwise ordered. They are usually conical in shape, and weigh about 5 gr. Bougies for the ear are sometimes known as *aurinaria*.

Pessi. Pessaries are medicated masses intended for insertion into the vagina. They may be made with a basis of oil of theobroma or glycerin suppository mass. If the basis is not specified, it is usual to use oil of theobroma. Pessaries produce a continued action on the parts in leucorrhœa, also for ulceration and inflammation of the cervix uteri. They are usually prepared like suppositories by moulding, the mould having an oil of theobroma capacity of 8 g. (120 gr.). The shape may be convex or suppository-shaped.

To be efficient, pessaries must be inserted as far as possible whilst the patient is in the supine position with the hips raised. They are most effectual at bedtime.

Ovula (*Fr. Cx.*) are ovoid pessaries prepared with a glycerin-gelatin or oil of theobroma basis.

Pessary Mass for Hot Climates.

Mixtures of white wax and oil of theobroma are usually used (*see* suppositories, p. 979).

Tampons. Consist of plugs of non-absorbent cotton-wool, globular in shape, about $1\frac{1}{2}$ in. in diameter, and covered with gauze. They are medicated by saturating them in a solution of the medicament, the usual solvent being glycerin.

Glycerin Tampons. Saturated with glycerin. **Mild Silver Proteinate Tampons,** containing 1, 5 and 10% mild silver

proteinate in glycerin. **Ichthammol Tampons** saturated with 5, 10 or 20% ichthammol in glycerin. **Iodoform Tampons**, with 5% iodoform in glycerin.

Pontampons (*Pontampon Co., London*) consist of a semi-solid slowly-soluble medicated cone with a non-absorbent wool tampon attached, the whole encased in a soluble gelatin shell.

For the treatment of gonorrhœa, endometritis, cervicitis, vaginitis, leucorrhœa, dysmenorrhœa, prolapsus uteri. Numerous medicated products are available.

TABELLÆ

COMPRESSED TABLETS

Tablets of medicaments are usually preferable to pills, since less excipient is required and the risk of not disintegrating in the alimentary tract is lessened. They may be of several types.

(a) **Easily friable and readily disintegrated after swallowing**, for such substances as acetylsalicylic acid, phenazone, phenacetin. This type is obtained by using the minimum amount of compression and incorporating from 5 to 15% of potato starch.

(b) **Hard Tablets** which slowly disintegrate or dissolve. These are obtained by using heavy compression which produces a tablet resembling a lozenge. Substances such as potassium chlorate or bromide, and ammonium chloride are made into tablets of this type. They are intended either to be dissolved slowly in the mouth or to be dissolved in water and taken as a draught.

(c) **Solveillæ**, or solution-tablets, which are intended to be dissolved in water for external or local use. When they contain poisonous ingredients a suitable dye is often added to distinguish them.

(d) **Tablet-triturates**. These are small tablets made with the minimum of compression in special metal or vulcanite moulds and intended to be crushed to powder before use. They consist of substances such as mercury with chalk, calomel, etc., which are usually prescribed as powders.

(e) **Hypodermic Tablets**. These are very small tablets, machine-made, readily soluble in water, and used for the preparation of subcutaneous injections. They contain a basis of sterilised lactose, and are made and packed under controlled aseptic conditions.

Preparation of Tablets. Fine powders will not compress to tablets, and it is necessary to convert such material into granules. If, however, the medicament is in the form of small crystals no further preparation is necessary. Thus, such substances as potassium bromide, chlorate or permanganate, sodium chloride, heavy crystal forms of acetylsalicylic acid, phenacetin, and phenazone only require drying and passing through a No. 16 sieve and any loose powder shaking out on a No. 30 sieve. The material can then be fed directly into the machine or, if a friable tablet be required, mixed with 5 to 15% of potato starch, and then compressed.

In the preparation of granules, it is necessary to add some liquid which will damp the mass so that it will cohere in small lumps on passing through a No. 16 sieve and remain as hard granules on drying. The liquid used will vary with

the medicament. A little alcohol is suitable for material which contains alcohol-soluble constituents, for example alcoholic extracts such as the dry extracts of belladonna and hyoscyamus.

By the use of vacuum drying it is possible to produce a dry mass in a very porous condition, so that on passing through a No. 16 sieve, granules quite suitable for immediate use in the tablet machine are obtained. Dry extract of cascara may be made suitable for tablet granules in this manner. The method could probably be extended to other similar extractives.

A general excipient which will be efficient in the majority of cases is a mixture of equal parts of syrup and dilute (1 in 4) mucilage of acacia. This is thoroughly worked into the powdered medicament until sufficient is present to give coherence on passing. It is then passed through a No. 16 sieve and dried at a temperature of about 40° in a drying oven. The mass is then resieved through the No. 16 sieve and loose powder shaken out on a No. 30 sieve. It is often advisable to include a little starch in the powder before granulation in order to ensure disintegration on swallowing.

In order to prevent sticking in the machine and to give an easy flow, from 1 to 3% of finely powdered French chalk may be added to the dry granules, as a lubricant, by shaking. Other lubricants may be used. Thus for tablets intended for the preparation of aqueous solutions, boric acid may be substituted. Liquid paraffin sprayed on to the granules is also used, and an emulsion of oil of theobroma has been recommended, but the oil of theobroma goes rancid on storage.

It is important that granules shall be of even size, free from much loose powder and *thoroughly dry*. Much of the trouble in tablet making results from neglecting the latter precaution.

In using the tablet machine, whether hand or power-driven, it is advisable to keep the punches in good condition. They should be kept well polished, if possible by "buffing" them on a polishing machine. An ordinary cork spiked on to the axis of the polishing machine and used with a trace of very fine emery powder forms a very suitable "buffing" surface. This precaution will tend to prevent "capping" or the splitting off of the surface of the tablet.

Owing to the necessity of granulating, tablets are rarely the same weight as the medicament. Thus a 5-grain tablet usually weighs from 5½ to 6½ gr.

Tablets introduced into the B.P. should be standardised with regard to the amount of medicament contained, the size and final weight, and the rate of disintegration. The latter is important, particularly when tablets of potent substances are to be swallowed whole. Many types of disintegration tests have been suggested, but most of them fail in not having a definite end-point. The new method described in this paper, which depends upon a weighted wire cutting through the tablet after the latter has been softened in water, overcomes this disadvantage, the end-point being the fall of the weight. Probably the chief factors affecting the rate of disintegration of tablets are the formula used in the preparation of the granules, particularly the type of binding agent, disintegrator and lubricant, and the age of the tablets, whilst speed and degree of compression, size, shape and weight of tablet, etc., also have a considerable influence. The rate of disintegration has been investigated for a considerable range of tablets and reasons are suggested for the variations observed.—H. Berry, *Quart. J. Pharm.*, 1939, 501. See also C. L. M. Brown, *ibid.*, 589, for a further method of testing.

Tablet-triturations. The mould consists of two plates, one with perforations and another with pegs corresponding in size and position with the perforations. If the medicament has a small dose, such as calomel or strychnine hydrochloride, it is necessary to make a dilution with lactose to give bulk. The powder is then dampened with 60% alcohol to give coherence and passed into the perforations. A spatula is used to ensure complete filling of each cavity and to smooth off excess. The filled plate is superposed on the pegs and pressed down, leaving damp tablets on the latter. The tablets are then dried. In order to ascertain the capacity of the mould, a few trial tablets must be made. Moulds are made in a range of sizes ½ to 4 grains, and will prepare 50 to 250 tablets at one time.

Notes on the manufacture of tablets.—*Pharm. J.*, ii/1935, 475, 503.

Details of the preparation of some types of tablet-triturations commonly in demand are described, together with the variations observed in the properties of such triturations when the proportion and strength of alcohol, the temperature of drying and quantity and nature of the active medicament vary.—G. W. G. Smithers, *Quart. J. Pharm.*, 1939, 478.

Trochisci. Lozenges consist of sugar bases containing gum, which causes the mass to set hard on drying. The medicaments in lozenges are usually those having a local action on the throat, but in some cases, such as sulphur and bismuth lozenges, they afford a convenient method of giving the drugs. The following are the usual bases employed and the lozenges made from them.

GENERAL BASIS. This is the official basis for lozenges in the *British Pharmacopœia*, and consists of sucrose and acacia flavoured with tincture of tolu. Tannic acid, extract of krameria, krameria and cocaine, morphine, morphine and ipecacuanha.

FRUIT BASIS. A basis flavoured with black currant. Benzoic acid, compound ammonium chloride, catechu, guaiacum resin, eucalyptus.

ROSE BASIS. A basis flavoured with oil of rose. Potassium chlorate, compound bismuth.

SIMPLE BASIS. An unflavoured basis. Antacid, reduced iron, liquorice (Brompton cough lozenge), ipecacuanha, santonin.

(For composition and uses of various B.P., B.P.C., and other lozenges, see under the drug.)

THEOBROMATIS SEMEN

(with THEOBROMINE and THEOPHYLLINE)

B.P.C.

Syn. CACAO OR COCOA SEED.

The seeds of *Theobroma Cacao* (Sterculiaceæ) containing in the kernel about 1 to 3% of theobromine, a small amount of caffeine and 40 to 60% of fat. The shell contains about $\frac{1}{2}$ to 2% of theobromine. When heated and deprived of husk and membrane, these yield cocoa nibs. The nibs with most of the oil pressed out produce, when reduced to powder, cocoa for use as a beverage. Before expression of fat the seeds may be treated with an alkali, and flavouring such as vanillin may also be added.

Oleum Theobromatis (B.P., U.S.P. XI, P. Helv. V). Syn. CACAO BUTTER, COCOA BUTTER, CACAO OLEUM (P. Belg. IV).

The concrete oil of the seeds (yield about 45%). M.p. about 30° to 35°, i.e., below the temperature of the body. It is therefore much used for suppositories. For substances which lower the melting-point of the oil, and for export to hot climates, it is well to add 5 to 15% of white wax. (See Suppositoria.)

Soluble freely in ether, chloroform, benzene, carbon disulphide and light petroleum; slightly soluble in alcohol 90%.

To deodorise for cooking, heating the oil in an open pan to 188° for 5 minutes has been suggested, and, to give it the consistence of butter, adding 5 parts of cotton-seed oil to each 4 parts of cacao butter has been recommended.

Pasta Theobromatis. Syn. CHOCOLATE.

This is made by grinding the nibs into a paste, with sugar and vanilla or other flavouring added; it contains about 40 to 60% of sugar and about 28 to 38% of fat.

Postonal, a wax-like polymerisation product of ethylene oxide, is used as a substitute for cocoa butter in Germany. It melts at 60°, is soluble in 10 parts of water, and resorption of Postonal suppositories is stated to be better than the resorption of those made with cocoa butter.—per *Pharm. J.*, i/1940, 172.

Theobromina (*B.P.C.*, *P. Helv. V*, *Fr. Cx.*, *P. Ned. V*).
Syn. 3 : 7-DIMETHYLBXANTHINE, SANTHEOSE.

$C_8H_{10}(CH_3)_2O_2N_4 = 180.1$.

Dose.—5 to 10 grains (0.3 to 0.6 g.).

A white, crystalline, neutral powder with bitter taste.

Soluble 1 in 1000 of water, 1 in 115 of boiling water, 1 in 1400 of alcohol 90%; sparingly soluble in chloroform and ether; insoluble in benzene. 2% aqueous solutions may be obtained with aid of trisodium phosphate.

Uses. Theobromine is similar in action to caffeine, but has less effect on the central nervous system and a more pronounced effect on the heart and kidneys. It is used principally as a diuretic, especially for the removal of cardiac effusions, in which connection it is often prescribed in association with digitalis. It may also be used in renal or hepatic effusions, though its efficiency in these is less certain and it is contraindicated in acute nephritis, since it may cause renal irritation. It may be employed in angina pectoris; doses of 20 to 30 gr. spread over twenty-four hours are stated to lessen the frequency and severity of attacks.

Theobromine Calcium Salicylate. *Syn. and Prop. Names.* THEOCALCINE, CALCIUM-DIURETIN (*Knoll, London*; *Savory & Moore, London*), CALCOTHEOBROMINE (*Richter, London*).

Dose.—7 to 15 grains (0.5 to 1 g.).

A white powder slightly soluble in water, containing about 48% of theobromine and 11% of calcium. Prepared similarly to the sodium salt from theobromine, calcium oxide and calcium salicylate.

Uses. Similar to theobromine. For arteriosclerosis 30 grains have been given daily, and up to 75 grains daily to achieve diuretic effect. It is also stated to be a preventive of asthmatic attacks.

Raminal (*Napp, London*). Tablets containing theobromine calcium salicylate $1\frac{1}{2}$ gr., chlorophyll $\frac{1}{2}$ gr., iron phosphate $\frac{1}{2}$ gr. *Dose.*—2 tablets thrice daily. Hypertension, angina pectoris, arteriosclerosis, cardiac asthma.

[P1-81] **Vasobroman** (*Richter, London*). Tablets containing theobromine calcium salicylate 0.25 g., papaverine hydrochloride 0.01 g., bromoisovaleryl-carbamide 0.2 g. *Dose.*—1 tablet thrice daily. Arteriosclerosis and hyperpiesis.

Iod-Calcium-Diuretin (*Knoll, London*; *Savory & Moore, London*). Tablets containing $7\frac{1}{2}$ gr. of Calcium-Diuretin and $1\frac{1}{2}$ gr. of potassium iodide. *Dose.*—1 thrice daily after food; may be increased temporarily to 2 tablets thrice daily. As improvement sets in, the smaller dose should be resorted to and may be maintained for lengthy periods. In hypertonia, angina pectoris and asthma.

Iodcalcotheobromine (*Richter, London*). Theobromine calcium salicylate 0.25 g., potassium iodide 0.05 g. *Dose.*—3 tablets daily. Arteriosclerosis, hypertension, etc.

Rhodan-Calcium-Diuretin (*Knoll, London*; *Savory & Moore, London*). Tablets containing $7\frac{1}{2}$ gr. of Calcium-Diuretin and $1\frac{1}{2}$ gr. of potassium thiocyanate. *Dose.*—1 tablet thrice daily after food; 2nd and 3rd weeks, 1 tablet twice daily; 4th, 5th and 6th weeks, 1 tablet once daily. Crush in a little water or milk before swallowing. For treatment of hypertonia of climacteric or sclerotic origin, and in renal cases.

Theobromina et Sodii Acetas. *Prop. Name.* AGURIN (*Bayer Products, London*).

Dose.—10 to 15 grains (0.6 to 1 g.), up to 45 grains daily in fresh solution.

White, crystalline, hygroscopic powder consisting of a mixture of sodium acetate with the sodium derivative of theobromine.

Soluble 1 in 2 of water and about 1 in 200 of alcohol 90%.

Its action resembles that of theobromine, but it has the advantage of greater solubility and of being well tolerated by the stomach. Not to be given with acid substances, nor with sugar or gum, and in general incompatible as for theobromine and sodium salicylate. To be preserved from the air, the CO_2 of which tends to decompose it.

Theobromina et Sodii Salicylas (*B.P., U.S.P. XI, P. Helv. V, etc.*) *Prop. Name.* DIURETIN (*Knoll, London; Savory & Moore, London*).

Dose.—10 to 20 grains (0.6 to 1.2 g.). *P. Helv. V* has max. in 24 hours 90 grains approx.

A mixture of sodium theobromine ($\text{C}_7\text{H}_7\text{NaO}_3\text{N}_4$) and sodium salicylate ($\text{C}_7\text{H}_5\text{O}_3\text{Na}$) in approximately molecular proportions. It is rapidly decomposed in moist air with absorption of CO_2 and liberation of theobromine—hence less soluble in water. It must be kept in stoppered bottles.

Soluble 1 in 1 of water; insoluble in alcohol 90%, chloroform and ether.

Incompatible with ammonium salts, sodium bicarbonate and all acid salts, alkaloidal salts, free inorganic and organic acids, and aromatic spirit of ammonia.

Uses. Its actions resemble those of theobromine. It is especially valuable as a diuretic in cardiac dropsy and chronic Bright's disease. Has prolonged effect when given with digitalis. In angina pectoris it lessens the frequency of attacks.

ANGINA PECTORIS. Purine-base diuretics are of value, but little to choose between any of the theobromine preparations. To avoid tolerance over a long period, the following (or some of them) were used on alternate weeks:—Theobromine 5 gr., theobromine sodium acetate 10 gr., theobromine sodium salicylate 10 gr., theobromine calcium salicylate $7\frac{1}{2}$ to 10 gr., theophylline 2 gr., theophylline sodium acetate 4 gr., theophylline-ethylenediamine $1\frac{1}{2}$ to 3 gr. Four doses daily usually given (often best taken in the middle of a meal) for the first 4 days of each week. Will not give complete relief, but more helpful than any other drugs used.—N. C. Gilbert and J. A. Kerr, *J. Amer. med. Ass.*, i/1929, 202.

In a comparative evaluation of various theophylline and theobromine preparations in the treatment of angina pectoris, the sodium acetate derivatives were found to be the most effective preparations. Patients who did not respond to these drugs usually showed a good response to theophylline with calcium salicylate, which was the next best preparation.—M. G. Brown and J. E. F. Riseman, *J. Amer. med. Ass.*, ii/1937, 256.

Tabellæ Theobrominæ et Sodii Salicylatis (*B.P.C.*) contain $7\frac{1}{2}$ gr. (0.5 g.).

Theophyllina (*B.P. Add. I, U.S.P. XI, P. Helv. V, Fr. Cx.*)
Syn. 1:3-DIMETHYLXANTHINE. $\text{C}_8\text{H}_{10}(\text{CH}_3)_2\text{O}_2\text{N}_4 \cdot \text{H}_2\text{O} = 198.1$.

Dose.—1 to $2\frac{1}{2}$ grains (0.06 to 0.15 g.). No dose is given in *B.P. Add. I*.

White crystalline powder obtained from tea, or prepared synthetically. M.p. 269° to 272° .

Soluble 1 in 160 of water, 1 in 120 of water at 25° , 1 in 100 of alcohol 90%, 1 in 80 of alcohol 95% at 25° , 1 in 86 of chloroform. Readily soluble in alkali hydroxide solutions. Sparingly soluble in ether.

More strongly diuretic than theobromine, and also more irritant to the stomach. It has been employed intravenously in the treatment of adrenaline-resistant cases of asthma, and is claimed to give prompt and prolonged relief.

The most effective of the xanthine diuretics. Best given in two doses of 0.3 to 0.5 g. with half a glass of water at 7 and 10 a.m.—H. A. Christian, *New Engl. J. Med.*, i/1936, 419.

CORONARY ARTERY DISEASE. In the treatment of congestive failure due to disease of the coronary arteries the preparations of theophylline are amongst the most effective remedies. The action is prompt and generally evident in those cases in which it is possible to restore cardiac function, provided the work of the heart is reduced to a minimum. It is given in doses of $1\frac{1}{2}$ to 3 grains after meals and continued after the patient leaves hospital. Not all cases of coronary artery disease are benefited, but in some the improvement is dramatic.—F. M. Smith, H. W. Rathe and W. D. Paul, *Arch. intern. Med.*, 1935, 56, 1260.

Theamin (*Lilly, London*). Theophylline monoethanolamine. Capsules contain 3 grains. Also issued in ampoules for intravenous use (0.25 g. in 10 ml.) or for intramuscular use (0.5 g. in 2 ml.).

Theophyllina et Sodii Acetas (*B.P., U.S.P. XI, P. Helv. V*). *Prop. Name.* THEOCIN SODIUM ACETATE (*Bayer Products, London*).

Dose.—2 to 5 grains (0.12 to 0.3 g.) dissolved in water, 3 or 4 times daily after meals. Nausea may be prevented by small doses of menthol beforehand, e.g., $\frac{1}{10}$ gr. in 15 m. of tincture of orange.

A white, crystalline powder obtained by mixing solutions of equimolecular proportions of sodium theophylline and sodium acetate and evaporating to dryness.

Soluble 1 in about 25 of water; insoluble in alcohol 90%, ether or chloroform.

Incompatible with acids, ammonium salts and sodium bicarbonate.

Uses. A soluble compound for the administration of theophylline. It is a more potent diuretic than theobromine, but is more liable to cause gastric disturbance.

Theophyllina cum Æthylenediamina (*U.S.P. XI*). *Syn. and Prop. Name.* AMINOPHYLLINE, METAPHYLLIN, CARDOPHYLLIN (*Whiffen, London*) (formerly marketed under the German proprietary name EUPHYLLIN).

Dose.—Orally, $1\frac{1}{2}$ to 3 grains (0.1 to 0.2 g.) thrice daily; rectally, $5\frac{1}{2}$ grains (0.36 g.) as a suppository or retention enema; intramuscularly, $7\frac{1}{2}$ grains (0.48 g.) in 2 ml. $3\frac{3}{4}$ grains (0.24 g.) may be given intravenously in emergency in 10 ml. of sterile water. *U.S.P. XI* average dose $1\frac{1}{2}$ grains.

White or slightly yellowish granules with a slight ammoniacal odour and bitter taste, prepared by dissolving theophylline in ethylenediamine and evaporating to dryness. To be stored in air-tight containers.

Soluble 1 in 5 of water (at 25°); insoluble in alcohol and ether. Aqueous solutions absorb carbon dioxide readily from the air with the liberation of theophylline.

Uses. Has the properties of theophylline with the advantage of greater solubility and consequently greater rapidity of action. In addition to its use as a diuretic in cardiac and renal oedema and eclampsia, the compound is also of value in cardiac asthma, angina pectoris and Cheyne-Stokes breathing, and when given intravenously relieves the dyspnoea of cardiac failure. It promotes coagulation of the blood and has been found useful in hæmoptysis and other hæmorrhages.

ANGINA PECTORIS.^a In almost every case of paroxysmal heart pain aminophylline can be depended upon to give relief no matter how acute the attack, and even when true coronary embolism appears to be the cause.—J. F. Quigley, *Prescriber*, 1935, 205.

Studies on a group of 100 patients with angina pectoris receiving either 15 to 60 gr. daily of theobromine, or 9 to 12 gr. daily of aminophylline, showed that the xanthines exert no useful specific action on cardiac pain. The patients were unable to distinguish between the effects of a xanthine and those of a placebo of lactose.—H. Gold, N. I. Kwit and H. Otto, *J. Amer. med. Ass.*, i/1937, 2173.

ASTHMA. Aminophylline in doses of 0.48 g. diluted to 10 ml. with saline or glucose solution, and introduced slowly intravenously, seems to be a most effective, prompt, safe and reliable therapeutic procedure for the combating of status asthmaticus even after refractoriness to adrenaline has developed. Of 41 injections given in 16 clinical cases 31 afforded prompt, complete and persistent relief.—G. Herrmann and M. B. Aynesworth, *J. Lab. clin. Med.*, 1937, 23, 135.

Successful results obtained by intravenous injections in adrenaline-resistant asthmatics. The contents of a 10 ml. ampoule, containing 0.24 g. of aminophylline are injected very slowly in cases in which repeated doses of adrenaline fail to relieve the attack within a few hours.—C. Hyman, *Med. Rec.*, 1939, 150, 279.

CARDIAC FAILURE. It has been definitely shown that theophylline with ethylenediamine, given intravenously in doses of 0.48 g. in 30 ml. of normal saline, has a favourable influence on the dyspnoea of cardiac failure, and on bronchial obstruction both in bronchial asthma and cardiac failure.—J. A. Greene *et al.*, *J. Amer. med. Ass.*, ii/1937, 1712.

CHEYNE-STOKES BREATHING. Euphyllin has a striking action in abolishing Cheyne-Stokes breathing, whereas theophylline alone has no effect. The effect of Euphyllin is due mainly to its ethylenediamine component, but Euphyllin may sometimes act when ethylenediamine fails. The effect is produced by a direct stimulation of the medullary respiratory centres and it occurs in the absence of any demonstrable changes in the circulation.—O. A. S. Marais and J. McMichael, *Lancet*, ii/1937, 437.

Carena (Continental Laboratories, London). Tablets containing 0.1 g. of aminophyllin.

Glucophyllin (Richter, London). Theophylline 2% in 5 ml. of 10% glucose solution. *Dose.*—5 ml. intravenously daily. Arteriosclerosis, cardiac decompensation, and pneumonia.

Glucophylline (Abbott Laboratories, London). Tablets containing theophylline 1.18 gr. and methyl glucamine 1.16 gr. Coronary dilator and diuretic for use in coronary disease and cardiac decompensation.

In both anaesthetised dogs and normal human beings Glucophylline acted as a good diuretic, exhibiting an action superior to caffeine but similar to the other salts of theophylline. It has a longer duration of action than aminophylline.—A. H. Maloney, A. F. Burton and J. W. L. Robinson, *J. Lab. clin. Med.*, 1937, 22, 600.

Bassia (B.P.C.). *Syn.* MOWRAH, MOWRA, ILLIPE.

The seeds of *B. latifolia* and *B. butyracea*, containing 50 to 55% of a semi-solid pale yellow fixed oil with unpleasant taste and odour. When bleached by light and air the product is mowrah butter (illipe butter), used as food in India and for the manufacture of chocolate. The powdered cane remaining

after expression of oil is mowrah meal. It contains the poisonous saponin, mowrin, and is used as a worm-killer for lawns (4 oz. per sq. yard). The hardened fat is used in margarine manufacture.

THYMOL

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., P. Belg. IV, P. Ital. V.

Syn. ACIDO TIMICO (F.E. VIII), 3-METHYL-6-ISOPROPYLPHENOL.

Dose.— $\frac{1}{2}$ to 2 grains (0.03 to 0.12 g.), in pills with soap and a trace of alcohol, or in oily or aqueous solution. *Anthelmintic dose.*—15 to 30 grains (1 to 2 g.). U.S.P. XI states 30 gr. divided into 3 doses. F.E. states maximum in 6 hours 1 to 2 g. It is best given finely powdered and mixed with sodium bicarbonate or lactose to prevent agglomeration of the particles.

Occurs in colourless crystals with characteristic pungent odour and taste. Prepared synthetically from piperitone obtained from the oil of *Eucalyptus dives* or extracted from oils of thyme, *Monarda punctata*, or ajowan, *Trachyspermum Ammi*.

Oil of thyme contains 20 to 30% of thymol, *Monarda punctata* oil contains about 60%, and ajowan oil 45 to 55%.

Soluble 1 in 1500 of water, 1 in 200 of glycerin, 1 in 8 of alcohol and glycerin, equal parts; soluble in fats and oils, and 8 in 3 of alcohol 90%, and freely soluble in ether, acetic acid and caustic alkalis. Liquefies with menthol, chloral hydrate, camphor and phenol.

Uses. Thymol is a more powerful antiseptic than phenol, but the local effects and the toxicity are relatively slight because of its low solubility and slow absorption. Large doses internally irritate the mucosa of the stomach and small intestine and after absorption produce tinnitus, headache, vomiting and collapse.

Almost its only use internally is in the treatment of ankylostomiasis. For this purpose it is customary to give the drug in two divided doses of 30 gr. each. The preparation of the patient is important and the following procedure is recommended. The patient is given a light meal and a saline purgative the night before. At 8.30 the following morning 30 gr. of powdered thymol is given in capsules; at 10 a.m. another similar dose is given, and at 12 a saline purgative. No food or alcohol is permitted until the bowels have moved. The treatment may be repeated in a week if necessary. In pregnant women, or cases of very bad infection, and in elderly patients, or those with heart disease or extreme debility, the dose is 30 gr. or less in divided doses. For children the doses are proportionately less. Thymol is also stated to have given good results, in similar dosage, in actinomycosis.

Externally, thymol is a powerful parasiticide and is used as a paint or ointment in the treatment of ringworm, eczema and other skin diseases. A 5% alcoholic solution has been used in place of tincture of iodine for sterilising the skin prior to operation.

A 1 in 2000 solution makes a pleasant and efficient antiseptic gargle or mouth-wash, and may also be used for spraying the nasal mucous membrane in catarrhal conditions.

ACTINOMYCOSIS. Thymol used with excellent results. The method consists in giving orally 1·5 g. of powdered thymol in capsules two days out of three; all sinuses are opened widely and curetted and filled with thymol in olive oil (10% solution). The sinuses are injected each day until they heal from the bottom.—Joyce, per *Med. Pr.*, 1935, 213.

ANKYLOSTOMIASIS. The dangers of thymol are overrated, but untoward effects in patients with chronic disease of the intestine and in oedematous patients. Most effective on hookworms, but usually fails to remove heads of tapeworms.—R. N. Chopra and A. C. Chandler, *Anthelmintics and Their Uses* (Ballière, Tindall & Cox, 1928).

Thymol was in greatest use when prolonged examination aimed at, and must often have succeeded in disclosing, deworming. For successful use it must be particulated. Thymol crystals readily set into a solid mass, so that when packed into a digestible capsule its shape may still be recognised in the bare lump of wasted thymol passed in the faeces. Two courses, each of 60 gr. of "finely particulated" thymol, will effect deworming in about 50% of adults. Moreover, such deworming is safe in those not already moribund or nearly so. Howard (1919) pointed out how persistently it was stated that 60-grain adult doses of thymol were dangerous, but there had actually been given over a million such doses in the United States with no death. Actually, thymol is as safe as it is because, like alcohol, it is apt to produce early symptoms of intoxication, and the intoxicating dose is far removed from that which kills. Methods of drug appraisal of the treatment of hookworm seem to leave thymol in the first place when safety and efficiency are both considered.—C. Lane, *Lancet*, i/1935, 1461.

Gargarisma Antisepticum (Mid. H.).

Boric acid 6 gr., thymol $\frac{1}{2}$ gr., oil of eucalyptus $\frac{1}{2}$ m., oil of peppermint $\frac{1}{2}$ m., glycerin 24 m., fuchsine q.s., water to 1 oz. A useful general gargle.

Glycerinum Thymolis Compositum (B.P.C.).

Syn. GLYCERINUM THYMOL ALKALINUM.

A solution containing sodium bicarbonate, borax, sodium salicylate, menthol and thymol with other aromatic antiseptics.

Moulds and bacteria will grow in this preparation even when undiluted. The germicidal powers of the dilutions usually employed must be negligible.—F. J. Bolton and R. W. Richardson, *Pharm. J.*, i/1936, 117.

Hartman's Solution. Thymol 1½ parts, ethyl alcohol 1 part, ether 2 parts (all by weight). Applied on a pledget of cotton-wool directly to the dentine it desensitises the pulp for from 20 minutes to an hour, thus allowing of the preparation of the cavity for filling.—per *J. Amer. pharm. Ass.*, 1936, 80.

Liquor Thymolis Compositum (B.P.C.).

Syn. LIQUOR ANTISEPTICUS.

Contains boric and benzoic acids, thymol and eucalyptol with other aromatic antiseptics.

N.B. Distinguish from *Liquor Antisepticus (N.I.F.)*, see page 468.

Mistura-Oleo-Balsamica. *Syn.* BALSAMUM VITÆ HOFFMANNI, "TINCTURE OF LIFE." *Dose.*—1 to 4 drachms in water.

Oils of lavender, thyme, lemon, nutmeg and orange-flowers, of each 4; oil of clove and cinnamon of each 3½; balsam of Peru 10½; alcohol 90% to 1000; allow to stand a few days, then filter.

A remedy for snake bites. A carminative stimulant.

Pigmentum Thymolis.

Thymol 1, ether 10, and alcohol 90% 5; used as pigment in ringworm of the scalp—whilst acting as parasiticide it dissolves the fat, loosens the hairs and thus helps epilation. 2½ to 5% in a mixture of chloroform and olive oil is also used.

Sapo Thymol (St. G. H.).

Thymol 5 gr., soft soap $\frac{1}{2}$ oz., alcohol 90% to 1 oz.

Volckmann's Thymol Solution.

Thymol 1, alcohol 90% 20, glycerin 20. Dissolve and add to water 00. Used as a spray and antiseptic lotion, e.g., for burns.

Unguentum Thymolis.

Thymol 20 gr., soft paraffin to 1 oz. Dissolved by heat. Used in the later stages of eczema and for other skin affections. Applied half strength to the skin keeps off gnats, etc.

Vapor Thymol (T. H.).

Thymol 6 gr., alcohol 90% 1 dr., light magnesium carbonate 3 gr., water to 1 oz. A teaspoonful to a pint of water at 140°F. for inhalation. A strong stimulant.

Angicid (Richter, London). Mouthwash tablets containing thymol, menthol, caryophyllum and peppermint oil.

Borol (Parke, Davis, London). Borate, bicarbonate and benzoate of sodium with eucalyptol, menthol, oil of pine, etc. For use as a gargle, mouthwash and spray, or for vaginal injection.

Eubrol (Parke, Davis, London). Euthymol and fluid extract of red gum. Mouthwash.

Euthymol (Parke, Davis, London). Eucalyptol, oil of wintergreen, menthol, thymol, benzoic acid and boric acid. Liquid mouthwash, gargle, etc.

Glycothymoline Brand Solution (Kress & Owen, New York; Christy, London). "Borax 2.010, thymol 0.037, orcelli 0.123, menthol 0.037, benzol hydrate 1.68, Ol. Betule Lentæ 0.030, Sod. acid carb. 2.346, S.V.R. 4.085, glycerin 16.749, cajuputol 0.075, distilled water 72.708, Hyd. Oxybenz. 0.074, Ol. Pumi Ess. 0.037."

Thymaglycine (Martindale, London). Antiseptic solution containing sodium benzoate, glycerin, menthol, essential oils, and thymol. As such, or diluted, is beneficial in rhinitis, pharyngitis, quinsy, and in gastric and intestinal catarrh. *Dose*.—10 to 30 minims (0.6 to 2 ml.).

Zymocide (Reed & Carmick, New Jersey; Coates & Cooper, London). Antiseptic germicide containing thymol, eucalyptol, menthol, methyl salicylate, boric and benzoic acids. For use as a spray, gargle and mouthwash and for local application.

Thymolis Iodidum (B.P.C., U.S.P. XI).

Syn. and Prop. Name. DITHYMOL DIODIDE, ARISTOL (Bayer Products, London). $(C_6H_2(CH_3)(C_3H_7)OI)_2 = 550.0$.

Reddish-brown or brick-red powder with slight aromatic odour; almost tasteless. Contains not less than 40% of I.

Insoluble in water, alcohol, glycerin, sodium hydroxide solution; soluble almost completely 1 in 10 of ether, also 1 in 50 of chloroform and in collodion, soft paraffin and fixed and volatile oils.

Incompatible with alkalis, mercuric chloride, metallic oxides or anything decomposing iodides.

Uses. Thymol iodide is used as an iodoform substitute, since it has the advantage of being practically odourless. It has, however, only weak antiseptic properties and does not liberate iodine in the tissues, and it cannot therefore replace iodoform in surgery. It is employed as a dusting powder for burns or wounds, as an ointment (2 to 10%) in psoriasis, eczema, etc., and as a 3% ointment made with soft paraffin for use in oœna.

Thymi Herba (B.P.C., P. Helv. V, Fr. Cx.).

The dried flowering tops of thyme, *Thymus vulgaris* (Labiatae).

Elixir Thymi (B.P.C.).

Dose.—1 to 2 drachms (4 to 8 ml.).

Contains ammonium bromide 2 gr. and liquid extract of thyme $7\frac{1}{2}$ m. per dr. with spirit of chloroform, glycerin, treacle and syrup. For whooping cough.

Extractum Thymi Liquidum (B.P.C.). *Syn.* EXTRACTUM THYMI VULGARIS LIQUIDUM. *Dose.*—10 to 60 minims (0.6 to 4 ml.). 1 in 1.

Syrupus Thymi.

Liquid extract of thyme 1, syrup 7. *Dose.*—1 to 4 drachms (4 to 16 ml.).

Oleum Thymi (B.P.C.).

Dose.—1 to 5 minims (0.06 to 0.3 ml.).

Distilled from the fresh herb. A dark reddish-brown liquid containing not less than 40% of phenols (thymol and carvacrol). Used in whooping cough and bronchitis, and externally as a rubefacient.

"Red" thyme oil on rectifying is converted into white thyme oil, which contains 20 to 30% of phenols. Spanish thyme oil is probably derived from a species of *Origanum*.

Oleum Ajowan (B.P.C.). *Syn.* PTYCHOTIS OIL. *Dose.*— $\frac{1}{2}$ to 3 minims (0.03 to 0.2 ml.). The oil distilled from the fruits of *Trachyspermum Ammi*, containing not less than 40% of thymol. Used in India as a carminative.

Oleum Majoranae, from *Origanum majorana*, contains practically no phenols.

Oleum Origani, from *O. hirtum* and *O. majoranoides*, may contain up to 85% of carvacrol.

Karvol (Crookes Laboratories, London). A mouthwash and gargle containing chlor-carvacrol as a basis. Also prepared as a dental cream, inhalant, liniment, insect-bite lotion, etc.

THYROIDEUM

B.P., U.S.P. XI, Fr. Cx., etc.

Syn. THYROIDEUM SICCUM, DRY THYROID, THYROID EXTRACT, THYROID GLAND, THYROIDINE (P. Belg. IV).

[P1] "*Thyroid gland, the active principles of; their salts.*"

[S6] "*Thyroid gland, the active principles of; their salts—specify proportion as either*

(a) *the proportion of thyroid gland contained in the preparation;*
or

(b) *the amount of thyroid gland from which a specified quantity of the preparation was obtained together with an indication whether the amount relates to fresh or to dried gland.*"

[S7] *Medicines made up ready for the internal treatment of human ailments containing—Thyroid gland, the active principles of; their salts—must be labelled with the words "Caution. It is dangerous to take this preparation except under medical supervision."*

Dose.— $\frac{1}{2}$ to 5 grains (0.03 to 0.3 g.).

For methods of assay and notes on iodine content see Vol. II.

In view of the increasing demand for 5-grain tablets of thyroid extract, it should be realised that the *B.P.* preparation "Thyroideum," is five times as strong as the fresh gland preparation. Complaints from doctors and chemists of untoward effects following the use of 5-grain thyroid tablets showed on enquiry that fresh gland was intended to be used. Unless fresh gland is specifically asked for there is almost a certainty of the stronger extract being supplied.—*Brit. med. J.*, i/1934, 1039.

Obtained from the thyroid glands of ox, sheep and pig. After removal of connective tissues and external fat the glands are dried below 60°, powdered, and fat extracted by light petroleum. The product is diluted with lactose to contain 0.09 to 0.11% of iodine in combination as thyroxine.

The thyroid gland is situated in the neck and consists of two lobes, one on each side of the upper part of the trachea and larynx, joined by an isthmus. In man the gland weighs about 25 grammes and the average length of each lobe is 2 inches. It is larger in the female than in the male. One lobe ($\frac{1}{2}$ gland) of the sheep's thyroid weighs on an average about 35 grains and yields about 9 grains of dry thyroid. Histologically the thyroid has an external capsule of dense connective tissue which sends trabeculae into the interior, dividing it into irregular lobules. The lobules consist of groups of closed oval or spherical vesicles connected by areolar tissue and lined by a single layer of columnar epithelium. The vesicles contain a yellow viscid fluid called colloid.

The gland normally contains about 10 or 15 mg. of iodine. Four iodine-containing compounds may be obtained from the gland—thyroxine, diiodotyrosine, diiodothyronine and iodothyroglobulin. (Diiodotyrosine has been used in the treatment of hyperthyroidism, but its effects would appear to be no different from those of iodine in other forms. Diiodothyronine has been used in myxœdema, the effect of 50 mg. of the disodium salt being equivalent to that of 1 mg. of thyroxine). Opinion is changing to the view that total iodine is a better guide to activity than thyroxine iodine.

The active substance liberated into the blood stream is not thyroxine. It may possibly be a peptide containing thyroxine and diiodotyrosine linked together directly or through other amino-acids. On this theory, artificial breakdown of thyroglobulin ruptures the linkage leaving residual activity in the thyroxine fraction only, whereas natural breakdown, which constitutes the normal release of active secretion, consists in the liberation of the intact peptide containing both thyroxine and diiodotyrosine.—C. R. Harington, *Brit. med. J.*, ii/1936, 1271.

Physiology. The principal function of the thyroid gland is to increase oxidation processes in the body; thus all body activities are influenced by the state of the thyroid. Deficiency of thyroid secretion results in a fall in heat production—*i.e.*, decrease in the rate of metabolism and general loss of mental and physical vigour. The pulse is slower, the skin becomes dry and thickened in the subcutaneous layers. Congenital thyroid deficiency leads to the condition of cretinism, characterised by poor mental and physical development. Deficiency in the adult results in the condition termed myxœdema. Excess of thyroid secretion increases the basal metabolic rate, body tissues are burned up with the result that the individual becomes thin. Mental activity is increased and the rate of the heart beat is quickened.

The functioning of the thyroid gland is intimately related to the amount of iodine in the diet—deficiency of iodine leads to enlargement of the thyroid, as seen in endemic goitre. Diets rich in protein and fats increase the rate of discharge of thyroxine from the gland and lead to enlargement. Rickets-producing diets (*i.e.*, diets low in phosphorus and high in calcium or *vice versa*) cause thyroid enlargements in dogs and cats if the iodine intake is low.

The activity of the thyroid gland is influenced by the action of other endocrine glands in the body. The anterior lobe of the pituitary gland contains a thyroid-stimulating or thyrotropic substance which can be extracted by aqueous alkali. Removal of the thyroid gland from animals leads to enlargement of the anterior

pituitary. Persons with large parenchymatous goitres have enlarged anterior pituitaries. The thyroid and pituitary glands are delicately balanced. Any deficiency in the thyroid secretion quickly stimulates the pituitary, either directly or by way of a nervous mechanism, to produce more thyrotropic hormone. Conversely, supplying the thyroid hormone reduces anterior pituitary activity.

Enlargement of the thyroid occurs during menstruation and pregnancy; this fact, together with the frequency of goitre at puberty and the menopause, suggests a relationship of thyroid function with that of the gonads. Removal of the gonads from animals results in a depression of thyroid function. Administration of thyroid has an inhibitory effect on oestrus. Contradictory results on thyroid activity have been reported from the administration of oestrin; some workers report increased thyroid activity, others the opposite effect. The influence of the thyroid on the gonads is probably exerted through the medium of the anterior pituitary.—D. Marine, *J. Amer. med. Ass.*, i/1935, 2253.

Tests for Thyroid Activity

BASAL METABOLIC RATE (B.M.R.) means the rate of energy exchange in the body as seen under basal conditions (after elimination of movement, digestion, etc.). A relatively simple way of determination (as described by Benedict, *J. Amer. med. Ass.*, ii/1921, 247; and Krogh, *Brit. Ass. Rep.*, 1921, 445) is to measure the oxygen consumption of the patient during a given period. Oxygen is rebreathed in a closed-circuit apparatus in which the exhaled CO_2 is absorbed; the diminution in volume of the gas indicates the amount of oxygen consumed. The B.M.R. does not vary as much as 10%. In hyperthyroidism it rises to 25 or 50% above normal, or even more; while in deficiency the rate falls below normal.

Determination and interpretation.—H. F. Moore, *Lancet*, i/1925, 219. See also J. D. Robertson, *Practitioner*, ii/1935, 780.

There is a steady increase in the rate during infancy from the low values of approximately 25 calories an hour per square metre of body surface obtained on new-born infants to a maximum value somewhat greater than 50 calories an hour per square metre at an age of between 3 and 5 years. Thereafter a gradual decrease in basal metabolism occurs during childhood, middle age and old age.—*J. Amer. med. Ass.*, ii/1936, 357.

Goetsch's Adrenaline Test depends upon the fact that the sympathetic nervous system in cases of hyperthyroidism is specially sensitive to adrenaline. Blood pressure, pulse rate and respiration rate are recorded at intervals after the subcutaneous injection of 0.5 ml. of adrenaline chloride solution. A rise of blood pressure, with an increased pulse and respiration rate, is considered diagnostic of hyperthyroidism.

THE "IMPEDANCE ANGLE" as a test for the diagnosis of diseases of the thyroid gland. In constant-current work the impedance of the body (i.e., resistance due to self-induction) is measured by a single factor, namely, the resistance; but with alternating currents the body functions as a condenser as well. It is the ratio of these two factors, termed the impedance angle (I.A.), which shows variations in disease of the thyroid. The author describes a comparatively simple apparatus which gives direct readings of this value. The patient, seated in a chair, has each arm immersed in a 10-litre bath of 1% saline at 25°. Alternating current of low intensity is passed through the patient into a simple bridge circuit. The impedance offered by the body is balanced on the bridge by adjusting a variable resistance and condenser. The impedance angle is increased in thyrotoxicosis; in non-toxic goitres it is generally lower than normal. This test is claimed to be more specific and certain than B.M.R. determination.—M. A. B. Brazier, *Lancet*, ii/1933, 742. See also *J. Instn. elect. Engrs.*, 1933, 203.

Estimation of blood cholesterol as a guide to thyroid therapy. Creatinuria occurs before any change in B.M.R. is noted, and is a delicate index of the effect of thyroid treatment.—J. E. Hess, *Ann. Int. Med.*, 1934 (Nov.), 607. Also Gilligan, *ibid.*, 1934, (Nov.), 84, 746.

Iodine tolerance test of value in diagnosis of a typical hypothyroidism.—A. W. Elmer, *Endocrinology*, 1934, 487.

Quinine Test. From a series of more than 4000 cases it appears that the quinine test for thyrotoxicæmia is a dependable guide in diagnosis, the frequency of error not exceeding 5%. The tolerance for quinine in hyperthyroidism appears to vary in direct proportion with the height of the basal metabolism rate, and is fairly parallel with it, serving as a guide to progress under treatment. Depending on the severity of active hyperthyroidism, patients are able to take 30 grains or more of quinine sulphate or hydrobromide daily for weeks without evidence of cinchonism. It is as dependable as the basal metabolic rate and as accurate a guide in treatment. It does not discriminate between toxic adenoma and exophthalmic goitre.—*J. Lab. clin. Med.*, 1935, 21, 123.

Toxic Effects. Over-doses of thyroid preparations may cause rapid pulse, "racing" of the heart, feverishness, headache, pruritus, and even delirium. Chronic thyroid poisoning has also been observed—the symptoms being emaciation, muscular weakness, loss of hair, dilated pupils and general debility.

Very rarely the administration of thyroid extract for the treatment of myxœdema, the relief of obesity, or some other purpose, is followed by the development of exophthalmos, and an example of this is reported. It is probable, therefore, that when exophthalmos follows the administration of thyroid extract, this is not a direct result of the action of the thyroid extract, but is due to some other substance which in certain rare individuals is produced in response to thyroid extract. Experimental evidence suggests that the substance may be the thyrotropic hormone of the pituitary.—W. Russell Brain, *Lancet*, i/1936, 186.

Thyroid Addiction. Details of three cases of thyroid addiction. The symptoms of excessive intake were loss of weight, fall in blood pressure, excitement and other indications of thyrotoxicosis. Keogh points out that the administration of thyroid hormone in sufficiently large amounts leads to a thyrotoxic condition resembling in many ways exophthalmic goitre.—S. W. Patterson, *Brit. med. J.*, ii/1934, 6.

Uses. Thyroid exerts a powerful effect on metabolism. Administered by the mouth, it increases energy, improves the appetite and brightens the mental outlook. The most striking results of thyroid treatment are in cretinism and myxœdema, doses of 1½ to 2 gr. daily being sufficient to produce dramatic improvement, though it is necessary in most cases for the patient to continue taking thyroid for the rest of his life. Owing to its marked action in stimulating the general metabolism thyroid treatment is often strikingly effective in obesity, especially in that developing at the menopause, but the results are not permanent and great care must be taken to avoid overdosage. Apart from its specific indications, thyroid is widely prescribed as a general tonic in neurasthenia, convalescence and fatigue; for this purpose it should be prescribed in doses of ½ gr. twice daily for a period not exceeding a fortnight at a time. Thyroid is also beneficial in young children who are making little physical and mental progress, and in women between the ages of 18 and 35 who appear to be suffering from a minor degree of thyroid deficiency, as evidenced by loss of appetite, loss of energy and amenorrhœa. It is also of value in dysfunctional menstrual disorders, especially when associated with a low metabolic rate.

Thyroid medication has been employed as a non-specific metabolic stimulant in numerous conditions, such as arthritis, psoriasis, senile eczema, indolent ulcers, etc., but the results are too inconstant for the treatment to be of appreciable value.

Following large doses there is increased excretion of water by the kidneys, and beneficial results may sometimes be obtained from its use in nephrosis.

CRETINISM. As soon as cretinism is recognised or even suspected treatment should be started. Thyroid should be given in very small doses at first and increased rapidly, if it is well tolerated. It is best to begin with $\frac{1}{8}$ gr. twice daily, and after three days give it three times a day. Then the dose is increased every week until $\frac{1}{2}$ gr. is given three times daily. Improvement is rapid and should be very obvious in three or four weeks. The optimum dose varies. There should be a steady gain in weight, regular action of the bowels, and no disturbance in general health. Loss of weight and diarrhoea are the two most useful indications of overdosage. Occasionally a baby is very intolerant even of the smallest dose, and with every increase much loss of weight, diarrhoea and general disturbance of health take place. In such cases it is necessary to proceed with extreme caution, allowing the child time to recover the lost weight and add a little more before any further increase in the dose is made. Thyroid must be administered without intermission and as soon as a child is old enough to co-operate it is useful to have an estimation of the basal metabolic rate. In general the earlier treatment is begun the better the outlook, and it is for this reason that early diagnosis is so important. It is true that so long as treatment has been started in the first year or two the physical signs of cretinism disappear entirely, but the effect on the mental development is much less satisfactory. Even in babies who have had an adequate dose of thyroid from the second or third month onwards the result is sometimes most disappointing and the intelligence may be subnormal or even abnormal. The majority always remain a little below the average in mentality, but some respond so well that they become indistinguishable either mentally or physically from normal people of their own age. Even in the case of cretins treated for the first time between the ages of one and three years the response is sometimes unexpectedly good. If, however, the treatment is not instituted until the later years of childhood neither the appearance nor the mentality ever becomes normal, though the improvement in looks and height may be considerable.—E. A. Cockayne, *Practitioner*, ii/1935, 767.

MENSTRUAL DISORDERS. Desiccated thyroid extract is a most effective weapon in the treatment of dysfunctional menstrual disorders. Acting as a specific agent, thyroid extract promptly alleviates the menorrhagia of hypothyroidism which is often the cause of hæmorrhages in adolescent girls. It is also of value when employed empirically as a non-specific adjunct in therapy, because of its augmentation of all cellular activity. The toxicity of overdosage may be avoided by observing two principles: (a) The initial dose should be small ($\frac{1}{2}$ gr. thrice daily) irrespective of the B.M.R. The amount administered should be increased rapidly to the point of tolerance, and the maintenance dose continued at a slightly lower level. (b) Accurate dosage should be ensured by always employing the same brand of extract.—S. L. Israel, *Endocrinology*, Feb. 1938, 253.

MYXEDEMA. In fully developed cases an initial dose of 1 gr. may be increased to 2 or 3 gr. and continued until the symptoms have disappeared. Then a maintenance dose of 1, $1\frac{1}{2}$, or 2 gr. daily is all that will be required during the second stage to keep the patient free from symptoms of hypothyroidism for the rest of his life. The dose should be reduced in hot weather and during the course of an acute febrile disease.—G. R. Murray, *Practitioner*, i/1938, 2.

ULCERS in the leg quickly healed under thyroid treatment (2 gr. t.i.d.) in a few weeks although they had not changed under other treatment for six years.—M. H. Cohen, *J. Amer. med. Ass.*, i/1934, 283.

[P1-87] **Soluté Injectable de Glande Thyroïde (Fr. Cx.).** It contains in 100 ml. the active principles equivalent to 10 g. of fresh thyroid.

[P1-87] **Tab. Mixed Gland (Male) (D.T.F.).** Pituitary (whole gland), supra-renal, didymin, thymus and thyroid glands, of each $\frac{1}{8}$ gr. per tablet. [P1-87] **Tab. Mixed Gland (Female) (D.T.F.)** are similar but contain mammary and ovarian glands, of each $\frac{1}{8}$ gr., in place of didymin.

SOME PROPRIETARY THYROID PREPARATIONS

[P1-87] **Anobese (Paines & Byrne, London).** Thyroid, anterior pituitary, thymus, ovary (or testes), and lymphatic substance. Capsules or ampoules ("M" or "F"). *Dose.*—3 to 6 capsules daily with 2 or more injections weekly. Obesity of the "water-logged" type.

[P1-87] **Cavolysin** (*Cavendish Chemical Co., London*). Contains thyroid, anterior pituitary, thymus and testicular substance; for women, the testicular substance is replaced by ovarian. Supplied in tablets and in ampoules for intramuscular injection. For obesity.

[P1-87] **Elityran** (*Bayer Products, London*). Biologically standardised thyroid extract tablets ($\frac{1}{2}$ gr. = 10 guinea-pig units) and ampoules (8 g.p. units). *Dose*.—1 or 2 tablets thrice daily, or 0.5 ml. intramuscularly daily, increased to 2 ml. Obesity, thyroid insufficiency, etc.

Production of Elityran outlined. Two iodine-containing protein fractions are separated from the thyroprotein by precipitation with saturated ammonium sulphate solution and dialysed.—*Endocrinology*, 1933, 13, 250.

[P1-87] **Endothylin** (*Endocrines-Spicer, Watford*). Each tablet contains $\frac{1}{2}$ gr. of desiccated thyroid with magnesium phosphate, calcium phosphate (dibasic) and glycerophosphate, and potassium and sodium bicarbonates.

[P1-87] **Glandiposan** (*Richter, London*). Tablets of thyroid B.P. $\frac{1}{2}$ gr. and anterior pituitary $\frac{1}{2}$ gr. *Dose*.—1 tablet thrice daily. For obesity.

[P1-87] **Glandiposan Forte** tablets contain thyroid 3 gr. and anterior pituitary $\frac{1}{2}$ gr. *Dose*.—1 thrice daily.

[P1-87] **Hormonigen Tablets** (*Hewlett, London*). Contain thyroid, pituitary, ovary and testis. *Dose*.—1 or 2 tablets before meals. In neurasthenia and for pluriglandular therapy.

[P1-87] **Hormotone** (*G. W. Carnrick, Newark, N.J.; Brooks & Warburton, London*). A combination of hormones derived from the thyroid, pituitary, gonad and suprarenal glands. Each tablet contains $\frac{1}{2}$ gr. of desiccated thyroid and pituitary. *Dose*.—One or two tablets thrice daily before meals; not more than six per day. Stated to increase mental, nerve, and muscular activity. Also available without post-pituitary.

[P1-87] **Incretone** (*G. W. Carnrick, Newark, N.J.; Brooks & Warburton, London*). Contains thyroid, pituitary and gonads. *Dose*.—1 to 2 teaspoonfuls before meals. For use in asthenia, general debility, etc.

[P1-87] **Iodobesin** (*Anglo-French Drug Co., London*). Tablets containing hepatic, pituitary, orchitic, ovarian, thyroid (deprived of lipoids), and suprarenal extracts, and Iodalbumin. For obesity.

[P1-87] **Neolydin Tablets** (*Endocrines-Spicer, Watford*). Each tablet contains whole adrenal gland $\frac{1}{2}$ gr., Endothylin $\frac{1}{2}$ gr., pituitary (anterior lobe) $\frac{1}{2}$ gr., prostate $1\frac{1}{2}$ gr., lydin ("a concentrated testicular desiccation prepared from the interstitial cells of Leydig") $1\frac{1}{2}$ gr., with magnesium phosphate, calcium gluconate and glycerophosphate, and sodium and potassium bicarbonates to 6 gr. In impotence, neurasthenia, etc. *Dose*.—1 tablet thrice daily, increasing to 2 or 3 thrice daily.

[P1-87] **Paromin** (*Paines & Byrne, London*). Preparation of thyroid standardised on its calorific activity, containing not less than 0.5% of natural organic iodine. In $\frac{1}{2}$ -grain tablets and 1 ml. ampoules (5 gr. of fresh substance).

[P1-87] **Protonuclein** (*Reed & Carnrick, Jersey City; Coates & Cooper, London*). Tablets containing thyroid, suprarenal, lymphatic gland, brain, spleen, pancreas, thymus, with pepsin, salivary glands and excipients.

[P1-87] **Semboi** (*Napp, London*). Mixed gland tablets containing extracts of thyroid, thymus, pituitary (anterior), suprarenal and cerebryn, and orchis, with calcium glycerophosphate and phosphate of iron. Asthenia, impotence and premature senility. [P1-87] **Fiatal** tablets for women contain in addition extracts of ovary and mammary gland.

[P1-87] **Tetraglandular Tablets** (*Parke, Davis, London*). Desiccated suprarenal, pituitary, thyroid and parathyroid glands. *Dose*.—1 or 2 tablets.

[P1-87] **Thyracoids** (*Reed & Carnrick, New Jersey; Coates & Cooper, London*). Desiccated thyroid tablets.

[P1-87] **Thyrafra Tablets** (*Parke, Davis, London*). Desiccated thyroid gland, desiccated suprarenal gland and Bland's pill. *Dose*.—1 tablet twice or thrice daily.

[P1-87] **Thyranon** (*Organon Laboratories, London*). Thyroid extract standardised chemically to 0.2% total iodine, and biologically.

[P1-87] **Thyryn** (*Richter, London*). A preparation of fresh thyroid gland substance for injection, 1 ml. containing 10 gr. of fresh thyroid extract. *Dose*.—1 ml. intramuscularly.

[P1-87] **Thyroidin Elixir** (*Allen & Hanburys, London*). Contains the equivalent of 5 gr. of fresh thyroid in each dr. *Dose*.—1 to 4 drachms.

[P1-87] **Thyroprotein** (*Beebe*) (*Parke, Davis, London*). A standardised, concentrated extract, consisting of the pure proteid of healthy thyroid gland without the undesirable accompaniments often present in commercial varieties of the dried gland. Standardised to contain 0.33% of organically combined iodine. Tablets weigh 2 gr. each and contain $\frac{1}{10}$ gr. of the thyroid proteid. *Dose*.—One tablet. Also supplied in ampoules containing Thyroprotein $\frac{1}{20}$ gr., and Chloretone $\frac{1}{15}$ gr., in 1 ml. for hypodermic injection.

[P1-87] **Thyroxinsodium** (*B.P.*). $C_{15}H_{10}O_4NI_4Na = 776.8$.

Dose.— $\frac{1}{100}$ to $\frac{1}{20}$ grain (0.0001 to 0.001 g.). It is usually given by intravenous injection. The *B.P.* states that when thyroxine is ordered, thyroxinsodium may be dispensed.

The amount should be determined with reference to the B.M.R. It is calculated that 1 mg. of thyroxine causes an average increase of 2.8% in the B.M.R.

In patients previously treated with desiccated thyroid 1 mg. of synthetic thyroxine produces action analogous to that of 0.2 g. of the dried gland. The initial dose of thyroxine in the adult should not be more than 0.5 mg.

With a myxoedematous patient the maximum effect is produced on the tenth day after a single injection.

A person afflicted with high-grade myxoedema requires from 1.5 to 2 mg. per day, and a small cretin from 0.2 to 0.4 mg. every day or every other day.

Thyroxinsodium is the monosodium salt of thyroxine, which is *dl*- β -[3 : 5-diiodo-4(3' : 5'-diiodo-4'-hydroxyphenoxy) phenyl]- α -aminopropionic acid. It contains 61 to 65% of I, and occurs as a white, crystalline powder, obtained by the action of a limited amount of sodium carbonate on thyroxine, which may be prepared synthetically or extracted from thyroid gland.

Sparsely *soluble* in water, more soluble in aqueous alkalis, forming unstable solutions.

Thyroxine prepared from casein and iodine was reported by Ludwig and Mutzenbecher (*Hoppe-Seyl, Z.*, 1939, 258, 195). This has been confirmed in every respect. The experiments must be conducted under very carefully controlled conditions, when the yield obtained approximates to 100 mg. of thyroxine from every 100 g. of iodinated casein. Possible mechanisms of the reaction are advanced.—C. R. Harrington and R. V. Pitt Rivers, *Nature, Lond.*, ii/1939, 205.

Caution. The action of thyroxine persists for 15 or 21 days. Wait until effect has passed off before giving a further injection.

The therapeutic use of thyroxine is limited by the necessity for intravenous injection as, owing to its extreme insolubility, it is absorbed irregularly when given by the mouth.

Uses. Thyroxinsodium is used for the same purposes as thyroid, and is given in cretinism, myxoedema and simple goitre (but *not* in exophthalmic).

Based on the view that otosclerosis results from a diminished blood supply to the ear, owing to the gradual failure of vasomotor response, this condition has been treated by the local application of thyroxine, which causes a prolonged active congestion without inflammatory reaction.

OTOSCLEROSIS. The tympanic membrane is anaesthetised with a freshly prepared 10% solution of cocaine in aniline, applied for 5 minutes and the canal mopped quite dry. Thyroxine $\frac{1}{10}$ gr. dissolved in 4 m. of water is injected into the tympanic cavity at a point midway between the tip of the handle of the malleus and the posterior margin of the membrane. A gag placed between the teeth prevents the patient from swallowing and so opening the Eustachian tube, and the head is tilted backwards for 5 or 10 minutes immediately after the

injection. In a preliminary report of 14 cases it is stated that about 50% of cases of otosclerosis and "dry middle-ear catarrh" can be greatly improved in regard to both hearing and tinnitus.—A. A. Gray, *J. Laryng.*, 1935, 50, 729.

In 30 cases treated, 4 patients showed improvement in bone conduction only, and 8 in air and bone conduction. Patients injected with histamine acid phosphate showed results as good as with thyroxine, and in 11 patients injected with normal saline only 7 showed improvement—tinnitus was relieved by saline more often than by thyroxine.—S. C. Suggitt, per *Med. Annu.*, 1937, 112. In a series of 15 cases treated by thyroxine there was definite improvement in one case and slight in 6.—T. B. Jobson, per *Med. Annu.*, 1937, 112. The results obtained are most discouraging. Suggitt is justified in concluding that the results are due to the injection of fluid into the middle-ear cavity. Some years ago temporary successes were occasionally obtained by injecting liquid paraffin and Fibrolysin into the middle ear to loosen hypothetical adhesions.—F. W. Watkyn-Thomas, *ibid.*

Of 42 cases treated in this manner, 23 showed definite improvement in hearing capacity, ten slight, and 9 were failures. Four consecutive thyroxine injections are given, alternately in the right and left ears at intervals of one week. A careful audiogram should be made at the beginning of treatment and a second within 2 or 3 weeks after the last injection.—M. A. Goldstein, *J. Laryng.*, 1938, 53, 444.

HYPOCHROMIC ANÆMIA. Thyroxine increases the reticulocyte response to reduced iron.—S. van Beurden, *Ass. méd.* 1935, 13, 116.

Injections of thyroxine increase the blood platelet count in the peripheral blood, the increase usually appearing in 24 to 48 hours after the injection, and disappearing in about 72 hours. Thyrotropic hormone produces the same effect, but its action is more protracted.—H. Zondek and Kaatz, *Brit. med. J.*, ii/1936, 387.

[P1-87] Thyroxinum (U.S.P. XI) is the acidic substance containing not less than 64% of I as an integral part of the molecule.

Average dose.— $\frac{1}{16}$ grain.

Antihormones. If the "hormones" are to be regarded as stimulating or exciting substances, then the "antihormones" (or "catechins" as they were originally called) may be regarded as their antagonists, whose special province is to prevent excessive effects of hormones or to modify their action. It was for long assumed that hormones, belonging as they do to the natural defences of the body, would not act as antigens, but as the result of Collip's observation that parathormone gradually loses its effect on repeated injection, the existence of antihormones has now been established. It is now known, for instance, that the blood contains an anti-thyroidal substance, and this has been isolated as an independent substance from the protein of the blood, with which it forms a loose combination. A prolonged treatment of rabbits with injections of thyroxine leads to a resistance of these animals against thyroxine, and to the appearance of serologic antibodies detectable by the complement fixation reaction. Preparations containing the thyroidal antihormone have been employed in the treatment of exophthalmic goitre, but their use has not met with any large measure of success. (*See also under ANTERIOR PITUITARY.*)

Serologic antibodies may also be detected, following prolonged treatment with thyroxine, diiodotyrosine, epinephrine, and frequently insulin and phenol. Most patients with hyperthyroidism give the same positive serum reaction, whereas in other individuals the reaction is negative as a rule. The complement fixation reaction is to be obtained in almost the same way with different antigens: thyroxine, diiodotyrosine, epinephrine, sympatol, insulin, tyrosine and phenol. Three patients with spontaneous hypoglycæmia gave a positive reaction, one of

them with only insulin as antigen. It is apparent that different degrees of endocrine hyperactivities, such as hyperthyroidism and hyperinsulinism, as well as experimentally produced states of hyperhormonisation in animals, may give rise to the appearance of non-specific serologic antibodies.—J. Bauer, *J. Amer. med. Ass.*, ii/1937, 1442.

HYPERTHYROIDISM. A new treatment has been suggested by Clutton, Harrington and Yuill, who attached thyroxine chemically to proteins and used these to form antigens. The antibodies these substances produced in rabbit's blood were found to neutralise the effects of both thyroglobuline and thyroxine when injected into rats. This work has a wider significance, in that it may be applied to prepare specific antidotes to all sorts of drugs.—J. H. Gaddum, *Pharm. J.*, i/1939, 27.

An extract of an antithyrotropic substance prepared from horse serum after injection of thyrotropic hormone. The substance obtained does not antagonise action of thyroxine but *does* depress the metabolic rate of normal animals and inhibits the action of the thyrotropic hormone in normal and hypophysectomised rats.—E. M. Anderson and J. B. Collip, *Lancet*, i/1934, 784.

Antithyroidin "Mœbius" (Merck, Darmstadt; Martindale, London). Thyroidectomised sheep's serum. In exophthalmic goitre. By intramuscular injection or in the form of fluid serum or tablets.

Thyroidectin (Parke, Davis, London). A powder prepared from the dried blood of thyroidectomised animals, available in capsules. *Dose*.—1 or 2 capsules thrice daily. In Graves' disease.

Parathyroideum (B.P.C.).

Dose.— $\frac{1}{10}$ to $\frac{1}{5}$ grain (0.003 to 0.006 g.).

The external parathyroid glands of the ox—dried and powdered. Should be free, or almost free, from thyroid and thymus. It does not contain iodine.

The fresh parathyroid glands weigh on an average 0.09 g. and yield from 0.015 to 0.02 g. of desiccated powder, *i.e.*, 1 = 5 of fresh substance.

The parathyroids are small glands which usually occur in close anatomical relationship to the thyroid gland. They are classified into external and internal—terms which relate to embryological development and do not necessarily denote their position in relation to the thyroid gland, although the external glands are usually found outside the capsule of the thyroid. In man the parathyroids are four in number—two in each lobe of the thyroid. The two internal parathyroids may be placed within the capsule of the thyroid in man and in the bovine species. In dogs both internal and external parathyroids are centrally placed within the thyroid. Accessory parathyroids are not uncommon and may occur in various situations in the neck and thorax—not infrequently in the thymus gland.

Physiology. The parathyroids control calcium and phosphorus metabolism; apart from its importance in the formation of bones and teeth the amount of ionised calcium in the blood serum controls the varying irritability of nerves and the contractility of both voluntary and involuntary muscles, and hence it also influences vascular tone. The normal value for the blood-serum calcium is from 9 to 11 mg. of Ca per 100 ml. of blood. The inorganic phosphorus does not normally exceed 5 or 6 mg. per 100 ml. Removal of the parathyroids is followed by tetany and death in a few days, the serum calcium is reduced, there is increased excretion of calcium and nitrogen, increase in the absolute and relative ammonia in the urine, and increase in the ammonia content of the blood. Hyperparathyroidism is characterised by increased viscosity of the blood, and a depletion of calcium from the osseous system. In hypoparathyroidism there is lowered calcium content of the blood and hyperexcitability of nerves and muscles. The occurrence of methylguanidine in the blood after parathyroidectomy may result

from the action of phosphoric acid on creatinine and it is possible that in hypoparathyroidism methylguanidine may accumulate in the blood in sufficient amounts to be toxic. A detoxicating action has been stated to be a function of the parathyroid glands, but there is insufficient evidence to confirm or disprove this.

The occurrence of two types of cells in parathyroid tissue has been held to denote that the glands may exert two different functions but it is not yet known which cells produce the hormone which controls parathyroid metabolism and what the other function, if any, may be.

Uses. Desiccated parathyroid gland has been given orally in tetany, tetany of pregnancy, tetany of childhood, epilepsy, paralysis agitans, sprue (with calcium lactate) and eclampsia. It is generally held that no increase of blood-serum calcium can be detected after oral administration, and *Extractum Parathyroidei* (q.v.) hypodermically is to be preferred.

Tabellæ Parathyroidei (B.P.C.). Contain $\frac{1}{10}$ gr. (0.006 g.).

[P1-87] **Thyrocalc** (Sharp & Dohme, London). Tablets containing desiccated thyroid $\frac{1}{4}$ gr., desiccated parathyroid $\frac{1}{10}$ gr., calcium lactate 5 gr. For use in calcium deficiencies.

Extractum Parathyroidei (B.P.C.).

Dose.—20 to 40 units intramuscularly, a unit being one-hundredth of the amount required to raise the blood-calcium of a 20 kg. dog by 5 mg. per 100 ml.

Prepared by extracting parathyroid glands with 5% hydrochloric acid at 100°; after cooling, fat is removed and sodium hydroxide added to pH 8, hydrochloric acid is added to precipitate protein (maximum precipitation occurs at about pH 5.5). The precipitate is removed, redissolved in NaOH and proteins again precipitated by hydrochloric acid. After this process has been repeated several times the filtrates are mixed and contain the active principle of the glands.

For details of method of preparation, see J. B. Collip, *J. biol. Chem.*, 1925, 63, 395; *J. Amer. med. Ass.*, 1927, 565. Also J. B. Collip and E. P. Clark, *J. biol. Chem.*, 1925, 63, 133, and 1925, 63, 439.

For methods of biological assay, see Vol. II.

Liquor Parathyroidei (U.S.P. XI). **Average dose.**—25 units, by hypodermic injection. One millilitre contains 80 to 120 parathyroid units, each unit being one-hundredth of the quantity required to raise the calcium level of 100 ml. of dog's blood serum by 0.001 g. within 16 to 18 hours after administration.

Uses. The chief indication for the use of parathyroid extract is tetany, especially post-operative tetany; it is of less value in infantile tetany and gastric tetany, and is ineffective in other spasmodic conditions such as chorea. It is also stated to be of value in the treatment of lead poisoning, causing the lead to be excreted.

The effects produced by injection of a solution of the parathyroid hormone are (a) increase in the amount of calcium and decrease of phosphorus in the blood; (b) increase in the Ca and P excretion in urine. The calcium is obtained chiefly from the bones. Overdosage may cause kidney damage, rise in blood pressure and accumulation of nitrogenous waste products in the tissues; deposits of calcium may occur in the soft tissues and calculi form in the kidney.

The extract must only be used in conjunction with repeated blood calcium estimations to control its effects. It is safe to give it when the blood calcium is below 9 mg. per 100 ml., but once the level has reached 12 to 13 mg. further administration is both undesirable and unnecessary. The treatment should be immediately discontinued when warning symptoms of overdosage appear, namely, vomiting and diarrhoea.

The rise in blood calcium following injection of the hormone occurs after a latent period of a few hours and persists for about 20 hours. After a few months' treatment, tolerance seems to be established and the effect diminishes.

It is doubtful if parathyroid hormone increases the amount of calcium salts absorbed from the intestine, and in this respect its action differs from that of vitamin D, which increases the serum calcium by increasing absorption from the intestine and the effect may last as long as two weeks after administration has ceased.

In normal subjects parathyroid extract lowers the glycaemia during fasting and increases carbohydrate tolerance, its action being very similar to that of insulin. In ten cases of diabetes intramuscular injection of one millilitre of the extract produced a clear hypoglycaemic effect, slightly lower than that produced by insulin. Administered along with insulin it may increase the hypoglycaemic action of the insulin, or it may scarcely modify it or even slightly inhibit it; given alone parathyroid extract has an undoubted insulin-like action.—A. Ferrannini, *Polilinetico*, 1935, 366.

In persons suffering from acute nephritis, parathormone produces a much smaller phosphate diuresis than when they have recovered. The hypothesis that parathormone acts directly on the kidneys to produce an increase of phosphate excretion is thus confirmed.—H. K. Goadby, *Biochem. J.*, 1937, 1530.

HYPOPARATHYROIDISM. Although substitution therapy, consisting of the subcutaneous or intramuscular injection of parathyroid extract, is the most specified treatment for chronic post-operative hypoparathyroidism, there are serious objections to the long continued use of this extract, and if successful management can be accomplished without it it is advisable not to use it, since its effectiveness is completely lost in many persons after a period of continuous use. These patients can be maintained in a state of good health by feeding a low phosphorus diet and large amounts of calcium salt—preferably a solution of calcium lactate in amounts sufficient to provide from 1.5 to 2.5 g. of calcium daily. Vitamin D in large amounts is of definite value.—R. H. Freyberg *et al.*, *J. Amer. med. Ass.*, ii/1936, 1774.

OSTEITIS DEFORMANS in a woman aged 54 much improved by 5 to 10 units of Parathormone daily for two years with periods of intermission. The serum calcium was normal and 30 gr. of sodium acid phosphate were given daily to decrease absorption of calcium and increase excretion in urine.—G. H. Colt and A. Lyall, *Brit. med. J.*, ii/1933, 10.

TETANY. The treatment of infantile tetany by Parathormone is a profound mistake. Although Parathormone bears a superficial resemblance to vitamin D in its effect in raising the blood calcium, Parathormone, so far from having a vitamin D-like effect does not influence calcium or phosphate absorption in rickety conditions, but has, in fact, a definitely deleterious action, aggravating the underlying error, draining still further minerals from the impoverished bones and causing a net loss to the body as a whole. Vitamin D is the proper remedy for infantile tetany.—L. J. Harris, *Brit. med. J.*, ii/1933, 372.

While Collip's Parathormone is active in raising the level of the serum calcium and relieving the symptoms of parathyroid tetany it is not satisfactory unless injected in large and repeated doses. It is also expensive. In most cases, therefore, it is impracticable to employ it. Calcium chloride (*q.v.*) intravenously or *per os* is an excellent emergency measure.—D. Campbell, *Lancet*, i/1935, 369.

The fact should be emphasised that the phosphorus content of the diet must be maintained at a relatively low level during administration of parathyroid before the conclusion is reached that this latter agent is ineffective. If this is done there will be fewer instances of refractoriness to solution of parathyroid in parathyroidic tetany.—A. Cantarow, *J. Amer. med. Ass.*, 1/1939, 1748.

RADIUM POISONING. Parathyroid extract and a low calcium diet slightly increased radium elimination in three cases.—Craven and Schleendt, *J. Amer. med. Ass.*, 1/1935, 959.

Euparato (*Allen & Hanburys, London*). Biologically standardised solution of parathyroid hormone, 20 units per ml. *Dose*.—In adult tetany, 20 to 60 units daily in 8-hourly doses may be necessary; in infantile tetany, 10 to 20 units daily may suffice. In other conditions, 10 to 20 units daily or every second day.

G.R.H. 141 (*Allen & Hanburys, London*). An extract of parathyroid free from the serum-calcium regulating factor (Collip) and containing a growth-retarding principle. *Dose*.—2 ml. daily subcutaneously. Effective in controlling abnormal cell-growth in a number of conditions.

Parathormone (*Lilly, London*). A solution of the active principles of the parathyroid glands. Is standardised on the relationship between the dose given and the increase in blood-serum calcium, the unit of potency being 0.01 of the amount of extract that produces an average rise of 5 mg. in blood-serum calcium in a 20-kilo dog in 15 hours. *Dose*.—Varies with individuals and conditions. Infantile tetany may be relieved by 10 to 20 units a day, but repeated serum determinations should be made to estimate the reactions. In tetany daily doses of 20 to 60 units are used. It is usually given subcutaneously though it may also be given intramuscularly or intravenously. Calcium gluconate or calcium lactate in large doses *per os* should accompany its use. Excessive dosage leads to increased concentration of calcium and phosphate in the blood, and their increased excretion.

Paroidin (*Parke, Davis, London*). Parathyroid extract standardised on its ability to raise the blood-serum calcium of normal dogs. It is supplied in solution containing 100 units per ml., the unit being one-hundredth of the amount necessary to raise the blood-serum calcium by 1 mg. per 100 ml. *Dose*.—20 to 40 units subcutaneously or intramuscularly.

TRAGACANTHA

B.P., U.S.P. XI, P. Helv. V, Fr. Cx., etc.

From *Astragalus gummifer* and some other species (Leguminosæ). Known in commerce as Persian Tragacanth.

It occurs in thin ribbon-like flakes, known as "flake" tragacanth, and in tears or more rounded masses called "Vermicelli" tragacanth. The power of forming mucilages varies greatly in the different grades.

Hog gum from species of *Prunus*, and Indian tragacanth (*sterculia* or *Karaya gum*) are used in industry as substitutes.

Uses. Widely used as a thickening or suspending agent in the manufacture of creams, jellies and pastes. The mucilage answers well for suspending Tinct. Jalapæ, Liquor Quinæ Ammoniatæ, Tinct. Cannabis and Tinct. Myrrhæ, but is useless for Tinct. Benzoini Co. and Tinct. Tolu. For these a mixture of mucilage of tragacanth and mucilage of acacia is best. In the case of a mixture containing 1 dr. of resinous tincture to the ounce, dilute 1 dr. of mucilage of acacia with as much water as possible, add the tincture, and lastly add the mucilage of tragacanth. For other resinous tinctures mucilage of acacia alone yields satisfactory mixtures. The mucilage is best diluted with as much water as possible, and

the tincture then added. *Tinctura Hydrastis* should have an addition of mucilage of tragacanth if salts are present. *Tinctura Lupuli* and *Tinctura Cimicifugæ* require no addition either in presence or absence of salts. *Tinctura Podophylli* requires no suspending agent in the absence of salts, but if any are present mucilage of acacia is best.

Cremor Emolliens (U.C.H.). *Syn.* SKIN CREAM.

Tragacanth 1, methylated spirit 7, glycerin 14, olive oil 3½, simple tincture of benzoin 2, water to 100.

Gelanthum (P.E.H.C.). Tragacanth 110 gr., acacia 30 gr., gelatin 120 gr., water 10 oz.; mix, heat, filter and add glycerin 6 dr., thymol ½ gr., water to 12 fl. oz. A basis for various applications for skin medication.

Glycerinum Tragacanthæ (B.P.C.). 1 in 5½. A pill excipient; must be used sparingly.

Lotio Tragacanthæ (B.P.C.). *Syn.* LOTIO EMOLLIENS.

Tragacanth 0.5% w/v with spirit of chloroform, tincture of tolu, Cologne spirit, glycerin and water.

Mucilago Tragacanthæ (B.P.).

Dose.—1 drachm to 1 ounce (4 to 30 ml.) or more.

Tragacanth 1½% w/v with alcohol 2½% v/v in chloroform water.

Mucilage made from whole gum has a much higher viscosity than that made from powdered gum and, if not heated, increases in viscosity on keeping. There is no advantage in adopting any particular method of preparation when the mucilage is to be diluted and used for its power of suspending an insoluble powder.—H. Brindle and H. Burlinson, *Quart. J. Pharm.*, 1934, 492. See also G. Middleton, *ibid.*, 1936, 493, 506.

Mucilago Tragacanthæ (U.S.P. XI).

Tragacanth 6% w/w and glycerin 18% w/w, in water. *Fr. Cx.* has 10% w/w, in water.

Pasta Tragacanthæ Composita (B.P.C.). *Syn.* PASTA LUBRICANS, CATHETER LUBRICANT.

Tragacanth 1% w/v with boric acid, glycerin, oil of lavender and decoction of chondrus.

[P1] **Catheter Lubricant (Meltzer's Formula).** Triturate tragacanth 3 with glycerin 20, add water 100, sterilise, and add mercury oxycyanide 0.25.

Pulvis Tragacanthæ Compositus (B.P.).

Dose.—10 to 60 grains (0.6 to 4 g.).

Tragacanth 15%, with acacia, starch, and sucrose. Is used as a suspending agent, 10 gr. to 1 oz. Specially useful for bismuth oxynitrate.

The presence of acacia in compound tragacanth powder results in a considerable reduction in the viscosity and suspending power of the tragacanth constituent and it is suggested that it be omitted.—J. M. Rowson, *Quart. J. Pharm.*, 1937, 404.

Ceratonie Gummi. *Syn. and Prop. Name.* CAROB GUM, LUCTIN (*Anglo-Gummiferous Products, London*).

The separated endosperms of the seeds of the locust bean tree, *Ceratonia siliqua*. A substitute for tragacanth.

Mucilago Ceratonie. Carob gum 1 g., glycerin 3 ml., benzoic acid 0.15 g., triturate and add water to 80 ml.; heat the mixture on a water-bath for 30 minutes.

Various other formulæ given for carob gum preparations.—W. A. Knight and M. W. Dowsett, *Pharm. J.*, i/1936, 35. The mucilage may be prepared without the use of glycerin.

TRINITROPHENOL

B.P., U.S.P. XI, P. Jap., Fr. Cx., P. Ital. V, F.E. VIII,
P. Helv. V.

Syn. ACIDUM PICRICUM, PICRIC ACID, CARBAZOTIC ACID.

[P] "*Picric acid.*"

[S3] "*Picric acid—in substances containing less than 5% of picric acid.*"

Dose.—1 to 5 grains (0.06 to 0.3 g.).

Made from phenol by nitration. It is in yellow, shining, bitter-tasting crystals, which melt at 121° to 123°. Trinitrophenol burns readily and explodes when heated rapidly or when subjected to percussion. For safety in handling it is usually supplied mixed with water, and except in small quantities its sale and storage are subject to legal restrictions. It forms salts with metals, some of which are very explosive.

Soluble 1 in 90 of water with yellow colour, 1 in 10 of alcohol 90%, 1 in 50 of chloroform, 1 in 8 of benzene, and about 1 in 20 of ether.

Antidotes. Empty stomach by stomach tube, washing out thoroughly with plenty of water. Give raw white of egg and milk freely. Purgative dose of sodium sulphate. Saline infusion.

Uses. Picric acid was at one time employed in malaria and as an antipyretic, but it is now seldom used internally, owing to its irritant action on the stomach and kidneys. After absorption it stains the skin and mucous membranes a yellow colour; the urine also is coloured yellow or red.

Externally, it is a powerful antiseptic and a 1% aqueous or alcoholic solution may be employed for pre-operative skin sterilisation. The 1% aqueous solution has been widely used in the treatment of burns, sterile gauze being soaked in the solution and placed over the burnt area. It should only be employed, however, in trivial burns, since poisoning may result from absorption if it is employed over a large area. The lotion has been used in addition in the treatment of eczema, erysipelas and other inflammatory skin conditions, but the staining of the skin and the fact that it may give rise to a rash militate against its usefulness. In stomatitis mercurialis a watery paste has been applied every two days and is stated to relieve the pain and remove the ulceration.

BURNS. W. M. Dennison states that from 1932 to 1934 he saw so many examples (at the Royal Hospital for Sick Children, Glasgow) of the toxic erythematous rash which can be produced by picric acid that he hesitates to use it even as a first-aid treatment in children.—*Lancet*, ii/1939, 1107.

ERYSIPELAS. Daily painting of the affected area and of the skin for a short distance round it with a 3% alcoholic solution of picric acid, then applying lint wrung out of lead lotion, re-applied, when it dries, causes the disease to undergo rapid resolution.—J. G. Watkins, *Practitioner*, ii/1933, 112.

HYDROCELE. After having tapped the hydrocele 50 to 70 ml. of a saturated aqueous solution of picric acid at about 100°F. is injected in the direction of the parietal layer of the tunica vaginalis. The solution is prepared by dissolving 1½

drachms of picric acid in 5 ounces of warm distilled water. The scrotum is gently massaged for 5 to 10 minutes and the solution withdrawn. The procedure is then repeated. The next day the patient is allowed to follow his occupation. The method is practically painless and the immediate and remote results excellent. In order to avoid shock, special care should be taken to inject the warm solution slowly and to keep the patient in a recumbent position.—J. Di Pace, *per Practitioner*, ii/1939, 123.

Carbasus Trinitrophenolis (B.P.C.). *Syn.* PICRIC GAUZE. 2%. Wool impregnated with trinitrophenol is also prepared.

[P1] **Liquor Trinitrophenolis** (B.P.C.). *Syn.* LIQUOR ACIDI PICRICI. 5% w/v in alcohol.

Lotio Trinitrophenolis (B.P.C.). *Syn.* LOTIO ACIDI PICRICI. 1% in water. May be diluted with 1 or more parts of water, as required.

A first-aid application for burns; applied on lint or gauze. After 48 hours remove and wash with potassium permanganate 5 gr. in water 16 oz.

Washing with weak ammonia and then with hydrogen peroxide removes the stains.

Pigmentum Trinitrophenolis et Camphoræ. *Syn.* PIGMENTUM ACIDI PICRICI ET CAMPHORÆ. Trinitrophenol 2, camphor 50, and alcohol 90% to 100. Ringworm has been treated by painting this over the scalp twice daily, the hair being clipped close and the scalp washed once or twice a week and covered by a calico cap. Generally the ringworm hairs are loosened, and come away with their bulbous portions in from 10 to 30 days. The paint is inflammable.

Unguentum Trinitrophenolis (B.P.C.). *Syn.* UNGUENTUM ACIDI PICRICI. 2%. For pruritus of scrotum. Also for burns; it relieves pain, and may be left 48 hours without changing. For burns of the eye it is preferred by some to solution, using a little cocaine solution beforehand.

[P1-81-84] **Dinitrophenol.** *Syn.* 2:4-DINITROPHENOL.
 $C_6H_3(NO_2)_2OH = 184.0$.

[P1], [81] and [84] "Dinitrocresols; dinitronaphthols; dinitrophenols; dinitrothymols."

[83] "Dinitrocresols; dinitrophenols—in substances not being preparations for the treatment of human ailments."

Yellow crystals sparingly soluble in cold water, readily soluble in hot water and in ether, benzene or chloroform. Given internally it raises the metabolic rate, and has been given in doses of about 5 gr. per day, for the reduction of obesity. Numerous cases of poisoning have occurred, agranulocytosis, cataract and other lesions being produced, and its use is now regarded as inadvisable.

Antidotes. Empty stomach by stomach tube, using 2 gallons of 5% sodium bicarbonate solution, or 1 in 2000 potassium permanganate. Oxygen inhalations. Place patient in an ice pack to bring down temperature. Dextrose or dextrose in saline intravenously. Ascorbic acid is said to bring about improvement of the cataract.

Treatment of acute dinitrophenol poisoning.—Tainter, *J. Amer. med. Ass.*, i/1935, 1071.

For numerous references to toxic effects see Vol. I, 21st Edn., p. 753.

[P1-81-84] **Dekrysil** (Crookes Laboratories, London). Capsules containing 0.05 g. of 4:6-dinitro-o-cresol. *Dose.*—0.0005 to 0.001 g. per kg. body weight. Given as a metabolic accelerator for the treatment of obesity.

Inquest on a young dancer who sought to reduce her weight by treatment which included Dekrysil. Death was found due to nitrophenol poisoning, traces of nitrophenol being found in the intestines and stomach. She had possibly taken 17 capsules in 3 days.—*Lancet*, i/1934, 652.

Dinitro-*o*-cresol is in the region of 5 times as potent as the dinitrophenol compound.—E. C. Dodds and J. D. Robertson, *Lancet*, ii/1933, 1139.

UREA

B.P.C.

$\text{CO}(\text{NH}_2)_2 = 60.05.$

Syn. CARBAMIDE.

Dose.—15 to 240 grains (1 to 16 g.) thrice daily. May be given in a mixture flavoured with syrup of lemon or orange. Larger doses are frequently given.

Colourless crystals with cooling, saline taste. M.p. 130° to 132° .

Soluble 1 in 1 of water, 1 in 5 of alcohol 90%; 1 in 1 of boiling alcohol 90%; insoluble in ether and in chloroform.

Uses. Urea is a powerful diuretic and may be employed in a dose of 15 to 30 g. daily with beneficial effect in chronic parenchymatous nephritis (but not in acute nephritis). The ability to excrete urea is markedly impaired when renal damage has occurred and urea is therefore widely employed as a test of renal efficiency (*for details of Urea Concentration Test, see Vol. II*).

The application of a saturated aqueous solution or of urea crystals to infected wounds hastens healing and removes the offensive odour.

When the blood urea is normal, urea is probably the best saline diuretic for general use (240 gr. in 5 ounces of water, flavoured with tincture of orange). It is rapidly absorbed and is almost non-toxic. It is, however, very diffusible and soon reaches about as high a concentration in the oedema fluid as in the blood, so that its power of drawing water from the tissues is probably limited.—T. H. Crozier, *Practitioner*, i/1940, 516.

Urea is an extremely valuable diuretic and deserves wider popularity than it seems to enjoy at present. All available clinical reports emphasise its complete freedom from untoward actions and its extraordinary constancy of diuretic effect. While it is usually less dramatic in its immediate effects than the mercurials, it has obvious advantages and may be used to supplement the latter. There are few patients who cannot take it for at least several weeks at a time, and many continue it for months or years without interruption. Syrup of acacia has been specially recommended as a vehicle for urea, its colloidal nature serving to mask the urea quite satisfactorily. After urea has been taken for a few days the blood nitrogen should be determined to ascertain whether it is being properly excreted.—H. M. Marvin, *J. Amer. med. Ass.*, i/1940, 757.

CARDIAC DROPSY. Urea in single daily doses of 20 to 40 g. is recommended for combined use with mercurial injections to prolong the periods between injections in case of cardiac dropsy.—M. Winternitz, *Lancet*, i/1940, 879.

OTITIS MEDIA. 20 cases of purulent otitis media were treated by drops of a saturated solution of urea 4-hourly, after washing out the meatus with normal saline. The discharge lost its foul odour in a few hours. Some cases cleared up in 36 hours, but the usual time taken was 3 to 6 days.—J. Foulger and L. Foshay, *J. Lab. clin. Med.*, 1935, 1113.

WOUNDS. The application of gross quantities of urea crystals or of strong to saturated aqueous solutions to infected wounds of various types definitely hastens healing, and is frequently efficacious when other therapeutic agents are ineffective. It does not irritate the surrounding normal tissue and practically obliterates

all odour from the wound.—H. G. Holder and E. M. MacKay, *J. Amer. med. Ass.*, i/1937, 1167.

The results of urea treatment on a series of 170 cases of infected wounds were so encouraging that the adoption of this method of treatment as a routine in the casualty department of the Royal Free Hospital is under consideration. The wound is syringed free from pus and necrotic material with a saturated solution of urea, excessive moisture removed, and urea crystals liberally applied. Waxed paper is placed next to the crystals to keep them in contact with the wound and to prevent the dressings becoming soaked. Zinc cream is spread over the adjacent skin. There are no contraindications to its use, though pain is sometimes experienced on application.—L. F. Muldavin and J. M. Holtzmann, *Lancet*, i/1938, 549.

Uniformly gratifying results from the use of a 25 to 30% solution in infected wounds and for the irrigation of wound sinuses. The odour from draining wounds is reduced to a minimum.—G. E. Baker, per *J. Amer. med. Ass.*, i/1938, 1874.

Hausstus Ureæ (C.X.H.). Urea 15 g., syrup of orange 15 ml., water to 100 ml.

Hausstus Ureæ Composita (K.C.H.). Urea 4½ dr., tincture of orange 15 m., water to 3½ oz. Both the above are given for the urea concentration test.

Urethanium (B.P.C., P. Helv. V). *Syn.* ETHYL CARBAMATE (*Fr. Cx., P. Dan., F.E. VIII, P. Ital. V*).
 $\text{CO}(\text{NH}_2)\text{OC}_2\text{H}_5 = 89.06$.

Dose.—¼ to ½ drachm (1 to 2 g.).

Colourless, odourless crystals with saline taste. M.p. 47.5° to 50°, b.p. about 180°.

Soluble 1 in 2 of water, 1 in 1 of alcohol 90%, and in ether, chloroform, glycerin and fixed oils.

Incompatible with caustic alkalis and with acids.

Uses. Mild hypnotic with very low toxicity and marked diuretic effect. Produces normal sleep without after-effects or depressant action on the heart, and is especially suitable for children, the aged, and those with heart affections. In 1 to 2 g. doses it is stated to give relief in severe bronchial asthma. In solution with quinine it is employed in the injection treatment of varicose veins (for further details, see p. 881).

ASTHMA. Of 30 patients suffering from severe bronchial asthma 14 received considerable symptomatic relief from the use of urethane 1 to 2 g., dissolved in water before administration. Not more than 4 g. daily was given, and it was not used longer than 4 or 5 days in succession. No untoward effects or narcotic action were observed. It is advisable to give urethane before full development of an attack; and in some instances to use 1 g. three times daily over a period of 3 to 4 days.—L. Farmer, *J. Lab. clin. med.*, Feb. 1939, 453.

Bromoisovalerianylurea (P.G. VI, P. Ned. V, P. Svec. X, P. Dan.). $(\text{CH}_3)_2\text{CH}\cdot\text{CHBr}\cdot\text{CONH}\cdot\text{CONH}_2 = 223.0$. *Syn. and Prop. Names.* BROMISOVALUM (*P. Helv. V*), BROMISOVALERILUREA (*F.E. VIII*), α -MONOBROMOISOVALERYLUREA, BROMVALERYLUREA (*P. Jap. V*), BROMURAL (*Knoll, London; Savory & Moore, London*), DORMIGENE (*Allen & Hanburys, London*).

Dose.—5 to 10 grains (0.3 to 0.6 g.). *P. Helv. V* has max. single dose 15 grains, max. in 24 hours 30 grains approx.

White, crystalline powder with slightly bitter taste. M.p. 145° to 150°.

Soluble 1 in about 450 of water; readily soluble in alcohol and ether.

Uses. Hypnotic, inducing sleep in from 5 to 25 minutes after ingestion. The effect lasts from 4 to 5 hours, and may be followed by natural sleep. It is claimed to be useful as a nerve sedative and for inducing sleep in functional nervous disease. It is of no value in insomnia associated with pain.

Sonasta (*Christy, London*). Tablets each containing ethylbromoisovaleryl-carbamide 0.22 g., and oxypropionylaminoethoxybenzene 0.12 g. **Dose.**—As soporific, 2 to 3 tablets one hour before retiring; as sedative, 1 to 2 tablets 3 to 4 times a day.

Elbon-Ciba (*Ciba, Horsham*). Cinnamylol-*p*-oxyphenylurea, $C_6H_5 \cdot CH : CH \cdot CO \cdot OC_6H_4 \cdot NH \cdot CO \cdot NH_2 = 282.1$, in 0.5 g. tablets.

Dose.—In tuberculosis: 1 tablet every 3 hours (8 per 24 hours), increased if no response, then decreased. In hay-fever, prophylactically: 1 tablet twice a day, increased during hay-fever season to 2.

Stated to have antipyretic and antiseptic action. Used in pulmonary tuberculosis, for infectious catarrhs of respiratory tract, and in chronic endocarditis; also for hay-fever and asthma.

Surfen (*Bayer Products, London*). Bis-2-methyl-4-aminoquinolyl-6-carbamide hydrochloride. A non-staining antiseptic for wounds, etc., used in 0.1 to 0.2% solution. For cystoscopy and irrigation of the bladder, 0.01% solution with 8 drops of dilute acetic acid per 100 ml. (to prevent turbidity in contact with urine).

[P1-81-84] **Somnosal** (*Napp, London*). α -Bromisovalerianylurea 5 gr., amidopyrine 2½ gr. **Dose.**—Sedative, 1 to 3 tablets thrice daily; soporific, 1 to 3 tablets with a hot drink.

Carbromalum (B.P., U.S.P. XI, F.E. VIII, P. Dan.).

Syn. and Prop. Names. URADAL, α -BROMO- α -ETHYLBUTYRYL-CARBAMIDE, BROMODIETHYLACETYLUREA, BROMDIETHYLACETYL-CARBAMIDUM (*P. Belg. IV, P. Svec. X*), BROMADALUM (*P. Helv. V*), DIETHYLBROMOACETYLUREUM (*P. Ned. V*), ADALIN (*Bayer Products, London*) (*P.G. VI*), NYCTAL (*Sitsa, Paris*; *Roberts, London*), PLANADALIN (*Pharmaceutical Specialities (May & Baker) Ltd., London*).

Dose.—5 to 15 grains (0.3 to 1 g.). U.S.P. XI average dose 8 grains. *P. Helv. V* gives max. single dose 23 grains, max. in 24 hours 45 grains approx. As a hypnotic, should be given half an hour before bedtime and followed by a hot drink.

Tasteless, crystalline powder. M.p. 116° to 118°.

Soluble 1 in about 3000 of water, 1 in 18 of alcohol 95%, 1 in 14 of ether, 1 in 3 of chloroform; slightly soluble in light petroleum. It is also soluble in strong mineral acids, from which it is precipitated by addition of water, and in caustic alkali solutions.

Uses. A safe hypnotic of medium strength. Does not produce after-effects. Is useful in insomnia due to worry, overwork or excitement, but is less efficient in insomnia due to pain.

[P1-81-87] **Sedormid** (*Roche Products, Welwyn Garden City*). Allylisopropyl-acetylurea in 4-gr. tablets. **Dose.**—As sedative, ½ to 1 tablet 2 or 3 times a day. As hypnotic, 1 or 2 tablets (or more) 20 minutes before retiring. Its activity is stated to be midway between that of the barbiturates and of the bromides or valerian. It is rapidly eliminated, thus avoiding accumulation. A sedative for nervous insomnia, Graves' disease, disturbances of menstruation and the climacteric, before operation and as an aid to drug-withdrawal treatment.

Thrombocytopenic purpura, following the use of Sedormid. Two cases.—A. M. Hoffman *et al.*, *J. Amer. med. Ass.*, i/1938, 725. A further case.—A. M. Moody, *ibid.*, 726: *ibid.*, ii/1939, 674. Two more cases.—J. Torrens, *Lancet*, i/1938, 749.

Thrombocytopenic purpura, following prolonged medication with Sedormid. Recovery on discontinuance of the drug.—J. Joekes, *Lancet*, ii/1938, 305. See also C. Miller and M. L. Rosenheim, *ibid.*, 402.

Symmetrical Ureas and Related Compounds.

Antrypol (*British Drug Houses, London*). Symmetrical urea of sodium-*m*-aminobenzoyl-*m*-amino-*p*-methylbenzoyl-1-naphthyl-amino-4 : 6 : 8-trisulphonate. Administered intravenously in isotonic saline in the treatment of trypanosomiasis. It is supplied in ampoules containing 1, 2, and 3 g.

Suramin. *Prop. Name.* GERMANIN (BAYER "205") (*Bayer Products, London*).

A complex organic urea, probably a derivative of the type:— $[(SO_3H)_2 \cdot OH \cdot C_{10}H_4NH \cdot CO \cdot C_6H_4NH \cdot CO \cdot C_6H_4 \cdot NH]_2CO$.

Dose.—15 grains (1 g.) intravenously in 10 ml. of water.

A white powder soluble in water or in solution of sodium chloride, but insoluble in alcohol.

Uses. Suramin is employed in the treatment of trypanosomiasis. It is advisable to start with 0.5 g. intravenously, and if it is well tolerated, to give 1 g. after 24 or 48 hours, this dose being repeated at weekly intervals up to a maximum of 5 g. Some authorities prefer to give this total of 5 g. within one week, contending that a maximum effect is thus produced on the organisms. If given in the early stages of the disease good results are obtained, but in the later stages tryparsamide is more effective. A recent tendency is to combine the two drugs, giving three 1 g. doses of Suramin during the first week, followed by four or five 2 g. doses of tryparsamide. Suramin is a toxic drug and must be used with care. At the end of a 5 g. course there are often signs of renal irritation, and not infrequently a toxic dermatitis appears, but both of these conditions clear up on cessation of treatment. Optic troubles, *e.g.*, amblyopia, have also been observed.

In addition to its curative employment Suramin also has a definite prophylactic value, a dose of 2 g. conferring protection against both *T. gambiense* and *T. rhodesiense* infection for at least three months. (*For further references to the use of Suramin in trypanosomiasis, see Vol. II.*)

In 1935 Jancsó and Jancsó, having reached the conclusion that Germanin acts by interfering with the carbohydrate metabolism of the trypanosomes, decided to examine the action of the hypoglycaemia-producing guanidine derivatives in experimental trypanosomiasis. They found that a number of these derivatives, especially Synthalin (*q.v.*), exerted a definite therapeutic action on mice infected with *T. brucei*. Subsequently, E. M. Lourie and Warrington Yorke found that while Synthalin does not produce any pronounced degree of hypoglycaemia in the normal animal unless given in doses which produce serious damage to the liver, it exercises *in vitro* a powerful trypanocidal action which is of the same order as that of the aromatic trivalent arsenicals.

This discovery that the trypanocidal action of Synthalin is a direct one, led to the preparation and examination by King at the National Institute for Medical Research of a large number of guanidines, isothiourreas, amidines and amines

with alkyl and alkylene chains, and it was found that certain of the diamidines had a powerful trypanocidal action, both *in vivo* and *in vitro*, and that with the most active member of the series, viz., undecane-1 : 11-diamidine, it was possible to produce permanent cures in approximately 100% of mice and rabbits infected with *T. rhodensis*. Following this, Ewins took up the investigation and prepared a series of aromatic compounds containing the amidine group, some of which showed a remarkable degree of trypanocidal activity, the most active being 4 : 4'-diamidinostilbene, 4 : 4'-diamidinodiphenoxypropane, and 4 : 4'-diamidinodiphenoxypentane; it was found in addition that these compounds had a marked therapeutic action on leishmania infections. The compounds are now being extensively tried in patients suffering from trypanosomiasis and leishmaniasis, and the early clinical reports (some 400 patients have been treated to date) are sufficiently encouraging to justify an optimistic outlook. The compounds have been given both intravenously and intramuscularly. Owing to their greater solubility, 4 : 4'-diamidinodiphenoxypropane and 4 : 4'-diamidinodiphenoxypentane are more suitable for intramuscular injection than the less soluble diamidinostilbene. The usual dose by the intravenous route has been 0.5 to 1 mg. per kg. bodyweight, and by the intramuscular route 1 to 2 mg. per kg. On many occasions the doses have been repeated daily or on alternate days until 10 or 12 injections have been given. No serious accidents have so far been reported though many of the patients receiving the larger doses by the intravenous route have exhibited transient symptoms as flushing of the face, headache, rapid pulse, sweating, etc. No signs of renal irritation have been observed.—Warrington Yorke, *Trans. R. Soc. Trop. med. Hyg.*, 1940, 33, 463.

Moranyl. *Syn.* FOURNEAU 309 (*Société Parisienne d'Expansion Chimique, Paris*). The symmetrical urea of disodium *m*-aminobenzoyl-*m*-amino-*p*-methylbenzoyl-1-naphthylamino-4 : 6 : 8-trisulphonate.

Administered in trypanosomiasis as a 10% aqueous solution in doses up to 10 ml. by subcutaneous or intravenous injection.

S.U.M. 36 (*British Drug Houses, London*). Sterile isotonic solution of the dissymmetrical urea of *m*-benzoyl-*m*-aminobenzoylaminonaphthol-3 : 6-sodium disulphonate. Solutions contain either 0.002 or 0.01 g. per ml.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.002 to 0.01 g.) intramuscularly every 5th day on two or three occasions.

In the treatment of gonococcal infections, such as urethritis, vulvitis and ophthalmia; also in very acute cases of gonococcal arthritis.

S.U.P. 36 (*British Drug Houses, London*). The symmetrical urea of *p*-benzoyl-*p*-amino-benzoyl-1-amino-8-naphthol-3 : 6-sodium disulphonate.

Dose.— $\frac{1}{2}$ to $\frac{1}{4}$ grain (0.005 to 0.02 g.) intramuscularly. Ampoules contain 0.01 g. in 1 ml. Also issued in bulk, 0.1 g. in 10 ml.

In the treatment of inflammatory and septic conditions, especially influenza, colds, broncho-pneumonia, acute pleurisy, puerperal pyrexia, vomiting of pregnancy, and the complications of gonorrhœa.

S.U.M. 468 (*British Drug Houses, London*) is the symmetrical urea of *m*-benzoyl-*m*-amino-toluyyl-1-naphthylamine-4 : 6 : 8-sodium trisulphonate.

Dose.—0.001 to 0.002 g. intramuscularly.

In the treatment of thrombosis, pemphigus and other infections caused by micro-organisms of the proteus group.

S.U.P. 468 (*British Drug Houses, London*) is the symmetrical urea of *p*-benzoyl-*p*-aminobenzoyl-1-aminonaphthalene-4 : 6 : 8-sodium trisulphonate.

Dose.—0.001 to 0.003 g. intramuscularly. In the treatment of acute streptococcal infections and in chronic streptococcal arthritis.

VALERIANA

B.P., U.S.P. XI, P. Helv. V, Fr. Cx.

Dose.—5 to 15 grains (0.3 to 1 g.). *U.S.P. XI* average dose 12 grains.

The dried rhizome and roots of *Valeriana officinalis* (*Valerianaceae*), collected in the autumn.

As a war emergency measure, when valerian is prescribed or demanded, Indian valerian may be dispensed or prescribed.

The odour may be removed from a scale pan or from the hands by rubbing with sodium bicarbonate.—R. G. Morrison, *Pharm. J.*, i/1935, 106.

Uses. Given in hysterical and neurotic conditions as a sedative. Its action has been attributed to its unpleasant smell, and if this is so, deodorised preparations cannot possess any activity due to their valerian content.

Alcoolature de Valériane Stabilisée (*Fr. Cx.*). Made by adding the fresh entire roots to an equal weight of 95% alcohol while maintained boiling on the water-bath for 20 minutes, allowing to cool and repeating the process, finally making up any loss.

Elixir Valerianæ (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.). Simple tincture of valerian, 1 in 3, with extract of liquorice and aromatic elixir.

[P1] **Elixir Valerianæ Compositum** (*B.P.C.*). *Syn.* ELIXIR BROMIDI ET VALERIANÆ COMPOSITUM.

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Contains potassium bromide $7\frac{1}{2}$ gr., chloral hydrate $7\frac{1}{2}$ gr., and liquid extract of valerian 15 m., with oils of orange, lemon, coriander and anise, in alcohol, syrup and water to 1 oz. To avoid waste the quantities of each of the four volatile oils should be reduced by 25%.

Extractum Valerianæ (*B.P.C.*).

Dose.—1 to 5 grains (0.06 to 0.3 g.).

The evaporated 70% alcohol percolate.

Extractum Valerianæ Liquidum (*B.P.C.*).

Dose.—5 to 15 minims (0.3 to 1 ml.). 1 in 1, from freshly dried valerian.

Infusum Valerianæ Concentratum (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 5.

Infusum Valerianæ Recens (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.). 1 in 40.

Mist. Pot. Brom. et Valerian. (*N.I.F.*). Potassium bromide 10 gr., ammonium carbonate $2\frac{1}{2}$ gr., concentrated infusion of valerian 30 m., water to $\frac{1}{2}$ oz.

Mistura Valerianæ Composita (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 ounce (15 to 30 ml.).

Potassium bromide 10 gr., ammoniated tincture of valerian 10 m., camphor water to 1 oz.

Tinctura Valerianæ Ammoniata (*B.P.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). Valerian 1 in 5, with dilute solution of ammonia 1 in 10, oils of lemon and nutmeg and alcohol 60%. An antispasmodic and nervine tonic.

Tinctura Valerianæ Simplex (*B.P.C.*). *Syn.* TINCTURA VALERIANÆ.

Dose.—1 to 2 drachms (4 to 8 ml.). 1 in 8 in alcohol 60%.

Valeriana Indica (B.P.C.).

Dose.—5 to 15 grains (0.3 to 1 g.).

Indian valerian consists of the dried rhizome and roots of *V. Wallichii*.

Uses. As for valerian. As a war emergency measure (1941), it may be dispensed or supplied when valerian is prescribed or demanded.

[P1] **Elixir Bromo-Valerianate Gabail** (*Anglo-French Drug Co., London*). Stated to contain extract of valerian (deodorised) 4.00 g., valerianic acid (deodorised) 1 g., ammonium carbonate 2.5 g., chloral hydrate 4 g., strontium bromide 4 g., syr. aurant. (*Fr. Cx.*) 100 g., distilled water 100 g.

[P1] **Elixir Valibrom** (*British Drug Houses, London*). Odourless extract of valerian with chloral formamide 10 gr., and potassium bromide 20 gr. per oz.

[P1] **Elixir Valibrom Compound** contains opium alkaloids equivalent to 0.03% of anhydrous morphine.

Euvalerol (*Allen & Hanburys, London*). Compound elixirs of valerian. "A": 1 oz. = 1 dr. of ammoniated tincture of valerian. [P1-81-84] "B": Elixir "A" with phenobarbitone $\frac{1}{2}$ gr. per dr. "C": Elixir "A" with ammonium bromide 30 gr. and strontium bromide 15 gr. per oz. *Dose*.—1 to 2 teaspoonfuls thrice daily in each case.

Valerianate (Gabail) (*Anglo-French Drug Co., London*). Non-alcoholic extract of valerian root, deodorised. *Dose*.—1 teaspoonful 3 or 4 times daily.

Acidum Valerianicum (Fr. Cx., P. Helv. V).

Dose.—1 to 5 minims (0.06 to 0.3 ml.), in syrup or in gelatin capsules.

Consists principally of optically inactive isovalerianic acid, $(\text{CH}_3)_2\text{CH}\cdot\text{CH}_2\cdot\text{COOH}$, with more or less dextrorotatory methyl-ethylacetic acid, $(\text{C}_2\text{H}_5)(\text{CH}_3)\text{CH}\cdot\text{COOH} = 102.1$.

An oily liquid, sp. gr. about 0.93, soluble 1 in 30 of water, from which it separates on the addition of soluble salts such as calcium chloride. It is miscible with ether and alcohol.

Given in hysteria and nervous affections.

Ammonii Valerianas (Fr. Cx.). *Syn.* AMMONII VALERAS.

Dose.—1 to 8 grains (0.06 to 0.5 g.). In masses of flat, colourless, deliquescent crystals, with a strong valerian odour, very soluble in water and alcohol. As supplied commercially it is an acid salt containing ammonia equivalent to only 35% of $\text{C}_4\text{H}_9\cdot\text{COONH}_4$. A 25% aqueous solution is prepared for dispensing.

Soluté de Valérianate d'Ammoniaque Composé (Fr. Cx.).

Dose.—2 to 4 drachms (7 to 15 ml.).

Valerianic acid 3, ammonium carbonate *q.s.* (about 4) to neutralise, extract of valerian 2, alcohol 90% 5, orange-flower water to 100, all by weight. A "nerve tonic".

Amyl Valerianate. $\text{C}_5\text{H}_{11}\cdot\text{C}_6\text{H}_5\text{O}_2 = 172.2$.

The isoamyl ester of isovalerianic acid. A mobile liquid, sp. gr. 0.858. Miscible with alcohol. Is known as "Apple Essence."

Ferri Valerianas. *Syn.* FERRI VALERAS. $\text{Fe}_3(\text{C}_4\text{H}_9\text{O}_2)_2(\text{OH})_4 = 381.9$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

A dark red or brown amorphous powder with slight odour. Insoluble in water, soluble in alcohol 90%. A nerve stimulant and emmenagogue, and has been used in anæmia.

Sodii Valerianas (B.P.C.). *Syn.* SODII VALERAS. $\text{C}_4\text{H}_9\text{O}_2\text{Na} = 124.1$.

Dose.—1 to 5 grains (0.06 to 0.3 g.).

In white hygroscopic masses, soapy to the touch. Used as a nerve sedative in hysteria and other neurotic conditions.

Zinci Valerianas (B.P.C.). *Syn.* ZINCI VALERAS.

$(\text{C}_4\text{H}_9\cdot\text{COO})_2\text{Zn}\cdot 2\text{H}_2\text{O} = 303.6$.

White powder or in pearly crystals with valerianic odour and sweet astringent taste.

Soluble 1 in 120 of water, 1 in 60 of alcohol 90%, 1 in 500 of ether.

Incompatible. Acids and metallic salts. (See also zinc salts.)

Used similarly to other valerian preparations.

Neo-Bornyval (*Riedel-de Haen, Berlin; Endocrines-Spicer, Watford*). *iso*-Valerylglucolic ester of borneol. Perles contain 0.25 g. *Dose*.—1 or 2 perles twice or thrice daily. Cardiac neurosis, nervous gastric troubles, etc.

[D-P1-S1] Trivalin (*Saccharin Corporation, London*). *Dose*.—Hypodermically, 8 to 15 minims ($\frac{1}{2}$ to 1 ml.) once to 3 times daily. A solution containing per ml. 0.0037 g. ($\frac{1}{27}$ gr.) of caffeine valerianate, 0.0054 g. ($\frac{1}{36}$ gr.) of cocaine valerianate and 0.019 g. ($\frac{3}{8}$ gr.) of morphine valerianate. Also available in capsules. Said to have the therapeutic effects of morphine without disadvantages. Anodyne, e.g., in painful dressings, inoperable cancer, gallstone colic and neuralgia. Is also made in combination with hyoscine valerianate $\frac{1}{18}$ grain (0.00056 g.) per ml., for treatment of the insane. *Dose*.—0.25 to 0.5 ml. daily.

Valisan (*Schering, London*). Borneol ester of bromoisovalerianic acid. *Dose*.—2 or 3 perles of 3.75 grains several times a day.

Valyl (*Bayer Products, London*). Valeryl-diethylamide. *Dose*.—2 or 3 perles of 0.125 g. several times a day.

Castor (*B.P.C., P. Austr.*).

The dried preputial follicles and secretions from the beaver, *Castor fiber* (Rodentia), in brown pieces. *Fr. Cx.* describes the two commercial varieties, Canadian and Russian. Contains from 35 to 70% of alcohol-soluble matter. Stimulant and anti-spasmodic. Is given in dysmenorrhœa as tincture.

Tinctura Castorei (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 20. It must be suspended in water with mucilage of acacia.

Sumbul (*B.P.C.*). *Syn.* MUSK ROOT. Dried transversely sliced root of *Ferula Sumbul* (Umbelliferae). Used as nerve sedative and anti-hysterical.

Tinctura Sumbul (*B.P.C.*).

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.). 1 in 10. When diluted it requires addition of mucilage of acacia to suspend the resin.

ZINCUM

$Zn = 65.38.$

Incompatibilities of Zinc Salts. Alkaline carbonates, and alkalis in general, vegetable infusions and milk.

Antidotes. Do not use emetic or stomach tube, patient is probably vomiting. Give copious draughts of sodium or potassium bicarbonate dissolved in warm water. Keep patient lying down; apply heat to abdomen. Give demulcents, such as milk and eggs, freely. Tannic acid or medicinal charcoal has been used. Morphine, $\frac{1}{4}$ gr. hypodermically, if pain is severe.

Zinci Acetas (*B.P.C., U.S.P. XI*).

$Zn(CH_3COO)_2 \cdot 2H_2O = 219.5.$

Dose.—1 to 2 grains (0.06 to 0.12 g.). 10 grains (0.6 g.), or more, as an emetic.

White crystals with faint acetous odour. Soluble 1 in 2.5 of water, about 1 in 40 of alcohol 90%. Used as astringent lotion ($\frac{1}{2}$ to 1%).

Zinci Bromidum (B.P.C.). $\text{ZnBr}_2 = 225.2$.

Dose.—2 to 5 grains (0.12 to 0.3 g.) in water.

White deliquescent powder. Soluble 4 in 1 of water, 2 in 1 of alcohol 90% and in ether. A little dilute hydrobromic acid will make a clear solution. Has been used in epilepsy.

Zinci Carbonas (B.P.C.). *Syn.* ZINC SUBCARBONATE.

A white impalpable powder varying slightly in composition but approximately corresponding to $\text{ZnCO}_3 \cdot 2\text{ZnO} \cdot 3\text{H}_2\text{O}$. Insoluble in water and alcohol. Mildly astringent and protective, and occasionally used similarly to the oxide in lotions or dusting powders.

Zinci Chloridum (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.).
 $\text{ZnCl}_2 = 136.3$.

In deliquescent sticks, masses or granular powder. Owing to presence of oxychloride it is not completely soluble in water, but solutions clear on neutralising to methyl orange with hydrochloric acid.

Soluble 1 in less than 1 of water, 1 in about $1\frac{1}{2}$ of alcohol 90%, 1 in 2 of glycerin, and in ether.

Uses. A powerful, odourless caustic, astringent, antiseptic and anti-putrescent. As a lotion for wounds and ulcers 10 to 20 gr. per oz. is used. A paste prepared with starch and glycerin is sometimes used in lupus and for ulcers. As an astringent antiseptic in ophthalmology, solutions containing $\frac{1}{2}$ to 2 gr. per oz. are used.

In the treatment of erosion of teeth, is useful to touch painful spots, or the addition of a little to chloroform-mastic forms a useful paint. (The zinc chloride must be dissolved in a small quantity of dehydrated alcohol, with a trace of hydrochloric acid if necessary, and added to the chloroform-mastic solution.)

TUBERCULOUS ULCERATION. Pain abolished and ulcerations healed after 5 applications of solution of 3 g. zinc chloride in 10 ml. of 80% alcohol. Repeat every 3 weeks: tincture of iodine applied daily.—*per J. Amer. med. Ass.*, i/1927, 1039.

Collutorium Astringens (R.D.H.).

Zinc chloride 5 gr., zinc sulphate 10 gr., water to 1 oz.

U.C.H. uses zinc chloride 0.4, zinc sulphate 0.4, spirit of chloroform 0.4, aniline yellow *q.s.*, dilute hydrochloric acid 0.15, peppermint water to 100. Use half a teaspoonful to half a tumblerful of water.

Collyrium Zinci Chloridi (B.P.C.). 0.1% *w/v*.

Guttæ Zinci Chloridi (R.L.O.H., St. T.H.). $\frac{1}{2}$, 1 or 2 gr. per oz.

Guttæ Zinci Chloridi cum Alcohol (Brompton H.). Zinc chloride 5 gr., alcohol 90% $\frac{1}{2}$ oz., water $\frac{1}{2}$ oz. For Eustachian self-inflator.

[D-P1-81] **Guttæ Zinci Chloridi cum Cocainæ Hydrochlorido.**

$\frac{1}{2}$, 1 or 2 gr. with cocaine hydrochloride 10 gr. per oz.

Injectio Zinci Chloridi (L.H.). For vaginal use.

Zinc chloride 5 gr., water to a pint.

Liquor Zinci Chloridi (B.P.C.).

Contains the equivalent of about 40% *w/v* of zinc. Sp. gr. 1.53.

4 m. of this solution = 3 gr. of solid zinc chloride. On diluting, a trace of hydrochloric acid will be necessary to clear it.

Lotio Zinci Chloridi (R.L.O.H.). $\frac{1}{2}$ or 1 grain to 1 ounce.

Zinci Oxidum (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.).
ZnO = 81.38. *Syn.* FLORES ZINCI (P. Jap. V).

Dose.—5 to 10 grains (0.3 to 0.6 g.).

Has been used for nervous debility, migraine, hysteria, and for the night-sweats of phthisis. Chiefly employed externally as a mild astringent and protective in ointments, lotions and dusting powders for skin affections.

Has definite bactericidal properties. While it is almost neutral so far as the cells of the skin are concerned, it is split up by acid-producing microbes into disinfectant compounds.—Haxthausen, per *Prescriber*, 1929, 330.

MUSTARD GAS BURNS. The following cold cream was found soothing and protective: zinc oxide 360 gr., oil of lavender 30 m., powdered tragacanth 360 gr., hydrous wool fat 240 gr., lime water to 6 ounces.—R. J. Rowlette, *Practitioner*, ii/1940, 202.

VINCENT'S ANGINA. The condition may be successfully treated by packing the gum margin with a paste prepared by mixing zinc oxide with eugenol or oil of cloves. Wisps of cotton wool are saturated with the mixture and tucked into the interdental spaces, especially between the loose gum margins and the teeth. It is of first importance that the dressing be carried into the parodontal sulcus all round every tooth, but without pressure and without causing pain. More wisps are spread over the first and pressed into place with a moist swab and smoothed over with a gloved finger. The mixture rapidly sets in the presence of moisture and forms a light cement casing over the gum margins. The results are very satisfactory. Within a few hours all pain and distress ceases and the patient can at once resume normal diet. When the dressing is removed 48 hours later, the gum margin is a delicate pink colour, and entirely free from slough, acute inflammation or undue tenderness. It is advisable, however, to repeat the dressing for a further four days. After-care is important and consists in applying daily friction to the epithelium covering the gum margins.—E. W. Fish, *Lancet*, ii/1938, 558.

Cremor Zinci (B.P.C.). Zinc oxide 32% in wool fat, almond oil and solution of calcium hydroxide.

Cremor Zinci (St. M. H.).

Zinc oxide 480 gr., wool fat 3 dr., olive oil 1 oz., solution of calcium hydroxide 1 oz. Useful in acute eczema in the drying stage where there is much redness.

Cremor Zinci cum Calamina (Mid. H.). Zinc oxide 30 gr., calamine 30 gr., thymol 2 gr., hydrous wool fat 2 dr., liquid paraffin to 1 oz. For eczema of the meatus.

Emplastrum Zinci Oxidi (B.P.C.). Spread with a rubber adhesive compound containing not less than 20% of zinc oxide.

Gelatinum Zinci (B.P.). *Syn.* UNNA'S PASTE.

Zinc oxide 15% in a glycerin-water-gelatin base. For use it is melted and applied with a brush to eczematous surfaces. Ichthammol, resorcinol and other medicaments may be added.

VARICOSE ULCERS treated by the above after thoroughly cleansing the leg or foot with soap and spirit, alcohol, mercuric chloride solution 1 in 4000 to 1 in 2000, or 1 in 40 carbolic lotion. The paste, previously melted and cooled, is poured over the ulcer. The part is then dried and the paste is bandaged on with a gauze bandage. Another layer of paste is applied; this is covered with a bandage, and so on until four layers have been applied. May be left in many cases undisturbed for weeks, but it is safer to dress again after 2 or 3 days with salicylic talc if any discharge. It forms a new skin, pliable and slightly elastic.

A preparation of the composition zinc oxide 1, gelatin 2, glycerin 3, water 4 parts, of value in arthritis, dermatitis, erysipelas, erythema nodosum and simplex, myositis, periostitis, phlebitis and varix of the leg, synovitis, "tennis leg," minor thrombosis, and contusions and sprains of joints or limbs. It is the treatment *par excellence* for chronic varix and acute phlebitis. Method of preparation and application of dressings.—W. Muir Smith, *Brit. med. J.* i/1927, 137.

P2] Gelatin Compound Phenolised. Gelatin 625 parts, zinc oxide 250, glycerin 1900, water 1900 containing 1.5% of phenol. Heat till liquid and apply with brush, apply spiral bandage, and brush on another layer, repeat to total of three bandages and four layers of the preparation. For chronic ulcers, unhealed secondary burns and varicose veins.—*J. Amer. med. Ass.*, ii/1929, 1809.

A further modified form: Zinc oxide 10, glycerin 10, glue 4, acacia 5, water 30. Spread on bandages for varicose ulcers.—C. J. and K. M. Cellan-Jones, *Brit. med. J.*, ii/1930, 560.

Gelatinum Zinci et Ichthammolis (B.P.C.). *Syn.* PASTA ZINCI ET ICHTHAMMOLIS. Ichthammol 2% in a zinc oxide and glyco-gelatin basis.

Ligamentum Pastæ Zinci (B.P.C.). *Syn.* ZINC PASTE BANDAGE. Prepared with a paste containing not less than 17% of zinc oxide.

Pasta Carbonis et Zinci. Soak gelatin 16 in a portion of the total glycerin required (20), and a portion of the water (50 in all required), for 12 hours. Make a paste of boric acid 6, zinc oxide 6 and charcoal 18 with remainder of liquids, mix on water-bath, and pour into suitable vessel to set.

For leg ulcers the charcoal is a useful addition. Boric lotion fomentation should first be carried out to clean the ulcer. If tending to be sluggish red lotion helps.

Pasta Zinci cum Amylo (St. M. H.).

Zinc oxide, starch, liquid paraffin, wool fat, of each equal parts. For intertrigo and excessive perspiration.

Pasta Zinci Oxidi Composita (B.P.). *Syn.* ZINC PASTE.

Zinc oxide and starch, of each 25%, in white soft paraffin.

Pasta Zinci Oxidi cum Acido Salicylico (B.P.C.). *Syn.* LASSAR'S PASTE.

Salicylic acid 2% in a zinc oxide, starch, and white soft paraffin paste.

Useful in the treatment of skin affections, especially for dry eczema with much scaling. In irritating conditions the acid may be omitted. It may be retained and increased in amount where there is less inflammatory reaction.

Pasta Zinci Oxidi (Fr. Cx.). *Syn.* LASSAR'S PASTE (Fr. Cx.). Contains equal parts of starch, zinc oxide, wool fat and Vaseline.

Pasta Zinci Oxidi cum Aqua (Fr. Cx.). *Syn.* DARIER'S PASTE. Equal parts of zinc oxide, calcium carbonate, glycerin and water.

[P1] Pilulæ Zinci Oxidi et Belladonnæ (B.P.C.).

Dose.—1 pill.

Contains zinc oxide 2 gr. and extract of belladonna $\frac{1}{2}$ gr.

[P1] Pilula Zinci cum Belladonna (T.H.).

Zinc oxide 2 gr., extract of belladonna $\frac{1}{2}$ gr. *Dose.*—1 or 2 at bedtime.

Pulvis Zinci et Acidi Borici (B.P.C.).

Equal parts of zinc oxide and boric acid.

Pulvis Zinc. et Acid. Boric. (N.I.F.). Boric acid 240 gr., zinc oxide 240 gr., talc 470 gr., salicylic acid 10 gr.

Pulvis Zinci et Amyli (B.P.C.).

Equal parts of zinc oxide and starch.

Pulvis Zinci et Amyli Compositus (B.P.C.).

Equal parts of zinc oxide, starch, boric acid and purified talc, perfumed with oil of geranium.

Unguentum Benzoini et Zinci (C.X.H.). Compound tincture of benzoin 2, ointment of boric acid 4, ointment of zinc oxide 4, olive oil 1. Gives relief in, and stimulates healing of, cracked nipples and small ulcers and fissures.

Unguentum Wilsoni (P. Jap. V). *Syn.* WILSON'S OINTMENT.

Zinc oxide 1, benzoinated lard 4.

Ung. Z.E.B. (N.I.F.). Ointment of zinc oxide 160 gr., oil of eucalyptus 20 m., yellow ointment of boric acid to 480 gr.

Unguentum Zinci cum Balsamo Peruviano (B.P.C.).

Balsam of Peru 4% in ointments of zinc oxide and boric acid.

Unguentum Zinci cum Benzoino (B.P.C.).

Compound tincture of benzoin about 1 in 8 in ointment of zinc oxide.

Unguentum Zinci et Olei Ricini (B.P.C.).

Zinc oxide and castor oil in benzoinated lard, corresponding to a mixture of equal weights of castor oil and the zinc ointment of the B.P. '14.

Unguentum Zinci et Olei Ricini cum Benzoino (B.P.C.).

Zinc oxide, castor oil and compound tincture of benzoin in benzoinated lard.

Unguentum Zinci Oxidi (B.P.). *Syn.* UNGUENTUM ZINCI.

Zinc oxide 15% in simple ointment. Does not mix with castor oil (see Unguentum Zinci et Olei Ricini).

The zinc ointment of the B.P. is, on the whole, the most generally suitable for all forms of dermatitis.—H. Haldin-Davis, *Brit. med. J.*, i/1935, 289.

Unguentum Zinci Oxidi (U.S.P. XI).

Zinc oxide 20, liquid petrolatum 10, wool fat 5, white wax 5, white petrolatum 60.

Unguentum Zinci Oxidi Compositum (St. T. H.). *Syn.* IGNOFORM OINTMENT.

Zinc oxide 100 gr., cocoa butter 10 gr., solution of hamamelis 10 m., distilled water 80 m., wool fat 150 gr., yellow soft paraffin to 1 oz.

Pellanthum (Handford & Dawson, Harrogate). A water-soluble artificial skin containing 20% of zinc oxide. For skin affections. Is also available with ichthammol and in other combinations.

[P1] **Proctoids (John Wyeth, London).** Suppositories containing zinc oxide 10, boric acid 10, bismuth oxyiodide 1.67, bismuth carbonate 8.33, powdered extract of belladonna 0.5, ephedrine sulphate 0.1, balsam of Peru 1.0, cocoa butter to 100. For hemorrhoids, pruritus ani, fistula, etc.

Zinc Oxychloride. Used as a dental filling. The "powder" is of zinc oxide and the "liquid" zinc chloride solution. Mix thoroughly. Sometimes used as a root-filling and for sensitive dentine; will irritate a live pulp. The following are also used:—

Zinc Oxyphosphate. It is supplied in the form of dried powdered zinc oxide in various colours, with the "liquid," which consists of phosphoric acid. These are mixed intimately prior to use as a flooring when not too near the pulp.

Zinc Oxysulphate. Consists of calcined zinc sulphate and zinc oxide; mucilage of acacia is used to mass.

Zinci Sulphas (B.P., U.S.P. XI, P. Helv. V, Fr. Cx.).

$\text{ZnSO}_4 \cdot 7\text{H}_2\text{O} = 287.55.$

Dose.—1 to 3 grains (0.06 to 0.2 g.); emetic dose 10 to 30 gr. (0.6 to 2 g.).

Soluble 1 in 0.65 of cold water, 5 in 1 of boiling water, 1 in 1 of glycerin; insoluble in alcohol 90%.

Uses. $\frac{1}{4}$ to 1% solutions, frequently combined with alum or sometimes ferrous sulphate, are used for inflammatory conditions

of the mucous membrane, *e.g.*, gleet and gonorrhœa. A 1% solution has been used as an intranasal spray in the prophylaxis of poliomyelitis (*see* Vol. II), but is of doubtful value. 1 in 500 may be added to eye lotions in conjunctivitis. A 0.5% solution requires 1 g. of sodium chloride or 6.5 g. of sodium sulphate per 100 millilitres to render it isotonic with the lachrymal secretion.

Smarting from zinc or copper salts in collyria may be relieved by using a saturated solution of potassium chlorate instead of water.

Experimental evidence indicates that the three types of cells in the sensory epithelium may be destroyed by 1% zinc sulphate and that replacement of only the non-sensory cells occurs. Those who contemplate the use of this solution as a protective (*e.g.*, in poliomyelitis) should be made aware of the destructive effect of this salt on the delicate olfactory mucous membrane.—C. G. Smith, *Canad. med. Ass. J.*, ii/1938, 138.

The loss of the sense of smell, which is an indication of the thoroughness of the treatment and of continued resistance to infection, may become lasting. There are reports of several cases in adults who have not regained their sense of smell after more than six months. Caution about the further use of the spray in man until more is known about the mechanism underlying the protection in monkeys.—E. W. Schultz and L. P. Gebhardt, *J. Amer. med. Ass.*, i/1938, 2024.

Zinc Sulphate Points are moulded for intra-uterine use. Points of equal parts zinc sulphate and alum, and of copper sulphate are also made.

Collyrium Astringens Luteum. *Syn.* GUTTÆ HORSTI, HORST'S EYE WASH. Ammonium chloride 2, zinc sulphate 5, distilled water 890, dissolve and add camphor 2, dissolved in diluted spirit (sp. gr. 0.895) 100, then add saffron 1. Digest 24 hours and filter. As an astringent lotion it is used for conjunctivitis.

A comprehensive review of the pharmacy of eye lotions covering type of glass for containers, sterilisation and antiseptic agents, isotonicity and pH. Formulæ are given for lotions claimed to be isotonic, sterile, stable and to have the optimum pH, namely 7.8.—F. Henrioult, *J. pharm. Belg.*, 1936 (a series of 15 papers).

Collyr. Zinci Co. (N.I.F.). Boric acid 5 gr. and zinc sulphate 1 gr. in water to 1 oz. For use dilute with an equal quantity of hot water.

Collyrium Zinci Sulphatis (B.P.C.). 0.2% w/v.

Guttæ Zinci Sulphatis (R.L.O.H.). $\frac{1}{2}$, 1 or 2 gr. per oz.

Gutt. Zinc. Sulph. c. Acid. Boric. (N.I.F.). Zinc sulphate $\frac{1}{2}$ gr., boric acid 1 gr., distilled water to 2 dr.

Injectio Zinci Sulphatis (L.H.). For vaginal use.

Has 60 grains in 1 pint of water, *i.e.*, 0.69% or 1 in 144.9.

Lotio Potassæ Sulphuratæ (B.P.C.). *Syn.* LOTIO ZINCI SULPHIDI, LOTIO ALBA.

Contains zinc sulphide freshly precipitated by interaction of 10 gr. of sulphurated potash and 10 gr. of zinc sulphate per oz. of rose water. Acne vulgaris is well treated with this.

Lotio Rubra (B.P.C.). Contains zinc sulphate 2 gr., with compound tincture of lavender and water to 1 oz. *R.L.O.H.* is similar but with 1 gr. of zinc sulphate per oz. It is often applied for its astringent effect to ulcers.

[P2] **Lotio Spiritus Sulph. Co. (L.S.H.).** Zinc sulphate 30 gr., sulphurated potash 30 gr., water to 3 oz.; mix and add phenol 1 dr., resorcinol 1 dr., industrial methylated spirit 6 oz.

Lotio Sulphatum. Zinc sulphate 30 to 40 gr., alum 30 to 40 gr., ferrous sulphate 20 gr., copper sulphate 2 gr., water to 8 oz.

Lotio Sulphuris cum Zinco (St. J.H.). Precipitated sulphur 15 gr., zinc sulphate 15 gr., sulphurated potash 15 gr., water to 1 oz.

Pessus Zinci Sulphatis (B.P.C.) contains 5 gr. (0.3 g.).

Pulvis Zinci Sulphatis Compositus (B.P.C.). *Syn.* PULVIS ACIDI BORICI COMPOSITUS, PULVIS ANTISEPTICUS SOLUBILIS.

Zinc sulphate, 1 in 8, with eucalyptol, menthol, phenol, thymol, salicylic acid and boric acid.

Calamina (B.P.C.). *Syn.* CALAMINA PRÆPARATA.

A basic zinc carbonate, with or without zinc oxide, yielding 68 to 90% of residue (ZnO) on ignition, and suitably coloured with iron oxide. It was formerly obtained by igniting the native carbonate, but is now prepared by precipitation.

Linimentum Calaminæ (B.P.C.).

Calamine about 20 gr. and zinc oxide about 15 gr. in an emulsion of liquid paraffin and solution of calcium hydroxide to 1 oz. This preparation has the advantage over similar preparations made with vegetable oils of not becoming thicker on storage.

In chronic eczema, *e.g.*, to a freely-weeping surface with redness and itching, apply with brush or cotton-wool swab, or spread on thin washed butter muslin. Very important that the inflamed surface should not be treated with a hot thick dressing. Perchloride 1 in 3000 to 1 in 2000 may be a desirable addition.

Linimentum Calaminæ (L.S.H.). Calamine 40 gr., zinc oxide 20 gr., solution of calcium hydroxide and sesame oil of each $\frac{1}{2}$ oz.

St. G.H.—Calamine 30 gr., zinc oxide 30 gr., glycerin of lead subacetate 6 m., olive oil $\frac{1}{2}$ oz., solution of calcium hydroxide to 1 oz.

W.H.—Calamine 30 gr., zinc oxide 30 gr., wool fat 4 gr., oleic acid 3 m., liquid paraffin $\frac{1}{2}$ oz., solution of calcium hydroxide to 1 oz.

P.E.H.C., St. M.H. (Lotio Calaminæ Oleosa)—Calamine 40 gr., zinc oxide 20 gr., solution of calcium hydroxide 3 dr., olive oil to 1 oz.

St. T.H.—Calamine 40 gr., zinc oxide 30 gr., oil of lavender 1 m., solution of calcium hydroxide $\frac{1}{2}$ oz., arachis oil 225 m.

Linimentum Calaminæ Compositum (B.P.C.).

Calamine 43 $\frac{1}{2}$ gr., zinc oxide about 22 gr. and zinc oleostearate about 11 gr. in wool fat, white soft paraffin and liquid paraffin to 1 oz.

Linimentum Calaminæ Compositum (U.C.H.). Prepared calamine 9, zinc oxide 5, zinc oleostearate 3, wool fat 3, soft paraffin 20, liquid paraffin to 100.

Lotio Calaminæ (B.P.C.).

Calamine about 65 gr. and zinc oxide about 22 gr. with glycerin and rose water to 1 oz.

An excellent slight astringent for itching skin diseases. Used in eczema, especially where the surface is red and tender, also to conceal acne spots on the face. [P2] Mercuric chloride 1 gr. may be added to 6 oz. as antiseptic. For chilblains, sunburn, etc., this lotion or the liniment made double or treble strength, allays the intense irritation.

The following formulæ for calamine lotion are taken from hospital pharmacopœias:—

C.X.H.—Calamine 15 gr., zinc oxide 10 gr., glycerin 30 m., solution of calcium hydroxide 80 m., water to 1 oz.

Gl. Orm. H.—Zinc oxide 30 gr., calamine 30 gr., glycerin 24 m. solution of calcium hydroxide 24 m., water to 1 oz.

L.S.H.—Calamine 20 gr., zinc oxide 20 gr., glycerin 30 m., solution of calcium hydroxide 5 dr., water to 1 oz.

Mid. H.—Calamine 30 gr., zinc oxide 20 gr., glycerin 15 m., water to 1 oz.

P.E.H.C.—Calamine 40 gr., zinc oxide 20 gr., glycerin 20 m., water to 1 oz.

St. G.H.—Calamine 30 gr., zinc oxide 30 gr., glycerin of lead subacetate 5 m., glycerin 30 m., water to 1 oz.

St. J.H.—Calamine 20 gr., zinc oxide 20 gr., glycerin 30 m., solution of calcium hydroxide 5 dr., water to 1 oz.

St. M.H.—Calamine 30 gr., zinc oxide 30 gr., glycerin 30 m., solution of calcium hydroxide to 1 oz.

St. T.H.—Calamine 20 gr., zinc oxide 20 gr., glycerin 24 m., solution of calcium hydroxide 1 dr., water to 1 oz.

U.C.H.—Calamine 9, zinc oxide 5, glycerin 3, water to 100.

W.H.—Calamine 60 gr., glycerin 10 m., solution of calcium hydroxide 2 dr., water to 1 oz.

Lot. Calamin. Co. (N.I.F.). Calamine 3 dr., zinc oxide 3 dr., glycerin 3 dr., solution of calcium hydroxide to 8 oz.

Lot. Calamin. Oleos. (N.I.F.). Calamine 180 gr., liquid paraffin 4 oz., oleic acid 20 m., wool fat 35 gr., solution of calcium hydroxide to 8 oz.

Unguentum Calaminæ (B.P.C.).

Calamine 1 in 6 in yellow soft paraffin.

[P1-81] **Unguentum Plumbi cum Calamina (St. G.H.).** *Syn.* ERYSIPELAS DRESSING.

Plaster of lead 3 dr., calamine 20 gr., olive oil 90 m., lard to 480 gr.

Stannum. Sn = 118.7. Given internally, pure tin powder is probably not absorbed. Was formerly used as a tænicide. From 4 to 15 g. were given suspended in syrups or made into an electuary and followed in from 3 to 6 hours by a brisk cathartic. Some of the salts (chiefly chloride) are credited with vermifugal properties. In dose of $\frac{1}{16}$ to $\frac{1}{2}$ grain the chloride has been used as an antispasmodic in chorea, epilepsy and other convulsive diseases.

Stanni Oxidum (Stannic Oxide). $\text{SnO}_2 = 150.7$.

Dose.—8 to 15 grains (0.5 to 1 g.) daily.

A white or greyish-white powder insoluble in water and hydrochloric acid, soluble in alkalis, forming stannates. Administered for staphylococcal infections. Used chiefly technically and diluted as a cosmetic, *e.g.*, as nail polish.

Distinguish from stannous oxide, SnO , which is dark grey—nearly black.

Tab. Stann. Co. (N.I.F.). Tin 1.7 gr., tin monoxide 0.3 gr.

Stanniform (Whiffen, London). Preparations containing methyl stannic iodide. Available as ointment, dusting powder, lotion and tablets. For treatment of boils, ulcers, carbuncles, whitlows, acne, eczema, burns, chilblains, etc.

Stannoxyl (Robert et Carrière, Paris; Anglo-French Drug Co., London).

Preparations of metallic tin, tin oxide or tin salts for the treatment of boils, carbuncles, acne, styes and all staphylococcal infections. Harmless and prompt in action, definite results being obtained in 5 to 6 days. **Tablets** contain metallic tin 42½% and tin oxide 7½%. *Dose.*—4 to 8 daily. May be supplemented by local applications of the following:—**Liquid** contains 25% of tin protochloride. Used as a 2 to 4% solution in water. **Glycerin** contains 2% of the chloride in glycerin. For use in furunculosis of the nasal and aural passages. **Ampoules**, containing equivalent of 0.004 g. of metallic tin in 2 ml., for hypodermic or intramuscular injection. A **Bath** and **Gauze** are also prepared.

Tin-Ox (John Bell, Hills & Lucas, London). Combination of tin and tin oxide in tablet form.

Titani Oxidum. TiO_2 . *Syn.* TITANIC OXIDE, TITANIUM DIOXIDE. A white powder insoluble in water, soluble in alkalis and in acids. Used in face powders and other toilet articles in place of zinc oxide.

Titanium salts appear markedly to diminish erythema and pruritus in certain dermatoses. An ointment of the following formula has been found efficacious in a variety of dermatological conditions: titanium salicylate 3, titanium peroxide 5, titanium boric acid 5, titanium oxide 12, titanium tannate 0.1, excipient to 100.

Siccolam (*British Drug Houses, London*). A desiccant paste for exudatory dermatoses, containing titanium dioxide, zinc oxide and small quantities of purified silicates in a fat-free base.

ZINGIBER

B.P., U.S.P. XI, P. Helv V, Fr. Cx., etc.

Dose.—5 to 15 grains (0.3 to 1 g.).

The dried rhizome (scraped) of *Z. officinale* (Zingiberaceæ).

Must yield not less than 4.5% to alcohol 90%, and not less than 10% to water; *U.S.P. XI* requires minimum of 4.5% to ether. *P.G. VI* has the rhizome not scraped.

Uses. Ginger has carminative properties and is sometimes added to purgatives to prevent griping. The tincture is valuable for the relief of acute flatulent distension or colic.

Fluidextractum Zingiberis (*U.S.P. XI*). *Average dose.*—10 minims (0.6 ml.). 1 ml. represents 1 g. of ginger, and it contains from 69 to 76% v/v of alcohol.

Oleoresina Zingiberis (*B.P.C.*). *Syn.* GINGERIN.

Dose.— $\frac{1}{4}$ to 1 grain (0.015 to 0.06 g.).

The acetone-soluble matter of ginger.

Syrupus Zingiberis (*B.P.*).

Dose.— $\frac{1}{2}$ to 2 drachms (2 to 8 ml.).

Strong tincture of ginger 1, syrup q.s. to produce 20.

Tinctura Zingiberis Fortis (*B.P.*). *Syn.* ESSENCE OF GINGER.

Dose.—5 to 10 minims (0.3 to 0.6 ml.).

1 in 2 by percolation with alcohol 90%.

Mist. Zingib. c. Rheo (*N.I.F.*).

Sodium bicarbonate 10 gr., strong tincture of ginger 2½ m., oil of peppermint ½ m., concentrated infusion of rhubarb 15 m., concentrated compound infusion of gentian 15 m., chloroform water to ½ oz.

Tinctura Zingiberis Mitis (*B.P.*). *Syn.* TINCTURA ZINGIBERIS.

Dose.— $\frac{1}{2}$ to 1 drachm (2 to 4 ml.).

Strong tincture of ginger, 1 in 5, with alcohol 90%.

Curcuma (*B.P.C., Fr. Cx.*). *Syn.* TURMERIC ROOT.

The dried rhizome of *C. domestica* (Zingiberaceæ). Used in curry powders and condiments. **Tinctura Curcumæ**, 1 in 6, is used as a colouring agent and for the preparation of turmeric paper.

Intravenous injection of curcumin, the pigment contained in turmeric, produces considerable increase of the flow of bile and rapid emptying of the gall-bladder. Clinically, oral administration of preparations containing curcumin shows remarkably good results in chronic cholecystitis.—A. Oppenheimer, *Lancet*, i/1937, 619.

Zedoary (*Fr. Cx., P. Jap. V*), the rhizome of *Curcuma Zedoaria* (Zingiberaceæ), resembles ginger in odour and taste.

VACCINES, SERA, TOXINS AND ANTITOXINS

Preparations made from bacteria, or from the products of bacterial activity, are used for the prophylaxis and treatment of infectious diseases. This form of treatment assists the natural defensive mechanism of the body. It is well known that some people possess an inherent immunity or insusceptibility to certain diseases; this is *natural immunity*. It is also common knowledge that certain diseases, *e.g.*, typhoid fever, scarlet fever and small-pox, rarely attack the same person twice; the first attack has caused the patient to develop a resistance to further attacks; this is *acquired immunity*.

Some bacteria produce during their growth a soluble poison or *toxin*, which can be obtained free from bacteria by filtering a culture through a bacteria-proof filter. A toxin so obtained is known as an *exotoxin* because it is outside, and diffuses readily from, the bacterial cell. Other types of pathogenic bacteria produce no trace of toxin in their cultures, but by grinding up the killed bacterial cells it is often possible to extract substances of a toxic nature from them. This type of toxin which remains attached to the protoplasm of the bacterial cells is termed an *endotoxin*.

If an exotoxin is injected in non-lethal doses, the body develops a certain resistance to it and by repeated injections of small doses of the toxin a considerable immunity can be produced. The substance formed in the blood, which neutralises the toxin, is known as *antitoxin* and is present in the blood serum after the blood cells have been removed by clotting. Such a serum is called *antitoxic serum*.

Similarly, it is possible to produce an immunity to pathogenic bacteria by inoculation into the body of dead or attenuated micro-organisms. The blood serum in this case becomes charged with antibacterial bodies—agglutinins, precipitins, bacteriolysins, etc. and the serum is referred to as an *antibacterial serum*.

It is usual to refer to antitoxic sera as “antitoxins” and to antibacterial sera simply as “sera.” Immunity which is developed by deliberate introduction into the body of bacteria or of their products is known as *artificial active immunity* and is practised in the various forms of prophylactic inoculation. The property of causing the formation of *antibodies* is possessed by a number of substances of a protein character. The general term *antigen* is used to describe any substance which, when injected into the body, will elicit the formation of substances antagonistic to itself. The antigens in common use for the production of artificial active immunity include bacterial vaccines, toxins, toxoids, antiviruses and bacteriophages.

Antitoxins and other antibodies developed in the blood of one individual can be transferred to a second individual by injecting a suitable quantity of the blood or serum containing the antibodies. In this way an immunity can be conferred on the second individual without calling upon his own defensive mechanism. This is

passive immunity, but the antibodies do not persist long in the blood of the second individual. Passive immunity is thus only a temporary phenomenon, whereas active immunity is usually of long duration. The antibodies used for temporary passive immunity are usually derived from the serum of horses immunised to the particular infection, and are either antitoxic or antibacterial in effect.

VACCINES

The ordinary type of bacterial vaccine is a suspension (emulsion) of the killed or attenuated bacteria in normal saline with, as a rule, $\frac{1}{2}\%$ of phenol or cresol as antiseptic.

Bacterial vaccines may be either (a) **Autogenous**, that is, prepared from cultures of the organisms obtained from the patient, or (b) **Stock vaccines** prepared from stock cultures. Opinions differ as to the relative merits of the two types. For *prophylaxis* it is obviously not possible to have an autogenous vaccine. For *treatment*, autogenous vaccines should, if possible, be used (a) when the infecting agent belongs to an ill-defined group, e.g., *B. coli* infections; (b) when the infection is severe and it is felt to be too great a risk to wait and see whether stock vaccine is effective; (c) when treatment with stock vaccine has failed.

In the case of *B. tuberculosis* an autogenous vaccine is not essential, and there are many obstacles in the way in other diseases, e.g., in gonorrhoea it may be difficult to secure a pure culture, and the loss of time may be of immense importance. In some cases a stock vaccine is used while a special one is being prepared from the case.

Freshly prepared autogenous vaccines are usually to be preferred to stock vaccines. A well-prepared stock vaccine is, however, to be preferred to a badly-prepared autogenous one. Vaccine therapy is of value in the treatment of rheumatoid arthritis, muscular rheumatism, recurrent iritis and other diseases due to focal infection; in staphylococcal infections, in otitis media, chronic sinusitis, unresolved pneumonia, bronchial asthma due to bacterial sensitisation and whooping-cough. Prophylactic immunisation by means of stock vaccines is practised for protection against typhoid fever, cholera, plague, meningococcal meningitis, whooping-cough, etc.—J. A. Kolmer, *J. Med. Soc., N.J.*, 1935, 472.

Vaccine Therapy aims at the production of *active immunity* by stimulating the development of specific antibodies within the blood serum of the patient. This action can be used to advantage in the prophylaxis of a number of infectious diseases of which typhoid fever and whooping cough are outstanding examples. Good results also follow the use of vaccines in the treatment of many chronic infections such as furunculosis, bronchitis and streptococcal infections. In pneumonia and gonorrhoea, appropriate vaccines are of value for raising the patient's immunity as an adjunct to chemotherapy.

The results obtained by increasing the power of the defensive mechanism, in other words, by increasing the immunity, are, in combination with sulphapyridine or sulphanilamide, far superior to immunotherapy or chemotherapy alone. The immunity can be increased specifically by vaccines and serums and non-specifically by a great variety of measures.—A. Fleming, *Proc. R. Soc. Med.*, 1939, 32, 911.

Administration. Vaccines may be injected into the subcutaneous tissue after the skin has been cleansed with alcohol or other suitable antiseptic. The container should be shaken before the dose of vaccine is withdrawn as the bacterial suspensions settle on standing.

Doses. The *prophylactic* doses indicated under the several vaccines in the following pages are suitable for adults in the majority of cases. The *intervals between doses* should usually be 7 days, and may sometimes be extended to 14 days with advantage; in some cases, *e.g.*, whooping cough, when the vaccine is given during the incubation stage of the infection, the intervals should be much shorter—2 or 3 days.

In *treatment*, as regards dose, it is a safe rule to follow that the more acute the infection and the more "toxic" the patient the smaller the initial dose. The doses stated are sufficiently small except possibly in severe generalised infections with marked toxæmia, in which perhaps the dose may be halved. As regards intervals there is no general rule, but the smaller the dose the shorter should be the interval between doses. Thus in septicæmic cases where minimal doses are employed these may be required daily or every other day. Clinical signs, and the focal and general reactions afford the necessary guidance.

The more acute the lesion and the greater the toxæmia of the patient the smaller should be the initial dose; in the case of the more chronic lesions a considerably higher initial dose may be safely used.

Reactions. Both localised and general reactions may follow the injection of a vaccine. The local effect is shown by some redness, tenderness, pain or swelling at the site of inoculation, and for an area of 2 to 3 inches around it. The reaction may develop soon after the injection or during the subsequent 24 hours. The general effects may be headache, malaise, slight rise in temperature and pulse rate, and occasionally a rigor. These may develop in about 12 hours and usually pass off within 24 hours.

Detoxicated Vaccines (*Research Products, London*). Thomson evolved the idea of treating bacteria, *e.g.*, the gonococcus, with an alkaline solvent, whereby the stroma or bacterial protoplasm and the toxic endotoxin are dissolved. On treatment with acid or acid salt the stroma is again precipitated, the idea being that the toxin is in the solution—the latter is rejected and the bacterial substance, after washing and suspending in slightly acid medium, is used therapeutically.

Dissolved Vaccines G.L. (*Glaxo Laboratories, London*). Bacterial cells in solution, a solution of sodium lauryl sulphate 0.025% being the solvent. The surface tension is also reduced, the sodium lauryl sulphate being absorbed by the toxins which are therefore liberated slowly, allowing the production of an adequate supply of antibodies. They are free from reaction and can be given in initial doses of $\frac{1}{2}$ to 1 ml. for adults and $\frac{1}{4}$ ml. for children, subsequent doses in both cases being 1 ml. The following are made: acne and staphylococcus, cold (prophylactic and curative), gonococcus, mixed influenza, staphylococcus, streptococcus, anti-typhoid-paratyphoid, whooping-cough (prophylactic and curative).

Sensitised Vaccines (*Sharp & Dohme, London*). *Syn. SEROBACTERINS.* Vaccines which have been treated with the corresponding antisera prior to their use.

The following are made: acne and staphylococcus, cold, coli, combined influenza, gonococcus, whooping-cough, pneumococcus, pneumococcus-streptococcus, staphylococcus, streptococcus, T.A.B.

Immunogens (*Parke, Davis, London*). A series of antigens of high activity and relative freedom from bacterial cells and toxins. The following are made: Gonococcus (combined), pertussis, pertussis (combined), pneumococcus, pneumococcus (combined), streptococcus, streptococcus (combined), streptococcus (arthritis).

A type of antigen based upon washing off 24-hour agar growths of the organism with normal saline, agitating to make a homogeneous suspension, and centrifuging. The antigens obtained in the washings are found to be more potent than broth filtrates. The toxic principles are left behind, the washed bacteria being practically as toxic as before treatment. Intramuscular injections thought to be best.

Phylacogens (*Parke, Davis, London*) are filtered, sterilised (72 hours) cultures of pathogenic micro-organisms, preserved with phenol 0.5%. The following Phylacogens are supplied: Pneumonia, rheumatism, gonorrhoea, erysipelas, and "mixed infection" (suggested for the treatment of all infections, acute or chronic, in which the condition is not due to a specific micro-organism). Nephritis is a contraindication to their use subcutaneously. Intravenous injection is contraindicated in nephritis, in arteriosclerosis, and in cases with severe and dangerous cardiac involvement. The initial dose should always be given subcutaneously.

Undenatured Bacterial Antigens (*Lilly, London*). *Syn.* U.B.A. Represent the natural antigenic complexes of the bacterial cells, are free from metabolites and other non-specific elements and constitute efficient immunising agents. They are standardised on the basis of their nitrogen content. The following are made: Acne mixed, coli mixed, gonococcus, pertussis, respiratory, staphylococcus, streptococcus.

Local Immunity to Infectious Diseases. The usual conception of the mechanism of immunity assumes that any change in the immunity level is generalised throughout the body, and that increased immunity brought out in response to stimulation by an antigen is accompanied by the formation of antibodies (antitoxins, precipitins, agglutinins, bacteriolysins, hæmolysins, etc.) in the blood serum.

Besredka claimed that certain tissues have a very low resistance to certain bacteria, though the other tissues may be able to deal with them easily. Hence, he argued, if the weak tissues be immunised the whole animal becomes immune to the infective organism. Thus he claimed that the skin is the weak spot in the case of anthrax, staphylococcus, and other infections, and the gut wall in typhoid, dysentery, etc. If these are immunised by local treatment then the animal becomes immune; he also says this is not accompanied by the formation of antibodies in the circulation.

Oral Administration of Vaccines. In accordance with Besredka's theory, the administration of vaccines by mouth has been advocated as an alternative to hypodermic injection. The only conditions in which oral vaccination has met with any measure of success are dysentery and typhoid (*see pp.* 1049, 1088).

A study of the use of dysentery vaccine *per os* was undertaken by the Medical Section of the League of Nations, and comprised the vaccination of 29,880 refugees in camps in Greece. As a result not one person contracted the disease, and in those regions where dysentery was epidemic this method of vaccination completely stopped the epidemics.

After reviewing much of the work done on oral vaccination against enteric fevers, the following conclusions emerge:—(1) On the evidence at present available it is very difficult to maintain that oral vaccination can be seriously considered as an alternative to vaccination by the subcutaneous route. (2) Oral vaccination may, however, be regarded as worth trying when the choice is between this and nothing.—A. Fleming, *Brit. med. J.*, ii/1939, 100.

Billivaccines (*La Biotherapie, Paris; Roberts, London*). A series of vaccine preparations in tablets and pills for oral administration. To be taken fasting before breakfast.

Antiviruses. Substances of microbic origin capable of local vaccination without the introduction of antibodies. They are selective in their action, and affect only a certain group of cells known as "receptives," e.g., the staphylococcus vaccine has a selective affinity for cells of the skin and certain mucous membranes. *Antivirus dressings* soaked with filtered cultures in bouillon (or a mixture of lanolin and soft paraffin incorporating the antivirus) left in place for 24 hours have been used in a variety of staphylococcal and streptococcal infections, and in many ocular affections, e.g., blepharitis, conjunctivitis, ulceration of the cornea and keratitis.

Antipeol (*Medico-Biological Laboratories, London*). Ointment prepared from vaccine filtrates for immunising and cicatrising treatment of sores, burns, and cutaneous infections.

Antivirin Brand Products (*Glaxo Laboratories, London*). Sterile detoxicated filtrates of bacterial cultures, including: Staphylococcus Antivirus Liquid, Streptococcus Antivirus Liquid, Mixed Antivirus Jelly (staphylo. and strepto.), *B. acne* Mixed Antivirus Jelly, Antivirus Nasal Jelly (*M. catarrhalis*, etc.).

Bacterial Antigen Jels (*Lilly, London*). Dissolved bacterial proteins in a water-soluble jelly base, for local application in various affections, e.g., Colo-Jel, Ento-Jel, Staphylo-Jel, Strepto-Jel.

[P1-S1] **Ophthalmic-Antipeol** (*Medico-Biological Laboratories, London*). Mixed antivirus filtrate with 0.5% Percaine in an ointment base for use in ocular infections.

Philterol (*Astier, Paris; Wilcox, Jozeau, London*). A polyvalent bacteriophage preparation active against *B. coli*, enterococci and staphylococci. Supplied in ampoules containing 3 ml. *Dose*.—One ampoule daily for 10 days. In gastrointestinal affections, staphylococcal infections, etc.

Propidex (*Pharmaceutical Specialities (May & Baker) Ltd., London*). A vaccine ointment containing killed bacteria and antivirus of staphylococci, streptococci and *B. pyocyaneus*. For local pyogenic conditions, burns, sores, etc.

[P1] **Rhino-Antipeol** (*Medico-Biological Laboratories, London*). Mixed antivirus filtrate with 3% adrenaline 1 in 1000, 0.5% Novocain, and essential oils in an ointment basis for affections of the nose and throat.

Bacteriophage. An ultramicroscopic, filter-passing agent that infects bacteria and can be transmitted from culture to culture. It can only be propagated in living bacterial cultures. By the action of bacteriophage the cultural properties of bacteria and the character of colonies on solid media may be altered; the antigenic properties of the bacteria may be modified and the bacteria are killed or lysed. Organisms most sensitive to the action of bacteriophage are members of the typhoid-dysentery-coli group; less susceptible organisms include the diphtheria bacillus, plague bacillus, staphylococci, streptococci, the bacillus of hæmorrhagic septicæmia and the cholera vibrio. Bacteriophage is extremely stable to heat and chemical reagents; it possesses antigenic properties and various antibodies can be made from it by appropriate manipulation.

The phenomenon of Twort-d'Herelle and its significance.—*Lancet*, ii/1935, 1312.

Use of the bacteriophage in an outbreak of institutional dysentery in a home for blind babies. Ten out of 32 children were affected, but only one further case occurred following administration of antidyenteric bacteriophage three times daily to all the inmates.—D. Haler, *Brit. med. J.*, ii/1938, 698.

Bacté-Phages (*Anglo-French Drug Co., London*). Therapeutic bacteriophages for oral and topical administration, e.g., Bacté-Intesti-Phage for intestinal affections, Bacté-Dysenteri-Phage for acute bacillary dysentery, Bacté-Pyo-Phage for purulent affections.

Bacterial Antigen Lysates (*Lilly, London*). Solutions of specifically (bacteriophage) dissolved (lysed) bacterial proteins for local and parenteral use, e.g., Colo-Lysate (combined), containing *B. coli*, streptococci, staphylococci and pneumococci proteins; Ento-Lysate, *M. catarrhalis*, pneumococci, *S. aureus* and streptococci; Neiso-Lysate, gonococci, *B. coli*, *S. viridans* and staphylococci; Staphylo-Lysate; Strepto-Lysate, etc.

Enterofagos (*Medico-Biological Laboratories, London*). Polyvalent intestinal bacteriophage. For intestinal affections.

SERA

Therapeutic sera may be (a) normal sera, *i.e.*, the blood serum from healthy animals that have not been subjected to any artificial immunising process, or (b) antitoxic or antibacterial sera, *i.e.*, the blood serum from animals that have developed an immunity in response to injections of a specific antigen (toxin or bacterial suspension), or (c) convalescent or adult immune sera, *i.e.*, the blood serum of human patients who are convalescing from a specific infection or who have had that infection in childhood.

In the *preparation of antitoxin* the antigen used is either the specific toxin or, more usually, the toxoid, *i.e.*, toxin which has been incubated for 4 to 6 weeks at 37° after the addition of 0.2 to 0.4% of formaldehyde. This is injected subcutaneously into the animal, e.g., the horse, with strict aseptic precautions. If unmodified toxin is used it is usually at first mixed with antitoxin, or the animal has a large protective dose of antitoxin given before the inoculation is started. Some reaction, rise in temperature and malaise may occur. Further injections are made at intervals. The quantity injected is gradually increased, and subsequently the injections may be intravenous. The blood is removed from the animal, by the aid of a large sterilised cannula, from the jugular vein; 6 to 12 litres may be collected in sterile flasks. The clot is allowed to form by standing 24 to 48 hours, and the serum is decanted into sterile bottles after the addition of a suitable preservative, e.g., 0.3% of cresol or 0.5% of phenol.

Refined and Concentrated Antitoxins. Methods have recently been developed which separate the antitoxin-bearing globulin from those proteins which are devoid of antitoxic value, and which are probably in part responsible for the serum rashes and other untoward reactions which serum therapy may produce in susceptible patients. The precipitation of the globulins containing the antitoxin has led to the production of exceedingly concentrated sera. Thus, whereas a few years ago diphtheria antitoxin contained from 500 to 1000 units per ml., to-day the potency of the refined antitoxin is at least 4000 units per ml.

Fibrinolysin produces a change in the antitoxic pseudoglobulin molecule so that it becomes disaggregated into protein components having different physical and chemical properties. By taking advantage of this property a method of critical differential heat denaturation has been evolved as a method for the further purification of antitoxins. The specific action is not limited to fibrinolysin, but appears to be a property of all the proteolytic enzymes. A process for the large-scale purification of antitoxins has been evolved on this basis, and by using these methods antitoxin of such purity that all the protein present can be specifically precipitated by diphtheria toxin has been prepared experimentally.—C. J. Pope, *Brit. J. Exp. Path.*, 1938, 19, 245.

In the *preparation of antibacterial sera* the antigen used is generally a suspension in normal saline of killed bacteria, and is injected intravenously; sometimes suspensions of live bacteria are used.

Convalescent sera are obtained from the blood of convalescent patients and are used for the prevention or modification of measles and whooping-cough and for the treatment of acute anterior poliomyelitis.

Adult immune sera are obtained from the blood of adults and are useful when convalescent sera are not available.

The use of immune sera confers only a temporary passive immunity by supplying the patient with ready-formed antibodies (antitoxins or antibacterial substances). Thus in antitoxin treatment a serum which already contains the antitoxin is introduced into the patient's circulation, and has the power of combining with the toxin produced by the infecting bacteria to form an inert substance. (Compare Vaccine Therapy, p. 1023, which confers active immunity.)

Serum Normale (B.P.C.). *Syn.* NORMAL HORSE SERUM.

Dose.—150 to 300 minims (10 to 20 ml.).

Normal serum is obtained from healthy horses. The blood is withdrawn from the jugular vein and, after it has clotted, the serum is collected, a preservative is added, and the serum filtered through a bacteria-proof filter. The product is tested for sterility and for freedom from toxicity.

Uses. It is employed locally, internally and subcutaneously in the treatment of hæmorrhage from wounds, etc., the bleeding of hæmophiliacs, and for hæmorrhage from gastric and duodenal ulcers. For the latter it is given orally 3 or 4 times daily, directly after food, in $\frac{1}{2}$ ounce of water. 60 or 80 ml. may be given in 24 hours. The serum must be fresh—if it does not produce a good reaction in 24 to 36 hours it is useless for the purpose. Those who have previously received an injection of horse serum may be hypersensitive to it. Symptoms, which may include urticarial eruptions, oedema and other signs of anaphylaxis, usually appear 8 to 14 days after treatment but may appear in a few hours. They may be prevented by injecting adrenaline solution.

Antilusin (Allen & Hanburys, London) "A" for use *per os* (*dose.*—10 ml. in milk or water 1 to 3 times daily directly after meals), and *Antilusin* "B" for local application, are preparations of normal serum.

Byno-plasma (*Allen & Hanburys, London*) contains 1 drachm of sheep's plasma in every $\frac{1}{2}$ ounce. For use in convalescence and debility. *Dose.*— $\frac{1}{2}$ to 2 drachms.

Hemostyl (*Roussel Laboratories, London*). Fresh hæmopoietic horse serum. In ampoules for oral administration, or as a syrup.

Thromboplastin.

This name is applied to a substance, derived from blood-platelets, blood cells or tissue cells, which initiates the changes that lead to the formation of the blood clot. According to Howell, thromboplastin acts by liberating prothrombin from combination with an "inhibiting substance"; in the presence of calcium ions the prothrombin is then converted into thrombin and this in turn acts on fibrinogen, converting it into fibrin, the solid substance of the blood clot. Thromboplastin contains the phosphatid cephalin (kephalin); it is soluble in ether, but insoluble in alcohol and acetone. In solution or in solid form cephalin slowly loses its power of hastening the clotting of blood.

Preparations containing thromboplastin are used as hæmostatics for local application to bleeding surfaces. Sterile preparations may be injected subcutaneously or intramuscularly.

Coagulen-Ciba (*Ciba, Horsham*). Described as a physiological hæmostatic derived from normal bovine blood platelets, supplied as a powder mixed with sugar to ensure ready solubility, and also in 3% solution in ampoules. May be sterilised by boiling. Administered intramuscularly, orally, or locally (3 to 5% solution); may be given very slowly intravenously in emergency. *Dose.*—Up to 20 ml. of 3% solution.

Hemagulen (*Lilly, London*). A physiological hæmostatic prepared from fresh brain substance. For topical application to capillary hæmorrhages.

Hemoplastin (*Parke, Davis, London*). Solution of prothrombin and thrombokinase for use as a hæmostatic. *Dose.*—2 ml. injected subcutaneously and repeated every 4 to 6 hours until hæmorrhage controlled.

Thrombin Coagulant (*Maw, London*). A stable preparation of thrombin stated to reduce the clotting time of shed blood from the normal period of 6 to 8 minutes to about 15 seconds. The thrombin is dissolved in sterile saline when required for use and applied to the wound on cotton-wool. Dressings impregnated with thrombin are also prepared.

Hirudin. *Syn.* LEECH EXTRACT. An active principle from leeches, obtained by treating the minced heads with warm normal saline. *Dose.*—Intravenously, 0.02 to 0.3 g. in 50 ml. of normal saline. Solutions must be freshly prepared. It has the property of maintaining blood in a fluid condition—1 mg. may be dissolved in 0.25 ml. of normal saline for the purpose—this quantity will prevent 7.5 ml. of blood from coagulating without otherwise altering its composition.

European leeches are varieties of *Hirudo medicinalis*. *H. quinquestriata*, the five-striped Australian leech, is used in Australasia.

Repeated injections of hirudin into rabbits makes their blood resistant to the ordinary anticoagulative effects of this substance. The serum of animals thus immunised, when added to blood from other animals, accelerates coagulation. The action of this immune serum on coagulation is much more powerful than the action of normal serum. Smaller quantities can therefore be used and troublesome secondary effects are less likely.—O. Országh and J. Alföldy, *Lancet*, i/1940, 28.

TOXINS AND TOXOIDS

A number of pathogenic bacteria when grown in artificial fluid culture media excrete into the media poisonous substances or

toxins. Other bacteria, whilst undoubtedly producing toxins, do not excrete them into the surrounding medium, but retain them within the bacterial cell. Toxins of the first type, *e.g.*, those of tetanus and diphtheria, are termed extra-cellular soluble toxins, or exotoxins. Toxins of the second type, *e.g.*, those of typhoid and plague, which are apparently inherent in the bacterial cell, are termed endotoxins.

Exotoxins when injected into animals cause the development of antitoxins in the blood serum. When an exotoxin is treated with formaldehyde solution it is converted into toxoid; by this change it loses its toxicity but retains its antigenic property. Anti-endotoxins are not easily produced, but are present in some antibacterial sera.

The toxins of the diphtheria bacillus and of the scarlet-fever streptococcus are used in dilute solution for diagnostic skin tests. The toxoids of diphtheria and tetanus are used for producing active immunity.

THERAPEUTIC USES OF BACTERIAL PRODUCTS

The various vaccines, sera, etc., described in the following pages are classified as far as possible under the diseases in connection with which they are used.

Acne.

The acne bacillus may alone be the cause of acne, especially of the non-pustular forms; in the majority of cases, however, it is associated with a staphylococcus. In those cases, in which the acne bacillus is found, the use of acne vaccine may give good results, especially in the cystic form and in acne indurata.

Acne Bacillus Vaccine is indicated in the above cases where comedones are the principal features. Combination with polyvalent staphylococcus vaccine may be advisable.

Initial dose.—5 millions; then increasing doses—a final dose of 500 millions may be wanted. The interval between doses is 7 to 10 days.

Acne Bacillus and Staphylococcus Mixed Vaccine is prepared from both these micro-organisms in various proportions. Some convenient ratios are the following quantities in each ml. Acne 5 millions with staphylo. 100 and 250 millions; acne 10 millions with staphylo. 250, 500, 1000 and 2000 millions; acne 20 millions with staphylo. 2000 millions.

For cultivation of the bacillus and preparation of vaccine see Vol. II.

Anthrax. Human anthrax is not a common disease in Great Britain. Three clinical forms are recognised. A malignant pustule may appear in the skin or in the alimentary canal, or the bacilli may be inhaled and infect the lungs. Serum is more useful in the

cutaneous form; recovery from the alimentary and pulmonary forms is rare.

Anti-Anthrax Serum. *Syn.* SERUM ANTICARBUNCOSUM (*F.E. VIII*), SUERO ANTICARBUNCOSO.

An antibacterial serum prepared by the immunisation of horses, mules or asses with cultures of *B. anthracis*. *F.E. VIII* states preferably from the horse.

Sclavo's Serum, obtainable in 10-ml. tubes (from the Jenner Institute for Calf Lymph Ltd., Battersea), is prepared in Italy by immunisation of asses.

Dose.—In three or four different parts of the skin of the abdomen, injections of 40 to 80 ml. are given at one time. After 24 hours, if there has been no improvement either in the general or local condition, further injections of 40 to 80 ml. are to be made and repeated next day if necessary. *Begin treatment early.*

Rise in temperature following the injection is favourable. Sometimes a rash develops 3 to 8 days after, with or without febrile symptoms; it is unimportant. The serum keeps for 2 years in the dark—a slight deposit is negligible.

For intravenous injection in severe cases 10 ml. or more, repeated after 2 or 3 hours if necessary.

Mortality from malignant pustule (a variety of external anthrax) reduced in Italy to 5.3% since the introduction of treatment by anti-anthrax serum.—*Brit. med. J. Ept.*, i/1928, 42.

Anti-anthrax serum alone, *i.e.*, without surgical excision of the local lesion, is the treatment of choice. 50 to 100 ml. are given intravenously, and the injections continued daily until temperature drops to normal. It is best to begin with 50 ml. normal saline solution containing 5 drops of serum. Also of value prophylactically in 10-ml. doses subcutaneously.—A. E. Hodgson, *Lancet*, ii/1928, 594.

Anthrax treatment. Serum 80 to 300 ml. as a preliminary, repeated until temperature is normal. "606" in dose of 0.9 g. daily for 3 days, and a fourth dose after a week. Large doses advised.—C. G. Brentnall, *Lancet*, ii/1930, 1174.

At Bradford Royal Infirmary (pulmonary anthrax is still named "maladie de Bradford" in France) excision has now been replaced in most cases by injection of Salvarsan, either alone or combined with Sclavo's serum.—F. W. Eurich, *Brit. med. J.*, ii/1933, 52.

Bronchitis and Pulmonary Catarrh. The bacteriology of bronchitis is broadly speaking the same as that of the common cold, except that there is as yet no evidence of a virus infection. The predominant organisms are:—

<i>B. influenzae</i>	present in 40%	<i>M. paratetragenus</i>	present in 23%
<i>Pneumococcus</i>	" " 52%	<i>B. Friedlander group</i>	" " 7%
<i>Streptococcus</i>	" " 53%	<i>B. septus</i>	" " 2%
<i>M. catarrhalis</i>	" " 72%	<i>Streptothrix</i>	" " 3%

(Sputum to be examined after washing out the mouth and throat, and expectorating into a sterile bottle immediately on waking.)

Bronchitis is pre-eminently suited for vaccine therapy—old age and a desperate condition of the patient are not contraindications to treatment.

Autogenous vaccines are more likely to be efficacious than stock ones, and it must be remembered that variation in the flora is liable to occur during the progress of immunisation, hence repeated examination is necessary.

Catarrh, Nasal and Tracheal (the "Common Cold").

The etiological agent of the common cold is now generally considered to be a virus. The common pathogenic bacteria, however, present in the posterior nasopharynx, are known to increase in virulence in the presence of influenza and the "common cold," and it is these which are widely held to account for the severity of the symptoms and for the development of complications in individuals whose resistance has been lowered by the virus.

The organisms principally involved—either singly or mixed—in setting up acute catarrhal infections of the respiratory tract are the *B. influenzae*, pneumococci, *B. septus*, streptococci and *M. catarrhalis*, and possibly staphylococci. The organisms appear in cycles. Thus *B. septus* may be found in 80 to 90% of the cases in each epidemic for 2 or 3 successive years and then disappear altogether for 4 or 5 years.

Vaccines for colds, bronchitis, etc., are usually prepared from mixtures of the micro-organisms commonly involved (*vide supra*).

Mixed vaccines containing some or all of the micro-organisms commonly found in infections of the respiratory tract are used for the treatment and prophylaxis of the common cold, bronchitis, influenza, etc. There is considerable variation in the composition and doses of the vaccines used, and, for treatment, the composition of a vaccine may have to be altered to suit prevailing conditions, e.g., when one particular micro-organism predominates in an epidemic.

Dose.—For prophylaxis, which is best attempted in late autumn or early winter, three doses of a mixed vaccine are usually given with an interval of 6 or 7 days between each dose. The first dose may be from 100 to 250 millions of the mixed organisms, and the second and third doses may be respectively twice and four times the initial dose.

For treatment smaller doses must be used—from $\frac{3}{10}$ to $\frac{1}{2}$ of the prophylactic dose. The more acute the attack, the smaller should be the dose of vaccine. Injections may be repeated at intervals of 3 or 4 days. The earlier treatment is begun the better.

Mixed vaccines of respiratory organisms have proved of value not only in the treatment of catarrhs, acute and chronic, but also in pulmonary phthisis where bronchitic symptoms are conspicuous—in such cases where staphylococci or streptococci are the secondarily infecting organisms they should be included in the vaccine used.

For a period of two years every second child admitted to a home for small children in Stockholm was inoculated with anti-catarrhal vaccine obtained from the State Medical Institution and prepared from strains isolated from patients in children's hospitals and other institutions. Three injections at weekly intervals were given. There were 122 treated children and 125 control children. More than half the number were under observation for three months or longer. No difference in the two groups was found regarding the number of children taking infections, the number of recurrences, the interval between the illnesses, the duration of treatment necessary, or the frequency of complications.—C. Gyllensward, *Acta pædiatr., Stockh.*, 1935, 17, Supp. I, 78.

A carefully controlled study conducted over two years on some hundreds of

University students with three different vaccines recommended for the prevention of colds (normal saline solution hypodermically or lactose capsules being given to the controls) produced no evidence either that vaccines reduce the complications of colds or that the condition of the nose and throat is related to the frequency of colds in a cold-susceptible group.—H. S. Diehl, A. R. Baker and D. W. Cowan, *J. Amer. med. Ass.*, ii/1938, 1168.

One of the factors which has to be taken into account in considering the reasons for the lack of success in the prophylactic use of cold vaccines is the value of the antigen or immunising substance in the vaccine. Every bacterial culture does not necessarily constitute a good vaccine, as has now been shown with a number of different organisms, and there is no doubt that this factor needs consideration when large-scale production of catarrhal vaccines is undertaken. The vaccine is liable to be produced from cultures which have undergone much subcultivation and have thus become liable to antigenic degeneration. At the moment there is no satisfactory means of assessing the value of a catarrhal vaccine, but work has begun and it is probable that in time a vaccine of known immunising power may be produced. At present the best cultures for the purpose are primary or at the most secondary subcultures.—Dennis Embleton, *Practitioner*, 1938, 725.

Vaccine given subcutaneously to 188 persons, intradermally to 95 persons, and 86 controls had placebos. Subcutaneous vaccine reduced the incidence of colds in 74% of persons, and in 8% there were no colds at all. With intradermal vaccine the incidence was reduced in 52.6%, and there were no colds in 11.6%; in the control group, colds were reduced in number in 60.5% and absent in 5.82%.—Hauser and Hauser, per *J. Amer. med. Ass.*, i/1939, 2563.

Composition of a stock vaccine. Almost every authority has recommended a different mixture of the vaccine organisms. A vaccine having approximately the following composition has been found very satisfactory: Pneumococci, *H. influenza*, *Streptococcus viridans*, *M. catarrhalis*, and staphylococci, of each 20%. Total bacteria per ml., 500 million.—D. Embleton, *Practitioner*, 1938, 732.

Micrococcus Catarrhalis Vaccine. A vaccine prepared from *M. catarrhalis* alone is of service in nasal, tracheal and bronchial catarrhs, both acute and chronic, in bronchitis and bronchitic asthma and in catarrh of the middle ear, when the causal relationship of this organism to the attack has been demonstrated.

Initial dose of 10 millions may be repeated in 5 to 7 days. In chronic cases 1000 millions or more may be ultimately necessary.

M. catarrhalis is one of the constituents of the combined vaccine for colds (see above). *M. catarrhalis* infections may begin at any part of the respiratory tract—characteristically with an inflamed feeling of the fauces and nasopharynx.

Chronic tracheal catarrh is frequently due to infection by this organism or *M. paratuberculosis*, to which secondary infection by staphylococci, streptococci, pneumococci, and other organisms may be added, or by the pneumococcus alone. Cultivations from the trachea showed that non-gram-staining cocci are present in 78% of normal throats and 68% of catarrhal throats.

M. catarrhalis is frequently concerned in the causation of common colds, and of influenza, bronchitis, and pneumonia. Causes very irritable cough with scanty viscid expectoration. It grows best on blood-agar, and produces no acid in glucose broth. *B. septus* causes a mild pharyngitis with painful throat, muscular pain, with, however, no temperature and little or no nasal catarrh—probably a common cause of stiff neck and muscular rheumatism. *B. Friedlander* occurs in many acute and chronic colds, and may cause very profuse coryza.

Directions for taking secretion for preparations of an autogenous vaccine.

If in the throat, the mouth is washed out in the morning, the throat gargled, and the teeth washed with sterile water; the patient spits once into a sterile bottle. If, on the other hand, the infection is in the nose, the entrance to the nostrils should be washed with soap and water and the discharge blown into a sterilised bottle, or better, post-nasal swabs should be taken.

Autogenous vaccines exerted no influence on the incidence of attacks in 67 individuals suffering from frequent and severe attacks of coryza. A reduction in severity of attacks is the most that can be expected.—L. Hoyle, *Brit. med. J.*, i/1933, 997.

Oral Cold Vaccine.

It is claimed that when cold vaccines are given by the mouth the soluble antigenic substances penetrate the intestinal mucosa and give rise to antibody formation. Although this is disputed by some workers there is evidence that the vaccines have definite prophylactic value.

A combined vaccine prepared by separately growing Pfeiffer's bacillus, pneumococci (types I to IV), streptococci, and *M. catarrhalis* in broth cultures in bacterial symbiosis with *Anaromyces bronchitica*; when taken for 4 doses ranging from 10 to 20 ml. at weekly intervals, produced in the blood, after the fourth dose, agglutinins for pneumococci in 1 in 40 dilution and for streptococci in 1 in 80 dilution, thus indicating a definite agglutination response after oral administration. No toxic symptoms were observed with these doses at weekly intervals, and it is suggested that this weekly oral dose (swallowed, on an empty stomach, before retiring) can be kept up all the winter without any trouble.—D. Thomson, R. Thomson and E. T. Thompson, *Brit. med. J.*, i/1936, 261.

The oral administration of vaccines for the treatment of colds is based on the observation that heterophile antibodies develop in the blood of rabbits after feeding of heterophile antigen by mouth. Heterophile antibody, often called "Forssman antibody," is a hæmolysin for sheep red blood corpuscles which is produced in rabbits by the injection of many animal tissues and is believed to play a part in resistance to infection. It has been shown that when rats are given pneumococci by mouth they develop an active immunity against pneumococcal infection, and their serum contains protective substances.—V. Ross, *J. Immunol.*, 1934, 27, 235.

In a group of 445 persons oral administration of vaccine reduced the incidence of colds by 43.7% as compared with the control group.—Rockwell and Van Kirk, *Science*, ii/1935, 178.

Clinical tests were made of an oral vaccine consisting of a mixture of bacteria infecting the respiratory tract, the strains selected having a high content of heterophile antigen and also a high resistance to the action of the gastro-intestinal secretions. The cultures were sterilised by heat, the bacteria separated, absorbed on starch, dried and filled into capsules each containing pneumococci 25 billion, *H. influenzae* 5 billion, streptococci 15 billion, and *M. catarrhalis* 5 billion. Tests were made on 100 patients and an equal number of controls. Treated patients took one capsule with cold water at least 30 minutes before breakfast for seven consecutive mornings and thereafter once weekly throughout the season. The treated group showed a decrease of 77.8% in the number of colds, the control group showing a decrease of 10.1%. The latter group had about four times as many colds as those who took the oral vaccine.—G. E. Rockwell, *J. Lab. clin. Med.*, 1937, 22, 912.

After the ingestion of oral vaccines prepared from organisms of the respiratory tract, antibodies cannot be detected in the serum of individuals who have not previously been inoculated subcutaneously.—A. Fleming, *Brit. med. J.*, ii/1939, 100.

B.D.H. Common Cold Vaccine Tablets (*British Drug Houses, London*). The vaccine has the following formula: *M. catarrhalis* 4000 million, *H. influenzae* (Pfeiffer) 4000 million, streptococci 8000 million, pneumococci 18,000 million, staphylococci 8000 million, Friedlander's bacillus 4000 million. *Dose*.—One tablet daily for a week, followed by 2 weeks' rest, then one tablet daily for a further week, and then one tablet weekly throughout the winter.

Entoral (Lilly, London). An oral cold vaccine consisting of killed bacterial cultures of pneumococci 25,000 million, *H. influenzae* 5000 million, streptococci 15,000 million, *M. catarrhalis* 5000 million. *Dose*.—1 capsule with a drink of cold water an hour before breakfast for 7 successive mornings and 2 capsules each week throughout the season.

Genora Cold Vaccine (Genatosan, Loughborough). Vaccine for oral administration containing 2000 million organisms per ml., including *H. influenzae*, *M. catarrhalis*, *Anaromyces bronchitica*, with pneumococci and streptococci. *Dose*.—10 ml. to commence with, taken in water on an empty stomach at bedtime, increasing to 15 to 20 ml. if there is no reaction. Then one dose a week for two months. For the prevention of colds, influenza and pneumonia and for treatment of bronchitis and post-influenzal cough.

Immunora Cold Vaccine (*Research Products, London*). A fluid vaccine for oral administration, containing *H. influenza* (Pfeiffer), influenza streptococcus (Thomson), hæmolytic streptococci, *Aeromyces bronchitica*, pneumococci (several types) and *M. catarrhalis* in 0.25% phenol solution with chloroform water. It contains 2000 million organisms per ml. *Dose*.—The average adult dose is 5 teaspoonfuls to be taken on an empty stomach either the last thing at night or 1 to 2 hours before breakfast. A dose should be taken once a week during winter. A high degree of immunity is stated to be produced after 12 doses.

Vacagen (*Sharp & Dohme, London*). Oral cold vaccine in enteric-coated tablets, each tablet containing the soluble antigenic fractions of 60,000 million organisms as follows: pneumococci 25,000 million, streptococci 15,000 million, *H. influenza* 5000 million, *M. catarrhalis* 5000 million, *Staph. aureus* 5000 million, Friedlander's bacillus 5000 million. *Dose*.—One tablet daily for a week and then one tablet once or twice a week during the winter.

Cerebrospinal Fever. *Syn.* CEREBROSPINAL MENINGITIS, MALIGNANT PURPURIC FEVER, PETECHIAL FEVER, SPOTTED FEVER.

A diplococcus, *Diplococcus intracellularis meningitidis* Weichselbaum, has been isolated from the cerebrospinal fluid, and from the brain membrane and the purulent exudate. Four serological types of the meningococcus are known, designated by Gordon's classification types, I, II, III and IV. Serums are prepared by immunising horses to all four types, as well as to individual types.

Griffith's Group I corresponds to Gordon's Types I and III, and Group II corresponds to Gordon's Types II and IV. It has been shown that the meningococcus possesses "rough" and "smooth" variants; "rough" cultures are likely to be less potent antigens than smooth, freshly isolated cultures.—C. G. Rake, *Proc. Soc. exp. Biol., N.Y.*, 1931, 29, 287; G. F. Petrie, *Brit. J. exp. Path.*, 1932, 380; and B. G. Malgraith, *ibid.*, 1933, 227.

Classifications of meningococci worked out in the years 1909 to 1918 represented true serologic relationships which can be plainly recognised to-day. Certain changes in these relationships have taken place; types I and III have become so closely interrelated that separation into two types no longer seems of definite value in practice. This I-III group has become markedly predominant in nearly all parts of the world. On the other hand, types II and IV have, in the United States at least, become entirely distinct from each other so that they do represent two separate groups. There seems to be three types of meningococci, I-III, II and IV. The evidence is that there is a greater number of type II strains in carriers and that this type is especially apt to be responsible for septicæmic and generalised forms of meningococcal infection, which may be relatively mild and chronic. Both the endotoxins of Gordon and the soluble toxins reported by Ferry are produced to a greater extent by the I-III group.—S. E. Branham, *J. Amer. med. Ass.*, i/1937, 692.

Serum Antimeningococcicum (B.P.C.). *Syn.* MENINGOKOKKEN-SERUM (P.G. VI).

Obtained from the blood of horses immunised to strains of the *Diplococcus intracellularis meningitidis* Weichselbaum, formerly known as *Neisseria meningitidis*. P.G. VI requires a titre of 1 : 100 in complement deviation test, and at least 1 : 1000 in bacteriotropic tests. 2-, 4- and 8-fold strengths are also mentioned.

Dose.—10 to 30 ml. by intrathecal or intravenous injection.

A dose of 30 ml. or more (except when less than this amount of cerebrospinal fluid can be removed) should be given *intraspinally* by lumbar puncture at the earliest possible moment, and repeated daily for at least 4 days. The amount of the dose should be less than that of the cerebrospinal fluid withdrawn, and the serum

should be warmed to body temperature and injected by the gravity method. In children under 5 it is inadvisable to give more than 10 ml. In severe fulminating cases the dose if possible should be 45 ml. After the injection the patient should lie with head and shoulders low and pelvis raised. It is also used intravenously, and, in severe cases, intracisternally. Up to 50 ml. for children and up to 100 ml. for adults may be administered intravenously every 6 to 12 hours, but intravenous injection should be supplementary to intraspinal injection and not a substitute for it.

MEMORANDUM ON CEREBROSPINAL FEVER (Ministry of Health Memo., 234, 1940, H.M.S.O.). According to this memorandum, recent advances in chemotherapy give grounds for hope that the routine use of serum treatment may be dispensed with, even as an adjuvant to chemotherapy. In the fulminating type of case, or if the patient when first seen is nearly comatose, the administration of a suitable serum may be considered. It may be given intrathecally at the first lumbar puncture and a large dose may also be given intravenously. Serum which is more than six months old and has not been kept in cold storage, or which is not known to be specific against the current epidemic strain, is likely to be ineffective. There is evidence that even acute and fulminating cases of the disease have been rapidly cured by chemotherapy without the use of serum at all. On the other hand, although there appears to be no convincing clinical evidence that the use of serum is necessary, even as an adjunct to chemotherapy, some recent animal experiments suggest that better results may be obtained by combining the two forms of treatment.

Use of sulphapyridine with meningococcus antitoxin or sulphapyridine with polyvalent-antimeningococcus serum. Thirteen of fourteen patients recovered.—W. J. Roche and C. J. McSweeney, *Brit. med. J.*, i/1939, 1278.

Serum is now unnecessary even as an adjunct to chemotherapy (sulphanilamide or sulphapyridine). It is expensive and bristles with difficulties, whereas chemotherapy is cheap and relatively easy. Intrathecal administration of serum is often dangerous because of the aseptic meningitis and spinal block which may be produced.—S. Banks, *Lancet*, i/1940, 44.

For references to the use of sulphapyridine and sulphanilamide in cerebrospinal fever, see pp. 946, 962.

Meningococcus Antitoxin (Ferry). An antitoxin prepared by the immunisation of animals to polyvalent filtrates of 6 to 8 day hormone-broth cultures of the four Gordon groups of meningococcus after the method of Ferry, Norton and Steele. It is claimed that the clinical manifestations of the disease, its commoner complications, and its mortality rate may all be favourably affected by the timely and proper administration of the antitoxin.

Dose.—Dependent on the condition of the patient, the degree of toxæmia, the occurrence of complications and whether child or adult, 60 to 100 ml. in 120 to 200 ml. of normal saline may be administered intravenously (injected slowly). This may be repeated daily if required. These doses may be given intramuscularly, but it is probably a less effective route. Dependent on the same factors and also on the volume of spinal fluid withdrawn, 20 to 40

ml. may be injected intraspinally or intracisternally. This procedure may be repeated daily if required (N.N.R., 1940).

Each of the four types of meningococcus forms, in young broth cultures, a soluble exotoxin which is type specific and also a toxin which is common to all four types. These toxins can be detected by a skin reaction following intradermal injection into the human skin. An antitoxin can be produced in the serum of the horse which is capable of eliminating the skin reaction of the toxin. Experimentally produced cerebrospinal meningitis in monkeys can be cured by intraperitoneal injection of the antitoxin.—N. S. Ferry, J. F. Norton and A. H. Steele, *J. Immunol.*, ii/1931, 293; also N. S. Ferry, *ibid.*, ii/1932, 315, 325, and i/1934, 133.

Treatment of 86 cases with Ferry's antitoxin gave mortality rate of 23.5%, compared with 45.9% for cases treated with anti-meningococcus serum. Doses of 20 to 40 ml. intraspinally, 60 to 100 ml. (in twice as much normal saline) intravenously, and repeated daily if necessary, are recommended.—A. H. Høyne, *J. Amer. med. Ass.*, i/1935, 980.

Four cases of meningococcal meningitis in children showed gratifying and rapid improvement following its use and all made a complete recovery. Administration by the intravenous route is the most advantageous.—J. A. Brocklebank, *Brit. med. J.*, i/1937, 857.

Meningococcus Toxin. Active immunisation with meningococcus toxin. By not less than three subcutaneous injections of Ferry's meningococcus toxin, a certain percentage of individuals who give a positive skin test can be immunised. The immunity to one type can be produced by injection of a mixture of toxins of all types.—N. S. Ferry and A. H. Steele, *J. Amer. med. Ass.*, i/1935, 983.

Although for active immunisation against epidemic meningitis a greater antibody-possessing substance is needed, further trial of meningococcus toxin is warranted. It is recommended that inoculation be carried out without a previous skin test.—Kuhns, Kisner and Williams, *J. Amer. med. Ass.*, i/1938, 484.

A PROPHYLACTIC EXPERIMENT. A vaccine containing 14 strains of meningococci belonging to Gordon's Types I, II, and III was employed prophylactically during the course of an epidemic of cerebrospinal meningitis in Cyprus. The vaccine was grown for 24 hours on boiled blood serum agar and killed by heat for one hour at 60°C. and sent out at 1000 million organisms per ml. The dosage was $\frac{1}{2}$ ml. and 1 ml. at ten days' interval, though a larger dosage, e.g., 2000, 4000, 4000 millions at weekly intervals is recommended. Although over 30,000 people were inoculated the authors conclude that for various reasons the experiment was unsatisfactory, and make various suggestions as to how a further experiment should be conducted in order to arrive at more conclusive results.—I. H. Maclean and C. E. Bevan, *Proc. R. Soc. Med.*, 1939, 32, 1551.

Cholera.

The disease is marked by the presence of the *Vibrio cholerae*.

Anti-Cholera Vaccine. *Syn.* CHOLERA VIBRIO VACCINE. As an immunising agent only.

Dose.—This vaccine usually contains 8000 million dead cholera vibrios per ml. An initial dose of $\frac{1}{2}$ ml. subcutaneously is followed by a second dose of 1 ml. at an interval of a week. This confers immunity for 5 or 6 months.

Oral vaccines have also been employed prophylactically with some success, but the subcutaneous method is said to give superior results (see A. J. H. Russell, *Bull. Hlth Org.*, L.o.N., 1927).

Cholera Bacteriophage. Although there is some evidence to show that cholera bacteriophage may be of definite therapeutic value, some time must elapse before a definite opinion can be given. It is best used in association with the simultaneous administration of hypertonic saline, and thus employed it may be a useful adjuvant. The bacteriophage is given undiluted in 1 drachm

doses every 30 minutes till the symptoms improve, or 5 ml. may be given intravenously with the hypertonic saline. It has also been used prophylactically but the evidence as to its utility is doubtful.

Under grants from the Royal Society and the Indian Research Fund Association, extensive field experiments have been carried out since 1929 by Lt.-Col. J. Morison and Drs. E. M. Rice and B. K. Palchondbury, on the treatment and prevention of cholera by means of bacteriophage. In Nowgang, in the province of Assam, with a population of half a million, the deaths per 10,000, subsequent to distribution of bacteriophage in 1929, were, for 1930, 0.99; for 1931, 0.78; for 1932, 0.46; for 1933, 0.36. The lowest previously recorded rates since 1906 were 1.34 in 1918, 1.42 in 1920, and 1.62 in 1923. There was no recorded period in which the death rate for four consecutive years compared with those for 1930-1933. In an epidemic in Darrang (an adjacent district) the mortality of the group treated with bacteriophage was only half that of the untreated when the bacteriophage was administered within 24 hours.—*Indian J. med. Res.*, April, 1934, per *Brit. med. J.*, ii/1934, 29. See also *Lancet*, ii/1930, 647; *Brit. med. J.*, i/1928, 365.

Anti-Colon Bacillus Serum.

Dose.—10 ml. or more. Is prepared from horses which have been immunised against a number of types of *B. coli* obtained principally from cases of peritonitis and puerperal fever.

The action of this serum is chiefly bactericidal, though it also possesses antitoxic properties.

In acute *B. coli* infection of the kidney, 25 ml. of the serum daily for 3 days has been advised, combined with calcium lactate to avoid rashes, joint pains, etc.

Colon Bacillus Vaccine is used in the treatment of post-surgical suppuration in abdominal cases, such as sinuses which refuse to heal after operations upon the appendix, gall-bladder, kidney or intestines; also in bacilluria complicating tubercular cystitis, in the nephritis of pregnancy and in endometritis, when due to infection by *B. coli*. Initial doses of 5 million organisms may be repeated at intervals of 7 to 10 days, and may be gradually increased till 100 millions or more are being given. If the doses employed cause any disturbance of the general conditions, as evidenced by rigors or rise of temperature, this must be taken as indication either of pus under pressure or if not this, for diminished subsequent dosage.

Immunisation of the patient 3 to 4 days prior to abdominal operations, in cases where the presence of pus is suspected, is to be advocated—for this purpose a dose of 500 millions may be employed.

In cases of bacilluria the urine should be kept well alkalised by full doses of sodium citrate or sodium bicarbonate.

Vaccine treatment of *B. coli* infections of the urinary tract has given favourable results.

Antitoxinum Diphthericum (B.P., U.S.P. XI). *Syn.* SERUM ANTIDIPHThERICUM (P.G. VI, P. Ital. V, F.E. VIII, P. Belg. IV, etc.).

Diphtheria antitoxin consists of the serum, or of a preparation of the serum, containing the antitoxic globulins separated from coagulated blood of the horse immunised by inoculation with

diphtheritic toxin, contained in the sterile filtrate from a culture of *C. diphtheriæ* in broth—a surface growth is important. It may consist of the serum, either liquid or dried, or of the antitoxic globulins, either in solution or dried.

The potency is determined by biological assay and is expressed in units.² Liquid preparations have a potency of not less than 400 units per ml., and solid preparations a potency of not less than 4000 units per g.

U.S.P. XI recognises only the solution of the antitoxic globulins and requires a potency of not less than 500 units per ml. *P.G. VI* includes the liquid or dried serum from horses, mules, oxen and camels. Liquid antitoxin from horses and mules must have a potency of not less than 350 units per ml., that from oxen and camels, only 100 units per ml. The latter is mainly used for prophylaxis. Solid preparations contain not less than 5000 units per g.

F.E. VIII describes separately the serum and, with a method of preparation, the antitoxic globulins (*Globulinæ Antidiphthericæ*).

For further details of standard, unit, and method of assay, see *Vol. II*.

It deteriorates rapidly during the first few months after preparation; subsequent rate of deterioration is at the rate of 5 to 10% per annum, if stored at a temperature not above 10°.

Storage. Solutions of standard diphtheria antitoxin in 66% glycerol saline were found to lose less than 10% of their potency during six years' storage at -4°; at room temperature a loss of about 23% occurred after 4 years; and at 35° the potency declined to one-half after nine months' storage.—*M. L. Smith, Quart. J. Pharm., 1939, 707.*

Dose.—For prophylaxis, 500 to 1000 units should be given to contacts as soon as possible after exposure. This will protect for 14 to 21 days. For treatment, not less than 8000 units intravenously or intramuscularly to be given for any age; larger initial doses, e.g., from 16,000 to 30,000 units, are required when the case has been delayed until the 3rd or 4th day from onset. Warm the antitoxin by standing in water at 40° for 10 minutes. Do not wait for bacteriological diagnosis. Children require as large a dose of antitoxin as adults.

Intraperitoneal injection may be employed in advanced cases when intravenous injections cannot be given.

The following scheme is recommended. 1000 to 2000 units intramuscularly for passive immunisation lasting up to 21 days; 2000 to 10,000 units intramuscularly for mild cases; 15,000 to 30,000 units intramuscularly or intravenously, according to severity (the latter route if more than 20,000 units are given); 50,000 to 100,000 units intravenously for the most severe cases. If the intravenous route is contraindicated for any reason in severe forms, the antitoxin should be administered intraperitoneally.—*Report of L.C.C. Departmental Committee, per Brit. med. J., ii/1936, 1266.*

The minimum therapeutic dose of diphtheria antitoxin is 4000 units. This may be considered an adequate dose for small scattered patches confined to the tonsils and of not more than 48 hours' duration. If each tonsil is completely

covered with a patch of membrane 8000 units is an appropriate dose. If the faucial pillars are also involved 10,000 units should be the minimum and if the membrane has extended on to the soft palate not less than 20,000 units should be given. If the membrane extends to the base of the uvula 30,000 units is the minimum dose, and if the uvula is also involved 40,000. Should the membrane have spread to the nasopharynx and nasal discharge be present 60,000 units should be ordered. Any spread of the membrane which occurs after the administration of the first dose of serum calls for more antitoxin, and the second dose should never be smaller than the first. If the disease is of longer than 48 hours' duration when first seen these doses should be substantially increased. In cases of "gravis" diphtheria the minimum total dose should be 120,000 units, the first portion given intramuscularly followed by the balance intravenously in six hours.—C. J. McSweeney, *Practitioner*, i/1939, 701.

Combined Use of Insulin and Antitoxin. In toxic cases give a preliminary injection of antitoxin intramuscularly; one hour later make a resting blood-sugar estimation, and inject together intravenously (very slowly at 37°) 32,000 to 100,000 units of antitoxin and 20 g. of dextrose in 50% solution; make further blood-sugar estimations at 1, 1½, and 2 hours after, and if the last figure shows a return to normal give 10 to 30 units of insulin intramuscularly, and subsequently dextrose by mouth or intravenously. Case mortality reduced from 35.9% to 22.5% and noticeable reduction of serum sickness.—E. C. Benn, E. Hughes, and S. Alstead, *Lancet*, i/1932, 281.

Patients experienced relief from physical distress by combined insulin and antitoxin.—H. E. de C. Woodcock, *Lancet*, ii/1932, 884.

Significance of sugar tolerance curves and value of insulin in toxic diphtheria discussed by N. D. Begg and E. H. R. Harries, *Lancet*, i/1935, 480.

Use of Refined Antitoxins. Purified antidiphtheria serum containing 27,000 units per g. of protein, prepared by the use of a fibrinolytic enzyme, has two or three times the therapeutic value of native antitoxin.—Pope, *Brit. J. exper. Path.*, 1938, 19, 245.

Experimental studies on guinea-pigs to compare the rates of absorption of diphtheria antitoxin concentrated by enzyme action, and of diphtheria antitoxin concentrated by precipitation with ammonium sulphate, show that the former is absorbed more rapidly, is eliminated more slowly, and will protect against a larger dose of toxin.—Glenny and Llewellyn-Jones, *Jour. Path. Bact.*, 1938, 47, 405.

Concentration of serum by use of enzymes impairs antigenic qualities. Guinea-pigs sensitised with normal horse plasma, immune horse plasma or modified globulins could only exceptionally be shocked with enzyme-digested antitoxin.—Weil, Parfentjev and Bowman, *J. Immunol.*, 1938, 35, 399.

Untoward Results—Serum Rashes, etc., with Diphtheria Antitoxin. Higher potencies are now used than formerly, and rashes, pain, and swelling are usually considered to be less frequent. Calcium lactate is said to relieve the rash, pain, etc. The symptoms of diphtheria serum sickness are fever and rash, usually urticaria or a variety of erythema multiforme. Sometimes more unpleasant effects, namely, pains in joints, tendons and fasciæ occur with fever. Asthmatic patients should receive injections with caution, even as prophylactic. Intense itching, subsequently vomiting, has been cured by ½ grain of morphine. Adrenaline hydrochloride solution given hypodermically is also useful in controlling serum rash.

Ephedrine by the mouth is successful in aborting these reactions—one tablet an hour before the injection and one tablet every 8 hours for the next fortnight. For children under 4, tablets containing 0.1 g.; between 4 and 9, 0.2 g.; and between 9 and 15, 0.3 g.—P. Paul Levy, *Brit. med. J.*, ii/1933, 354.

An analysis of 4935 cases treated with concentrated diphtheria antitoxin showed that general reactions developed in 17.5% of cases; if local reactions and albuminuria are included the percentage is 21.9%. 80% of the serum rashes were urticarial, 10% were erythematous and scarlatiniform. Concentrated horse

serum used for the treatment of diphtheria rarely causes any anxiety on account of possible serious development.—H. M. Davis, *Lancet*, i/1938, 193.

Among 200 patients treated, with refined diphtheria antitoxin (Pope) the death-rate was only 2.5%. No serum rashes were recorded and immediate reactions after intravenous injections were few. The small bulk of the serum caused less discomfort to the patient than ordinary concentrated serum.—A. Hutchison, *Brit. med. J.*, i/1939, 384.

Serum sickness can be prevented by means of serum from persons convalescing from serum sickness. Convalescent human serum can be given safely on the third day after diphtheria antitoxin.—J. Amer. med. Ass., i/1939, 1260.

The Tellurite Test for Rapid Diagnosis of Diphtheria.

Diphtheria bacilli reduce potassium tellurite to a black substance. This chemical test for diphtheria bacilli may be applied to cultures or directly to a membrane in the throat.

A 2% solution of potassium tellurite is prepared, the salt being dissolved in distilled water at a temperature not above 40°C. This solution should not be kept for more than 30 days. A swab dipped into the solution is applied to the membrane or exudate on the patient's throat. If the infection is caused by *C. diphtheriae* the area that has been in contact with the swab is stated to show obvious blackening within 5 to 10 minutes. If not, there should be no change in colour. The tongue should not be touched and the throat should not have been recently treated with hydrogen peroxide, tannic acid or methylene blue.

In 72 out of 75 cases complete agreement was reached between the results of this bedside method and the bacteriological diagnosis in the laboratory. A. Manzullo, per *Brit. med. J.*, ii/1938, 1152.

Accuracy of the test confirmed (100%) in 44 cases. It is unlikely that any case of diphtheria would be missed through reliance being placed on the test, but the test can in no way take the place of the clinical and bacteriological methods of diagnosis already in use.—E. Tomlin, *Brit. med. J.*, i/1939, 1273.

With careful application a negative finding affords presumptive evidence against diphtheria, but a positive finding does not establish the diagnosis. Though the test possesses a certain value it cannot replace clinical diagnosis, either alone or supplemented by cultural methods.—J. B. L. Tomblinson and R. M. Campbell, *Brit. med. J.*, i/1939, 1275.

The test cannot be depended upon entirely as it apparently misses approximately one case in six and may give false positives.—*Brit. med. J.*, i/1939, 1291.

Many false reactions are given which render the test of little value as an aid to the diagnosis of diphtheria.—K. E. Cooper *et al.*, *Lancet*, ii/1939, 248.

84.3% of the diphtheria cases gave positive results, but on the other hand 36.6% of non-diphtheritic cases also gave positive results. With such a high percentage of error in each direction it seems unlikely that the test is of any practical value.—J. F. Murray, *S. Afr. med. J.*, 1939, 787.

Diphtheria Carriers are found of all ages and of either sex; the presence or absence of an obvious pathological condition is no criterion for detecting a carrier, or of virulence. The length of carrier life seems to have no effect on virulence—bacilli have been demonstrated to be virulent after 4 to 8 months in the ear and nose of different individuals. Artificial immunisation under certain conditions may increase the number of virulent carriers, especially when only partially carried out in a community.

Schick Test in Diphtheria (introduced by Prof. B. Schick, of Vienna, in 1913). Schick test toxin is injected into the skin to discover whether a person is immune or susceptible to diphtheria. If his blood contains antitoxin, so that he is immune, this antitoxin

prevents the injected toxin from causing a skin reaction. If his blood contains no antitoxin, or insufficient for protection, a circumscribed area of redness about $\frac{1}{2}$ in. or 1 in. or more in diameter (which may not appear until the third day), persisting 7 to 10 days, is produced, and on fading shows superficial scaling and persistent brownish pigmentation.

Schick Test Toxin. A standard diphtheria toxin is diluted so that 0.2 ml. contains the test dose. To ensure that the toxin injected is harmless, B.P. requires that when it is diluted 50 times, 0.2 ml. must cause no reaction when injected into the skin of a guinea-pig, but when diluted 25 times, this dose must cause a reaction. Now the test toxin also contains toxoid which produces no skin reaction but combines with antitoxin. Tests are therefore required to ensure that the test toxin contains a normal amount of toxoid, neither unusually large nor unusually small. The first test requires that 1 ml. Schick toxin mixed with 1 ml. of a dilution containing $\frac{1}{125}$ of a unit of antitoxin, must give a reaction on the skin of a guinea-pig when 0.2 ml. is injected. This test ensures that the amount of toxoid present is not unusually small, for, if it were, a person might appear immune who in fact had a very small amount of circulating antitoxin. The second test requires that 1 ml. of Schick toxin mixed with 1 ml. of a dilution containing $\frac{1}{125}$ of a unit of antitoxin must give no reaction when 0.2 ml. is injected into the skin of a guinea-pig. This test ensures that the amount of toxoid present is not unusually large, for, if it were, a person might appear susceptible who had a fair amount of circulating antitoxin. The diluting fluid may be either a sterile solution of sodium chloride, so that the diluted liquid is isotonic with the blood, or may be a sterile solution containing 1.5% v/v of a mixture of 57 g. of borax, 85 g. of boric acid and 99 g. of sodium chloride.

The improvement in methods of making dilutions of diphtheria toxin used in the Schick test has steadily increased their stability during the past sixteen years and now such dilutions remain unaltered for at least six to twelve months or more, at room temperature. 0.1% Witte peptone in borate buffer solution has been found sufficient to stabilise Schick toxin so that it would remain of full potency for twelve months. Recent reports, however, show that in a very small percentage of cases the peptone may give rise to severe allergic reactions. It is now proposed that human serum should be used as a stabilising agent free from this disadvantage, since it has been shown by animal experiments to be a suitable substitute. A 1 in 500 human serum in borate buffer solution will remain stable for six months at room temperature.—A. T. Glenny and M. E. Stevens, *Brit. med. J.*, i/1937, 709.

Allergic Reactions to the Schick Test. Report of 14 cases and treatment with 0.5 to 1 ml. of adrenaline chloride solution 1:1000. "In view of the rarity of the hypersensitive state, practitioners need not be unduly alarmed, nor hesitate to perform a Schick test where indicated. The worst of the reactions caused some anxiety for a time, but the subjects soon recovered completely."—H. J. Parish, *Lancet*, ii/1936, 310.

Method of Conducting the Test. 0.2 ml. of the standardised diluted diphtheria toxin is injected intracutaneously into the left forearm. A similar amount of control, i.e., toxin which has been heated, is injected into the right arm. A flush, sometimes with a

deeper red centre, on the site of injection into the left arm, and the absence of an identical flush on the right arm, indicates a positive reaction. This develops in from 24 to 72 hours and is more easily read on or after the third day.

The control test serves to eliminate *pseudo reactions* due to the presence in the test toxin of some substance which is more stable than the specific toxin and which causes reactions in sensitised individuals.

The results of Schick tests may be distorted by the use of tuberculin syringes insufficiently cleansed. Tuberculin has an extraordinary power of adherence to glass and ordinary methods of sterilisation fail to remove it. It is not generally realised that an apparently healthy person may give a vivid tuberculin reaction to a minute dose of tuberculin, e.g., 0.1 ml. of a dilution of 1 in 50,000 or even 1 in 100,000, and false "positive Schick reactions" have been shown to arise from this cause. It is safer to use separate syringes for different dilutions of tuberculin or to employ previously unused syringes wherever there is a possibility of confusion between tests.—*Brit. med. J.*, ii/1937, 670.

Diphtheria Prophylactic. The B.P. '32 includes five forms of Diphtheria Prophylactic (Toxinum Diphthericum Detoxicatum). A sixth variety (alum precipitated toxoid) is recognised by B.P. Add. I.

(a) **Diphtheria Toxin-Antitoxin Mixture**, prepared by adding diphtheria antitoxin to a filtrate of a culture on nutrient broth of *C. diphtheriæ*.

(b) **Diphtheria Toxoid or Anatoxin** (F.T.—Formol Toxoid), prepared by treating the filtrate with formaldehyde.

(c) **Diphtheria Toxoid-Antitoxin Mixture** (T.A.M.), prepared by treating the filtrate with formaldehyde and adding a small quantity of diphtheria antitoxin.

(d) **Diphtheria Toxin-Antitoxin Floccules**, prepared by adding diphtheria antitoxin to the filtrate in the proportion necessary to produce suitable flocculation, separating the floccules and washing and suspending them in physiological solution of sodium chloride.

(e) **Diphtheria Toxoid-Antitoxin Floccules** (T.A.F.), prepared by treating the filtrate with formaldehyde and then proceeding as for toxin-antitoxin floccules.

(f) **Alum Precipitated Toxoid** (A.P.T.), prepared by treating the filtrate with formaldehyde, adding alum in the proportion necessary to produce a suitable precipitate, separating the precipitate and washing and suspending it in physiological solution of sodium chloride.

All forms of diphtheria prophylactic are submitted to a test to ensure freedom from toxicity which consists in injecting 5 ml. into each of 5 healthy guinea-pigs, and in seeing that none die within 6 days. Hence, 1 ml., which is the amount injected into a person, must contain less than one-fifth of the fatal dose for a guinea-pig. Further, if any of the guinea-pigs die later than 6 days, a second test is applied in which 1 ml. is injected into each of 5 more guinea-pigs. None of these guinea-pigs must die within 30 days. There are also tests to ensure efficiency.

B.P. Add. I includes the following tests:—A quantity not exceeding 5 times the adult dose is injected once, or one-tenth the adult dose is injected twice, with an interval of not more than 4 weeks, into each of not less than 10 guinea-pigs. The immunity produced is such that not more than 2 out of the 10 (or 25% if more than 10 were used) are Schick-positive. For the toxin-antitoxin floccules and toxoid-antitoxin floccules an alternative test is to carry out the above immunisation with prophylactic on not less than 9 guinea-pigs and then to inject each animal twice, at different sites, with one test dose and two test doses, respectively, of Schick test toxin. A positive reaction to one test dose must not occur in more than one-third of the guinea-pigs and a positive reaction to two test doses must not occur in more than two-thirds. This part of the test is carried out not later than six weeks after the single injection of prophylactic or not later than three weeks after the second of the two injections.

Diphtheria toxin-antitoxin, which was the original form of prophylactic used, has been largely displaced by a preparation of diphtheria toxoid. Injections of toxin-antitoxin may be attended with some danger. Some fatalities have been ascribed to freezing of the mixture which destroys the antitoxin, leaving excess of the toxin. The toxin-antitoxin mixture should not be used after exposure to a temperature below 0°. The addition of formaldehyde renders the toxin non-toxic. (The anatoxin is stable for long periods below 20° and resists heating for 1 hour at 65° to 70°). It is not advisable to attempt immunisation in patients with advanced heart disease and kidney affection, or those recovering from acute infectious diseases. It is claimed that 70 to 90% of those treated are found to be immune after 8 weeks. From 1 to 5 years is the most favourable age for diphtheria prophylaxis.

Immunisation. Patients who give a positive Schick reaction should be immunised by *diphtheria prophylactic*, of which usually 3 injections of 1 ml. each are given at intervals of 7 to 14 days.

Babies up to 6 months seem to be immune; between the ages of 6 months and 5 years the majority give a positive reaction, and for children within these age limits the test is often considered unnecessary, and the children may be immunised without previous Schick testing.

Immunisation Against Diphtheria (Instructions by the Ministry of Health). The Ministry of Health have issued to county councils and sanitary authorities a revised edition of the official memorandum (Memo. 170/Med.) on the Production of Artificial Immunity against Diphtheria. While various forms of diphtheria prophylactic are available for use, all must satisfy the requirements of the Therapeutic Substances Regulations as regards immunising potency and freedom from toxicity. Those mainly used are:—A.P.T., F.T., T.A.F., T.A.M.

It is now generally agreed that in routine immunisation a preliminary Schick test need not be done. If F.T. or A.P.T. is used then in order that any undue sensitiveness may be detected the first dose should not exceed 0.1 or 0.2 ml. If there is undue reaction the initial dose should be repeated, if there is not, then a relatively large dose, say 0.5 ml., should be given. Of T.A.M., T.A.F. or F.T. it is customary to give three doses at two to three weekly intervals, though attempts have been made to reduce the number. For some time much was claimed for the efficacy of one injection of 0.5 ml. of A.P.T. It has been conclusively shown, however, that in children under eight years of age a dose of 0.1 ml. followed in four weeks by one of 0.5 ml. gives much better results. Owing to its relative insolubility and slower rate of absorption a somewhat longer interval is advocated for A.P.T., and it has been suggested that better results would be obtained by increasing the interval between the injections of the other prophylactics also to four weeks. For older children and adults, the first dose of 0.1 ml. serves to detect an unusually sensitive person. Such a person should be given two further similar doses at intervals of two to three weeks or he may be given two doses each of 1 ml. of T.A.F. If the person is not unduly sensitive, the same procedure as advocated for younger children should be followed. In this country and in the U.S.A. the present practice is to use two doses of 0.2 ml. and 0.5 ml. respectively of A.P.T. particularly for young people, though the first dose need not exceed 0.1 ml., while for adults, three doses of 1 ml., 1 ml., and 1.5 ml. of

T.A.F. are commonly employed. In the ordinary routine of immunisation of children, probably A.P.T. will be the prophylactic preferred.

Where protection is urgently required and the necessary tests can be carried out, F.T. is the prophylactic of choice; where, on the other hand, no preliminary testing can be done, where the demands on the Medical Officer's time must be reduced to a minimum and reactions must be avoided even at the cost of somewhat lower immunity less quickly attained, T.A.M. or T.A.F. should be chosen. For nurses and busy adults, T.A.F. should be employed as being less likely to produce local reactions. In all cases the Schick test should be done not less than two months after the last injection. It will usually be found that a few of those who have been given the ordinary course, the number varying from 1 to 10 or 15%, are still susceptible. Such cases should be subjected to a second similar course and again tested not less than four weeks later.

REFERENCES TO CLINICAL USE OF DIPHTHERIA PROPHYLACTIC.

"The evidence already available leaves no doubt that the disease and its often fatal consequences may now fairly be called avoidable."—J. Graham Forbes, *Spec. Rep. Ser. med. Res. Coun., Lond.*, No. 115, 1927.

Diphtheria, an almost preventable disease, still attacks some 40,000 people every year in England and kills 2000. In a crucial test in the Edinburgh and Birmingham isolation hospitals immunisation virtually abolished diphtheria among the staff and the nurses, constantly and intensely exposed to risk.—W. T. Benson, *Edinb. med. J.*, May, 1934, 293, per *Brit. med. J.*, i/1934, 1081.

Artificial immunisation against diphtheria continues to make uninterrupted progress in this country, although but slowly. Its value is undeniable and is not as yet sufficiently appreciated.—*Rep. med. Offr. Minist. Hlth, Lond.*, 1938.

In New York, in 1936, some 75% of the infant population had been vaccinated. About 1924 this city had annually some 10,000 cases of diphtheria with 700 deaths, but in 1936 the cases had fallen to 1143 with 35 deaths, and in 1938 the reported cases fell to 163. We have nothing like this to show in England; London has only some 5-3% of its child population immunised.—Sir J. C. G. Ledingham, *Brit. med. J.*, ii/1939, 841.

An anti-diphtheria campaign in Montreal progressively reduced the number of cases from 1632 in 1928, with 157 deaths, to 183 cases in 1935, with 21 deaths.—J. Graham Forbes, *Brit. med. J.*, ii/1937, 1209.

(a) **Diphtheria Toxin-antitoxin Mixture.** As already stated, this has now largely been replaced by other forms of prophylactic. For references to its use see previous edition.

(b) **Diphtheria Toxoid or Anatoxin.** Diphtheria toxoid (anatoxin) is a better immunising agent than toxin-antitoxin and may safely be employed in immunising adults. A first dose of 0.5 ml. is given, a second of 1 ml., and a third of 1 ml. to 1.5 ml., with an interval of 14 days between doses. If there is a marked "pseudo reaction" in the Schick test, or a history of diphtheria, give preliminary doses of 0.1 ml. to 0.25 ml. of toxoid.—G. F. Dick and G. H. Dick, *J. Amer. med. Ass.*, i/1929, 1903.

Diphtheria toxoid used for active immunisation without any undesirable local or general reactions. Sensitivity to toxoid demonstrated by intradermal tests. It should replace toxin-antitoxin.—Keller and Harris, *J. Amer. med. Ass.*, i/1934, 2163.

In animal experiments a higher degree of immunity produced by a dose of formal toxoid in 5 ml. of normal saline than by the same dose in 0.5 ml. saline.—P. Hartley, *Brit. J. exp. Path.*, 1935, 468.

Disappearance of Vaccinating Power. A subcutaneous injection of anti-serum protected guinea-pigs from death when followed by a lethal dose of toxin 18 days later, but not when the toxin was administered 45 days later. An injection of anatoxin did not protect guinea-pigs from death when inoculated with toxin on the 18th day, but it did protect those inoculated on the 45th day. A dose of antiserum followed $\frac{1}{2}$ to 8 hours later with one of anatoxin protected animals for 18 days, but not for 45 days. The identical results were observed when the order of administration was reversed. It appears, therefore, that anatoxin was destroyed or rendered ineffective by serum.—A. Besredka, *Compt. rend.*, 1938, 206, 380 per *Amer. J. Pharm.*, 1938, 209.

(c) **Diphtheria Toxoid-antitoxin Mixture.** Review of eight years' work in Birmingham. Since 1927 toxoid-antitoxin mixture has been given in 3 doses of 1 ml. each at fortnightly intervals. Only 14 cases of diphtheria have occurred in 58,000 immunised children.—M. Bard and V. Fellowes, *Lancet*, ii/1934, 1181.

(d) **Diphtheria Toxin-antitoxin Floccules.** The precipitate formed by mixing toxin and antitoxin in equivalent amounts contains all the specific antigen and antibody in the mixture with little non-specific matter.—P. Hartley, *Brit. J. exp. Path.*, 1925-6, 112. Owing to the elimination of much of the non-specific matter, the reaction following injection of floccules is less than that with toxin-antitoxin.

(e) **Diphtheria Toxoid-antitoxin Floccules.** Three injections may be needed. Little likely to produce reactions.—*Brit. med. J.*, i/1931, 757.

Rarely produces reaction in adults and practically never in children.—*Lancet*, i/1935, 229.

Satisfactory results obtained in adults.—D. J. Thomas and N. G. Howell, *Lancet*, i/1935, 579.

Immunisation with one injection of A.P.T. is much less certain in result than three injections of toxoid-antitoxin floccules or toxoid-antitoxin mixture. Of 825 children under 10 treated with A.P.T., 14.55% were Schick positive 12 months later. Of 3673 treated with T.A.F. (or T.A.M.) only 0.9% were Schick positive 12 months later.—H. C. M. Williams, J. D. Dear and W. Stewart, *Brit. med. J.*, ii/1935, 1078.

(f) **Alum-Precipitated Toxoid.** In the immunisation of 1160 school children, in no case was there any constitutional disturbance. A large number showed a very small subcutaneous lump at the site of injection which persisted for some weeks; many showed a slight tenderness, but only of a very trivial nature. Reactions were more numerous in older children, none at all occurring below the age of 10.—J. E. Haine, *Brit. med. J.*, ii/1935, 896.

Injection of 0.1 ml. of alum-precipitated toxoid followed by 0.4 ml. (or less) 3 weeks later, advocated for older children in whom reactions are likely to occur. The small initial dose gives warning if the patient is likely to react to the larger dose of toxoid. 185 children, of whom 20% were over 10 years of age, immunised by this 2-dose method, with only one mild reaction.—Chesney, *Brit. med. J.*, i/1936, 208.

Evidence to show that the 2-dose method gives a better immunity than a single injection representing the same total amount. Of 321 children given one injection only 64% were rendered Schick-negative, whereas of 35 children who received 0.1 ml. and 0.2 ml. 3 weeks apart, all were Schick-negative 15 weeks later.—Parish, *Brit. med. J.*, i/1936, 209.

Several hundred children, all originally Schick-positive and derived from a semi-rural community with an average Schick-negative rate of 13.2%, were given a single dose of 1 ml. of A.P.T. At the end of three months only 37% had become Schick-negative. Another brand of A.P.T. was used as a single dose in the immunisation of several hundred Schick-positive children in a London borough. Of these children 175 were re-tested after 3 months and 20% were found to be still Schick-positive.—G. Bousfield, *Med. Offr.*, 1937, 15.

Two small but well-spaced doses of a reliable alum-precipitated toxoid give a very high rate of "Schick immunity," 99.6% of 1555 children being found to be Schick-negative two months after treatment with two doses of 0.2 and 0.5 ml., given at an interval of four weeks.—G. Chesney, *Lancet*, ii/1938, 587.

The results obtained by some workers with T.A.M. and T.A.F. have varied widely, and those following the use of "one-shot" A.P.T. have been so diverse as to make the method clearly untenable. All the reports of the use of two injections of A.P.T. are in accord with a consistently high Schick-negative rate. The fears of reaction after A.P.T. seem to have been ill-founded. These well-documented facts should go a long way towards giving A.P.T. by two injections a more accredited place in immunisation schemes. This method is now employed in over 40% of schemes investigated, and there is no reason why the other 60% should not have equal confidence in its efficacy.—J. T. Lewis, *Brit. med. J.*, ii/1939, 1226.

Two doses of alum-precipitated toxoid produced the highest antitoxic response in children of any method of immunisation tried.—Volk and Bunney, *Amer. J. Publ. Hlth.*, 1939, 29, 197.

A.P.T. by at least two injections, properly spaced and given in adequate dosage, possesses so many advantages over other antigens that it would be a

misfortune of the greatest magnitude if it should fall into disrepute through wrong technique. The method advocated for use by all authorities responsible for the control of diphtheria is: (1) the dosage should be 0.5 ml. and 0.5 ml. in children under 8 years; in children of 8 years or more the first dose should be 0.25 ml., to be followed by 0.5 ml. if there is no reaction; (2) the interval between the doses to be in no case less than 4 weeks; (3) the injections to be given in opposite arms.—J. T. Lewis, *Brit. med. J.*, i/1940, 728.

Intranasal immunisation. A method of actual immunisation against diphtheria by a single subcutaneous injection of purified aluminium hydroxide toxoid, followed by intranasal instillation of purified toxoid dilution. The results, based on quantitative estimations of antitoxin, appeared to be excellent in both rabbits, children and adults, the effect of the intranasal instillations being greatest on those who gave a poor response to the subcutaneous injection. There were no reactions to the intranasal instillations in children, but in adults transitory headache, nausea or fatigue were occasionally experienced. Of the children, 100% developed more than 0.01 unit of antitoxin 6 weeks later, and 96 to 100% developed 0.10 unit or more. Nine months afterwards the immunity appeared to have fallen off considerably, but the response to nasal reimmunisation only, after twelve months, was even better than to the original combined treatment. In the group of 319 probationer nurses, 94% developed more than 0.01 unit and 85% more than 0.10 unit, while 1% were refractory. The method is recommended for adoption for all children without preliminary or control Schick-testing.—Prof. Claus Jensen (Director of the Department of Biological Standards at the State Serum Institute of Copenhagen), per *Lancet*, i/1937, 934.

Combined Diphtheria and Tetanus Prophylaxis. A mixture of diphtheria and tetanus toxoids produced a higher antitoxin titre for each infection than that produced by a single antigen. Two doses of the mixed toxoids at two months interval is advocated.—J. V. Cooke, per *Amer. J. Pharm.*, 1938, 209.

Combined alum-precipitated diphtheria and tetanus toxoids in two doses should be used as a routine in pediatrics. A subsequent dose of tetanus toxoid, rather than antitoxin, can be given when there has been risk of infection.—O. L. Von Canon, *Arch. Pediat.*, 1939, 56, 409.

A stimulating dose of the combined diphtheria and tetanus toxoids gives much greater and more durable immunity than two individual injections.—Jones and Moss, *J. Lab. clin. Med.*, 1939, 24, 512.

Dysentery.

The bacteria causing bacillary dysentery are of two main types—the Shiga and Flexner types of *B. dysenteriae*; the former is prevalent in South-Eastern Europe and Asia, and the latter in Western Europe and North America.

During recent years epidemics of a mild type of dysentery have occurred in Great Britain, the organism responsible being the *Sonne* bacillus, a sub-type of the Flexner group. The disease, which occurs mainly in children, runs a mild course and does not call for the use of antidyenteric serum.

Serum Antidyentericum (Shiga) (B.P.). *Syn.* SERUM ANTIDYSENTÉRIQUE (*Fr. Cx.*). The serum (or preparation of the serum) of horses that have been immunised to the toxin of Shiga strains of the *B. dysenteriae*.

For method of standardisation and unit, see Vol. II.

Doses.—Preventive, 4000 units subcutaneously; curative, an initial dose of 8000 to 10,000 units intramuscularly on the outer side of the thigh (into the body of the *vastus externus*), repeated daily till improvement sets in. For a grave case, 10,000 to 20,000 units repeated daily if necessary. Some dilute the dose with 150 to 300 ml. of normal saline and give *intravenously*. In any case, it should be given early. Stools are stated to return to normal

rapidly in successful cases, but treatment must be continued. Pains and temporary rashes may result, which, however, need not alarm.

In fulminating cases large doses should be given; also magnesium sulphate 1 dr. 3 times daily for the first few days. In bad cases morphine may be needed, and for very severe tenesmus a suppository containing cocaine $\frac{1}{2}$ gr. and iodoform 3 gr. is useful.

It is stated that while much of the endemic dysentery prevailing in tropical and sub-tropical countries is caused by pathogenic amœbæ, epidemic dysentery due to *B. dysenteriae* occurs all over the world, and this bacillus is also found in asylum or institutional dysentery, in some sporadic cases of ulcerative colitis and in certain forms of summer diarrhœa.

Polyvalent Antidysentery Serum is prepared by immunising horses to more than one strain—Shiga, Flexner, Sonne and Hiss-Y strains of the *B. dysenteriae*. Only the Shiga antibody can, at present, be assessed in terms of a standard unit.

Dose.—In mild cases, 10 ml. intramuscularly at intervals of from 6 to 10 hours if necessary; in severe cases, from 60 to 100 ml., preferably intravenously.

ULCERATIVE COLITIS. Believing that the majority of cases of ulcerative colitis are the result of infection with a dysenteric organism, the author has used polyvalent antidysenteric serum in treatment for the past 15 years. After preliminary desensitisation, 20, 40, 60, 80 and 100 ml. of serum are injected intravenously on consecutive days; sometimes a few additional doses of 100 ml. are given. The treatment can only be undertaken safely in a hospital or nursing home, where the patient is under continuous supervision, owing to the possibility of delayed anaphylaxis. If the patient is treated at home 10 ml. of serum should be injected intramuscularly daily for about 10 days; good results are sometimes obtained, although less frequently than with intravenous injections. The great disadvantage of treatment with serum is the possibility of a dangerous reaction. An anaphylactic reaction may occur during the injection of serum, but it is occasionally delayed several hours. Prompt treatment with adrenaline, 1 minim of which should be injected every $\frac{1}{2}$ minute, after an initial injection of 3 minims, until complete recovery takes place, is almost always effective. Rapid recovery is most likely in the early stages, but it is occasionally very striking, even in the long-standing cases. More frequently the serum produces a certain degree of improvement, with the result that other treatment leads to recovery more rapidly than it otherwise would have done.—A. F. Hurst, *Brit. med. J.*, 1/1936, 321.

Antidysentery Vaccine. *Syn.* DYSENTERY BACILLUS VACCINE.

B. dysenteriae (Shiga) produces in culture a powerful toxin, but the Flexner type does not produce a similar toxin. The presence of this toxin makes it difficult to prepare from Shiga's bacillus a vaccine that can be given in doses large enough to be efficient. From the results which have been obtained by prophylactic vaccines against Shiga's *Bacillus dysenteriae*, there seems to be no doubt that when vaccine is given in sufficiently large doses a considerable degree of immunity results. The extreme toxicity of the vaccine has been countered by combining it with an antitoxic serum or by treating it with chemicals. Both methods seem to furnish a more or less efficient vaccine. It seems likely that the most satisfactory vaccine of this bacillus will be made by treating cultures with formalin.

B. dysenteriae (Flexner) includes a number of strains that are antigenically different. A stock vaccine should include representatives of all types. Vaccines of *B. dysenteriae* (Flexner) are practically non-toxic.

Dose (of Flexner organisms).—For prophylaxis 250, 500, 1000 millions at intervals of 7 to 10 days. Some give two doses only, 500 and 1000 millions. Initial dose for treatment, 5 to 10 millions.

Oral Use of Dysentery Vaccine. Vaccine *per os* reduced morbidity and mortality from dysentery. Both prophylactically and therapeutically as effective as serum: of 3600 men treated in the Rhine Army, none contracted dysentery, while 471 cases occurred in untreated men.—Prof. Besredka, *Lancet*, i/1929, 1092. Criticism by W. F. Harvey, Prof. A. Fleming and others. "Difficult to know what antiviral is."—*ibid.*, 1093, 1157.

Prophylactic oral vaccine reported on favourably in the case of mental patients in an Ontario institution. Flexner strains isolated from patients were grown in broth for 4 days, the organisms killed by heat, and 10 ml. of the suspension of dead organisms in the broth given orally in place of the evening meal on the first day, 20 ml. on each of the next 3 days, and 40 ml. on the sixth day, with no appearance of reactions or inconvenience.—E. P. James and S. G. Chalk, *Canad. med. Ass. J.*, ii/1933, 40.

The literature on oral immunisation against bacillary dysentery is not so extensive nor so conclusive as that on oral typhoid vaccination. Nevertheless, animal experiments and the available statistical reports of immunisation experiments carried out in humans demonstrate the possible value of this method in the prophylaxis of dysentery.—D. Thomson and R. Thomson, *Med. Pr.*, ii/1935, 133.

For details concerning differential diagnosis of bacillary and amebic dysentery, and other bacteriological data, see Vol. II.

Gas Gangrene.

A large group of bacteria, the anærobic spore-bearers or genus *Clostridium*, are the cause of the condition known as gas gangrene, of which the most commonly found species are *Cl. Welchii*, (*B. perfringens*), *Cl. oedematiens*, *Cl. septicum* (*Vibrio septicum*), and *Cl. histolyticum*.

It is not possible to say which of the gas gangrene anærobes is the most virulent, but it may be said that *Cl. oedematiens* is mainly toxigenic, *Cl. Welchii* is more toxigenic than invasive, while *Vibrio septicum* is both toxigenic and invasive. Thus, the latter organism may be found in the blood of patients with well-established gas gangrene due to it, whereas the invasion of the blood by *Cl. Welchii* is a late or terminal event.

Antitoxins, both simple and polyvalent, are employed either prophylactically or therapeutically. They may also be employed in association with chemotherapy.

Gas gangrene, like diphtheria, is to be diagnosed principally on clinical evidence which the bacteriologist may or may not be able to confirm, but, as in diphtheria, it would be quite unjustifiable to wait for a bacteriological report in a suspected case, though where mono-specific antitoxins are available for treatment it is an urgent necessity to know the species of the infecting anærobe.

There is no doubt that there exists a synergic action between the drug (sulphapyridine) and antitoxin, for which the most likely explanation is that the antitoxin neutralises the bacterial toxin while the drug exerts a bacteriostatic effect on the organism itself; thus the body's natural defences are able to play their part in completing the destruction of the invader. It would thus be unwise

in any wounded patient in whom gas gangrene is diagnosed or even suspected to withhold treatment with polyvalent antitoxin. It should be given intravenously at the earliest possible moment and in adequate dosage—say one therapeutic dose for the suspected case, and for the established case three to five doses, combined with 6 to 9 g. of sulphapyridine daily until the infection is controlled.—Editorial, *Lancet*, i/1940, 1127.

Antitoxinum Welchii (B.P.). GAS GANGRENE ANTITOXIN (PERFRINGENS).

Prepared from the blood serum of animals immunised by injection of the filtrate from a culture of *Bacillus perfringens* (*Cl. Welchii*). Used either as unconcentrated or concentrated (globulin) serum, either in the liquid form or dried.

Dose.—Prophylactic, 4000 units. Therapeutic, 10,000 to 20,000 units intravenously.

Uses. Has the property of neutralising the toxin produced by *Cl. Welchii*, and is used for the treatment of wounds infected by this anærobic organism; also in acute intestinal obstruction and peritonitis, and some cases of puerperal sepsis (e.g., following attempts at criminal abortion).

INTESTINAL OBSTRUCTION. Improvement recorded in patients suffering from peritonitis with paralytic obstruction by treatment with *Cl. Welchii* antitoxin. In 54 cases of acute intestinal obstruction treated with antitoxin, mortality rate was 9.3%, as compared with 24.8% in cases not treated with antitoxin. In 256 cases of acute appendicitis treated with antitoxin, mortality rate was 1.2% as compared with 6.3% in control cases.—B. W. Williams, *Lancet*, i/1927, 907; and *Brit. J. Surg.*, 1926, 54.

Cl. Welchii serum of real value when gangrenous bowel has to be dealt with, but of no benefit in straightforward cases of simple obstruction.—D. P. D. Wilkie, *Brit. med. J.*, ii/1932, 545.

PUERPERAL SEPSIS. Gas gangrene antitoxin should be given early in all cases presenting circumstances which may lead to generalised infection, without waiting for bacteriological confirmation of the presence of anærobic organisms.—A. J. Wrigley, *Proc. R. Soc. Med.*, 1930, 1643.

Recovery in a case of puerperal infection treated with antistreptococcus serum, gas gangrene antitoxin and anticoli serum.—F. Ivens, *Lancet*, i/1929, 606.

Details of a case of gas gangrene infection in a woman who died during parturition.—J. and P. Adams, *Brit. med. J.*, ii/1931, 1179.

WOUNDS. Use of polyvalent gas gangrene antitoxin, together with tetanus antitoxin, advised in all cases showing suspicion of gas gangrene.—M. Wiseberg, *Canad. med. Ass. J.*, ii/1932, 278. See also C. H. Fagge, *Brit. med. J.*, i/1930, 50; and D. C. Corry, *Brit. med. J.*, i/1931, 219.

It is considered that the serum should be given early to all wounded men with gross injury of muscle, to all cases in which a large artery is severed, and to all cases in such a state of shock that they must be allowed to resuscitate before an operation is possible. The serum should be polyvalent with the weight thrown on *Cl. Welchii* antitoxin. In the case of established gangrene the serum should be given intravenously and in large doses. It should also be injected into the muscles round the focus and by instillation into the gangrenous focus. The injections should be repeated every few hours intravenously, and locally at every dressing and operation. For prophylaxis the following combined injection is proposed: *Cl. Welchii* antitoxin 3000 units, *Vibrio septique* antitoxin 1500 units, *B. œdemaens* antitoxin 1000 units; this is contained in a dose of approx. 10 ml. For treatment, 2½ times this dose may be given for therapeutic purposes in established cases.—J. R. Army med. Cps, 1940, 74, 92.

Antitoxinum Œdemaens (B.P. Add. I). GAS GANGRENE ANTITOXIN (ŒDEMATIENS).

Prepared from the blood serum of animals immunised by injections of the filtrate from a culture of *Clostridium œdemaens*.

Used either as unconcentrated or concentrated (globulin) serum, either in liquid form or dried.

Dose.—Prophylactic, 20,000 units. Therapeutic, 50,000 to 100,000 units.

Uses. Is injected in the treatment of gas gangrene due to *Clostridium oedematiens*. This organism was responsible for about 15% of cases of gas gangrene on the Western front during 1914-18.

Antitoxinum Vibriosepticum (B.P. Add. I). GAS GANGRENE ANTITOXIN (VIBRION SEPTIQUE).

Prepared from the blood serum of horses that have been immunised by injections of the filtrate from a culture of the *Clostridium* commonly known as *Vibrio septique* (also known as *B. oedematis maligni*). Used either as unconcentrated or concentrated (globulin) serum, either in the liquid or dried form.

Dose.—Prophylactic, 5000 units. Therapeutic, 10,000 to 20,000 units.

Uses. *Vibrio septique* is another of the organisms responsible for gas gangrene, and the antitoxin is used for the same purposes as the other gas gangrene antitoxins.

Gonorrhœa.

Vaccinum Gonococcicum (B.P.C.). Prepared from recently isolated cultures of *Micrococcus gonorrhœæ*.

Dose.—Gonococcus vaccine is of value for raising the patient's resistance. A dose of 5 million organisms may be gradually increased to 100 millions, injections being given twice weekly.

Opinions differ widely concerning the value of gonococcus vaccine in treatment and concerning dosage. In acute urethritis and such complications as arthritis, prostatitis, vesiculitis, epididymitis, the initial dose may be 5 millions (or less), and by judicious use of the vaccine the duration and severity of the disease may be materially shortened. In chronic cases larger doses up to 500 millions may be given. The diagnostic dose in cases of arthritis of doubtful origin is 500 millions (*vide* Streptococcus Rheumaticus vaccine).

A series of injections will usually free any case of chronic gleet from the gonococcal infection, although it may not succeed in stopping discharge entirely in all cases owing to secondary infections.

Doses may be repeated at intervals of 7 days, and gradually increased until a maximum dose of 500 million organisms has been attained.

The injection of large doses of gonococcal vaccine usually gives rise to a reaction, which may be local or general. The *local reaction* consists in redness and swelling at the site of injection. The *general reaction* is manifested by a rise of temperature accompanied by increased pain and tenderness in the affected joints (in the case of gonorrhœal arthritis). Both reactions usually subside within 24 hours. The reactions are less marked after small than after large doses, and are absent in cases free from gonorrhœa.

In the acute stages of gonorrhœa and cases of uncomplicated chronic urethritis, provided the disease is localised to the urethra, vaccine treatment is unavailing.

Vaccines in suitable doses materially assist the treatment by stimulating the resistance, but they can do harm if given in doses that are too large, particularly at a time when the tissues are coping with large doses of toxin evolved from the infecting micro-organism. The best time to begin vaccine treatment seems to be when the symptoms are abating and the discharge has become no more than a morning gleet.—L. W. Harrison, *British Encyclopædia of Medical Practice*, 1937, Vol. 6, p. 18.

For details concerning the use of gonococcus vaccine in conjunction with the sulphonamides, see pp. 945, 961.

Arthigon (*Schering, London*). Polyvalent gonococcal vaccine in a sterile solution of urotropine 40%. Supplied in ampoules of 1 ml., containing doses of from 10 to 1000 million organisms, given either intravenously or intramuscularly.

Gono-Antipeol (*Continental Laboratories, London*). Vaccine filtrate of polyvalent gonococci, streptococci, staphylococci and pyocyanus for the prophylaxis and treatment of gonorrhœa. Supplied in bottles of 40 ml.

Gono-Yatren (*Bayer Products, London*). Polyvalent gonococcus vaccine preserved in 3% Yatren solution. Given intramuscularly or intravenously in the treatment of chronic gonorrhœa and its complications.

Gonoderm (*Parke, Davis, London*). The bouillon filtrate of the gonococcus grown in liquid culture medium—contains the soluble toxin described by Corbus and Ferry. Used by intradermal injection in the treatment of acute, sub-acute and chronic gonorrhœa.

Toxogon (*Bayer Products, London*). Concentrated gonococcal vaccine containing 500 to 2000 organisms per ml. for intramuscular or intravenous injection.

Hay Fever Vaccine. A solution of grass pollen toxin preserved with 0.5% phenol. Prepared by extracting grass pollen by alternately freezing and thawing the pollen in normal saline. Strength stated in "units." 1 unit is defined as the amount of extract yielded by one-millionth of a gramme of pollen. *Immunisation* should be commenced in susceptible persons during February with an initial dose between 20 and 100 units (depending on the degree of susceptibility as shown by the skin test or eye test). Subsequent doses may be given every 7 or 10 days, cautiously increasing the amount each time. If time is short, doses may be given more frequently—several times a day if necessary. In treatment the initial dose may be determined by the ophthalmic reaction, or failing this, give 50 units initially.

Extracts from all grass pollens furnish one and the same antigen for the purpose of desensitisation to hay fever. A patient who is sensitive to one grass pollen is sensitive to all. Timothy grass, *Phleum pratense*, is the pollen to which patients are most sensitive, and desensitisation to this pollen desensitises to all grass pollens.—J. Freeman, *Lancet*, i/1933, 573 and 630.

Best method for immunisation is by long succession of prophylactic doses given in the early spring up to the hay fever season, commencing with a small initial dose of 40 units and gradually rising to as much as 10,000 units. If immunisation is commenced in February, a dose every other day will prove sufficient; if in March, a dose every day, and in May, three, four or even five doses a day. It is always possible to resort to a "rush" course in a hospital, when desensitisation can be completed in a week by cramming eight doses into each day. The most convenient method is to teach the patients to inoculate themselves.—J. Freeman, *Lancet*, ii/1936, 92.

For a consideration of cutaneous tests and non-specific protein therapy in asthma, hay fever and numerous allied affections, see p. 792 et seq.

Influenza Vaccine. Influenza vaccines are usually polyvalent, containing the chief types of bacteria found in the catarrhal secretions of the respiratory passages in epidemic influenza, *viz.*, *H. influenzae* (Pfeiffer's bacillus), pneumococci and streptococci.

The influenza bacillus, believed by Pfeiffer to be the cause of epidemic influenza, must now be regarded as a secondary invader, since it has been shown by Smith, Andrewes and Laidlaw (*see* Vol. II) that the primary infecting agent is a filter-passing virus. It is generally recognised, however, that the secondary organisms are responsible for the serious pulmonary complications which so often prove fatal, and on these grounds, therefore, it is reasonable to suppose that the prophylactic use of a mixed influenza vaccine might raise the individual resistance. To be of service the injections should be given before the beginning of the influenza season, *i.e.*, in the early autumn.

A formula which has been widely used consists of *H. influenzae* 400 millions, pneumococci 200 millions, and streptococci 80 millions, in 1 rnl. An initial dose of $\frac{1}{2}$ ml. is given, followed after an interval of 10 days by 1 ml.

Whittingham's Influenza Vaccine (Duncan, Flockhart, Edinburgh). A prophylactic vaccine containing *H. influenzae* 25 mill., pneumococcus 100 mill., streptococcus 50 mill., *M. catarrhalis* 100 mill., pneumobacillus 25 mill. This is the "A" strength; "B" and "C" strengths are also supplied containing respectively twice and four times the number of each of the organisms in "A."

Influenza Virus Vaccine. Influenza virus, isolated from cases of human influenza, can be propagated by passage through mice or ferrets, or on the chorioallantoic membrane of developing chick embryo. In preparing vaccines for human use the virus is grown in one of these ways and the living cells removed by filtration. Its potency is measured in terms of the infective dose for mice, and it is inactivated by means of formaldehyde solution.

Protection experiments in mice and ferrets, and antibody production in man and the rabbit, indicate that suspensions of elementary bodies killed by heat at 57° constitute a satisfactory immunising agent against epidemic influenza. Dramatic results are not to be expected from the use of immunising agents to prevent influenza in human beings, but in certain circumstances these should be of definite value.—R. W. Fairbrother, *Lancet*, 1/1938, 1269.

A formalised vaccine made from the lungs and spleens of ferrets suffering from a simultaneous infection with the viruses of influenza and distemper produced a solid immunity in ferrets, associated with a high titre of influenzal antibodies. The immunity evoked by the vaccine protects the ferret not only against the strain of influenza present in the vaccine, but also against antigenically unrelated strains. Trials with the composite vaccine in man are proposed.—F. L. Horsfall and E. H. Lennette, *Science*, 1940, 91, 492.

Epidemic Influenza Virus Suspension I.V.S. (*British Drug Houses, London*). Epidemic influenza virus inactivated by heat at 57°. *Dose*.—1 ml. subcutaneously. The resulting immunity is stated to last approximately 12 months. As complete immunity is not produced for a few weeks, prophylactic treatment should be given in the autumn.

Measles. The ætiology of measles is still unknown, but it is thought to be due to a filter-passing virus.

Seroprophylaxis. Good results have attended the use of seroprophylaxis, by means of which either active or passive immunity can be conferred. Except in an ailing or weakly child

the aim should be to attenuate rather than to prevent an attack of measles, since such a procedure will enable the child to gain a lasting immunity; active immunisation is therefore the more important measure.

Immunisation may be achieved by the injection of either (a) convalescent serum, (b) adult serum, (c) parental blood, or placental extract (immune globulin). Certain local authorities have arranged for the collection and issue to practitioners of adult measles serum, and many hospitals, including the hospitals of the Metropolitan Asylums Board, keep supplies of "pooled" convalescent serum ready for use. Immune globulin is available commercially.

A review of the literature would seem to indicate that, from the point of view of effectiveness, there is little to choose between any of these methods, though convalescent serum and immune globulin are perhaps the two most widely used.

(a) Convalescent Serum. The blood is collected from convalescents on the seventh to tenth day of normal temperature, and after treatment with Trikresol the serum is stored in an ice-chest.

Dose.—From 3 ml. for patients under 1 year, increasing by 1 ml. for each year up to 7 ml. for those over 5, 10 ml. at 10 to 12 years, and 12 to 20 ml. for adults. Its use in infants under 6 months is inadvisable. If complete protection is desired, with passive immunity for 2 to 4 weeks, serum should be given on or before the 5th day of incubation, but if a modified attack is desired the serum should be given between the 6th and 9th days. The injections, which are given intramuscularly, do not cause anaphylaxis or reaction.

Injections of 5 ml., even up to eighth or tenth day of exposure, of great benefit. Complete protection secured in 185 out of 233 patients (80%), whereas 23 out of 32 controls contracted measles.—T. M. Hunter, *Brit. med. J.*, i/1933, 218.

Immune measles serum finds its most brilliant application when administered in the incubation period. Doses of pooled convalescent serum, of from 5 to 20 ml. according to age, given before the fifth or sixth day after earliest ascertained exposure, almost invariably afford complete though temporary protection. If given later in the incubation period, but before the onset of symptoms, attenuation of attack is more likely to follow and should be aimed at in every instance when circumstances permit.—W. Gunn, *Practitioner*, ii/1936, 515.

The *intravenous injection* of adequate amounts of convalescent serum, if given in the pre-eruptive stage, modifies the course of the measles in most cases. The effective dose is from 40 to 50 ml. given at least one day before the appearance of the eruption. It is especially indicated in weak and debilitated children, in those just recovering from whooping cough and other infectious diseases of childhood, and in those in whom measles has developed during the course of another acute or chronic disease.—J. L. Kohn, *J. Amer. med. Ass.*, ii/1938, 2361.

(b) Adult Serum. The blood serum from adults who have had an attack of measles in childhood. The serum is collected under aseptic conditions and stored in an ice-chest, when it will retain its full potency for 6 months. The serum from adults up to 50 years of age is as potent as that from adolescents.

Dose.—A dose of 20 ml. is given intramuscularly. If given within the first four days after exposure a mild or attenuated attack may be expected in 80% of those contracting the disease;

if given from the 5th to the 7th day after exposure a mild attack may be expected in 60%. The duration of the partial immunity conferred is at least 10 days and possibly longer.

In the epidemic of 1931-2, during which 11,526 cases were admitted to the L.C.C. Hospitals, comparisons were made of the results obtained with convalescent and adult serums, with the conclusion that 90% prevention was secured by convalescent and nearly 80% by adult serum, and that adult serum used in prevention yielded about 70% better results than those in untreated or control cases. "Adult serum a valuable therapeutic agent which can be used in the treatment of measles on a larger scale than is possible with human convalescent serum."—Rept. of M.O.H. and School M.O. on the Measles Epidemic, 1931-32, *Brit. med. J.*, ii/1933, 830.

Adult serum in a school epidemic of measles. The serum exerted a beneficial effect, as shown by a less severe illness and a diminished incidence of complications in the majority of the inoculated cases, compared with the unprotected cases.—L. R. Lempriere, *Brit. med. J.*, i/1939, 1137.

Normal adult serum has been found to be about one-third as potent as convalescent serum, but is reasonably effective in modifying attacks. The immune globulin from human placentas is not much more effective than adult serum, and reactions sometimes follow its use.—W. Gunn, *Lancet*, ii/1939, 601.

(c) **Parental Blood.** Where there is a difficulty in obtaining convalescent or adult serum, blood may be withdrawn from the vein of either parent (who must, however, have suffered from measles at some previous date) and up to 10 ml. injected forthwith intramuscularly into the exposed child. No anti-coagulant is necessary and there is no risk of anaphylaxis.

The blood of normal adults is a valuable source of antitoxin. While 23 infants left unprotected during an epidemic all suffered from a typical attack, 19 out of 56 injected with 30 ml. of parental blood escaped entirely and the remainder only had a mild attack.—J. M. Lewis and L. H. Barenberg, per *Brit. med. J.*, i/1933, 423.

The injection of whole adult blood has been much less often employed than the alternatives—convalescent serum, adult serum and immune globulin—a fact which is greatly to be deprecated, since it is the most generally applicable, useful, convenient and inexpensive method, and is particularly suitable to private medical practice. Of 20 contacts treated, 4 were completely unaffected, 14 developed modified measles and 2 were failures. The average injection was 10 ml. intramuscularly.—T. D. Culbert, *Brit. med. J.*, ii/1938, 705.

(d) **Immune Globulin (Placental Extract).** A sterile, refined and concentrated preparation of globulins made from human placental blood and tissues, and containing immune factors against measles. The immunising potency of the product is determined on the basis of the diphtheria antitoxin titre of the placental blood. It is said to be equivalent in usefulness to convalescent serum, while being more readily available. The only objection is that reactions, such as pain and redness at the site of injection, rise of temperature, nausea and pallor, may follow its use.

Dose.—From 2 to 10 ml. intramuscularly, according to the age of the patient and the intimacy of the contact. The usual doses are: for prevention 2 to 5 ml.; for modification 2 to 10 ml.; for treatment (with caution) 5 to 10 ml.

Doubtful whether the injection of sufficiently large doses to give complete protection is justifiable outside institutions, except in cases of debilitated, tuberculous or other acutely or chronically affected children. Rather the immune globulin should be used to modify the disease and presumably thereby to render the patient permanently immune. American workers are of the opinion that it is at least as effective as the most potent globulin serum.—*Pharm. J.*, i/1936, 739

The advantages and disadvantages of immune globulin (human) as an immunising agent in the prevention and modification of measles are at least equal to those of other preparations which have been used for a similar purpose. Reports seem to be about equally divided on the question of whether or not this immunising agent is superior to convalescent serum. Reactions are not infrequent and not always mild.—Report of the Council on Pharmacy and Chemistry of the A.M.A., *J. Amer. med. Ass.*, ii/1938, 1764.

In an epidemic of measles in a girls' school, immune globulin was used as a prophylactic. There were no serious reactions following the injections. The treatment did not prevent or postpone an attack of measles, but rendered it mild and the duration of fever shorter, and lessened the incidence of complications. The immunity probably diminished rapidly after three weeks.—T. N. Parish, *Brit. med. J.*, ii/1938, 65.

Immune globulin obtained from placentas is considered to be as effective as convalescent serum for the prevention and modification of measles. It remains to be seen to what extent measles can be modified and still allow the development of a permanent immunity such as follows a definite case of measles.—*Int. med. Digest.*, 1939, 34, 189.

Immune Globulin (Human) is issued in 2 and 10 ml. vials by *Parke, Davis & Co., London*, and *Lederle Laboratories, New York (C. F. Thackray, Leeds)*.

Embryonin (*Bioglan Laboratories, Hertford*). A placental extract in 2 ml. ampoules. Advocated for the prevention and modification of measles.

Antistreptococcal serum. It is a matter for doubt whether immune measles serum—convalescent, normal adult, or placental—exerts any specific curative action once the disease is established. The therapeutic results of considerable doses, from 20 to 30 ml., of convalescent serum given intravenously have failed to convince the impartial observer of its value. It is probable that any benefit that may accrue is attributable more to complement and allied bodies, or even to streptococcal antitoxin, in the serum than to a specific anti-measles action. So pronounced are the effects of anti-streptococcal serum in lowering the incidence and severity of complications, the majority of which are due to streptococci, that it is administered almost as a routine in fever hospital practice. Doses varying from 10 to 50 ml. by the intramuscular route usually suffice.—W. Gunn, *Practitioner*, ii/1936, 515.

In the common and fatal broncho-pneumonias and empyemas following measles in camps, *S. hæmolyticus* was found constantly. The importance of carriers of this organism in measles wards cannot be over-estimated. Cole found 11.4% of measles cases carried it on admission, 38.6% after 4 days, and 56.8% after 8 to 16 days.—Stitt.

Pneumonia.

The organism responsible is the pneumococcus. It has been customary in the past to describe four principal types of pneumococcus—Types I, II, III, and a fourth group, IV, consisting of cocci which do not conform to the characteristics of the other three types. Recent work has shown, however, that this last group contains at least 29 different types (Types IV to XXXII), and that it is this heterogeneous group which is largely responsible for primary broncho-pneumonia. In other words, there are 32 aetiological forms of pneumococcic pneumonia.

The bacteriotherapy of pneumonia may therefore be achieved (a) by the subcutaneous injection of a stock pneumococcus vaccine (or, where possible, of an autogenous or type-specific vaccine), or (b) by the intravenous injection of a type-specific serum.

Pneumococcus Vaccine. Prepared from killed cultures of representatives of all the recognised serological types of the pneumococcus, or from one of the types only.

Dose.—In the treatment of lobar pneumonia the recommended dose varies widely, an appropriate initial dose (for a monovalent

vaccine) being from 10 to 50 millions, repeated every 24 hours until the temperature falls, though some workers prefer to give a much larger dose, e.g., 100 millions or even more, to abort the attack. If a polyvalent vaccine is used, much larger doses, e.g., up to 1000 millions, may be employed. It should be borne in mind that successful results are only obtained by early administration, preferably not later than the third day of the disease.

Pneumococcus vaccine is also employed in the treatment of chronic and sub-acute localised infections due to the pneumococcus, such as empyema, arthritis, sinusitis, abscesses, etc., and numerous conditions of the respiratory tract in which the pneumococcus is the infecting agent. Frequently other organisms are present in these conditions, e.g., *H. influenzae*, staphylococci, streptococci, etc., giving rise to mixed infections, and in these cases mixed vaccines should be employed.

The percentages of cases of pneumonia due to bacteria other than pneumococcus is probably very much greater than is supposed. This was verified by the experience of the widespread epidemics in 1918-19 of so-called "Spanish flu." In cases where pneumonia is said to supervene upon influenza, the infection is a double one from the beginning, and much may be done to prevent the pneumonic attack by giving doses of 25 to 50 millions of pneumococcus vaccine, combined with 50 to 100 millions of *H. influenzae*, as early as possible during the influenzal attack. Thus, "P.S.I." vaccine, advocated by W. H. Wynn (see *Brit. med. J.*, ii/1934, 1159) contains 200 millions each of pneumococci, streptococci and *H. influenzae*, the initial dose for an adult being 600 millions (1 ml.) and for an infant of one year 20 millions, these doses being repeated at 24-hour intervals.

Opinions are sharply divided as to the value of vaccine therapy (as opposed to serum therapy) in lobar pneumonia, and some workers have condemned it as useless. The special advantages claimed for it by its exponents are that it is easy to apply, requires no special technique, and is without dangerous effect. It is probable that a large percentage of failures with stock vaccines is due to the vaccine not conforming in type with the infecting organism. Stock vaccines must be polyvalent, and polyvalent in each of the types peculiar to the country. Autogenous or type-specific vaccines are clearly preferable.

Method for the rapid production of autogenous vaccine for treatment of pneumonia, with notes on its successful use in nine cases.—F. P. G. de Smidt, *Brit. med. J.*, ii/1938, 1140.

Vaccine treatment appears to be successful in reducing the duration of uncomplicated pneumonia by an average of 3 days. Recovery within five days of the development of pneumonia is much more likely if vaccine has been administered. Some cases respond immediately with crisis and marked improvement of condition.—J. H. Bolton, *Quart. J. Med.*, 1938, 7, 171.

Prophylactic Use. In addition to their therapeutic use polyvalent pneumococcus vaccines have also been employed prophylactically with some measure of success in camps, mines, etc.

Sir A. E. Wright found that doses up to 40,000 million produced nothing more than a slight constitutional disturbance and a slight rise in temperature. Lister advises a vaccine of four types, containing 6000 millions per ml. of each type, making a total of 24,000 millions per ml. Of this 1 ml. is given as initial dose, twice repeated, at intervals of 7 days. Borel holds similar views, and he inoculated Senegalese troops in France with initial doses of 32,000 millions without ill effect.

For white races, work of investigators of the Rockefeller Institute shows that initial doses of 1000 millions each of the prevalent strains can be safely used, and that with lower doses full immunity may not be secured. After 7 days, either 1000 or 2000 millions is given, and a further 2000 millions 7 or 14 days later.

The pneumococcus types now included in the prophylactic vaccine employed in the Witwatersrand goldfields are I, II, III, V, VII, XII and XIV. (D. Ordman, per *Lancet*, ii/1938, 579.)

P.S.I. Vaccine (Evans) (Evans, Sons, Lescher & Webb, Liverpool). Vaccine prepared according to Wynn's formula (*vide supra*) for the treatment of pneumonia. Dose.—1 ml. repeated after 24 hours.

Anti-Pneumococcus Serum. As already stated, the pneumococci have been classified serologically into 32 types, and successful serum treatment is dependent upon accurate bacteriological type diagnosis, the therapeutic effect of any anti-pneumococcus serum being strictly type-specific. Not only has the incidence of these numerous types in pneumonia been fully studied, but the characteristic features of the disease produced by some of them have been defined, and in every one of the new types so far studied from the therapeutic standpoint, serum treatment has been found effective.

The Incidence Rate of the various types of pneumococci varies in different localities and in different years. A compilation of data made in America on many thousand cases showed the type distribution in lobar pneumonia for adults to be approximately 29% for Type I, 17% for Type II, 12% for Type III, 5% for Type IV, 7% for Type V, 2% for Type VI, 6% for Type VII, 8% for Type VIII, and 3% for Type XIV, leaving approximately 11% for other types. It was further found that the type incidence in children and adults is quite different. The incidence of Types II and III in children is extremely low, while Types VI, VII, XII, XIV and XIX are most frequently seen; Type I occurs infrequently as compared with adults. In this country it is generally considered that from 60 to 70% of all cases of lobar pneumonia are either Type I or Type II.

Of the 29 types separated from the group originally known as Type IV, it was found that Types V, VII, VIII and XIV occur with much greater frequency than the others. The mortality in serum treated cases was lower than in those not given serum, especially when the serum was given early in the disease.—M. R. Rosenblüth and M. Block, *Arch. intern. Med.*, 1937, 50, 567.

Type VII pneumococcus present in 6.5% of cases of pneumococcal pneumonia in adults and 2.4% in children.—J. G. M. Bullowa and E. Greenbaum, *Arch. intern. Med.*, 1937, 50, 179.

In over 80% of 102 cases, diagnosis of Type I or Type II pneumococcal pneumonia was made by the Neufeld technique using diagnostic anti-pneumococcus horse serum.—Cruikshank and Montgomery, *Lancet*, i/1938, 217.

Direct Typing of Pneumococci (The Neufeld Test). The pneumococcus in sputum undergoes a complete change which is observable microscopically when it is acted upon by a specific serum; there is a visible "swelling" of the capsular zone. By means of this test the type of pneumococcus can be ascertained

within a few minutes. The sputum is emulsified in normal saline solution and successive drops of the preparation are mixed on slides with drops of the type-specific sera (from rabbits). A control consists of a drop of the emulsified sputum mixed with a drop of normal saline. Microscopic examination is facilitated by adding a drop of Löffler's methylene blue to the mixtures; the swollen capsules appear unstained and have a ground-glass appearance.

Therapeutic Value of Anti-Pneumococcus Serum. The efficacy of serum treatment in pneumococcal infections due to Types I and II is established beyond doubt, so much so that in certain of the American states an organisation exists to ensure that serum shall be available free of charge for every case of pneumonia requiring it. While the most striking results have been obtained in Types I and II, a considerable reduction in mortality has been shown to follow type-specific serum treatment in Types V, VII, VIII, and XIV. No satisfactory serum is yet available for Type III.

To obtain the best results serum treatment must be given early and in adequate dosage. Though it is sometimes of value in cases treated from the 5th day onwards, the results obtained do not warrant its administration as a routine procedure in such cases. Serum treatment is of particular value in two classes of patients; (a) in people of 40 years of age and over, and (b) where there is an infection of the blood stream. Invasion of the blood stream by pneumococci has a marked adverse effect on prognosis. Type I cases with bacteremia, not treated with serum, have been found to have a mortality rate as high as 80%, compared with a rate of from 25 to 40% in serum-treated cases with bacteremia, and of 5% in serum-treated cases without bacteremia. This underlines the necessity for early treatment in the prevention of bacteremia and other complications.

Within 8 to 24 hours after administration of serum there is usually a marked improvement in the patient. The pulse rate and temperature fall, the toxæmia lessens, and a positive blood culture may become negative.

Analysis of cases of lobar pneumonia with early administration of serum. The following phenomena were observed in patients treated with homologous serum during first 24 to 48 hours: Disease may be completely aborted, temperature, pulse and respiration rate dropping to normal within 12 to 24 hours after administration; improvement in general condition due to disappearance of toxæmia; prevention of spread of infection from one lobe to another and limitation of area in lobe primarily infected; prevention or rapid check of bacteremia; rapid return of leucocytes to normal.—R. L. Cecil, *Brit. med. J.*, ii/1936, 308.

Specific sero-therapy of pneumonia is not popular because of the expense, difficulties in giving intravenous injections, and the limited facilities for typing the organisms.—R. Cruikshank, *Lancet*, i/1939, 1222.

In the absence of any definite contraindications, patients with lobar pneumonia whose early urine specimens contain pneumococcus polysaccharide are suitable cases for serum therapy.—Cruikshank and Montgomery, *Lancet*, i/1938, 217.

In a total of 120 cases treated with type-specific serum the mortality rate was 3·8%; in 125 cases not treated with serum the mortality rate was 16·8%.—R. Horn, *Arch. intern. Med.*, 1939, 12, 922.

Reactions Due to Serum Sensitivity. Anaphylactic reactions may appear almost immediately following an intravenous injection of the serum, or they may be delayed for one or two hours,

or serum sickness may develop after an interval of some days. Before serum is administered it is advisable to enquire into the patient's previous history with regard to asthma (especially horse asthma), hay fever, etc., and to employ one of the undermentioned tests for sensitivity. Even in the presence, however, of a negative history and tests, the greatest care should be taken to give the serum extremely slowly and to have a syringe filled with 1 in 1000 adrenaline solution at hand.

Ophthalmic Test. A drop of a 1 in 10 dilution of normal horse serum is dropped into the outer canthus of the conjunctival sac of one eye, the other acting as a control. If the patient is sensitive, itching, watering and reddening of the eye occur within 5 to 10 minutes.

Intradermal Test. Inject 0.2 ml. of normal saline into the skin of the volar surface of the forearm, and 2 inches away inject 0.2 ml. of a 1 in 100 dilution of normal horse serum. In positive cases a wheal of at least 10 mm. in diameter, surrounded by a zone of redness, appears in from 5 to 20 minutes.

Blood Pressure Test (for rabbit serum). Rabbit serum (*q.v.*) produces a positive intradermal reaction in the majority of normal persons, and when this serum is used sensitivity should be tested by giving an intravenous injection of 0.1 ml. of serum, diluted with 5 ml. of normal saline; if the fall of blood pressure following this does not exceed 15 mm. Hg., and no symptoms of shock appear within 5 minutes, the patient may be considered non-sensitive.

Serum Antipneumococcicum I (B.P. Add. I). *Syn.* ANTI-PNEUMOCOCCUS SERUM (TYPE I). Prepared from the blood serum of animals immunised by injections of cultures of *Diplococcus pneumoniae* Type I. Used either as unconcentrated or concentrated (globulin) serum, either in the dried or liquid state.

Dose.—50,000 to 150,000 units intravenously.

Serum Antipneumococcicum II (B.P. Add. I). *Syn.* ANTI-PNEUMOCOCCUS SERUM (TYPE II). Is similar to the preceding, except that the cultures used for immunising the animals are of pneumococcus Type II.

Dose.—50,000 to 150,000 units intravenously.

The first injection should be made cautiously and slowly, and the ampoule should be warmed to blood-heat beforehand. If there are any signs of collapse or urgent dyspnoea after the injection, from $\frac{1}{2}$ to 1 ml. of a 1 in 1000 solution of adrenaline should be injected subcutaneously.

Since from 60 to 70% of all cases of lobar pneumonia are either Type I or Type II, a duovalent serum has often been given during the 24 hours which used to elapse before the bacteriologist's report was available. With the Neufeld method of rapid typing, however, the type of pneumococcus can be identified within an hour, and where facilities exist for the use of this method the use of duovalent serum is unnecessary and uneconomical.

Felton's Serum. This is a concentrated and refined serum in which the antibody-containing globulins are precipitated by dilution with distilled water or weakly acid buffer solutions (*see* L. D. Felton, *J. infect. Dis.*, Dec., 1928, 543). By the use of this serum it is possible to give an effective dose intravenously in comparatively small bulk, and with a consequent reduction in the frequency and

severity of the reactions due to the protein content. The concentrated serum is stated to be from five to ten times as potent as the unrefined serum, an initial dose of 10,000 Felton units being the equivalent of 50,000 units of the unrefined serum.

In 1934 the Therapeutic Trials Committee of the M.R.C. issued an authoritative report on the use of this serum, based on observations on 1375 cases treated during 1930 to 1933 in Aberdeen, Edinburgh, London and Glasgow (*see Brit. med. J.*, i/1934, 245). They concluded that the treatment seemed definitely to reduce the average duration of fever and illness in patients who recovered, and it appeared to decrease the liability to empyema amongst the survivors. They recommended that each case be typed as soon as possible, and that where this could not be done at once a preliminary dose of 20,000 units of Type I and II sera together should be given, followed later by the specific type serum, treatment being continued by injection of 20,000 units at a time, twice a day, with approximately an 8-hour interval, an average total of 80,000 units being required.

In America, antipneumococcus sera, prepared according to Felton's method, are now used almost to the exclusion of the unrefined sera. *New and Non-Official Remedies* (1940) describes Anti-Pneumococcus Serum (Refined and Concentrated) Type I, Type II, Types I and II combined, Types IV and VIII combined, Types V and VII combined, and Type VII. The sera are also coming into general use in this country and several Types are now available commercially.

Anti-Pneumococcus Sera (Refined and Concentrated) of various Types and dosages are issued by *Parke, Davis & Co., London; Burroughs Wellcome & Co., London; and Lederle Laboratories, New York (C. F. Thackray, Leeds)*.

Rabbit Anti-Pneumococcus Serum. Recently a serum has been developed derived from rabbits. It has been shown that rabbits form antibodies to the pneumococcus more rapidly and in greater amount than do horses, and owing to the fact that the globulin molecule in the rabbit is only one quarter the size of that in the horse, it is thought to pass more readily through vascular endothelium and to have greater diffusibility. Although encouraging results have been reported (especially from Denmark, where it has been widely used), sufficient time has not yet elapsed for a final evaluation.

The production of antipneumococcus rabbit serum.—B. S. Fritz, *Amer. J. Publ. Hlth*, 1939, 29, 224.

Description of rapid method for producing diagnostic type-specific antipneumococcus sera in rabbits, and methods of determining potency and specificity.—Welch, Borman and Mickle, *Amer. J. Publ. Hlth*, 1939, 29, 35 and 43.

69 patients with lobar pneumonia caused by pneumococci of Types I, II, V, VII, VIII, and XIV were treated with homologous rabbit antipneumococcus serum. None of the patients died when treated within the first ninety hours of the disease, and the mortality rate for the entire series was 7.4%. There were no severe untoward reactions and the incidence of serum sickness was lower with rabbit serum than with horse serum. None of the patients were found to be sensitive to rabbit serum. The minimum quantity of serum, measured in Felton units, which has been found adequate to treat lobar pneumonia is considered as the projected or necessary dose. The projected dose was given in one

administration in the 69 cases, and was found to be sufficient in 40. As much as 500,000 units, included in a volume of 500 ml. of unconcentrated and refined rabbit antipneumococcus serum, has been given in one administration without any untoward effects. From 10 to 15 grains of aspirin is given by mouth just prior to the administration of the serum.—E. H. Loughlin *et al.*, *J. Amer. med. Ass.*, ii/1938, 497.

Intramuscular injection of sera into human patients not suffering with pneumonia showed that the pneumococcus antibody Type I was absorbed more rapidly, and reached and maintained a higher titre than the same antibody in horse serum.—Finland and Brown, *J. Immunol.*, 1938, 36, 245.

Forty-five cases of pneumococcal pneumonia were treated with homologous type-specific immune rabbit serum. In 36 cases early recovery by crisis or rapid lysis ensued—no serious serum reactions occurred and there were only 2 deaths in this series.—V. B. Calloman, *Amer. J. med. Sci.*, 1939, 198, 349.

Data collected in Copenhagen hospitals between 1936 and 1938 show that if adequate serum therapy is given within the first four days of the disease, the mortality in lobar pneumonia is reduced to less than 10%. Rabbit serum is just as effective as horse serum.—N. I. Nissen, *Acta. Med. Scand.*, 1939, 98, 231.

The pneumococcal rabbit serum issued by the State Serum Institute, and now in general use in Denmark, has been found to be quite as effective as horse serum and only about one-tenth as expensive. The concentration of the serum has been increased so that now there are 4000 to 6000 units in every ml. The serum is usually given intravenously.—per *Lancet*, ii/1939, 449.

Serotherapy and Chemotherapy. The important advances made during the past decade in the typing of the pneumococci, and in the preparation and clinical use of type-specific sera, have recently been somewhat overshadowed by the outstanding achievements of chemotherapy, and in particular of sulphapyridine, in the treatment of pneumonia. In view of the obvious advantages and conveniences of chemotherapeutic agents, combined with their undoubted efficacy, there is a possibility that they may entirely supplant serum therapy. At the same time, as has been pointed out by Fleming and others, different strains of pneumococci vary enormously in their sensitivity to sulphapyridine, and where it is not possible to test the sensitivity of the infecting organism to the drug, a good case may be made out for the simultaneous use of vaccines or serums in order to increase the patient's immunity and improve his chances of recovery.

For references to the use of chemotherapy in pneumonia see pp. 964, 970, and for further information concerning the bacteriology of pneumonia see Vol. II.

Rheumatoid Arthritis.

Streptococcus Rheumaticus Vaccine. *Syn.* ANTIRHEUMATIC VACCINE.

Prepared from killed cultures of streptococci isolated from rheumatic cases.

Dose.—Initial dose 1 to 5 millions. Subsequently at weekly intervals, with a 50% increase each time.

Extreme caution in the use of this vaccine is necessary. Even 500,000 may cause a most unpleasant reaction, and until the urine is free from organisms more than 5 millions can seldom be given.

Although they have been employed for many years, opinion is still divided as to the value of vaccines in rheumatoid arthritis, and they no longer enjoy any widespread use. It would appear

to be a matter of personal opinion whether a stock vaccine or an autogenous vaccine should be employed, but it is generally agreed that whichever is used it should be given over a prolonged period, in small doses, and with a careful avoidance of reactions. Vaccines should never be used in acute rheumatism, and should preferably be given subcutaneously. The initial dose should be small; 1 million organisms is usually sufficient and injections are given at weekly intervals. Even a mild reaction is sufficient to indicate that the dose should not be increased at the next injection. The injections are continued so long as improvement is occurring, but if there is no benefit within two or three months they should be stopped. Physiotherapy should be avoided during the period of vaccine treatment.

It has been suggested that any improvement following the use of these vaccines is due to non-specific desensitisation, and in view of the successful results attending the use of *B. coli* vaccines, T.A.B. vaccines, etc., in rheumatoid arthritis there would appear to be some foundation for this view.

A questionnaire sent to all patients treated during the year 1928-9 at the Devonshire Hospital, Buxton, showed that there was no evidence of greater benefit in those treated with autogenous vaccines than in the vaccine group as a whole, and it would appear that vaccines show no better prospect of improvement or cure of infective arthritis than other methods of treatment.—P. M. Congdon, *Lancet*, i/1932, 180.

The use of vaccines in rheumatism rests on pure empiricism. It is justifiable to employ them in selected cases under close observation, with the object of obtaining more precise information, but their routine use, with any implication of certain cure, cannot be too strongly deprecated.—E. P. Jordan, *J. Amer. med. Ass.*, ii/1937, 1444.

Results with vaccine in juvenile rheumatism have been inconclusive. Haemolytic streptococcus vaccine given intravenously in 47 rheumatic children with negative results.—W. Sheldon, *Lancet*, i/1938, 769.

122 patients with chronic arthritis were observed for from 6 months to 4 years; treatment consisted of weekly subcutaneous injections of 0.5 ml. of saline solution in 97 cases, and intravenous injections of polyvalent streptococcus vaccine in 25. Of 64 patients with chronic osteoarthritis treated by saline, 56 were improved. Of 58 patients with chronic rheumatoid arthritis, 33 treated with saline injections were improved (72%), and of 25 treated with vaccine, 17 were improved (68%). The psychological effect of the injection itself, rather than the substance injected, seems important, and this factor, plus the tendency to natural remission, may explain the high percentage of improvement.—N. Sidel and M. I. Abrams, *J. Amer. med. Ass.*, i/1940, 1740.

Treatment with *formolised bacterial filtrates*, based on the premise that chronic non-specific infectious arthritis presents a problem of re-infection of a previously sensitised host. It was thought that if these patients could be treated by the same substances to which they are allergic there might result an antigenic stimulation of some value. Strains of streptococci were isolated from patients with active rheumatoid arthritis and cultures made from teeth, tonsils, throat, nasopharynx, nose, sinus puncture, urine and stool. These were grown in beef-heart broth with a pH of 7.7 to 7.8. Only the strains having potent soluble toxins were used. The filtrates were then treated with formalin, the same as in diphtheria toxoid. Dilutions were then made of 1:10, 1:100, 1:1000, 1:10,000. Treatment by subcutaneous injection was begun with 0.1 ml. of the highest dilution, and increased gradually according to the patients reaction to the original test dose of the toxin and the reaction to the therapeutic dose. Individual dosage is essential. A very slight local reaction at the site of injection was considered favourable and was used as a guide in raising the dosage. The intradermal tests were used as indicators of the type of streptococcus probably responsible, and the one giving the strongest reaction was used in treatment, but only in single strain.

Whenever possible autogenous material was used. Otherwise, treatment was given with stock strain giving the strongest reaction. Treatment was given twice a week and continued for 3 to 6 months or longer. Of 100 cases treated (in various stages of the disease) 43 showed marked improvement, 26 moderate improvement, and 31 were failures.—A. C. Gordon, *J. Lab. clin. Med.*, 1937, 22, 559.

Rheumatic convalescent serum. Preliminary observations on the use of convalescent serum in the treatment of acute rheumatism. The serum was taken from patients in good general condition, free from cardiac complications and with a sedimentation rate approaching normal, about the fourth to eighth week after the temperature had settled. The serum was given intramuscularly or intravenously in doses of 10 to 20 ml. Of 15 cases treated, 9 were considered to have benefited. When given in the early stages of an attack the serum appeared to reduce the period of pyrexia, especially in primary attacks, and arthritic pain was relieved in such cases. Partial collapse appeared in two cases shortly after receiving an injection of the serum.—C. A. Green *et al.*, *Proc. R. Soc. Med.*, 1940, 33, 275; see also *Brit. med. J.*, ii/1939, 1291.

Lipovaccine (Research Products, London). An oily suspension of polyvalent streptococci, containing 5 million organisms per ml. with the addition of Gomenol 2% as antiseptic. For the treatment of fibrositis, except when associated with rheumatoid arthritis. *Dose.*—Initially, 5 ml. by deep injection into the fibrositic area, the needle being moved from place to place to secure even distribution. Subsequently the dose is increased up to as much as 40 ml., the injections being given at intervals of 5 to 7 days.

Scarlet Fever. Scarlet fever is an infection due to certain strains of *S. hæmolyticus*, the rash and the constitutional symptoms being due to absorption of the toxin.

Antitoxinum Scarlatinum (B.P.C.). *Syn.* STREPTOCOCCUS ANTITOXIN (SCARLATINA), SCARLET FEVER STREPTOCOCCUS ANTITOXIN CONCENTRATED (GLOBULIN).

An antitoxin prepared from the serum of horses that have been immunised by injection of the toxic culture filtrates of *Streptococcus hæmolyticus scarlatinæ*, or of the toxin from this organism, or by a modification of these methods. There is no international unit for this antitoxin. The potency is sometimes stated in terms of a "unit" based on a skin test on the human subject. The test (which is an application of the Dick Test, *q.v.*) depends upon the fact that injection of the toxin intradermally produces in non-immune subjects a reddening of the skin; if the toxin is mixed with antitoxin before injection this reaction does not occur. The original neutralising unit of the Dicks was the amount of antitoxin required to neutralise one skin dose of toxin. The United States Public Health Service has adopted a "unit" (the American unit) which is the amount of antitoxin capable of neutralising 50 skin-test doses of toxin, *i.e.*, it is 50 times the original neutralising unit of the Dicks. Another method of assay (used in Great Britain) is the Parish-Okell rabbit method. 0.25 ml. of a satisfactory antitoxin injected into the vein of a rabbit will protect it against the subsequent injection of 6 ml. of a virulent culture containing the *Streptococcus scarlatinæ*. The manufacture of the antitoxin is controlled by patent.

The absence of agreement regarding a satisfactory "unit" has led to lack of uniformity in statements of dosage; this is variously stated in terms of volume and of the (American) "units" described above, without any direct correlation.

Dose for Treatment.—10 to 30 ml. (equal to about 3000 to 9000 U.S.A. units) according to severity of case.

Dose for Prophylaxis.—5 to 10 ml. (1500 to 3000 U.S.A. units) for children of 5 to 15 may confer passive immunity for 10 to 14 days.

Uses. Serum therapy now plays an important role in the treatment of severe forms of scarlet fever. Early administration rapidly alleviates the toxæmic symptoms, arrests the progress of complications and may lessen the severity of complications already developed. It is best given intramuscularly, but in severe attacks intravenous injections are preferable. From 10 to 30 ml. of serum is adequate for the treatment of a simple case of scarlet fever, but toxic or severe cases may require from 60 to 120 ml. It need not be administered in mild attacks except in weakly children.

The serum may also be employed for the production of passive immunisation, from 5 to 10 ml. intramuscularly, producing immunity in a few hours which will last for 10 to 14 days, but there is little to recommend its use in general practice.

In addition to its use in scarlet fever it has also been used in the treatment of other acute streptococcal infections, especially puerperal septicæmia and acute rheumatism.

Schultz-Charlton Reaction. This is a diagnostic test to distinguish the rash of scarlet fever from other rashes. 0·2 ml. of streptococcus antitoxin (scarlatina) is injected intradermally into the chest, abdomen or forearm, where a uniform scarlet-fever rash not more than 70 hours old is available. A blanching 10 mm. to 40 mm. in diameter appears 4 to 10 hours later, and persists from 12 to 72 hours in most patients suffering from scarlet fever. The antitoxin may be used undiluted or diluted 1 in 10 in normal saline solution—diluted antitoxin should not be used later than six months after preparation.

Intravenous antitoxin in scarlet fever. 10 to 20 ml. dose in acute stage stops the acute process in a few hours.—H. S. Banks and J. C. H. Mackenzie, *Lancet*, i/1929, 381; H. S. Banks, *Lancet*, i/1929, 1248.

As regards the use of scarlet-fever antitoxin, most observers probably are now agreed that an early and sufficient dose aborts the initial toxæmia and thus puts some check on subsequent complications, though the evidence as to the value of serum in averting complications is somewhat conflicting. In Rumania, convalescent human serum has been used with considerable success.—J. V. Armstrong, *Lancet*, ii/1939, 327.

The administration of anti-scarlatinal serum advocated in every case; great prophylactic value in the prevention of otitis media.—S. Sutherland, *Lancet*, ii/1939, 328.

Passive Immunisation. A new scarlet fever antitoxin has been tested as a means of passive prophylaxis in the wards of the Gt. Ormond St. Hospital for Sick Children. The sera employed (Lederle Laboratories) are refined and concentrated and are said to contain the pseudoglobulin fraction only. The dosage recommended by the makers for passive protection against scarlet fever is 1 to 1·5 ml., but a routine dosage of 0·75 ml. was employed. Secondary cases were practically abolished in the hospital during the year in which it was used. In prophylactic doses it gave rise to serum reactions in less than 2% of cases.—D. B. Bradshaw, *Lancet*, ii/1939, 6.

PUERPERAL SEPTICÆMIA. Scarlatina antitoxic serum used in puerperal septicæmia with mortality 29·6%. In every case *S. pyogenes hæmolyticus* was found.—H. Burt-White, *Lancet*, i/1930, 19.

There is no trustworthy clinical evidence that the administration of anti-streptococcal serum for the treatment of human infections by hæmolytic streptococci has had any specific curative effect. The evidence obtained in puerperal fever cases at Queen Charlotte's Hospital suggests that such administration may sometimes have an *unfavourable* effect on puerperal infections by hæmolytic streptococci, and in such cases it is best not to interfere with the immunising mechanism of the patient until we can be sure that such interference does not do harm. Until our knowledge of the immunisation against hæmolytic streptococci has progressed further it would seem desirable to discontinue the use of antistreptococcal sera in the treatment (and prophylaxis) of puerperal fever and "surgical sepsis."—L. Colebrook, *Lancet*, i/1935, 1085.

RHEUMATIC POLYARTHRITIS (ACUTE). In a series of 44 cases, concentrated antiscarlatinal serum has proved itself an effective form of therapy worthy of extended trial. Patients were previously tested for serum sensitivity by intradermal injection of 0.2 ml. of a 1 in 10 dilution of serum. Non-sensitive patients received 30 ml. of serum intramuscularly and this dose repeated in 36 hours. This dose is equivalent to 18,000 new units of antitoxin (New York State Board) or to 900,000 old Dick units. Sensitive patients are desensitised as follows: give 0.2 ml. subcutaneously as the initial dose and double this each half hour until 2 ml. has been given; the remainder of the 30 ml. is given as 8 ml. and 20 ml. intramuscularly at half-hour intervals. Serum therapy is of value in the treatment of patients resistant to salicylates. The incidence of relapses is considerably lower with serum than with salicylates, and the stay in hospital and duration and nature of the convalescence compare very favourably with the latter. It is safe to give serum to very ill patients, even when suffering from grave carditis. The disadvantages attached to its use are that the average initial period of fever is longer, and there is a certain amount of discomfort from serum sickness.—J. Eason and G. Carpenter, *Quart. J. Med.*, 1937, 93.

Serotherapy and Chemotherapy. There has so far been no evidence to suggest that the sulphonamide derivatives are more effective than serum in the treatment of scarlet fever, but they are of undoubted value in dealing with complications such as otitis media, and in septic attacks they may usefully be employed to supplement serum therapy.

The results with sulphanilamide in a dose of 2 to 6 g. daily in 200 cases were distinctly inferior to those in a parallel series of serum-treated cases. The initial toxæmia was uninfluenced by the drug, and heavy desquamation was common. H. S. Banks, *Lancet*, ii/1939, 328.

For mild cases treated at home, no antitoxin or sulphanilamide; for mild cases admitted to an open ward, antitoxin intramuscularly; for all moderate cases antitoxin intramuscularly; for severe cases, antitoxin intravenously; for complications, sulphanilamide.—M. Mitman, *Lancet*, ii/1939, 329.

Toxinum Scarlatinum (B.P.C.). *Syn.* STREPTOCOCCUS TOXIN (SCARLATINA), SCARLET-FEVER STREPTOCOCCUS TOXIN.

The diffusible exotoxin obtained from a broth culture of a good toxin-producing strain of *Streptococcus hæmolyticus scarlatinae*. The organism is grown in a suitable fluid medium which is then centrifuged and filtered through a bacteria-proof filter. The potency of the toxin is expressed in skin-test doses (S.T.D.). One S.T.D. is the amount required to give, on hypodermic injection, an erythematous zone 10 mm. or more in diameter in the majority of susceptible persons.

The toxin, suitably diluted, is used in the Dick Test for susceptibility to scarlet fever, and also for actively immunising those who are susceptible, though during the present mild phase of scarlet fever it is not advisable for general application.

Dick Test. The toxin is diluted with normal saline so that 1 S.T.D. is contained in 0.1 to 0.2 ml., and this quantity of toxin is injected *intradermally* (not subcutaneously) into the front of the forearm, the site having been carefully cleansed. If the patient is susceptible to scarlet fever, a positive reaction will appear, reaching a maximum in 18 to 24 hours and characterised by a circumscribed area of redness, about 1 to 2 cm. in diameter, which persists for a few days and then fades, leaving a brownish pigmentation. The slightest reddening constitutes a positive reaction provided it attains a diameter of 10 mm. Owing to the high dilution of the toxin, pseudo reactions are very rare and a control is unnecessary. The syringe and needle must *not* be sterilised by means of alcohol since this precipitates the toxin; they should be boiled in distilled water.

Active Immunisation. Streptococcus toxin (scarlatina) produces a more permanent immunity than that conferred by scarlet-fever antitoxin. It is administered subcutaneously or, preferably, intramuscularly. Five injections should be made at 5 to 7-day intervals, the doses being 500, 2000, 8000, 25,000 and 80,000 skin-test doses respectively. In strongly Dick-positive reactors the initial dose may be reduced to 250 S.T.D. In about 10% of cases a reaction occurs, characterised by vomiting, malaise and a scarlatiniform rash. The reaction may occur at any stage of the course. According to the Dicks, the reaction is prevented by administering 2 to 3 m. of 1 in 1000 adrenaline solution simultaneously with the toxin.

Local antitoxic immunity to scarlet fever toxin may be produced by intradermal injections of varying amounts of scarlet fever toxin. Repeated tests on the same person for scarlet fever immunity should not be made on the site of a previous test.—Dick and Dick, *J. infect. Dis.*, 1938, 62, 83.

Septicæmia.

The term "septicæmia" is applied to conditions in which pathogenic organisms multiply in the blood, and give rise to symptoms of general poisoning, the commonest organisms found being streptococci and staphylococci, which gain entrance through abrasions in the skin or through the tonsils, nasal sinuses or the puerperal uterus.

Serum Antistreptococcicum (B.P.C.). The serum of horses that have been immunised by injections of streptococci. In the preparation of polyvalent sera, a large number of strains (hæmolytic, non-hæmolytic and *S. faecalis*) are used. They are obtained from a number of infections, *e.g.*, erysipelas, septicæmia, endocarditis, uterine infections, influenza, appendicitis, etc. Some strains of streptococci, *e.g.*, those from scarlet fever, erysipelas and puerperal sepsis, produce toxic culture-filtrates; injection into horses of these toxic products, as well as of the bacterial cultures, yields a serum that is antitoxic as well as antibacterial. The serum may be used without further treatment (natural serum), or the antibodies may be partially purified and redissolved in saline (concentrated serum).

Dose.—From 10 to 30 ml. intramuscularly, or intravenously when diluted with twice the volume of normal saline, and repeated daily or even 12-hourly for about a week. Early administration and adequate dosage is important.

The serum is employed in the treatment of general septicæmia, infective endocarditis, wound infections, etc., also in erysipelas, scarlet fever and puerperal fever, though in these latter conditions sera prepared from the specific strain of streptococcus are preferable.

Although the use of the sulphonamide derivatives has met with considerable success in the treatment of septicæmic conditions, better results may often be obtained by employing them in conjunction with serum therapy.

Antistreptococcal serum 50 to 70 ml. during labour, or a few days prior to onset, if trouble anticipated.—S. J. Cameron and H. Thomson, *Brit. med. J.*, i/1931, 350.

Streptococcal septicæmia treated with scarlet fever antitoxic serum. Given subcutaneously or intramuscularly, and never more than 20 ml. at a time.—A. B. Rosher, *Lancet*, i/1930, 129.

ERYSIPELAS. An antitoxin prepared by immunising horses with several strains (eight) of the streptococcus of erysipelas, used in 3311 cases over a period of five years at the Bellevue Hospital, New York, reduced the number of deaths by 30% and reduced the average duration of the disease by 60%, but only of value in controlling the immediate process, and does not prevent additional attacks. It is given intramuscularly in 10 ml. doses, commenced as soon as diagnosis is made, and repeated every 12 to 24 hours for 6 doses, when it is discontinued if no improvement is evident.—D. Symmers and K. M. Lewis, *J. Amer. med. Ass.*, ii/1932, 1082.

Streptococcus Vaccine (Polyvalent). Polyvalent vaccines are prepared from numerous strains of streptococci for use in localised infections, such as erysipelas, lymphangitis, ulcers, sinuses, tonsillitis, adenitis and mastitis; also in asthma and bronchitis, and in generalised infections such as septicæmia and pyæmia, provided the streptococcus has been proved to be responsible. *Initial dose* in very acute and in generalised infections should be 5 or at the most 10 millions; in more chronic conditions a dose of 25 to 50 millions is suitable and may be increased to 100 millions. The action of these vaccines is very erratic, however, and their value is doubtful. In erysipelas doses of $\frac{1}{2}$ to 1 million may be repeated at intervals of 1 or 2 days. In most other conditions the interval between doses should be 6 or 7 days.

FIBROSITIS. In 25 cases of long standing the local injection of a lipovaccine was found of value. The lipovaccine was made up in two strengths, representing one and ten million organisms (polyvalent streptococci isolated from rheumatic cases) suspended in sterile olive oil. The oil was injected deeply into the fibrositic area and distributed throughout it by moving the needle; as much as 10 ml. of the stronger concentration used at one sitting. Within a few hours the area became hot and tender, with malaise and evening pyrexia, but all symptoms subsided at the end of a few days, leaving the fibrositic area comparatively painless and a marked gain in general health.—G. Laughton Scott, *Brit. med. J.*, i/1936, 302.

Coley's Fluid. Contains the combined toxins of *Streptococcus erysipelas* and *B. prodigiosus*, and has been employed in the treatment of inoperable cancer (especially sarcoma) and Hodgkin's disease.

Dose.—Inject a dose daily into tumour, or neighbourhood of tumour, beginning with 0.25 minim into the tumour, or 0.5 minim elsewhere, and if little or no

reaction increase by 0.25 or 0.5 minim daily till a rise of temperature to 102° to 104°F. is reached. For first few doses dilute with boiled water to ensure accurate dosage. If depression follows injections give at longer intervals. Continue injections till reaction has calmed down and temperature fallen.

Snake Bite.

The chief poisonous snakes belong to the Colubrine and Viperine families. The former includes the cobras, coralline snakes, kraits, hamadryad and the death-adder, the latter includes the rattlesnake, puff-adder, bush-master and copperhead. A serum produced from a Colubrine venom is not effective against the venom of a Viperine snake and *vice versa*. Specificity is also shown by the antitoxins produced from the venoms of individual members of the two families.

Serum Antivenenosum (B.P.C.), syn. ANTIVENENE, is a generic name for anti-venom sera. It consists of the serum of horses immunised by subcutaneous injections of snake venom. The most useful serum for general use is prepared by injecting a mixture of 80% cobra venom and 20% viperine venom.

Dose.—100 ml. or more intravenously.

Therapeutic Use of Snake Venoms.

During recent years snake venoms have been introduced into medicine for the treatment of numerous conditions, the venoms from different species of snakes being employed for different therapeutic purposes. Thus, cobra venom has been used as an analgesic in severe intractable pain, particularly in cancer, and this and puff-adder venom have also been employed in epilepsy. Moccasin venom is used in certain hæmorrhagic conditions, such as functional uterine bleeding and purpura hæmorrhagica. All of these are given by injection. Russell's viper venom and the venom of *Bothrops atrox* (fer-de-lance) are employed in dilute solution as local hæmostatics, and the former in particular is stated to be one of the most effective local hæmostatics available.

Cobra Venom.

Dose.—The initial dose is usually 0.1 mg. of the dried venom, subcutaneously or intramuscularly, increasing up to 6 mg. Alternatively, the amount to be injected may be calculated in "mouse units," one unit being sufficient to kill a mouse of 25 g.

It has been employed with some success in the relief of pain due to carcinoma, trigeminal neuralgia, tabes, etc., especially when morphine is contraindicated or is losing its effect. It has also been used in epilepsy.

Although analgesia undoubtedly occurs, it is erratic and unreliable, and at its best is no better than that obtained with morphia. Trial in 51 cases.—J. Lavedan, per *Med. Annu.*, 1937, 419.

Of 14 cases of trigeminal neuralgia treated by cobra venom, 6 were cured and 4 improved. The initial dose was gradually increased to 4 mouse units, one intracutaneous injection being given every third day.—M. Brünner-Ornstein per *Brit. med. J., Epit.*, 1/1937, 50.

Cobra venom relieves pain not through a peripheral action on sensory nerve endings or ascending nerve tracts, but through its effect on the central nervous system, more particularly the brain. The analgesic action on the brain, however, is not identical with that produced by morphine, for which it may sometimes be substituted clinically, because the higher or intellectual faculties are not depressed by cobra venom as they are by opium alkaloids. The *modus operandi* for cobra venom would therefore seem to be an action on some lower synapses, probably in the optical thalamus. Cobra venom seems to be less depressant for neuromuscular performance than morphine and other opiates. Unlike both narcotics and antipyretics it actually widens the field of vision. In contrast to opium alkaloids and other analgesics it actually stimulates intellectual performance. In moderate doses, e.g., 5 to 10 mouse units intramuscularly, it does not injure either the circulation or the kidney or liver functions. It has a wide margin of safety. It has been found a useful analgesic not only in patients with advanced cancer, but also in certain cases of chronic arthritis, neuritis and neuralgia (particularly tic douloureux), tabetic crises, and advanced Parkinson's disease. Of 115 cases treated, 65% experienced relief of pain.—D. I. Macht, *Med. Pr.*, i/1939, 254.

Of 17 cases suffering from severe intractable pain (carcinoma, ureteral spasm, interstitial cystitis), 46% were completely relieved and 88% were relieved of half their pain or more by injections of cobra venom, beginning with 2 or 3 ml (10 or 15 mouse units), and continuing the dosage at that level for 4 to 6 days, then lowering the dose to a maintenance level (usually 1 ml. = 5 mouse units). Injections must be given intramuscularly; subcutaneous injections cause redness and tenderness.—R. N. Rutherford, *New Engl. J. Med.*, ii/1939, 408.

The Council on Pharmacy and Chemistry of the A.M.A. considers purified cobra venom to be of some value for the relief of pain, especially that of inoperable cancer; it does not displace morphine completely in more than relatively few cases, but it is of value; it appears to be of limited value in the treatment of tic douloureux and the various conditions grouped under the names of rheumatism and arthritis; its therapeutic effects are variable and uncertain in all painful conditions; the disagreeable side actions, including nausea, vomiting, diarrhoea and pain of injection must be brought to the notice of those who use cobra venom; it must not be recommended for those who are severely ill, except those suffering from inoperable malignant tumours or from incurable disease. The effects are not immediate but may take hours to appear.—*J. Amer. med. Ass.*, ii/1940, 1196.

17 patients with intractable pain, principally from carcinoma of the cervix, treated with cobra venom, 5 mouse doses every other day; results good in 8, fair in 6, and poor in 3.—W. T. Black, per *Trop. Dis. Bull.*, 1940, 515.

Of 85 patients suffering from neuritis, sciatica and arthritis, 23 experienced marked relief, 23 definite relief, and 9 slight relief from intramuscular injections of cobra venom, given twice or thrice weekly in doses ranging from 1 to 20 mouse units.—R. N. Chopra and J. S. Chowhan, *Indian med. Gaz.*, 1940, 69.

Puff-Adder Venom.

Dose.—The initial dose is 0.2 mg. of the dried venom subcutaneously, gradually increased to 10 to 12 mg. Solutions for injection should be freshly prepared.

This has been employed in the treatment of epilepsy. In a series of 14 cases treated in this country by B. Barnett (*Med. Annu.*, 1937, 418), 4 showed a complete cessation of fits, 1 was unaffected, and 9 were improved.

There is sufficient evidence of the successful treatment of epilepsy with snake venom to warrant further investigation. The treatment would, of course, be quite empirical, though reports seem to show it depends on something in the nature of protein shock.—B. Barnett (Curator of Reptiles, Zoological Society of London), *Brit. med. J.*, ii/1934, 1073. Dr. Burgess Barnett is prepared to advise medical men as to the most suitable form of snake venom for use in any particular type of case, and as to the method of obtaining an aseptic product by appropriate treatment of the venom.—R. H. Elliott, *ibid.*

Venene, prepared by F. W. FitzSimons from puff-adder venom, wight-adder venom, cobra venom and mamba venom, at the Fort Elizabeth Museum and Snake Park (S. Africa), has been similarly used in epilepsy.

Dose.—Initially, for a healthy adult, 5 minims subcutaneously, increased at weekly intervals of 2, 3 and 4 weeks up to a maximum of 40 minims.

The preparation has been widely used for epilepsy in South Africa, and Mr. FitzSimons, in a paper read before a combined meeting of the British and South African Associations for the Advancement of Science, in July, 1929, reported encouraging results. There seems to be a *prima-facie* case for investigation of the claims. The benefits claimed may be due to desensitisation.—*Lancet*, ii/1930, 915.

Moccasin Venom.

Dose.—The initial injection in patients over 10 years of age is 0.4 ml. of a 1 in 3000 dilution of the venom subcutaneously, rapidly increased to 1 ml., the injections being given twice weekly and continued for 2 or 3 months if necessary. For younger children the maximum dose is 0.6 ml.

This venom has been used in various hæmorrhagic conditions, such as intractable uterine bleeding, recurrent nasal hæmorrhage, symptomatic purpura, and purpura hæmorrhagica—but not hæmophilia.

HÆMORRHAGE. Moccasin snake venom given intradermally or subcutaneously has a definite effect in decreasing the permeability of the capillaries, and is of value in hæmorrhagic states other than hæmophilia or idiopathic thrombocytopenic purpura.—S. M. Peck and N. Rosenthal, *J. Amer. med. Ass.*, i/1935, 1066.

MENORRHAGIA. 7 cases of menorrhagia, in which no organic lesion could be demonstrated, were successfully treated by subcutaneous injections of a 1 in 3000 solution of moccasin venom. Initial dose 0.4 ml., increased by 0.2 ml. at 3-day intervals for the next two doses, when reaction usually occurred and the dose was reduced to 0.05 ml. Subsequent injections at 3-day intervals were increased to 0.1 ml. and then 0.2 ml., provided no untoward local reaction occurred. Dose then increased by 0.3 ml. until a dose of 1 ml. could be given twice a week. Injections continued for several months, but improvement usually within 1 or 2 months.—C. H. Watkins, *Proc. Mayo Clin.*, 1936, 261. See also Venoms and Antivenenes, a collection of abstracts from recent papers.—*Trop. Dis. Bull.*, 1936, 379.

PURPURA HÆMORRHAGICA. An intradermal moccasin snake venom test has been used as a prognostic measure in essential thrombocytopenic purpura hæmorrhagica. Persistence of a positive reaction to successive tests, or a reversal to a negative reaction, is of value in determining the trend of the purpuric state. Subcutaneous injections of moccasin snake venom have been employed as a therapeutic measure in chronic purpura hæmorrhagica. It apparently has been of value in 22 of the 34 cases in which it has been used. The effect of subcutaneous venom injections and the trend of the intracutaneous venom test are important for the indication and prognosis of splenectomy.—S. M. Peck, M. Rosenthal and L. A. Erf, *J. Amer. med. Ass.*, i/1936, 1791.

EPILEPSY. Eight institutional epileptics were treated for nine weeks with moccasin venom. Injections of a 1 : 3000 venom solution were used, beginning with 0.2 ml. and increasing by 0.2 ml. to a dose of 1 ml. Injections were given twice weekly till the maximum dose was reached, and then at weekly intervals. The frequency and severity of the seizures were compared during the period of no treatment, during Luminal therapy and during venom therapy. During the administration of venom the frequency and severity of the seizures were greater than during the other periods and the patients were more irritable. It is concluded that venom therapy not only does not induce a refractory state to convulsive seizures in epileptics, but may render them more susceptible to seizures. There is no distinguishable difference in the physiological action of the venom of the water moccasin from that of the rattlesnake.—I. Finkelman, *J. Lab. clin. Med.*, 1937, 22, 572.

Viper Venom.

The venom of Russell's viper is an effective local hæmostatic, both for cases of hæmorrhage due to superficial injuries and for

external wounds suffered by hæmophiliacs. The solution of venom is applied directly to the bleeding point by means of a pledget of cotton wool, or by dropping from a fine needle. It is especially valuable in dental surgery and following tonsillectomy. It may also be employed for the estimation of prothrombin (see H. W. Fullerton, *Lancet*, ii/1940, 195).

Snake venoms lose their toxicity before they are absorbed by the intestinal mucous membrane, so that in regard to the possibility of toxic effects, only that portion of the dose that comes in contact with the broken surface need be considered. If the susceptibility in man is the same as that in monkeys the estimated smallest fatal dose of Russell's viper venom is 42 mg.—B. Barnett and R. G. Macfarlane, *Brit. med. J.*, ii/1936, 1286.

HÆMATEMESIS. A severe case which had continued for more than 24 hours successfully treated by the oral administration of the contents of one phial of Stypven.—A. Barratt, *Brit. med. J.*, ii/1936, 1083.

HÆMOPHILIA. The venom of Russell's viper clots hæmophilic blood more quickly than any other venom—one drop of a 1 in 1000 solution added to 10 drops of hæmophilic blood causes clotting in 17 seconds, and a 1 in 100,000 solution in 60 seconds, the clot being tough and firm. The solution is easily sterilised by filtration through a Berkefeld filter: the venom maintains its potency unchanged when dry, but soon deteriorates in dilute solution. Striking results in local hæmorrhages (e.g., from tooth sockets) in hæmophiliacs; bleeding stopped at once by application of 1 in 100,000 solution.—R. G. Macfarlane and B. Barnett, *Lancet*, ii/1934, 985.

Hæmorrhage in a hæmophilic boy successfully controlled by application of 1 : 10,000 dilution of Russell's viper venom.—G. A. Baker and P. C. Gibson, *Lancet*, i/1936, 428.

Snake venom and its use in dental hæmorrhage.—J. Draper Cambrook, *Proc. R. Soc. Med.*, 1936, 281.

Rusven (Boots, Nottingham). Venom of Russell's viper for external local application in the treatment of hæmorrhage.

Stypven (Burroughs Wellcome, London). Russell's viper venom for topical application in the control of external bleeding. It is issued in rubber-stoppered bottles accompanied by hermetically sealed ampoules of solvent consisting of sterile distilled water containing 0.5% of phenol.

Fer-de-Lance Venom Solution (Lederle Laboratories, New York; C. F. Thackray, Leeds). A 1 in 5000 solution of the venom of *Bothrops atrox* (fer-de-lance) in 50% glycerin. For use as a local hæmostatic, especially in dental practice.

Staphylococcal Infections.

Antitoxinum Staphylococcicum (B.P. Add.1). Prepared from the serum of horses that have been immunised by injections of the toxin of *Staphylococcus aureus*. It may consist either of the unconcentrated or of the concentrated (globulin) serum, either in the dried or liquid state.

Dose.—Prophylactic, 2000 to 4000 units. Curative, 10,000 to 20,000 units, intravenously or intramuscularly, repeated after 12 or 24 hours.

Uses. Although the majority of cases of staphylococcal infection of the skin respond to local treatment with or without treatment with vaccine or toxoid, in some patients a generalised toxæmia or septicæmia may follow. The antitoxin appears to be chiefly efficacious in pyæmic cases. Useful in acute staphylococcal infections and toxæmias so long as the cocci are not detectable in the circulating blood. Few cases of staphylococcal bactæmia recover, except when the primary focus is in the bone marrow;

treatment with staphylococcal antitoxin should supplement surgical measures, and will sometimes avert a fatal issue.

Prophylactically, it is employed when there is risk of a generalised infection, *e.g.*, from carbuncles, osteomyelitis and mastoiditis, or before operations.

A serum obtained by immunisation of horses, first with toxoid and afterwards with unaltered toxin, given intramuscularly in 104 cases of staphylococcal infection, ranging from carbuncle to septicæmia; as much as 600 ml. may be needed in a severe case. Of 64 patients in whom positive blood cultures were obtained, 29 recovered.—C. E. Dolman, *per Brit. med. J.*, ii/1934, 950.

Vaccinum Staphylococcicum (B.P.C.). *Staphylococcus vaccine* is prepared from killed cultures of *Staphylococcus albus*, *S. aureus* and *S. citreus* (mixed vaccine), or from *S. aureus*, or (less commonly) from *S. citreus* or *S. albus* alone.

Dose.—Initial, 100 millions, increased to 1000 or even 5000 millions, at intervals of 7 days.

Used in the treatment of localised staphylococcal infections, *e.g.*, furunculosis. Often an autogenous vaccine is to be preferred to a stock one.

In cases of acne, *Staphylococcus albus* is commonly associated with the acne bacillus (*q.v.*). In boils, carbuncles, sycosis, ulcers, and sinuses generally, and in acute generalised infections, such as pyæmia, ulcerative endocarditis, septicæmia and in peritonitis, either *S. albus* or *S. aureus* may be found, but *S. aureus* is relatively the more common. The mixed vaccine may, if necessary, be used.

Propidex (*Pharmaceutical Specialities (May & Baker) Ltd., London*). Antistaphylococcal ointment. A mixed vaccine of streptococci, staphylococci and *B. pyocyaneus*, for local application to surface lesions of a pyogenic nature—boils, carbuncles, etc.

Staphar (*Bayer Products, London*). Mixed staphylococcus vaccine. **Dose.**—0.5 to 0.75 ml. subcutaneously or intramuscularly, increasing to 1 ml. 3 times weekly. Staphylococcal infections.

Staphylococcus Toxoid. The staphylococcus toxin, like diphtheria toxin, can be converted to toxoid by formaldehyde. To a high-potency staphylococcus toxin, formaldehyde is added to give 0.1 to 0.15% *w/w* of HCHO and the mixture incubated at 37° for 14 days.

Dose.—0.05 ml., increased to 1.0 ml. at intervals of 7 days.

Staphylococcus toxoid may be used instead of the vaccine in the treatment of chronic staphylococcal infections. It is especially useful in severe cases, *e.g.*, recurrent furunculosis, chronic and sub-acute osteomyelitis and in patients convalescing from acute staphylococcal toxæmia.

Report of the Therapeutic Trials Committee. Amount of circulating antitoxin readily increased by injections of staphylococcus toxoid, and this is attended with clinical improvement in the majority of cases of furunculosis, but acne does not respond as well as do pure staphylococcal infections. Doses of 0.05, 0.1, 0.2, 0.3, 0.4 and 0.5 ml. at weekly intervals, intramuscularly. Very few reactions noted.—D. S. Murray, *Lancet*, i/1935, 303.

Of 23 cases of sycosis barbe treated with injections of toxoid, 12 were cured and the remainder much improved. Of 24 cases of staphylococcal infection

other than sycosis (mostly carbuncles and boils) 18 were cured and the remainder much improved.—J. I. Connor, *Brit. med. J.*, ii/1935, 1195.

Favourable results, with no serious reactions, in treatment of staphylococcal infections of the skin with sterile formalinised filtrates of staphylococcus cultures.—M. A. Gohar, *J. trop. Med. (Hyg.)*, 1935, 259.

Alum precipitation increases potency of the toxoid.—Leonard and Holm, *J. Immunol.*, ii/1935, 209.

Method for the production of staphylococcus toxin and toxoid. Toxoid should contain at least 6 flocculating units per ml. and at least 5 antitoxin-binding units per ml.—Dolman and Kitching, *J. Path. Bact.*, 1935, 137.

Antigenic efficiency of staphylococcus toxoid should be maintained in respect of leucocidin as well as alpha-hæmolysin.—F. C. O. Valentine, *Lancet*, i/1936, 526.

Immunisation is a delicate process which if over-exercised may lead to diminished immunity, and as we immunise we may also hypersensitise, since immunity and hypersensitivity are not antagonistic but may co-exist. Thus, one must try to immunise as efficiently as possible and avoid sensitising; the most probable way to effect this is to give the shortest possible course of injections consistent with recovery. In a case of furunculosis the most successful method seems to be to begin treatment immediately a lesion has become definitely circumscribed or has opened; to begin with, a small dose of toxoid such as 0.1 ml. of 1 in 10 is given, rapidly increasing with bi-weekly injections up to 0.5 ml. of undiluted toxoid, avoiding severe local reactions. This can usually be done in three weeks. Then, if there are no fresh lesions, treatment is stopped. If a fresh boil begins to appear at any time in the next few weeks or months, a single small dose of toxoid is given at once, and it is remarkable how often these recurrent lesions abort.—P. N. Danton, *Proc. R. Soc. Med.*, 1936, 30, 516.

The results obtained by the use of the toxoid in a small series of cases (20 cases of sycosis and 13 cases of boils) were not sufficiently encouraging to justify a continued trial. The injection of staphylococcus toxoid constantly increased the circulating antihæmolysin. There was no evidence, however, that this increase had any clinical value. Toxoid has no evident advantage over the use of "non-specific" antigens or other treatments for multiple boils.—R. Klaber, *Lancet*, ii/1936, 786.

G. Ramon states that the efficacy of refined staphylococcus anatoxin in affections due to staphylococci, especially skin diseases such as furunculosis, onychia, sycosis, and acne, is proved by his study of more than 15,000 cases during the last three years. The first injection consists of 0.1 ml., the second of 0.25 ml., the third of 0.5 ml., the fourth of 1 ml., and subsequent injections of 2 ml., the doses being halved for children. The injections should be given subcutaneously at 4 or 5 day intervals. No serious reactions have been observed.—per *Med. Annu.*, 1940, 429.

Staphylococcus Vaccine Toxoid (S.V.T.) (*Lister Institute, London; Allen & Hanbury, London*). A mixture of staphylococcus vaccine and staphylococcus toxoid—1000 millions staphylococci and 0.5 ml. toxoid per ml. *Dose*.—0.1 ml., increased to 1 ml. at intervals of 4 to 7 days.

Staphylococcus Vaccoid (*St. Mary's Hospital, London; Parke, Davis, London*). A mixture of staphylococcus vaccine and toxoid; issued in two strengths, (a) for children, contains 60 millions of staphylococci per ml., with "weak" staphylococcus toxoid; and (b) for adults, contains 300 millions of staphylococci per ml. with "strong" staphylococcus toxoid. *Dose*.—0.1 ml., increased to 1.0 ml. at intervals of 7 days.

Staphygen (*Bayer Products, London*). A staphylococcus formol toxoid preparation. *Dose*.—0.1 ml., increasing to 1 ml. at 2 to 3 day intervals.

Tetanus. The tetanus bacillus is found in cultivated and manured soils and in the faeces of various animals, especially the horse. Infection usually occurs from wounds and minor injuries; punctured wounds, infected compound fractures, abrasions and lacerations into which dirt has been introduced are especially liable to cause tetanus. The incubation period is usually from eight to twelve days. The bacilli multiply in the wound and produce toxin

which is conveyed to the spinal cord by the motor nerves, and to the medulla and brain stem by the blood stream. If sufficient antitoxin is given in the early stages the central spread of toxin is checked and that which is in circulation is neutralised, so that tetanus either does not develop or appears only in a mild form, but once the symptoms have developed the outlook is more grave. Early diagnosis is therefore of great importance, among the first symptoms being an unexplained rise in temperature, abdominal rigidity, increased nervousness, temporary giddiness, violent headache, trembling of the tongue, profound sweating and slight stiffness of the neck and jaws.

Antitoxinum Tetanicum (B.P., U.S.P. XI).

Prepared from the serum of horses that have been immunised by injections of the toxin or toxoid of *Bacillus tetani* (*Clostridium tetani*); the serum may be used in the liquid state or dried, or it may be concentrated by precipitating the antitoxin-containing globulins which are used either in solution or in the dry state. Liquid preparations for prophylactic use contain not less than 300 units per ml., and for therapeutic use not less than 1600 units per ml. Solid preparations contain not less than 3000 and 16,000 units per g. respectively. *U.S.P. XI* recognises only the solution of the antitoxic globulins and requires a potency of not less than 300 U.S.A. units (approximately 600 international units) per ml.

Dose.—Prophylactic, 1000 to 2000 units; therapeutic, 20,000 to 40,000 units.

(a) **Prophylactic Use.** An injection of 1000 to 3000 International Units within a few hours of receiving a wound soiled with dirt greatly reduces the probability of tetanus developing. The larger dose is strongly recommended by the Medical Research Council (*Brit. med. J.*, i/1939, 738) and doses up to 10,000 units may be used when the wound is not seen until the second day and shows signs of turning septic. The passive protection conferred lasts for about three weeks. During the war of 1914-1918 it was the rule among military surgeons to give a routine injection of 1000 International Units, preferably intramuscularly, as soon as possible after reception of a wound. Combined tetanus and gas gangrene antitoxins have also been employed prophylactically.

(b) **Use in Treatment.** Although the prognosis in an established case of tetanus is extremely grave, there is a wide measure of agreement that the use of antitoxin in large doses is of undoubted value. Opinions differ as to the best method of administration, but the combined administration of 40,000 International Units intrathecally (preferably by the cisterna magna), 20,000 to 40,000 units intravenously, and the same amount intramuscularly, is probably the most popular method, though some workers prefer to give a single massive dose of 100,000 or 200,000 units intravenously. An objection to the intrathecal injection is that it is

liable to set up an irritation and cause serous meningitis. It is important to note that treatment of the wound should not be undertaken until at least an hour after the antitoxin has been given. For the control of the spasms, bromides, chloral hydrate, morphine, or chloroform inhalations may be given simultaneously with the antitoxin; many workers now favour the rectal injection of bromethol or paraldehyde.

Better results obtained by giving large doses (50 to 100 ml.) subcutaneously by the intraspinal route *under chloroform anaesthesia*, ending with subarachnoid injection of 10 to 30 ml. The chloroform impregnates the lipoids of the nervous system, rendering it impossible for the toxins to become fixed—an example of "phylaxis."—René Cruchet, *Brit. med. J.*, i/1932, 86.

Toxin which has been absorbed by nervous tissue can be displaced by the vapour of a general anaesthetic, and can then be neutralised by antitoxin. Dufour's method consists in giving either chloroform or ether as a general anaesthetic, and administering antitoxin by any parenteral route, preferably by the intravenous drip method. The anaesthetic is given for half an hour twice a day, and two or three administrations may be sufficient.—C. T. Barry, *Brit. med. J.*, ii/1936, 896.

Five cases of tetanus treated with doses of from 160,000 to 200,000 units of antitoxin—sodium Luminal and Avertin used as sedatives. Avertin more efficacious in producing relaxation.—E. T. Freeman, *Brit. med. J.*, i/1936, 552.

Best treated by a combined method of administration of the antitoxin, intrathecally through the cisterna magna (40,000 units), intravenously and intramuscularly (80,000 units in equal parts), with daily administrations of 40,000 to 80,000 units, according to the severity of the case, intravenously or intramuscularly, or both, until spasms are fully controlled. The routine use of paraldehyde per rectum is recommended in all cases as the most suitable sedative. The total mortality in a series of 438 consecutive cases was 50.6% and 29.4% after excluding those that died within 24 hours of admission.—B. B. Yodh, *Brit. med. J.*, i/1937, 855.

The treatment of tetanus should aim at preventing the absorption of toxin by the central nervous system, controlling reflex spasms and maintaining strength. Antitoxin in doses of 200,000 units intravenously is recommended, together with Avertin.—L. Cole, *Proc. R. Soc. Med.*, 1938, 31, 1205.

There is usually unnecessary delay in making a diagnosis and therefore in giving antitoxin. The administration of antitoxin at the earliest possible moment is as important in tetanus as it is in diphtheria. Prophylactic antitoxin should be repeated in all cases of suspicious wounds, and all soldiers before going on active service should be actively immunised against tetanus. It is unnecessary to continue to give antitoxin when reflex convulsions have ceased, and only tonic rigidity remains, except when there is a septic wound which cannot be drained.—L. Cole, *Lancet*, i/1940, 164; see also *Brit. med. J.*, i/1940, 742.

Toxinum Tetanicum Detoxicatum (B.P. Add. II). Syn. TETANUS TOXOID, ANATOXIN.

Dose.—0.5 to 1 ml. subcutaneously or intramuscularly.

Tetanus toxin, the toxicity of which has been removed by the action of chemical substances while retaining its immunising properties. It may occur either as (a) tetanus toxoid in simple solution, prepared by treating the filtrate with formaldehyde, or (b) as alum precipitated tetanus toxoid, prepared by adding alum to tetanus toxoid in simple solution, separating the precipitate and washing and suspending it in normal saline.

The injection is preferably made in the back of the left arm, a second injection being given after an interval of three months.

Tetanus toxoid, or alum-toxoid, is employed for the production of active immunity to tetanus in individuals (e.g., soldiers) who

are subjected to a greater than normal hazard of the disease. The injections are said to convey a lasting immunity.

Alum-precipitated tetanus toxoid in a dose of 1 ml. induces a higher degree of immunity than three doses of toxoid without alum.—D. H. Bergey, *J. infect. Dis.*, 1934, 55, 72.

Two injections of alum-precipitated toxoid better than three of unprecipitated toxoid.—Jones and Moss, *J. Immunol.*, i/1936, 115.

There seems to be no doubt that by the injection of toxoid, or of alum-toxoid which seems to give even better results, it is possible to confer complete and permanent immunity on the vast majority of those inoculated. The immunity thus produced results in a much greater and more active response to the antigenic stimulus, so that infection by tetanus bacilli at any later date will be countered by a rapid and increased output of antitoxin sufficient to afford complete protection. Such protection might be afforded to the British Army by the injection of two doses of alum-toxoid at an interval of three months, with the additional protection of a third inoculation before being called on for foreign service or in the event of war.—H. H. Brown, *Brit. med. J.*, i/1937, 494.

Because of the marked variation in individual response, and the lack of an easily performed test to determine immunity against tetanus, repeated injection of toxoid should be resorted to on the occurrence of an injury. Otherwise a false sense of security may result.—Herman Gold, *J. Amer. med. Ass.*, ii/1937, 481.

Anti-tetanus vaccination with tetanus anatoxin has received a unanimously favourable reception in France, where some one and a half million persons have been vaccinated. Compared with anti-tetanus serum the anatoxin was found to be stronger and more lasting. Serovaccination gives protection which is achieved rapidly, but is of short duration, and post-serum tetanus occurring as late as the third month after vaccination has been reported. Experience has proved that immunisation can become lasting if serovaccination and the use of anatoxin are associated as a routine. Such association is recommended as a therapeutic measure also.—per *J. Amer. med. Ass.*, i/1939, 2448.

Two cases of anaphylactic shock following administration of a second dose of tetanus toxoid. The incidence of general and local reaction following the subcutaneous inoculation of 61,042 healthy individuals with tetanus toxoid, using two 1 ml. doses at a weekly interval is reviewed. Anaphylactic reaction occurred in 0.003% of cases, less severe constitutional reactions in 0.02%, and local reactions in 1.06%. Though the incidence of general reaction after tetanus toxoid is rare, it is advisable to be prepared to treat it expeditiously with adrenaline hydrochloride when it does occur.—H. E. Whittingham, *Brit. med. J.*, i/1940, 292. A further case described.—H. J. Parish and C. L. Oakley, *ibid.*, 294.

Tuberculosis. In spite of the fact that the cause of tuberculosis was proved by Koch in 1882 to be the tubercle bacillus, the value of specific treatment by means of tuberculin is still the subject of dispute. Although some workers consistently maintain that beneficial results may be obtained, in general it may be said that tuberculin is no longer regarded as possessing the high therapeutic value formerly attributed to it.

It is important to remember that tuberculin treatment is only indicated in the early stages of the disease, and that it should never be used in the treatment of exudative tuberculosis with signs of systemic intoxication; the best results have been obtained in extrapulmonary disease, such as glandular or bone and joint tuberculosis.

Owing to the danger of severe reactions following its use, tuberculin must be employed with great caution; indeed, the advocates of tuberculin treatment contend that the poor results often obtained and the relative frequency of severe reactions are due to faulty administration, and that the treatment requires special knowledge and experience.

Tuberculins.

There is no consensus of opinion either as regards the proper variety of tuberculin to use or the correct dose to employ. The preparations now described are **Old Tuberculin**, **Albumose-Free Tuberculin** or **T.A.F.**, **Tuberculin T.R.**, **Bacillary Emulsion** or **B.E.**, **Beranek's Tuberculin**, **Raw's Vaccine**, **B.C.G.**, and certain other modifications.

Tuberculinum Pristinum (*B.P.*, *U.S.P. XI*). *Syn.* **OLD TUBERCULIN**, **TUBERCULIN KOCH** (*P.G. VI*).

This is an amber-coloured liquid—a mature glycerin broth culture of the tubercle bacillus concentrated to $\frac{1}{10}$ its volume, filtered, and diluted to the requisite standard with 50% *v/v* aqueous glycerin.

The Therap. Subs. Regns. 1931 and the B.P. specify Old Tuberculin as proper name for this; if with the suffix "T" the tuberculin has been made from a case of human infection, while "P.T." indicates made from bovine infection.

It has been used (a) as a *diagnostic* both in man and beast (*see p. 1085*), and (b) for treatment, but is now little used for this purpose. Tubercle vaccine and tuberculin A.F., *q.v.*, replace it.

Effects of Injection. The tuberculin seems to act upon the tuberculous lesions, and even partly destroys them—it is not definitely destructive to the tubercle bacilli—or their surroundings, and subsequently there is a risk of further symptoms from blood poisoning dependent on this. The tuberculin may cause a serious fall in blood pressure, leading even to a fatal issue; in other cases there have been congestion and hæmorrhage, or other irritant effects have been produced.

Contraindications for the injection are laryngo-tuberculosis, cardiac troubles, diabetes, nephritis and pregnancy. In epilepsy and neurasthenia it should be given with the greatest caution.

The general reaction usually sets in about 8 to 16 hours after the injection—more or less severe attack of shivering, with headache and pains in the limbs.

At the point of injection redness appears after 1 to 2 hours, and gradually an infiltration shows itself, varying in size from that of a farthing to that of half-a-crown, the absorption of which may take several days.

The height of the reaction is indicated by a profuse outbreak of sweating, a lessening of all the other symptoms and a more or less speedy return of the temperature to normal. Generally the entire reaction is over in 24 to 36 hours. There may be slight lassitude, and in the case of phthisis an increased expectoration, disappearing in a few days.

In lupus patients, besides the general reaction, a marked local reaction sets in.

Unguentum Tuberculin (Old). Lupus vulgaris has been diagnosed and treated by use of old tuberculin ointment—5% of old tuberculin in a basis of soft paraffin. This is well rubbed in for one to two minutes, and is also

applied by means of a bandage to the affected area—the part being previously cleansed and crusts, if any, removed. On removal of the application, varying degrees of hyperæmia and swelling are seen in the actual lupus tissue, with a moderate amount of hyperæmia with reddish papules extending one or two inches into the surrounding healthy skin (Moro reaction, *q.v.*). After cleaning the surface, similar applications for treatment are made for the next three or four days, till the lesion closely resembles that produced by the application of a salicylic acid plaster. This typical reaction only obtains in the actual disease and does not extend into the surrounding healthy skin. The pain produced may be considerable.

Tuberculin Ointment (for percutaneous use—Philip). Tuberculin original (Koch) 10 to 50, eucalyptol 5, Eucerin to 100. Beraneck's tuberculin is also suggested.

Percutaneous exhibition of tuberculin exerts a remarkable influence on the first buddings of tuberculosis in childhood. Continued observations, over long periods, show it is capable of effecting the nearest approach to detuberculation yet realised. Used as a diagnostic and therapeutic agent, the two-fold aspect must be kept steadily in view. The local stimulation by tuberculin at each tuberculous focus is an important step. When tuberculin is rubbed firmly into the skin of a tuberculous patient it is freely absorbed and exerts a specific curative influence. Generally, a 25% preparation is convenient. In young subjects, or where there is doubt as to the number and extent of foci involved, begin with 10%. The actual amount of tuberculin used in a straightforward case (using, say, 25% dilution), may be approximately 0.1 ml. The ointment containing this quantity is rubbed into the cleansed skin, over an area of 1 or 2 square inches, by means of a small glass rod. Repeat once weekly.—Sir Robert Philip, *Brit. med. J.*, i/1923, 493.

Tuberculin Liniment. Tuberculin Old or P.T.O., or equal parts of both, mixed with compound camphor liniment in proportion of 1 to 5 minims to 1 drachm, used for local application, *e.g.*, in abdominal disease or pulmonary tuberculosis. An ointment using anhydrous lanolin employed for lupus or adenitis.

Tuberculin P.P.D. The purified protein derivative of old tuberculin. It is issued for use in the form of a dry powder which is dissolved in a special borate buffer solution. It is employed only for diagnostic purposes (in the intradermal reaction or the patch test, *q.v.*). Tuberculin P.P.D. possesses the advantages of constant potency on a weight basis and of greater stability in the dry state.

A comparative study of old tuberculin and the purified protein derivative.—R. M. Seideman, *Amer. J. Hyg.*, 1939, 30, 1.

Tuberculin Bouillon Filtrate. *Syn.* TUBERCULIN B.F., T.O.A., TUBERCULIN-ORIGINAL ALT. A germ-free tubercle bacilli bouillon culture, resulting from filtering mature cultures; with or without the suffix T.O.A. or P.T.O., *i.e.*, from human or bovine source.

Dilutions greater than 1 in 10 do not keep well.

It has been used in the "dispensary treatment," (p.1082). Asthma and hay fever have been treated with it on empirical lines.

Vacuum Tuberculin and Vacuum Bovine Tuberculin are analogous to T.O.A. and P.T.O. concentrated to $\frac{1}{10}$ volume—for treatment of special cases (not for diagnosis) where a mild effect is desired. *Initial dose.*—0.1 ml. of 1 in 100,000 dilution twice or thrice a week, at most doubling on second occasion. If reaction occurs, 8-day interval after complete abatement of symptoms. Diluent, normal saline with 0.5% of phenol.

Tuberculin A.F. (ALBUMOSE-FREE) (P.G. VI).

Distinguish from diphtheria toxoid-antitoxin floccules, also known as T.A.F.

Dose (Initial).—0.0001 ml. in pyrexial cases; 0.0001 ml.

in apyrexial cases. Subsequent doses are determined from a study of the resulting reactions—constitutional, or general and focal. As a rule, reactions should have subsided before more is given.

A light amber-coloured liquid, the product of the tubercle bacillus grown in a special culture medium free from albumoses and peptones, evaporated to $\frac{1}{10}$ its volume and finally filtered.

This preparation, as already indicated, may replace old tuberculin. It is used as *diagnostic* by conjunctival, intracutaneous and percutaneous application.

For treatment it is employed subcutaneously where a fold of skin and underlying tissues can be raised. Reactions obtained are thought to be specific, and anaphylactic symptoms are excluded in consequence of the absence of non-specific proteins.

Tubercle Vaccine. This is the proper name under the *Therap. Subs. Regns.* 1931 for preparations made from the bacillary substance by growing the organism on artificial media. They are suspensions of the killed organisms or products derived from them, and are often referred to as "New Tuberculin."

Vaccinum Tuberculinum (B.P.C.). *Syn.* TUBERCLE BACILLARY EMULSION, B.E.

The original "new tuberculin" of Koch. Human type, bovine type, or the two mixed, are available.

Dose.—0.00001 to 0.00002 ml. as a rule to begin with. The dose is increased carefully at a rate which causes little or no rise in temperature (1°F.), and with intervals of about 1 week. With the small initial dose stated it is very exceptional for any reaction to appear. Should a rise occur, the dose should not be exceeded until the temperature has reached its previous level.

As proof of the immunising properties of his T.R. and other preparations, Koch demonstrated the production of specific immunising bodies, which he called *agglutinins*. The difference between B.E. and T.R. is that B.E. contains the *entire body substance of tubercle bacilli*, whilst with T.R. the *soluble constituents* of the bacillus are first rejected. The soluble endotoxins are thought to play an important part in the production of agglutinins and are contained in B.E.

B.E. is, therefore, a suspension of entire pulverised tubercle bacilli in a mixture of equal parts of glycerin and water. 1 ml. contains 5 mg. of thoroughly dried tubercle bacilli.

The bacilli, grown on a solid medium, are pulverised by prolonged grinding in a ball mill. Before grinding they may be either alive or killed by heat. The powdered product is emulsified in normal saline and diluted so that 1 ml. contains 5 mg. of powdered bacilli. A 1% dilution of the original is sometimes called "Dilution No. 1," a 0.1% is No. 2 and so on.

Bold dosage was advocated by the German school. Starting with the same initial dose (0.00001 to 0.00002 ml.), at 1 or 2 days' interval, the dose was rapidly increased from twice to 5 times the dose at each injection, until definite reaction appeared

with a rise of $2\frac{1}{4}^{\circ}$ to 5°F. in temperature. As soon as such violent reaction developed, much longer pauses, 6 to 8 days, were made. The injections were increased to 4 ml. undiluted B.E. Koch regarded the immunisation as complete only when the patient could tolerate this without reaction. The larger doses of 2 to 4 ml. were only injected at intervals of 2 to 4 weeks.

In exceptional cases (*English dosage*) the initial dose may be as minute as $\frac{1}{1000000}$ mg. bacillary substance with gradual rise—the limit being $\frac{1}{1000}$ mg. of bacillary substance ($= 0.0004$ ml.). *Average doses* are respectively $\frac{1}{100000}$ mg. ($= 0.00001$ ml.), $\frac{1}{10000}$ mg. and $\frac{1}{1000}$ mg. diluted in 1 ml.

Tuberculin T.R. Human, Bovine and Mixed Types.

Dose.—Initial (subcutaneous), 0.00001 to 0.0001 ml. according as the case is pyrexial or not, rising gradually to 0.2 or even 1 ml. Dilutions are made in 1 ml., using 20% glycerin as diluent.

N.B.—*Doses should be stated in decimals and by no other method.*

Although a stereotyped increase of dose is not advised, the following scheme will be useful as a guide (reading downwards in each column):—

0.00001 ml.	0.0001 ml.	0.001 ml.	0.01 ml.
0.00002 "	0.0002 "	0.002 "	0.02 "
0.00003 "	0.0003 "	0.003 "	0.03 "
0.00004 "	0.0004 "	0.004 "	0.04 "
0.00005 "	0.0005 "	0.005 "	0.05 "
0.00006 "	0.0006 "	0.006 "	0.06 "
0.00008 "	0.0008 "	0.008 "	0.08 "
			0.1 "
			0.2 "

As a rule weekly injections are given.

Several commercial preparations made on the lines of Koch's directions for T.R. are available.

T.R. of Koch contained 2 mg. of solid substance, *not* 10 mg. as originally stated. It may be recalled therefore that:—

0.00001 ($\frac{1}{1000000}$) ml. of T.R. = 0.00002 ($\frac{1}{500000}$) mg. (or 0.00000002 g.) of solid substance.

Bold dosage.—The large doses advised by Koch, starting from 0.0002 ml. and repeated every second day with moderate increase of dose so that a rise of temperature greater than 0.9°F. was avoided, are not now generally administered.

The *English School* start with smaller initial dose (as already outlined) and do not look for any marked rises in temperature.

Tuberculosis Immunising Vaccine (Nathan Raw). *Syn.* TUBERCLE VACCINE "R." Raw states that virulent tubercle bacilli—after years of subculturing—can be attenuated. In his opinion this remedy should be of greatest value, not only in curing the disease, but also in its prevention, by protecting the human body against attack. Cattle can be rendered immune to virulent bovine bacilli by previous inoculation with virulent human bacilli. There is a marked antagonism in the human body between human and bovine infections. These two organisms cannot flourish in the body at the same time.

Extended clinical investigation at Liverpool showed that the human body is attacked by two quite distinct forms of tubercle—the one conveyed by direct

infection and attacking chiefly the lungs (so-called consumption); the other, the surgical form, conveyed by milk from tuberculous cows and developed in the first few years of life. A vaccine made from bovine cultures should be used in the treatment of human infections and *vice versa*.

Raw's Vaccine is a bacillary emulsion of the bacilli containing all the products of the bacillus. It is non-toxic and avirulent, and produces no reactions even in large dose.

Dose.—0.001, 0.002, 0.003, 0.004, 0.005 and 0.006 mg. for immunising susceptible children at weekly intervals, repeated in three months.

For treatment of the active disease, commence with 0.001 and increase to a maximum of 0.025 mg. Twelve injections should be given at intervals of seven days. Vaccine should be freshly made.

General References to Use of Tuberculin in Treatment.

If tuberculin were entirely useless it would have been discarded long ago, and would not be the subject of serious discussion 42 years after its introduction. It has definite therapeutic uses—considerable in localised and surgical manifestations; strictly limited in pulmonary forms.—R. A. Young, *Brit. med. J.*, ii/1932, 1091.

Contraindicated in active, spreading, caseous disease, or with continuous remittent or intermittent fever.—R. A. Young, Sect. of Tuberculosis, B.M.A. Cent. Meeting, 1932, *Brit. med. J.*, ii/1932, 316.

Of 267 tuberculosis specialists replying to a questionnaire only 5 used tuberculin as the main form of treatment. The majority counselled against its use in all but quiescent or slightly active cases, and 63 reported harmful results.—L. Hektoen and E. E. Irons, *J. Amer. med. Ass.*, i/1929, 869.

TUBERCULOUS ASTHMA can be ameliorated or cured by the following technique. Commence with 0.1 ml. of tuberculin liniment (see p. 1079) and double weekly till 1 ml. is given. A tuberculin rash often appears in due course at the site of application, usually accompanied by amelioration of the asthma. If not, proceed to injections, commencing with T.A.F. 0.0001 ml. and increasing weekly. If reaction or an attack of asthma ensues, return to the liniment.—F. E. Gunter, *Brit. med. J.*, i/1929, 575.

TUBERCULIN DISPENSARY TREATMENT. Only early or suspected cases are suitable for this form of—Dispensary—treatment. The treatment should be refused to all presenting evidence of mixed infection.

None but experts should give tuberculin for diagnosis or treatment, and not even the best qualified medical practitioner should use it in treatment without at least three months' training at a tuberculin dispensary. The scientific method has not had a fair trial in any country, because it is highly technical, difficult to learn, to teach, and to practise, and its evaluation demands exacting conditions; leading men had rejected Koch's work and teaching because they have never seriously investigated it under these conditions. Wrong doses have been given in the wrong way at the wrong time, and in the wrong cases. Experiences at the tuberculin dispensary in London showed that in all patients in Stages I and II, where tubercle bacilli were found in the phlegm, 68% were alive at the end of 8 to 10 years, and 70% able to follow their ordinary occupations; the L.C.C. results in similar cases, under sanatorium treatment, were 28% alive at the end of four years. The advocacy of tuberculin, both as a diagnostic and curative agent, rests on facts that cannot be impeached.—W. Camac Wilkinson, *Brit. med. J.*, ii/1928, 444.

From a study of his papers his usual treatment is first a course of P.T.O., then P.T. (may be repeated courses), then Tuberculin Old—or more recently Tuberculin A.F.

B.D.H. Tubercle Endotoxoid (*British Drug Houses, London*). A preparation of the tubercle bacillus from which the toxicity has been eliminated. For use in the treatment of all forms of tuberculous infection. *Dose*.—0.05 ml. subcutaneously, increasing to 1.5 ml. The following system of dosage is advised: first week, two doses of 0.05 ml.; second week, two of 0.1 ml.; then increase by 0.1 ml. weekly until two doses of 0.5 ml. weekly are given.

In the majority of cases, either no reactions or only very mild ones follow administration, and a definite therapeutic action, which is antitoxic, progressive and durable, takes place. There are no contraindications.

It may also be employed to produce active immunity in hospital attendants and other contacts.

"B.C.G." (Bacille Calmette-Guérin), a strain of tubercle bacillus grown on glycerinated ox bile, first described by Calmette in 1909, was subcultured 230 times up to January, 1921, when vaccination experiments were started, and was then incapable of producing tubercles. Caused a general disease in calves resembling typhoid fever, clearing spontaneously after 15 to 20 days without producing slightest tubercle formation. "B.C.G." now cultivated on potato and glycerinated veal broth or Sauton's Asparagin medium; cultures must not be more than 10 days old. It is employed for the prophylactic vaccination of the newly-born against tuberculosis, and is administered in milk at body temperature in three doses. It is harmless even in new-born infants.

The method has been widely employed on the Continent, and especially in France, but has so far not met with any favour in this country.

Destructive criticism of B.C.G. Figures unsatisfactory. Calmette's claims "optimistic."—*Brit. med. J.*, i/1928, 364.

Prophylactic inoculation of adults with B.C.G.—*Lancet*, ii/1928, 931.

Prof. Calmette's statements on B.C.G. to Roy. Soc. Med. The untreated child is auto-vaccinated by milk, food, dust, etc. In Calmette's method an attenuated strain (230 passages) of living organisms is employed. Mention of first child treated (born of tuberculous mother and grandmother): 10 years after the child is healthy and well.—*Brit. med. J.*, i/1931, 1070, 1080.

Reasons for absence of official support for B.C.G. vaccination in Great Britain, as submitted to the Office International d'Hygiène Publique (Paris) by Sir George Buchanan, and Professor Calmette's reply.—*Lancet*, i/1933, 653.

B.C.G. in America. After eight years' experience of B.C.G. vaccinations in America, C. Keresztesi and W. H. Park state that they are able to substantiate Calmette's claim that B.C.G. vaccine is harmless in humans, provided they are free from tuberculous infection, and that it is effective in the prevention of tuberculosis in children. Intracutaneous or subcutaneous injection is superior to oral administration. They urge that B.C.G. vaccine should be used as a public health measure in the prevention of tuberculosis in children of tuberculous families, and that it should be given as early as possible. Oral vaccination may begin within 10 days of birth, three 10 mg. doses being administered at two-day intervals. The parenteral method may be used on patients of any age with a negative tuberculin test.—*Amer. Rev. Tuberc.*, Oct. 1936, 437.

After sufficient trial the veterinarians of America have not adopted B.C.G. as a satisfactory method of prevention. They have had a better opportunity to observe the effects of B.C.G. on cattle than we could ever hope to have on human beings. The veterinarian's experience and his record of success in controlling tuberculosis should discourage every physician from administering B.C.G. to children. Certainly a preparation that the veterinarian considers unsafe and ineffective for cattle should not be used in an experimental way on the children of the United States. To prove the efficaciousness of an immunising agent for tuberculosis in the human body would require decades.—F. E. Harrington, J. A. Myers and N. M. Levine, *J. Amer. med. Ass.*, i/1937, 1315.

B.C.G. in France. Statistics show a striking difference in the tuberculosis mortality in France existing between infants who have been vaccinated by the method of Prof. Calmette and those not so vaccinated. The procedure is to give 3 doses, each of 10 mg. of a non-virulent strain of tubercle bacilli during the first 10 days of life, and the figures represent the mortality calculated on each of the first two years of life.—Editorial, *Brit. med. J.*, i/1927, 845. See also *ibid.*, 897, 1082, in which limitations in the value of the statistics are suggested by M. Greenwood.

In France one child out of every five is inoculated within the first week of life with B.C.G. vaccine, the average number of vaccinations each month being 10,700. Outside France more than half a million children have been vaccinated. The general mortality, including all traumatisms as well as diseases, is 4.6% in the vaccinated against 25% in the non-vaccinated during the first year. It

is perfectly safe to revaccinate at 1, 3, 5 and 7, such children as are specially menaced.—*per J. Amer. med. Ass.*, i/1933, 130.

B.C.G. in Rumania. During the past 12 years there have been some half million vaccinations in Rumania. The main conclusions reached are that it appreciably reduces the tuberculosis mortality among children and that the tuberculosis morbidity is also reduced. At present about 70% of the babies in Bucharest are given B.C.G. at birth. The tuberculosis mortality during the first year of life is said to be 1.3 per 1000 among the B.C.G. babies, compared with about 4 per 1000 among the others.—*Lancet*, i/1939, 524.

B.C.G. in Sweden. From 1927 to 1937, 13,103 babies were given B.C.G. at birth, the vaccine being given by the mouth in three successive doses as a voluntary measure. The conclusion reached is that B.C.G. vaccination has seemed to affect a remarkable diminution in the tuberculosis deaths, and there has also been an obvious fall in general mortality among the vaccinated.—*Lancet*, i/1939, 39.

B.C.G. Vaccine (Pasteur Institute, Paris). B.C.G.: for oral administration soon after birth, 1 cg. bacilli in 2 ml. B.C.G.-NR: for oral use in children over 2 years and in adults, 5 cg. bacilli in 10 ml. B.C.G.-SC: for subcutaneous injection, $\frac{1}{10}$ cg. in 2 ml.

The following additional (unclassified) preparations are also used:—

Beraneck's Tuberculin consists of a mixture of tubercle-broth filtered free from bacilli and concentrated *in vacuo*, with an extract of the bacilli made with phosphoric acid. It is stated to contain exotoxins and endotoxins and acts like a vaccine, strengthening the bacteriolytic power of the protective cells; it also exercises a bactericidal or attenuating effect on the tubercle bacillus.

It is supplied in 6 dilutions, T.Bk₁ to T.Bk₆, viz. 1:10 to 1:1,000,000 for use.

Spahlinger's Tuberculosis Vaccine. A bovine vaccine for cattle immunisation and a harmless vaccine for human prophylaxis. Tubercle bacilli for making the vaccine are grown under environments of food, heat, etc., natural to the disease. They are emulsified with normal saline in the absence of oxygen, then placed in ampoules and kept in the cold and dark for a year or longer and allowed to die a natural death. They thus retain unimpaired the chemical and physical structure by reason of which they are effective vaccinating agents. This replaces customary animal passage from human beings and subsequent culture on artificial media, different from the original environment which, it is claimed, alters the character of the organism. It is held that a vaccine made on the latter lines cannot deal with the disease in an animal of the group from which it was originally taken.—*Brit. med. J.*, i/1932, 252.

Tests carried out under the supervision of the Government in Northern Ireland. A new simplified vaccine conferred a high degree of resistance against massive intravenous injection of tubercle bacilli.—Abstract from the report, *Vet. J.*, 1935, 423.

Vole Bacillus Vaccine. An investigation into the cause of the periodical waves of high death-rates of voles showed it to be due to a disease resembling partly tuberculosis and partly rat leprosy. The disease was found to be due to tubercle bacilli closely related to the human and bovine types, but distinct from them, highly virulent for voles, but relatively avirulent for guinea-pigs and rabbits. Experiments on guinea-pigs showed the protective power of a vaccine prepared from this organism to be much greater than that afforded by B.C.G. Further work is proceeding on monkeys and cattle.—*Brit. med. J.*, ii/1940, 261.

Tuberculin Reactions for Diagnosis.

Of the various tuberculin reactions employed for the diagnosis of tuberculosis, the best known are the subcutaneous test (Koch), the cutaneous test (von Pirquet), the intradermal test (Mantoux), and the percutaneous test (Moro). Of these, the one now most widely employed is the intradermal test, though the Vollmer patch test recently introduced is rapidly finding favour. The subcutaneous test is now seldom used in human beings owing to the dangerous reactions to which it may give rise.

Subcutaneous Test. *The test in the human being.* An initial dose of 0.2 ml. of a 1 in 1000 dilution of old tuberculin is injected subcutaneously. If no rise of temperature follows, give 1 ml. of a 1 in 1000 dilution at least 48 hours later. If again no rise of temperature occurs give 0.5 ml. of a 1 in 100 dilution. Finally, if necessary, 1 ml. of a 1 in 100 dilution. A rise of 2.3°F. or more occurs in tuberculous subjects some 6 or more hours after the injection of tuberculin.

While Koch's subcutaneous test is definitely inapplicable to persons with pyrexia, and is unsafe in those with lesions of the easily-activated type, the chronic, productive, inert, sputum-negative cases stand the test well, and the risk is not serious. Koch's test remains the most valuable in diagnosis; the only thing against it is its risk.—S. L. Cummins, *Brit. med. J.*, ii/1932, 1090.

The test for veterinary use. The animal is confined to its stall for 24 hours before the injection is made, and its temperature observed. 3 to 4 ml. of a 1 in 10 dilution is injected subcutaneously in the neck. The temperature is taken 6, 9, 12, 15, 18, 24 and 36 hours after inoculation. If there is a rise of temperature of 1.4°C. or more the animal should be regarded as tuberculous. With a rise of temperature from 0.8° to 1.4°C. the diagnosis is doubtful, and the test should be repeated after 1 month. This test has been proved to be of the utmost value for the diagnosis of tubercular infection in cattle. Occasionally in animals with advanced infection the test is negative. In these cases, however, the diagnosis can usually be arrived at by other means. In a few cases, in animals suffering from echinococcus infection, a slight positive reaction has been obtained. After a dose of tuberculin in cattle, a further dose during 6 months may fail to produce a rise in temperature again.

Tuberculin Committee's Report. Tuberculin tests in cattle. Subcutaneous test unsatisfactory under farm conditions, and ophthalmic test only regarded as subsidiary. Complete confidence in intradermal test.—*Brit. med. J.*, i/1925, 797.

Cutaneous Test (von Pirquet). Cleanse the inner side of the forearm with ether and alcohol. Make two similar scratches with a sterile needle 3 inches apart (avoid drawing blood). On one scratch place a drop of 1 in 4 old tuberculin in sterile water (pure old tuberculin is sometimes used); keep the other scratch as a control. Examine at 12, 24 and 36 hours. A positive reaction occurs in from 3 to 24 hours, and is usually at its height at 36 to 48 hours. The skin becomes red and slightly raised on each side of the scratch over an area 10 mm. broad; reactions under 5 mm. should be regarded as doubtful.

Intradermal Test (Mantoux). For this test 0.1 ml. of diluted old tuberculin is injected intradermally, employing a fine needle. For the initial dose a 1 in 10,000 dilution in 0.5% phenol-saline is used. If this fails to cause a positive reaction, consisting of an area of erythema not less than 5 mm. in its greatest diameter in 48 to 96 hours, the test is repeated with a 1 in 1000 dilution, and if again negative with a 1 in 100 dilution, and finally with a 1 in 10 dilution. In practice, the initial dose of 1 in 10,000 is often omitted.

Alternatively, Tuberculin P.P.D. in the same doses and dilutions may be substituted for old tuberculin with equally good results.

The usual technique is to inject 0.1 ml. of 1 in 1000 old tuberculin intradermally. Extremely valuable in children. Negative result excludes tuberculosis, strongly positive suggests active tuberculous disease with bad prognosis, and mildly positive suggests tuberculous infection amenable to open-air treatment.—W. F. Gaisford, *Lancet*, i/1931, 521.

The von Pirquet test is the simplest and easiest for infants and young children: if negative, an intradermal test with 1 in 100 dilution should be carried out; in older children repeat the test, if still negative, with 1 in 10. The Mantoux Test (1 to 10 dilution) should always be carried out with a control injection of the broth used for the preparation of tuberculin. Pirquet test only positive when there is at least 1 mm. of erythema each side of scarified area, and the minimum for a positive Mantoux is an area of erythema 10 mm. in diameter, with swelling to the touch or a well-defined erythema greater in area than this. An erythema of 5 mm. or more should be regarded as doubtful, reinspected on the fourth day and, if still doubtful, the test repeated with a stronger dilution. Instead of maintaining the controversy as to the relative values of the Pirquet and Mantoux tests they should be combined as a routine (first Pirquet, followed by Mantoux 1 in 100).—G. G. Kayne and B. Weill-Hallé, *Brit. med. J.*, ii/1934, 468.

As a test for "active clinical tuberculous disease" the cutaneous and intradermal tests are too delicate. "Positive" reactions in adults cannot be interpreted to mean "active" tuberculous disease. A markedly positive reaction has, however, *serious significance during the first year of life*: the value of a "negative" may be very great, especially in childhood, but it is insufficient to stop short at a von Pirquet test, even with full strength tuberculin, or at a Mantoux with 1 in 1000 tuberculin, as many persons negative to these concentrations are found positive with 1 in 100 or 1 in 10.—S. L. Cummins, *Brit. med. J.*, ii/1932, 1089.

The purified protein derivative of tuberculin is recommended for diagnosis by the intradermal test in place of old tuberculin. It is recommended that the initial dose should be 0.00002 mg. of the P.P.D., and that 0.005 mg. be given as a second dose to those who fail to react to the first dose.—*Amer. Rev. Tuberc. Suppl.*, ii/1934, 708.

A report on 3010 tests (using 0.1 ml. of 1 in 1000 old tuberculin). An analysis of the tests suggests that the diagnostic value of the Mantoux test is under-rated, especially in older children. The test enables a diagnosis of tuberculosis to be excluded in three "suspect" cases out of four up to 8 years of age, and in one half of those aged from 10 to 12.—D. B. Bradshaw, *Brit. med. J.*, i/1939, 825.

Clinical trials were instituted in order to compare the diagnostic value of O.T. and P.P.D., 119 persons being tested at comparable sites on each forearm. An appreciably greater percentage of positive reactions was obtained with P.P.D., indicating slightly greater potency in this product as well as greater stability. The reactions obtained from P.P.D. are similar in character to the response to O.T., and they are clear-cut and easy to interpret. P.P.D. is the most suitable reagent for use in the application of the Mantoux test.—A. T. Doig *et al.*, *Brit. med. J.*, i/1938, 992.

Percutaneous Test (Moro). An ointment made of lanolin and old tuberculin in equal parts is rubbed on to the skin of the chest. A positive reaction is shown by the development of reddening and papules. The test has the disadvantage that one cannot ensure that the same amount of tuberculin is absorbed in successive tests.

The Vollmer Patch Test. The patch consists essentially of a small strip of adhesive plaster, 4 inches by 1 inch, on which are set three squares of filter paper. The two outer squares have been saturated with undiluted old tuberculin, the centre with glycerin broth to act as a control. An area of skin over the sternum, or in the intercapsular region, is cleansed with ether or acetone, allowed to dry and the patch applied and left in place for 48 hours, washing of adjacent parts during this period being avoided. The strip is then removed and the result read after a further 24 hours. A positive reaction may appear as a sharply circumscribed, indurated and reddened square set with small vesicles, the central square remaining unchanged. The reaction, however slight within the limits of the test squares, is significant.

The test approaches in reliability the intracutaneous method of Mantoux. It is simple and causes no local or general reaction.—D. Court, *Brit. med. J.*, i/1939, 824.

In a series of 744 cases in which the Vollmer patch test was compared with the Mantoux test, using 0.1 mg. O.T., the results indicate that the simpler Vollmer test is equally as effective as the Mantoux test, and possesses many advantages for the physician as well as for the patient.—G. Taylor, *Amer. Rev. Tuberc.*, 1939, 40, 236.

In the tuberculin patch test old tuberculin is decidedly superior to purified protein derivative.—H. Vollmer and E. W. Goldberger, *Amer. J. Dis. Child.*, 1939, 58, 527.

From observations on 712 school children it was concluded that the tuberculin patch test has a high degree of correlation with the Mantoux test and appears to give 7% more positives than the Mantoux. It is the method of choice in large-scale tuberculin testing, especially for children.—A. J. Pearse, *J. Amer. med. Ass.*, i/1940, 227.

The Copenhagen Patch Test. The Tuberkulin-salve of the Danish State Serum Institute is a mixture of old tuberculin and purified tuberculin, standardised at three times the international standard, and put up in tubes containing 4 ml. An amount sufficient to cover a threepenny piece is squeezed on to a piece of adhesive tape 1 inch square, and applied to the skin below the right clavicle, after cleansing with acetone. The plaster is removed in 24 hours and read in a further 24 to 48 hours. As a control a simple piece of plaster is applied below the left clavicle. There is little to choose between this and the Vollmer patch test, and a combination of patch test and Mantoux is suggested as best calculated to spare the child and the physician, and to give as few false reactions as possible.—F. D. Hart, *Lancet*, ii/1938, 609.

Typhoid.

Vaccinum Typho-Paratyphosum (B.P., U.S.P. XI). *Syn.* ANTI-TYPHOID-PARATYPHOID VACCINE, T.A.B. VACCINE.

Is made from cultures of typhoid and paratyphoid A and B organisms, containing 1000 million of *B. typhosus* and 500 million each of *B. paratyphosus A* (U.S.P. XI—*Salmonella paratyphi*) and *B. paratyphosus B* (U.S.P. XI—*Salmonella schottmülleri*) in each ml. F.E. VIII specifies 1000 million *B. typhosus* with 750 million of each paratyphoid organism.

Dose.—For immunising, two doses are given, 0.5 and 1 ml., at intervals of not less than 7 days; an interval of 10 days is to be preferred. (Some give three doses, 0.25, 0.5 and 1 ml., and the interval between doses may be extended to 14 days.) The dose is given *subcutaneously* into the tissues of the upper arm just below the insertion of the deltoid. The patient should take no alcohol whatever during the 24 hours preceding and after the injection.

For children the dose should be proportional to age. Thus a child of 7 would receive one-third of the average dose.

There is no sound reason why prophylactic antityphoid inoculation should not be given to children aged 2 years and upwards, a diluted vaccine being used.—Col. H. M. Perry and co-workers, per *Lancet*, i/1934, 584.

Contraindications. Alcoholics react more strongly than others. Kidney disease requires caution, and there is possibly slight risk in the case of old-standing tuberculosis.

Effects. Tenderness at the site of inoculation is at its worst in about 18 hours. Redness may be caused. Give free use to the arm the day after injection. Malaise begins in about 6 hours. Occasionally a rigor. There is usually headache and a slight

degree of pyrexia. Occasionally temperature up to 101°F., rarely 103°F.

The immunity created by prophylactic inoculation with T.A.B. vaccine remains at a high level for at least 6 months—probably for 12 or 18 months, and should an inoculated person contract the disease its severity is diminished and the percentage mortality lowered.

T.A.B. inoculation leads to the production of a considerable amount of O antibody. In the case of *B. paratyphosus A* this response is not evident to the same extent as that for the other two organisms. A fundamental difference exists between primary and secondary response to T.A.B. inoculation in human beings. With a primary stimulus the maximum rise of O antibody titre falls significantly short of that obtained with secondary and subsequent stimuli. It is therefore suggested that the second T.A.B. inoculation should be practised at the end of six months. In those individuals who have had multiple inoculations, the O agglutinin titre remains fairly high for 12 months only. The desirability of repeating T.A.B. inoculation every year is therefore stressed.—S. S. Bhatnagar, J. F. Freeman and J. C. S. Dhilon, *Indian J. med. Res.*, 1937, 24, 597.

Anti-Typhoid Vaccine (plain) is also made.

Dose.—1000 million and 10 days later 2000 million.

Vaccinum Typhosum (U.S.P. XI) contains not less than 1000 million bacilli per ml.

Anti-Typhoid-Paratyphoid A and B and Cholera Vaccine. (*This name should not be abbreviated to T.A.B.C. Vaccine.*)

1st dose.—500 million *B. typhosus*, 250 million each of *B. paratyphosus "A"* and *"B"* and 1000 million *Vibrio cholerae*; *2nd dose*—10 days later, twice these quantities.

Castellani's Tetra-Vaccine contains:—(No. 1) 1 ml. contains 500 million *B. typhosus*, 375 million each *B. paratyphosus A* and *B*, also 5000 million *Vibrio cholerae*; (No. 2) contains double quantities of No. 1 per ml.

Dose.—1 ml. of No. 1, followed by 1 ml. of No. 2, after customary interval.

Typhoid Endotoxoid Vaccine.* This vaccine consists of *B. typhosus* endotoxin extracted from concentrated heated bacterial emulsions by means of an alternate freezing and thawing process. The toxic soluble antigen, separated by centrifuging, is subsequently transformed into an atoxic product which still retains its original immunising properties. Finally, it is diluted for use to an antigenic concentration corresponding to that extracted from 5,000,000,000 to 6,000,000,000 organisms of the original emulsion, i.e., to 1.5 to 1.8 mg. of the dry bacilli, as the standard concentration, and up to 8,000,000,000, i.e., 2.4 to 2.5 mg. when the single inoculation method is contemplated. A single injection is sufficient to produce in man an agglutinin titre as high as 1/10,000 H and 1/5000 O without undue reaction.

5445 workers out of a total of 6652 (in S. Africa) were submitted to this single inoculation during the period September 1936 to July 1937. Only one non-fatal case of typhoid has been noted among these inoculated subjects during the year following the immunisation, while 8 cases with 2 deaths were recorded among the small proportion of non-inoculated workers.—E. Grasset, *Brit. med. J.*, ii/1939, 58.

Anti-typhoid Vaccine for Treatment. *Dose.*—50, 100, 250, 500, 1000 and 2000 millions. An initial dose of not less than 250 millions can be safely used—these to be repeated or increased under guidance of the clinical signs and symptoms. It might be of value to give a vaccine of *B. coli* and *Streptococci* to raise the immunity against these organisms before they can take an active part in the process of destruction of the tissues (as in the later stages of typhoid).

Oral Typhoid Vaccine. The oral administration of typhoid vaccine, in accordance with Besredka's theory of local immunity,

has been widely employed on the Continent and in S. Africa and the Far East. The usual course consists of three successive daily doses each of 50,000 million *B. typhosus*, and 25,000 million each of *B. paratyphosus A* and *B. paratyphosus B*, taken simultaneously with a 3-grain keratin-coated ox-bile tablet. The special claims made for it by its advocates are its ease of administration, the absence of a negative phase, and the fact that it does not give rise to unpleasant sequelæ. In spite of its extensive employment in various parts of the world, it has not found any great measure of favour with British workers who, in general, consider that, if employed at all, it should be reserved for special circumstances.

A variation of Besredka's typhoid immunisation by oral administration of a vaccine is used by the S. African Institute for Medical Research, and thousands of natives have been vaccinated by this method, which consists in giving *per os* a liquid suspension of killed *B. typhosus* and *B. paratyphosus A* and *B*, and simultaneously a pill of ox bile. No unpleasant reaction or malaise is stated to follow, and immunisation is supposed to be as efficacious as by the hypodermic method.—*Brit. med. J.*, ii/1927, 1050.

Vaccine therapy *per os* effective for typhoid. Of 4410 men treated with oral antiviral, preceded by bile, not one developed typhoid in the Rhine Army, while of 549 treated without bile 0.07% were affected. The method prevents the gradual encroachment of *B. typhosus* on cells still healthy and cuts short the period of illness.—Prof. Besredka, *Lancet*, i/1929, 1092.

Oral immunisation against typhoid in S. Africa at least equal to subcutaneous injection—quicker effect.—E. Chuvet, *Lancet*, i/1929, 1302.

Typhoid vaccine administered orally produces as great or greater concentrations of agglutinin bodies in the blood serum of human beings as typhoid vaccine administered subcutaneously, and the concentration is brought about in a shorter time and without any reaction. Economically and practically, the oral vaccine is more desirable than the subcutaneous.—H. D. Moor and I. L. Brown, *J. Lab. clin. Med.*, 1937, 1223.

From a review of the work done on oral vaccination against the enteric fevers, the following conclusions emerge: (1) on the evidence at present available it is very difficult to maintain that oral vaccination can be seriously considered as an alternative to vaccination by the subcutaneous route; (2) oral vaccination may, however, be regarded as worth trying when the choice is between that and nothing.—A. Fleming, *Brit. med. J.*, ii/1939, 100.

Anti-typhoid Serum (Felix). The factor present in virulent strains of *B. typhosus*, and responsible for their virulence and inagglutinability, is an antigen. This antigen is distinct from the O and H antigens of *B. typhosus*, and renders the O antigen resistant to the action of the O antibody. The symbol Vi (referring to virulence) has been suggested for this antigen and the corresponding antibody. Active and passive immunisation disclose the powerful protective action of the Vi antibody. The O antibody, which is known to exert bactericidal and opsonising effects, also neutralises the endotoxin of *B. typhosus*, whereas the Vi and H antibodies are incapable of this action.

Anti-typhoid sera containing O and Vi antibodies exert two separate and distinct effects: (a) the Vi antibody confers protection against infection with highly virulent strains of *B. typhosus* by suppressing the multiplication of the organisms; (b) the O antibody appears to be chiefly responsible for effecting the neutralisation of the endotoxin of *B. typhosus*.

The therapeutic dose for adults is 25 ml. intramuscularly as soon as possible after diagnosis has been confirmed; in severe cases this dose should be repeated twice at intervals of 24 hours; and in cases of extreme severity three injections of 25 ml. each may be given on three consecutive days, intravenously or intramuscularly. For children under 5 the dose is 5 ml., from 6 to 9 years 10 ml., and from 10 to 14 years 15 ml.

As a prophylactic for the conferring of immediate protection, one intramuscular injection of 25 ml. is given (children *pro rata*).

Of 8 cases treated with this new serum, 7 ceased to cause anxiety within a few days of receiving the last dose, the only failure was the case receiving a very inadequate dose, who died from a local complication.—C. J. McSweeney, *Lancet*, i/1935, 1095.

During the Bournemouth outbreak of 1936, Felix anti-typhoid serum was given to 73 patients, of whom 55 were classified as severe or very severe cases. In 73% of cases there was improvement within 48 hours of the injection, and in a further 10% some benefit was noted after a few days. 7 of the patients died, and 6 of these deaths were in patients treated later than the third week of the disease; only one patient died among 33 treated during the first three weeks, and in this case the dose of serum (13 ml.) was inadequate. For sporadic cases or small outbreaks, where the numbers do not admit of proper controls, the evidence so far available warrants the administration of serum at the earliest possible moment and in full doses, irrespective of the severity of the disease.—H. Cookson and R. V. Facey, *Brit. med. J.*, i/1937, 1009.

In the majority of cases so far treated (61), the Felix serum has been found beneficial, sometimes dramatically so. In not less than one-third of the serious cases the results were excellent, in another third they were definitely good, and in the remaining third they were doubtful or negative. Complications were exceedingly rare in serum-treated cases.—C. J. McSweeney, *Brit. med. J.*, ii/1937, 1118.

The titre of the Vi antibody in the concentrated anti-typhoid serum as issued at the present time is 1 in 3000. Until serum with a considerably higher content of this antibody can be prepared, it is recommended that for prophylactic use one intramuscular dose should be given, lying between the limits of one-third and one-sixth of the full curative dose, which is 99 ml. for an adult and proportionately less for a child. When deciding on the dose the degree of risk and length of exposure to the infection should also be taken into account.—A. Felix, *Brit. med. J.*, i/1938, 1091.

At the present time the value of anti-typhoid sera prepared from the horse is still *sub judice*, and there is no evidence that the mortality is reduced by their use. The danger of a prejudicial disturbance of the delicate mechanism of immunity in the human subject appears to outweigh the possibility of benefit.—Sir W. Willcox, *Brit. med. J.*, i/1938, 1085.

The prophylactic use of anti-typhoid serum prepared by Felix's method in a localised outbreak. The serum was given to 31 contacts, 10 ml. for an adult and 5 ml. for a child, intramuscularly. No case of typhoid occurred among these contacts, though this is not considered a proof that the serum did actually prevent the onset of typhoid in any of these people.—J. Fenton and C. P. Hay, *Brit. med. J.*, i/1938, 1090.

Variola. Smallpox is a virus disease for which there is no specific treatment, but vaccination with calf lymph diminishes the liability to attack, and when the latter does occur the disease is milder and less fatal. Protection against attack is greatest during 9 or 10 years after vaccination, though it is still efficacious for a further period of five years. Smallpox is now a very rare disease in this country—there were only 18 cases notified in 1938.

Vaccinum Vaccinæ (B.P.). *Syn.* VACCINUM ANTIVARIOLUM, VACCINE LYMPH, VACCINUM VARIOLÆ (U.S.P. XI), VACCINO

ANTIVAILOSO, VACCINO JENNERIANO (*P. Ital. V*), VACCINUM ANTIVARIOLICUM (*P. Belg. IV*).

The substance obtained from the vesicles produced by inoculation of vaccinia virus on the skin of healthy animals.

To meet the requirements of the Therap. Subs. Act, 1925, the animals used must be healthy, the animal after lymph collection must be examined *p.m.*, the lymph must be treated with glycerin or other partial disinfectant (*v. postea*), it must be continuously in cold storage at below 0°; each tube must contain enough for one human subject. A label on the box or carton must show the proper name, name and address of maker, number of licence, a distinctive batch number, the date of completion of manufacture after testing for organisms, and a statement that the potency cannot be relied on for more than 7 days unless it is kept at below 10°.

In emergency a larger amount may be issued in sterile containers of larger dimensions.

The seed lymph used in this country is derived from calf lymph received from Cologne in 1907, its quality being maintained by cutaneous passage through the rabbit (repeated transference from calf to calf being found to lead to deterioration).

Its potency is maintained for long periods if stored at 0°. Between 0° and 5° it may be expected to remain potent for three months, between 5° and 10° for four weeks only, and above 10° not more than seven days.

Glycerinated calf lymph has advantages over that obtained even from healthy children (as used in the past). The amount of protection afforded seems to be greater than that afforded by humanised lymph. Glycerinated lymph is recognised as the safest lymph for vaccination, and by the Vaccination Acts Amendment Act, 1898, it is enacted that if a child has not been vaccinated when 4 months and 1 week old, the public vaccinator of the district shall visit the home of the child, and shall offer to vaccinate the child with glycerinated calf lymph free of charge.

The Vaccination Order, 1929 (framed on the Report of the Rolleston Committee—*vide infra*) instructs public vaccinators to make single insertions of lymph instead of the previous 4 insertions, multiple insertions being available to those desiring them. Re-vaccination is to be encouraged at the ages of 5 to 7 and 14 to 16. In a covering letter, the importance of primary vaccination in infancy is emphasised, and as "post-vaccinal nervous disease" occurs mainly in children of school age or adolescents who have never been vaccinated, it is not considered wise to press for vaccination of such persons (unless directly exposed to infection) while the small-pox prevalent in this country retains its mild character. The new Order came into force on Oct. 1, 1929.

Chloroform water has been recommended to replace glycerin to kill off extraneous bacteria; more rapid effect. Urgent demands for vaccine, as in an epidemic, could be met by this method with a supply of vaccine in 14 days, instead of the month or 6 weeks necessary for glycerination.

Calf vaccine, diluted 10 to 50-fold with N/50 phosphate solution (pH 7.6) or with saline or sterile water, reduces risk of post-vaccinal encephalitis, and gives more satisfactory "takes."—S. P. Bedson, *Lancet*, ii/1929, 920.

Post-vaccinal encephalitis. On very rare occasions (8 cases were reported in this country in 1938) vaccination gives rise to a form of acute nervous disease which is frequently fatal. In the great majority of cases the condition arises following primary vaccination in adolescents or young adults, hence the Ministry of Health warning that primary vaccination at school age and in adolescents, except in special circumstances, is to be deprecated.

The exact nature of the agent responsible for the condition is undetermined. The special Committee set up by the Ministry of Health to consider the subject concluded that although no particular lymph can be incriminated, it is the vaccinia virus which initiates the nervous disturbance (see *Brit. med. J.*, i/1931, 64). On the other hand, the League of Nations Commission concluded that the virus of vaccinia itself is not responsible, but rather some unknown factor—a filter-passing or latent virus (see *Ser. L.o.N.P.*, 1928, iii, 12).

The incidence of post-vaccinal encephalitis is tending to fall in all the countries previously most affected, except Holland. Only 17,000 vaccinations were performed in Holland in 1935, the proportion of encephalitis cases being 1 per 1000 vaccinations.—per *Med. Annu.*, 1937, 541.

In none of 110 cases which had survived attacks of post-vaccinal encephalitis from two to six years earlier was there any serious impairment of health, and in particular there was noted the complete absence of the dreaded sequelæ of encephalitis lethargica, such as idiocy and epilepsy.—M. Kaiser and J. Zappert, *Munch. med. Wschr.*, 1937, 801.

For earlier references to post-vaccinal encephalitis see Vol. I 21st Edn.

Chick Embryo Vaccine Lymph. Experiments to provide a bacteria-free vaccine lymph led to the production by W. D. H. Stevenson and G. G. Butler of the Government Lymph Establishment of a lymph obtained by cultivation of the vaccinia virus on the chorio-allantoic membranes of chick embryos. Numerous clinical experiments have been made with this lymph, but it is too early yet to say whether there is any likelihood of it replacing calf lymph.

Dermal strain of vaccinia virus grown on the chorio-allantoic membrane of chick embryos. A possible large scale production of a bacteria-free virus. Experiments indicate that such a vaccine may be produced at little expense, absolutely free from contaminating micro-organisms and apparently producing on the rabbit lesions comparable to those produced by calf vaccine and, so far as observed, non-hæmorrhagic. The virus retains its potency at least two months in glycerin if kept below 0°C. Chicks usually hatch out from the inoculated eggs at maturity and healthy chicks result. Further effects on animals, especially monkeys, must be carefully watched.—W. D. H. Stevenson and G. G. Butler, *Lancet*, ii/1933, 228.

Satisfactory vaccination with chick embryo lymph, both with lymph of a sixth passage and of a 75th passage, in 7 persons. Appearances of vaccinia typical, and the reaction, if anything, milder than that produced by calf lymph. Way now cleared for trials on a wider scale. 38 eggs opened on the fourth day of their incubation after inoculation with vaccinia yielded sufficient lymph to vaccinate 7000 persons.—E. W. Goodpasture and G. J. Buddingh, *Science*, Nov. 24, 1933.

Whooping Cough

Vaccinum Pertussis (B.P.C.). *Syn.* PERTUSSIS VACCINE, WHOOPING COUGH VACCINE, BORDET-GENGOU BACILLUS VACCINE.

A simple sterile suspension of freshly isolated cultures of smooth phase I organisms of *Hæmophilus pertussis*, grown on Bordet-Gengou medium containing potato extract, glycerin and human blood. For details of *H. pertussis*, see Vol. II.

Is of service for active immunisation in non-epidemic times, for preventing the development of the disease in contacts, and for the treatment of symptoms; it reduces the violence and frequency of the paroxysms and shortens the duration of the attack.

Since the *Hæmophilus influenzae* (Pfeiffer) and the pneumococcus are frequently secondary invaders in whooping cough, the incorporation of these two organisms in vaccines used for treatment is likely to be beneficial. For prophylaxis, either a vaccine prepared from Bordet's bacillus (*H. pertussis*) alone, or a mixed vaccine containing the pneumococcus and Pfeiffer's bacillus also may be used. The simple Bordet's bacillus vaccine does not cause much reaction even in young infants, but care is necessary to avoid giving too large doses of pneumococcus and Pfeiffer's bacillus if the mixed vaccine is used.

A review of the literature during recent years shows conflicting views on the subject of dosage. For a number of years Sauer in America advocated a total of 80,000 million organisms, and Silverthorne in Canada has given a total of 120,000 million organisms. Smaller doses have been used in Great Britain, and the following recommendations are based on the experience of Maclean at St. Mary's Hospital, London.

Dose.—For prophylaxis, in non-epidemic periods, children may be given three doses each of 4000 million at intervals of 3 to 7 days, and a fourth dose of 4000 million not less than four weeks after the third dose.

In the case of contacts, as the maximum incubation period is fourteen days, the interval between the doses should be shortened so as to allow the development of as much immunity as possible within the incubation period; three doses of 4000 million each should be given at intervals of 2 to 3 days.

For treatment, children over 6 years of age should be given doses at intervals of 24 to 48 hours, commencing with 800 million and increasing by 400 million up to 4000 million. Children under 6 years should have half these doses. With these doses may be included appropriate amounts of *H. influenzae* (Pfeiffer) and pneumococcus.

The nature of the culture medium used for the preparation of the vaccine is of great importance in regard to antigenic capacity. Freshly isolated strains should be grown on media containing fresh human blood in order to retain the pathogenic phase I (see Vol. II).

There is no danger in vaccines for whooping cough, and after a reasonable initial dose enormous doses can be given with safety. To get results it is necessary to give at least 5 times the ordinary amount:—At 1 year a suggested second dose is 400 millions of ordinary, or 8000 millions of detoxicated vaccine, with maximum quantities of 1000 and 25,000 millions respectively. No case treated without definite benefit since using these large amounts.—R. W. Cockshut, *Brit. med. J.*, ii/1933, 819.

Controlled experiments with vaccine in the treatment of 60 children showed that the injection in the paroxysmal stage of large doses of a pertussis vaccine prepared in accordance with modern methods and beliefs neither curtails the duration of the disease nor ameliorates the symptoms.—N. D. Begg, *Lancet*, i/1936, 83.

The incubation period is probably 3 to 7 days, which is shorter than formerly supposed. By the cough-plate method it is possible with some degree of certainty to pronounce a patient free from infection after 3 weeks of illness. Freshly isolated organisms grown on human blood are necessary for the preparation of vaccines, and prophylactic vaccination with these organisms in doses from 30 to 80 billion at an early age is recommended. There is no evidence to show that vaccines are of any value in treatment, except possibly in the earliest stages. Convalescent human serum in doses varying from 20 to 40 ml., stated to be of value if given in the early catarrhal stage, and 10 ml. is probably an efficient prophylactic dose for contacts either before possible infection or in the incubation phase.—R. E. Smith, per *Quart. J. Med.*, 1936, 321.

Of 747 patients given a total of 120,000 million organisms, 91 exposures occurred, only one of whom contracted the disease. In 161 controls there were 27 exposures, 23 (85%) of whom contracted the disease.—Silverthorne and Fraser, *Canad. med. Ass. J.*, 1938, 556.

The consensus of opinion in this country is unfavourable to the use of vaccines in the treatment of whooping cough. When given in the paroxysmal stage they may even cause an increase in the frequency and severity of the spasms. Nevertheless, the use of small frequently repeated doses in the early stages should not be discouraged.—R. Cruickshank, *Lancet*, ii/1938, 33.

Investigation of a prophylactic vaccine containing 10,000 million smooth phase *H. pertussis* per ml. on 5815 children between the ages of 8 months to 4 years, the investigation extending over a consecutive period of 44 months. The vaccine was given subcutaneously in doses of 1 ml., 1.5 ml., and 3 ml. at weekly intervals. The final analysis was based on a test group of 1815 vaccinated children and 2397 controls. There were 15.1 per 100 annual pertussis attacks in the control group, compared with 2.3 per 100 in the vaccinated group, and there was a marked difference in the severity of the attacks in favour of the vaccinated group. After all known exposures the attack rate was 12.8 and 65.8% for the test and control groups respectively. By imposing the monthly incidence of pertussis (calculated on the experience of the experiment) on an imaginary section of the general population of 1000 injected children and a similar number of controls, at the end of 44 months 94.4% of the injected children would have escaped pertussis against 61% of the controls.—P. Kendrick and G. Elderling, *Amer. J. Hyg.*, 1939, 133.

211 infants vaccinated with vaccine prepared from unwashed phase I organisms; total dose 80,000 million. During 34 months there were 29 exposures with 9 cases of whooping cough. Among 182 controls in the same period there were 32 exposures and 29 cases of whooping cough.—Miller and Faber, *J. Amer. med. Ass.*, i/1939, 1145.

In a test group, 513 children received a total of 16,000 million organisms each; 46 of these were known to be subsequently exposed to whooping cough and 45 others were suspected exposures but no cases of whooping cough occurred. In a control group of 154 exposures 89 cases occurred.—I. H. Maclean, *Proc. R. Soc. Med.*, 1940, 33, 425.

Formalinised vaccine given intracutaneously or subcutaneously in total dosage of 30 billion organisms effective in prophylaxis.—Blatt, Levine and Shapiro, *J. Pediat.*, 1938, 12, 619.

Sauer's Vaccine. Prepared from hæmolytic strains of the Bordet-Gengou acillus, the culture medium containing 10% of defibrinated human blood. It contains 10,000 million bacilli per ml. *Dose.*—Children under 3, 8 ml. in divided doses, 1 ml., 1.5 ml., and 1.5 ml. under the skin of each arm, at weekly intervals. Children over 3, 1 ml., 2 ml., and 2 ml. respectively.—L. W. Sauer, 2nd Congress for Microbiology, London, 1936.

Oral Whooping Cough Vaccine (*Research Products, London*) contains per ml. *H. pertussis* 500 millions, *H. influenzae* (Pfeiffer) 250 millions, pneumococci 200 millions, *A. bronchitica* 50 millions. *Dose*.—For prevention: Age 10 to 16 years, 1 fl. oz. weekly; 7 to 10, 5 teaspoonfuls weekly; 2 to 7, 3 teaspoonfuls weekly; under 2, one teaspoonful weekly. For treatment, half the above dosage twice weekly. It should be administered upon an empty stomach, diluted with water.

Pertussis Antigen (Detoxified) (*Lederle Laboratories, New York; Thackray, Leeds*). A formalinised filtrate of the toxic principle derived from smooth phase I strains of *H. pertussis*; it is free from bacterial cells and contains a minimum of autolytic products. *Dose*.—*Curative*: 1.5 to 2 ml. subcutaneously every other day for 3 to 5 injections; *Prophylactic*: 3 subcutaneous injections of 2 ml. at weekly intervals; *Immunisation of direct contacts*: 3 subcutaneous injections of 1.5 to 2 ml. every 2 or 3 days.

Pertussis U.B.A. (*Lilly, London*). The undenatured bacterial antigen (see p. 1025) of *H. pertussis*. *Dose*.—*Curative*: 0.25 ml. subcutaneously, increasing by daily injections up to 1 to 1.5 ml. for 10 to 15 doses. *Prophylactic*: 1 ml. subcutaneously, followed every other day by 1.5 ml. until 6 doses have been injected.

Recently isolated strains of *H. pertussis* are grown on Bordet's medium enriched with human blood. The bacteria are washed in buffered isotonic solution and disrupted in a ball-mill. The suspension is filtered through acetic-collodion membranes and the antigen obtained as a water-clear filtrate.—J. W. Frawley, *J. Amer. med. Ass.*, ii/1934, 960.

A controlled study indicated that undenatured bacterial antigen conferred negligible immunity. A vaccine similar to Sauer's vaccine gave 83.4% protection of exposed children.—C. H. Singer-Brooks, *J. Pediat.*, 1939, 14, 25.

Petein (*Schering, London*). Detoxicated pertussis vaccine produced from 60 different strains of Bordet-Gengou organisms. Bottles of 2.5 ml. contain 50,000 million organisms. For the prophylaxis and treatment of whooping cough. Treatment consists of three injections over a week in consecutive doses of 0.5, 1.0 and 1.0 ml.

Topagene (*Sharp & Dohme, London*). A sterile solution of soluble antigenic substances from phase I culture of *H. pertussis* for the intranasal treatment of whooping cough. Each ml. represents the antigenic substances from 20,000 million organisms, a mercurial preservative in a dilution of 1 in 20,000 being added. 0.25 ml. is applied to the middle and superior turbinate area of each nostril once daily, or on alternate days for at least 2 weeks. Improvement should follow 4 to 5 applications, especially in early cases. Used prophylactically, the preparation will abort or markedly modify an attack.

Convalescent Serum from whooping-cough cases has been used with benefit in prophylaxis, but with doubtful benefit in treatment of pertussis. With Sauer's vaccine, immunity is completed in 4 months and lasts for years.—D. Paterson, R. H. Bailey, R. G. Waller, *Lancet*, ii/1935, 361.

BLOOD TRANSFUSION

The recognition of blood groups, and the introduction of the indirect method of transfusion of citrated blood, by means of which clotting is avoided, has changed blood transfusion from a difficult and hazardous procedure, to be undertaken only in rare emergencies, to a safe and comparatively simple measure which is rapidly finding increasing use in a wide variety of conditions.

Thus, blood transfusion is currently employed following any type of severe hæmorrhage, such as post-partum hæmorrhage, traumatic hæmorrhage due to injury or war wounds, hæmatemesis, etc., in hæmorrhagic diseases, in severe shock, in subacute and chronic infections, and in pernicious anæmia and certain forms of secondary anæmia.

In the selection of a donor, an adult individual of either sex is suitable. The donor should be reasonably healthy and free from any disease transmissible by blood (syphilis and malaria in particular), and if possible allergic individuals should be excluded.

Since the bloods of different individuals, even of the same family, are not always compatible with each other, two such incompatibles cannot act as donor and recipient respectively, owing to the fact that incompatible bloods are liable to agglutinate or clump and to hæmolyse each other, causing serious reactions and even collapse. According to Moss (and Jansky) there are four distinct classes or groups of bloods. This means that the blood of a person in a particular group can safely be mixed with that of another person belonging to the same group, but not necessarily with the blood of a person belonging to one of the other groups.

Three systems of classification of the four groups have been suggested. The Moss classification is the one which has been most employed in this country, while the Jansky classification has been most used on the Continent, but in place of both of these the League of Nations Committee on Standardisation recommends the International Classification, which identifies the agglutinogens in the red blood cells, and is based on Landsteiner's Law of Iso-agglutinins.

According to Landsteiner, there are present in human blood corpuscles two agglutinable substances, A and B, which react with specific agglutinins (a) and (b) in serum. If any blood contains an agglutinable substance, it will contain the agglutinin which reacts with the alternative agglutinable substance. Thus, blood which contains the A substance will contain (b) agglutinin, and *vice versa*. The law is "In any blood there are always present agglutinins against the agglutinable substances absent from the same blood."

The relationship between these three systems is shown in the following table:

Moss	International	Jansky
I	AB	IV
II	A	II
III	B	III
IV	O	I

With samples of serum from the Groups A and B it is possible to test the blood of any donor before transfusion. The blood of Group AB does not cause agglutination of the cells of either of the other groups. Hence, these individuals are "universal recipients," because they can receive blood from each of the other three groups; they cannot, however, give blood to any but their own group. Since the corpuscles of Group O are not agglutinated by the serum of any other group, the members are "universal donors."

Wherever possible the donor should belong to the same group as the recipient, but where this cannot be arranged a donor of another compatible group may be used according to the following table:

Group	may receive from	may give to
AB	AB A B O	AB
A	A O	AB A
B	B O	AB B
O	O	AB A B O

Technique of Blood Grouping. Wherever the facilities are available, blood grouping should always be carried out by an expert. Standard test sera of Groups A (II) and B (III) are required, and these must be absolutely fresh (blood-grouping sera are now available commercially). The method of performing the test is to place a drop of each serum at either end of a glass slide, and to add to each a drop of normal saline and a drop of the blood to be tested (taken from the finger or ear). The mixtures are then stirred with a match-stick on the end of a glass slide, and the result observed. Agglutination is visible to the naked eye and appears as a deposit, the particles of which may get larger until in some cases a few crimson dots float in clear serum; for certainty, however, the reactions should be examined under the 2/3 objective.

Result observed	Group to which blood belongs
Agglutination with both sera	AB
No agglutination with either serum	O
Agglutination with Group B serum only ..	A
Agglutination with Group A serum only ..	B

Where it is not possible for the grouping to be done by an expert, or on occasions of great urgency when no known sera are available, a suitable donor may be selected by the *direct test*. A sample of serum is obtained from the recipient, by withdrawing 2 ml. of blood from a vein and allowing the serum to separate, and a sample of the corpuscles of each of the prospective donors is obtained by allowing two drops of blood from the finger or ear to fall into a small test-tube containing 2 ml. of normal saline, and mixing thoroughly. A drop of the recipient's serum is then placed on a clean glass slide or porcelain tile, and a drop of the cell suspension from the prospective donor is added to it, mixed with a match-stick, and gently rocked to and fro. If the prospective donor's cells are not agglutinated within 15 to 30 minutes, the donor may be regarded as suitable for the transfusion. To further ensure complete compatibility a drop of the recipient's blood may be mixed with a drop of the donor's serum and saline, and the result observed.

Collection of Blood from Donor. Both to the operator and the donor, the indirect use of citrated blood has definite advantages over the direct arm-to-arm technique with whole blood, and it is now the method almost universally employed.

For the collection of the blood the selected donor lies on a couch, with his arm extended away from the side and supported on a firm pad or pillow. A vein is selected at the elbow, the skin cleansed with spirit, and the sphygmomanometer adjusted to the arm, sufficient pressure being raised to cause the vein to stand out prominently. 1 or 2 m. of a 2% solution of procaine hydrochloride is then given over the site of the intended puncture, the injection being made with a fine needle, and a tiny nick is then made into the skin. To draw off the blood a French's needle is employed, to which is attached about 12 inches of wide-bore rubber tubing. The needle is inserted into the lumen of the distended vein through the small nick in the skin; before the needle is inserted both needle and rubber tubing should be washed through with citrate solution. The blood is received into a sterile graduated flask containing 3.8% sodium citrate solution (about 10 ml. for every 90 ml. of blood to be transfused), and the flask must be maintained at body heat by standing it in a basin of warm water. The blood is thoroughly mixed with the sodium citrate solution by continually rotating the flask or by stirring with a sterile glass rod. A steady flow of blood is maintained by adjustment of the sphygmomanometer and by the donor opening and closing his hand at regular intervals. As a rule about 500 ml. of blood is collected from one donor. The blood should be given to the recipient as soon as possible after collection, and it should be kept warm in the meantime, though care should be taken to see that it is not overheated.

The withdrawal of 500 ml. of blood seldom causes the donor any unpleasant feelings or reactions, but it is advisable that he

should lie down for half an hour after the collection and should be given some light refreshment before leaving.

Transfusion into the patient. The blood may be given to the patient either by means of (a) a single transfusion, or (b) by continuous drip transfusion. The former method is preferable where urgency is desired, or where hospital facilities are not available; the latter is essentially a hospital procedure, and has proved especially valuable in the treatment of anæmias.

(a) *Single transfusion.* When a vein is readily accessible the transfusion can be made by inserting the needle directly into it, the infusion apparatus being connected to the needle by an adaptor. But when, as often happens, the veins are collapsed or difficult to find, a suitable vein must be exposed and the needle inserted directly into it, employing a similar procedure as outlined above for collection of blood from donor, or the vessel is cut across, ligatured with catgut, and a cannula inserted; in this case care must be taken not to divide the vein completely—about half the circumference of the vein is adequate.

Various types of apparatus are employed for the infusion, that used for the funnel-gravitation method being the simplest and most inexpensive. This apparatus consists of a graduated glass funnel of some 300 ml. capacity, to which is attached about 2 feet of stout rubber tubing, into the end of which is inserted a metal nozzle to fit the needle. The cylinder and rubber tubing are first washed through with sodium citrate solution, and the funnel is then filled with blood, which is first filtered through layers of sterile gauze placed over the mouth of the funnel. The blood is allowed to flow slowly into the patient by gravity, the funnel being constantly replenished with blood, until the required amount has been given; the operator must keep the needle steady with his hand throughout the transfusion. The blood should not be transfused into the patient too rapidly; a single transfusion of from 500 to 600 ml. should take from 30 to 40 minutes. Care must be taken to see that the blood is kept warm. A small quantity of normal saline should precede and follow the transfusion.

(b) *Continuous drip transfusion.* This method is valuable for giving large amounts of blood over a continuous period, and is especially applicable in severe gastric or duodenal hæmorrhage, also in pre-operative cases in which there is severe anæmia. A satisfactory rate of flow is 40 drops per minute, *i.e.*, a pint in 4 hours, and the total amount required is governed by the hæmoglobin figure; it is estimated that 750 ml. of blood will raise the hæmoglobin in an average adult about 15%. As with the single transfusion, the blood must be kept warm, and provision must be made to avoid the cells settling in the reservoir, either by shaking or stirring the contents, or by passing a continuous stream of oxygen through the blood.

(For a description of other methods of blood transfusion,

including the Jubé Syringe method and the Keyne's Flask method, see paper by H. F. Brewer, *Brit. med. J.*, i/1938, 241.)

The average in 87 cases treated by continuous drip transfusion was 5 pints and 29 hours, the largest figures being 11 pints and 62 hours. A pint is woefully inadequate for an anæmic patient, especially if he is bleeding. The principle should be made one of quantitative measurement and the restoration of a normal hæmoglobin percentage. Hæmoglobin estimations should check the infusion. The best rate is to try to increase the patient's hæmoglobin by 10% every 4 hours, i.e., in the non-bleeding patient, a pint in 4 hours, or 40 drops a minute. In bleeding patients, the rate must be governed by hæmoglobin estimations. If the patient is weak there should be three stages at intervals of a few days. The method has proved extraordinarily effective. In peptic ulcer the blood can be run in as it is lost; 18 out of 22 serious cases had lived, and at least half of them could not have lived without the massive transfusion.—H. L. Marriott and A. Kekwick, *Lancet*, i/1936, 86; see also *Lancet*, i/1935, 977, and ii/1935, 78, for description of apparatus.

The following is a summary of the principles regarding the rate of transfusion in anæmia uncomplicated by acute hæmorrhage: (1) The rate should never exceed 1 ml. per lb. bodyweight per hour; (2) In subjects suffering from very severe anæmia, cachexia, or cardiac or respiratory disease the rate should not exceed 0.5 ml. per lb. bodyweight per hour; (3) The rate of flow should be maintained steadily and not accelerated even for short periods; (4) Careful watch should be kept for manifestations of cardiac failure (dyspnoea, cough, basal rales) and transfusion suspended if they appear. The custom of "giving a transfusion," meaning about a pint of blood in about half an hour, is irrational and unsatisfactory.—H. L. Marriott and A. Kekwick, *Brit. med. J.*, i/1940, 1043.

Blood transfusion for the practitioner—a simple domiciliary method.—G. R. Bashford, *Brit. med. J.*, i/1940, 901.

Reactions. Reactions resulting from blood transfusion may be due either to the too rapid administration of blood, to incompatibility of the blood, or to the presence of pyrogens or other bacterial by-products in contaminated blood.

Transfusions should always be made slowly; a too rapid administration may give rise to cardiac embarrassment, especially in debilitated patients.

Disturbances in which the patient becomes agitated, shivers and sweats, complains of severe lumbar pain, or shows signs of circulatory collapse, are due to faulty grouping; a further complication arising from this is hæmoglobinuria, due to hæmolysis of the transfused blood, and unless steps are taken at once to supply alkalis freely by the mouth, death may result from uræmia.

At the first signs of collapse, transfusion must be discontinued, and the patient given 5 minims of 1 in 1000 adrenaline solution.

Reaction following blood transfusion may be avoided by the use of a buffered citrate solution prepared as follows. *Stock solution.* Dissolve 0.6 g. KH_2PO_4 , 0.9 g. CaCl_2 , and 3.0 g. glucose in 100 ml. of distilled water. This keeps many months. *Buffered solution.* Take 30 ml. of physiological saline and 30 ml. of distilled water into a clean flask and add 2.0 g. of sodium citrate. Add 2 ml. of stock solution. Boil for 10 minutes. As the solution cools add a few drops of phenol red solution. The reaction will be alkaline. Filter while hot into another flask. When cool, 2 or 3 drops of normal HCl will give the copper colour of pH 7.3. Cover with a suitable rubber cap. This solution keeps indefinitely. For use take one volume of the solution for nine volumes of blood.—Temple Grey, *Lancet*, ii/1937, 1431.

Complete bacteriostasis of the usual bacterial contaminants in stored blood is made possible by the addition of 20 mg. per 100 ml. of sulphanilamide. Such blood will not only not support bacterial growth for 10 to 15 days, but may actually become sterile in that time.—M. Novak, *J. Amer. med. Ass.*, ii/1939, 2227.

Stored blood in transfusion. The increasing use of blood transfusion in current therapeutic practice and, more recently, the need for large and rapidly available supplies of blood for war emergencies, led to numerous laboratory and clinical investigations as to the value of stored blood for transfusion purposes. It has now been definitely established that blood may be satisfactorily preserved for periods up to 3 weeks by storing in an ice-box at 4°C. The blood is collected from donors in the usual way into pint bottles, each bottle being labelled with the donor's name, group, and date of bleeding, and the results of a sterility test and Wassermann reaction. Various types of anticoagulant diluent have been suggested, including both 2.5% and 3.8% sodium citrate solution, and what is known as I.H.T. solution, consisting of sodium chloride 7 g., sodium citrate 5 g., potassium chloride 0.2 g., magnesium sulphate 0.04 g., and distilled water to 1000 ml., and mixed volume for volume with the blood. The solution now advocated for use by the M.R.C. (see M.R.C. War Memo. No. 1, H.M.S.O., 1941) consists of 100 ml. of 3% sodium citrate in distilled water to which is added 20 ml. of 15% glucose in distilled water. The citrate and glucose must be of a high grade of purity and the distilled water filtered and autoclaved immediately after distillation. As glucose tends to caramelize during autoclaving in the presence of citrate the citrate and glucose solutions must be sterilised separately and mixed after sterilisation. 120 ml. of this anticoagulant solution is used for 420 ml. of blood.

Although stored blood may be used up to three weeks from the time of collection, the best results are obtained with blood not more than eight or ten days old. Stored blood should not be used for cases of traumatic shock uncomplicated by hæmorrhage.

During storage a certain amount of sedimentation occurs, and before use the flask is gently agitated to mix the cells again with the plasma.

It is essential that cross-matching should be done at the time of the transfusion, and when more than one lot of blood is given in one transfusion, each lot must be regrouped besides being cross-matched.

"Blood banks" have been established by numerous municipal and health authorities in various parts of the country for the storage and distribution of blood, and the Medical Research Council, on behalf of the Ministry of Health, has set up its own Emergency Blood Transfusion Depots in London and other large towns.

The following significant points should be stressed if optimum results in the use of stored blood are to be obtained: (1) The anticoagulant solution should be prepared from freshly distilled water from a clean still and should be filtered and autoclaved immediately. (2) All apparatus must be scrupulously clean. In the case of the rubber tubing a stiff wire, carrying a swab or narrow elongated brush, should be passed throughout its length, and new tubing must be washed to remove the French chalk with which its inside is coated. (3) Strict surgical asepsis should

be observed when collecting the blood. (4) Storage should be carried out at 2° to 4°C. (5) Blood showing undue hæmolysis should not be used. A zone of discoloration due to hæmolysis extending above the corpuscle layer up into the supernatant citrated plasma for $\frac{1}{2}$ to 1 cm. or less may be allowed, but greater degrees, including complete tingeing of the plasma, should be a definite contra-indication to use. (6) Corpuscles and plasma may be mixed before the transfusion by as little and as gentle agitation as possible. (7) The blood should be warmed to body temperature before use; the avoidance of overheating is equally important. The highest temperature advised is 104°F.—H. F. Brewer, M. Maizels, J. O. Oliver and Janet Vaughan (M.O.'s in charge of Emergency Blood Transfusion Depots, set up by the M.R.C. on behalf of the Ministry of Health), *Brit. med. J.*, ii/1939, 1052.

For the treatment of anæmias, blood dyscrasias and infections, blood should not be used if it has been preserved for more than two or three days.—J. A. Kolmer, *Amer. J. med. Sci.*, April 1939.

Though stored blood is suitable for the treatment of acute hæmorrhage and shock, it is not advisable for use in cases of anæmia; fresh blood is preferred.—L. E. H. Whitby, *Practitioner*, ii/1939, 391.

As a result of 1458 transfusions of blood stored from one to 38 days it was found that no types of reaction were encountered distinctive of preserved blood, and the incidence of reactions did not increase or decrease with the period of storage of the blood mixtures. A limit of 10 days of storage at 3 to 5°C. was found to be safe for citrated blood, and blood stored in a dextrose-citrate mixture was found safe for transfusion after 30 days' storage.—E. L. DeGowin and R. C. Hardin, *Brit. med. J.*, ii/1940, 1.

From the standpoint of clinical results, stored blood is as good as fresh blood in acute hæmorrhage, and the available data present no evidence that it is of less value in non-acute hæmorrhage. On the average the gain in hæmoglobin is greater with fresh than with stored blood. Mild reactions occurred more commonly with stored than with fresh blood. There is an advantage in warming the blood to 37° before administration.—H. F. Brewer, M. Maizels, J. O. Oliver and J. Vaughan, *Brit. med. J.*, ii/1940, 48.

An account of the organisation of the Merseyside War Blood Bank. The blood taken is preserved in 3·8% sodium citrate, one pint to nine pints of blood. The unit adopted is one of 450 ml. (405 ml. of blood and 45 ml. of anticoagulant solution). 1364 transfusions with preserved blood have been given and the response to the administration of preserved blood in acute hæmorrhage and in chronic secondary anæmia is clinically satisfactory, and in these groups the ready availability of stored blood in bulk marks a true advance over the individual donor system. For certain other diseases of the hæmopoietic system, however, and for anæmia associated with sepsis, the administration of fresh blood is to be preferred. The incidence of all types of reaction is probably no greater with stored than with fresh blood, but it increases with the age of the blood, and it is recommended that stored blood should be administered if possible before it is ten days old.—F. R. Edwards and T. B. Davie, *Brit. med. J.*, ii/1940, 73.

Changes in stored blood. In blood stored in I.H.T. solution there is not only a decrease in the actual number of, but also degenerative changes in the remaining red blood cells. These changes may be seen two days after withdrawal and increase slowly during storage. All the white cells of the blood rapidly decrease in number, and at the end of a week the remaining nucleated cells are small lymphocytes. The fragility of the stored corpuscles to hypotonic saline begins to increase from the 8th to 9th day, while the sedimentation rate of the cells gradually diminishes, till by the 21st day of storage there is often no sedimentation. The appearance of stored blood, and particularly of the supernatant fluid, is not a true index of its transfusion value.—A. Macdonald and G. M. Stephen, *Lancet*, ii/1939, 1169.

Many of the solutions added to blood for the prevention of coagulation are hypertonic when compared with fresh erythrocytes. The mixture resulting from the addition is also hypertonic. The following solution is isotonic with fresh erythrocytes: sodium chloride 0·43%, sodium citrate 1·05%, and on experimental grounds should be preferred to other citrate solutions. The addition of dextrin to citrate-saline-blood mixtures enables storage to be continued for at least seven weeks, at the end of which time hæmolysis is less than half that observed in a simple citrate-saline-blood control.—M. Maizels and N. Whittaker, *Lancet*, ii/1939, 1219.

When fresh blood is mixed with a solution of 1.05% sodium citrate and 0.85% sodium chloride there is an initial decrease in volume, because the anticoagulant is hypertonic. Thereafter the cells lose their impermeability to salts, swell, and finally undergo hæmolysis. These changes may be checked and the blood preserved by the addition of dextrin.—M. Maizels and N. Whittaker, *Lancet*, i/1940, 113.

A suitable anticoagulant diluent for blood is sodium chloride 0.43%, sodium citrate 1.05%. It is, however, probably desirable to add glucose or dextrin in a final concentration of 1.0 and 3% respectively to improve preservation. If this is done the system becomes slightly more acid, and to counteract cell swelling due to acidity it may be desirable to increase the content of sodium chloride in the solution to 0.5%.—M. Maizels and N. Whittaker, *Lancet*, i/1940, 590.

Stored blood survives considerable periods after transfusion. Red cells stored for less than a week show about 70% of survival 14 days after transfusion. If storage is between 7 and 14 days, more than half the transfused red cells are still present in the recipient's circulation 14 days after transfusion. During storage normal cells lose potassium and take up a great excess of sodium. Within 24 hours of transfusion the chemistry of stored cells is restored to normal.—M. Maizels and J. H. Patterson, *Lancet*, ii/1940, 417.

A high proportion of the erythrocytes of stored blood survive transfusion. Furthermore, the total time of survival is little less than that of fresh blood.—P. L. Mollison and I. M. Young, *ibid.*, 421.

Plasma and Serum Transfusions.

The use of stored blood for transfusion purposes, though an obvious advance on the use of fresh blood from the point of view of convenience, was found to possess certain disadvantages. Thus, it is limited in usage and source to the two most common groups O and A, from which the "blood banks" are made, and the necessity for correct blood grouping still remains; reactions are more common than with fresh blood, due in part to the increased potassium content and to increased fragility of the cells, especially in blood stored for more than 14 days.

Since the cells are one of the principal sources of reaction, attempts have recently been made to replace the use of whole blood by the use of either plasma or serum. Both possess the advantages that they may be kept indefinitely if stored in a cool dark place (they need not be kept in a refrigerator), and that they may be administered without preliminary grouping of the recipient and regardless of the group from which they have been collected.

Plasma and serum have identical therapeutic effects and are both excellent substitutes for whole blood for emergency purposes. They are particularly valuable in the treatment of shock (traumatic, post-hæmorrhagic or due to extensive burns) and in recent severe hæmorrhage. It should be emphasised, however, that when shock is associated with a degree of hæmorrhage sufficient to lower the hæmoglobin content by 50% or more, their use is contraindicated even as a temporary measure pending whole blood transfusion.

Plasma is the fluid content of whole blood, *i.e.*, whole blood minus the cells; it constitutes about 55% of the total volume, contains several important proteins and salts, and differs from whole blood chiefly in its inability to carry oxygen. It may be obtained either from stored or fresh blood, preferably from the latter, since that obtained from stored blood is almost devoid of bactericidal value and may have a high potassium content. The

chief disadvantage of plasma from the technical standpoint is the difficulty of filtration owing to the filter becoming choked with fibrin, and after storage for about a fortnight fibrin webs are apt to develop, necessitating further filtration before administration. Bottles of plasma which are uniformly turbid before shaking should not be used, since they are probably contaminated with bacteria.

Serum is the clear fluid expressed when blood clots (*i.e.*, plasma minus the substances which produce clotting) and may be obtained either from whole blood or from plasma (in the latter case by precipitating the fibrinogen by the addition of 8% calcium chloride solution and aspirating the serum from the clots formed—see J. W. Clegg and J. H. Dibble, *Lancet*, ii/1940, 294). It is preferably obtained from fresh blood or fresh plasma.

Dried Plasma and Serum. The difficulties encountered in connection with the storage and transport of large volumes of plasma and serum led to the production of these blood substitutes in desiccated form suitable for dissolving at the time of use (see F. R. Edwards *et al.*, *Brit. med. J.*, i/1940, 377, and F. X. Aylward *et al.*, *ibid.*, ii/1940, 583). The process of desiccation is one which needs skilled supervision and special apparatus and it is unsuited for undertaking by small-scale units.

The special advantages of the dried products are their stability, even at room temperature, their small bulk, and their high protein concentration. Their disadvantages are the loss of time entailed in getting them into solution and the difficulty in preserving sterility in solutions under emergency conditions.

For use, 20 g. of the dried product is dissolved in 500 ml. of 5% dextrose in sterile freshly distilled water. This has approximately the same concentration as citrated blood. They are employed similarly to whole blood. Dried plasma or serum after reconstitution should be used without delay and should not be stored away for future use.

A more recent development is the employment of concentrated solutions, *i.e.*, double or four times normal concentration. The drying of plasma and serum is carried out on a large scale at Cambridge, and the dried product is issued in 12 oz. bottles containing the solids from 200 ml. of plasma or serum. These are known as Cambridge "flats" and are marked at different levels, showing the volume of water required to bring the solution up to normal strength, or to twice or four times normal strength. The use of these concentrated solutions is still largely in the experimental stage and since they are highly viscous and often require to be given under pressure, they should be used with discretion pending further clinical investigation.

References to Use of Plasma and Serum.

Clinical reports on the use of stored blood and plasma include occasional unexplained reactions, and some of these may be due to the potassium content of the transfusion fluid, and it is wise, therefore, to use plasma with the minimum

potassium content until more precise information is available. It is recommended that separation of the plasma should be made as soon as possible after withdrawal of the blood, i.e., within two or three days.—B. R. G. Mainwaring *et al.*, *Lancet*, ii/1940, 385.

Under standard experimental conditions the therapeutic actions of various blood substitutes have been compared with whole blood and the conclusion is reached that plasma is the only one which, in the cat, consistently gives results approximating to those of whole blood. The other substitute solutions are placed in the following descending order of value: serum, hæmoglobin-Ringer, gum saline, red cells in crystalloid solution, isotonic saline, isotonic glucose. Filtration is the best method to overcome the danger of plasma infection.—G. A. H. Battle *et al.*, *Lancet*, ii/1940, 507.

GASTRIC ULCER. In patients suffering from severe hæmorrhage from the stomach or duodenum, plasma is not only of no value as a substitute for whole blood in therapy, but has given rise to untoward and dramatic ill-effects.—D. A. K. Black and A. F. Smith, *Brit. med. J.*, i/1941, 189.

HÆMORRHAGE. It is suggested that plasma transfusions should become a routine measure in the treatment of severe hæmorrhage.—H. J. Brennan, *Brit. med. J.*, i/1940, 1047.

SHOCK. In certain conditions transfusion of plasma is theoretically preferable to transfusion of whole blood. The over-concentration of the blood in shock, especially after burns, cannot very well be relieved by adding whole blood, and replacement of the lost fluid by plasma is a more rational method of treatment. If a supply of stored blood is available it is an easy matter to draw off the supernatant plasma. The red cells remaining behind can be resuspended in saline and transfused into anæmic patients who have no need of the plasma fraction.—Lehmann, *J. Amer. med. Ass.*, i/1939, 1406.

The preparation and use of dried blood plasma for transfusion. Its anti-shock property appears to be comparable to that of whole blood and it would seem ideal for use in emergency where no supply of blood is easily available, and in war surgery. 20 g. of dried plasma dissolved in 250 ml. of distilled water, or 500 ml. of 5% glucose in distilled water, is equivalent in plasma protein value to one pint of citrated blood.—F. R. Edwards *et al.*, *Brit. med. J.*, i/1940, 377.

In the treatment of post-hæmorrhagic shock, approximately 40% of the blood removed must be restored to secure recovery. Comparable volumes of serum or plasma produce equally satisfactory results. Experimental findings indicate: (1) that under these conditions the volume of the red cells restored to the animal is more important than their oxygen-carrying capacity; and (2) that serum and plasma, which can be stored for long periods, are effective blood substitutes for the treatment of hæmorrhage. It is important to administer blood or blood substitutes at a rapid rate (50 to 100 ml. per minute) as soon as possible after the hæmorrhage.—J. W. Magladery *et al.*, *Brit. med. J.*, ii/1940, 249.

The Treatment of Wound Shock:—Description of the Army Blood Transfusion Outfits and Instructions: Methods of Continuous Drip Blood Transfusion and Intravenous Infusion: The Reconstitution and Administration of Dried Serum or Plasma.—Committee on Traumatic Shock and on Blood Transfusion. *M.R.C. War Memo. No. 1, H.M.S.O.*, 1941.

POISONS

For the purpose of the *Pharmacy and Poisons Act, 1933*, and of the *Poisons Rules, 1935 to 1940*, a poison is any substance described in the *Poisons List*. The List is divided into two parts. Poisons included in the first part may be sold or supplied to the general public only by pharmacists; those in the second part by pharmacists and by persons whose names have been entered in a list by their local authority as defined by the Act. In either case the sale or supply may take place only from recognised premises and subject to the fulfilment of the conditions laid down in the Act and Rules.

Appended to the Poisons Rules are thirteen Schedules. Those of most general interest are *Schedules 1 and 4*. The former describes those poisons in respect to the sale, supply and storage of which more stringent conditions must be satisfied than are required for the other poisons in the Poisons List. The latter describes those poisons which may be sold to the public only upon the prescription of a doctor, dentist or veterinary surgeon. In *Schedule 3* are described articles which are exempted from the provisions of the Act and Rules. *Schedule 5* indicates the only form in which certain poisons named in Part II of the Poisons List may be sold by persons whose names have been entered in the local authority's list. *Schedule 7* describes those poisons the sale or supply of which, not being treated as a dispensed medicine (see page 1110), are, in the circumstances mentioned in the schedule, to be labelled with an indication of character other than the word "POISON." *Schedule 8* names those poisons which, except as medicines, may be transported only if certain conditions are fulfilled. The remaining schedules indicate those poisons which are exempted from the normal labelling provisions when sold or supplied in certain circumstances (*Schedule 2*); the manner in which the proportion of certain poisons may be calculated (*Schedule 6*); the form of application to be used by a person desiring his name to be entered in the local authority's list for the purpose of selling poisons in Part II of the Poisons List (*Schedule 9*); the form in which the local authority's list is to be maintained (*Schedule 10*); the form of the certificate for the purchase of a First Schedule poison to be used by a person not known to the seller (*Schedule 11*), the form of entry to be made in the Poisons Book when a First Schedule poison is sold (*Schedule 12*), and the form of authority for the purchase of strychnine for the purpose of killing moles (*Schedule 13*).

The Poisons List is set out in full on pages 1118 to 1119; the Schedules to the Poisons Rules on pages 1120 to 1128.

Throughout these notes no reference is made to poisons which are subject to the Dangerous Drugs Acts and Regulations, and in any transaction in respect of a "dangerous drug" the requirements of the Dangerous Drugs Acts and Regulations must be complied with in addition to the requirements summarised below. The words "doctor," "dentist," "veterinary surgeon," "pharmacist" and "wholesaler" mean, respectively, duly qualified medical practitioner (*i.e.*, registered in Great Britain under the Medical Acts); registered dentist; registered veterinary surgeon; registered chemist and druggist or pharmaceutical chemist; and a person, firm or body corporate who sells an article otherwise than to the general public. Where reference is made to poisons in the First Schedule only, such references do not apply to machine-spread plasters, surgical dressings, articles containing barium carbonate and prepared for the destruction of rats and mice, and corn paints in which the only poison is a

poison included in the Poisons List under the heading of "Cannabis."

General Prohibitions.

(a) In no circumstances may a poison be sold or supplied by means of an *automatic machine*.

(b) *Strychnine*, otherwise than as an ingredient of a medicine, may not be sold or supplied except to (i) persons who require it to sell again; (ii) purchasers outside the United Kingdom to whom it is to be exported; (iii) persons requiring it for dispensing, and, if a doctor or veterinary surgeon, also for administration by himself or under his supervision; (iv) persons concerned with scientific education, research or chemical analysis, and requiring it for that purpose, and (v) persons who require it for the purpose of killing moles, provided they produce a written authority as set out in Schedule 13 (*see p. 1128*) not more than three months old, and signed by the executive officer or secretary of a County War Agricultural Executive Committee in England, or by the chairman or secretary of an Agricultural Executive Committee in Scotland; this authority must specify the amount of strychnine, not greater than four ounces, which the authorised person may buy, and must be retained by the seller.

**HOW TO OBTAIN POISONS FOR USE IN
"BUSINESS OR PROFESSION"**

A person "carrying on a business in which poisons are regularly sold or used in the manufacture of other articles" may purchase poisons from a manufacturer or wholesaler without formality. The seller, nevertheless, is required to satisfy himself that the purchaser of a First Schedule poison requires it for the purpose of his business or profession. Any other person (including organisations, hospitals or nursing homes) requiring poisons for use in his business or profession may purchase them from a wholesaler or a retailer. It will be observed that purchases may be made not only by those persons whose business or profession is directly concerned with medication, but also by others such as analysts, science teachers, research workers, and by persons such as farmers or market gardeners who use the poison in connection with agriculture or horticulture. If the poison is included in the First Schedule to the Poisons Rules, the purchaser must attend at the premises of the seller and sign the Poisons Book and supply the information necessary to enable the seller to make the required entries in that book (*see page 1111*).

Alternatively, the purchaser may order the poison from the seller by post or otherwise, provided that if the poison is included in the First Schedule the order must be in writing, signed by the purchaser, state his name and address, his business or profession, the name and quantity of the article to be purchased, and the purpose for which it is required. It is not necessary to state

business or profession or the purpose for which the poison is required when the purchaser is a hospital, infirmary, dispensary or clinic, or the purpose for which the poison is required when the purchaser is a doctor, dentist or veterinary surgeon.

Before supplying a First Schedule poison stated to be required for the purpose of the purchaser's business or profession, the seller must satisfy himself (a) that the poison is used in the business or profession of the purchaser; (b) that the purchaser is engaged in the business or profession stated, and (c) if the order is in writing, that the signature of the purchaser is genuine.

Emergency.

In an emergency, a person who represents that he urgently requires a First Schedule poison for the purpose of his business or profession may be supplied if the seller is satisfied as to the emergency, and the purchaser at the time undertakes within 24 hours to attend personally and sign the entry of supply in the Poisons Book kept by the supplier or to furnish a written order as above. Failure on the part of the purchaser to fulfil such an undertaking is an offence.

THE SALE OR SUPPLY OF POISONS

A. The doctor, dentist or veterinary surgeon.

Doctors, dentists and veterinary surgeons may not sell or supply poisons except as medicines for patients under their care. If the supply is otherwise than by administration by the doctor, etc., personally, a record must be made in a book showing the date of supply, the ingredients and quantity of the medicine and the name of the patient. No record is necessary of the supply by a doctor (but not a dentist or veterinary surgeon) if the poison is not in the First Schedule, or if the medicine is supplied on a National Health Insurance prescription or on a prescription issued in connection with the health scheme of a local authority. Records where required must be made on the day on which the medicine is supplied or, if that is not reasonably practicable, on the following day. The container in which the medicine is supplied must be impervious to the poison and strong enough to prevent leakage from the ordinary risk of handling. The medicine must be distinctly labelled with the name and address of the practitioner, and if it is a liquid for external application, with the words "For external use only," together with the name of the article, e.g., "The Liniment," "The Lotion," "The Embrocation."

It is appropriate here to mention that a prescription given to his patient by a doctor, etc., for a medicine which is a poison in the Fourth Schedule to the Rules to be dispensed by a pharmacist otherwise than at a hospital must include the following particulars:—

- (i) the name and address of the person to whom the medicine is to be supplied, or, in the case of a prescription of a veterinary surgeon, the name and address of the person to whom the medicine is to be delivered;
- (ii) the date (to be inserted by the prescriber);
- (iii) the total amount of medicine to be supplied and the dose to be taken;
- (iv) the usual signature of the prescriber (not his initials);
- (v) the address of the prescriber (except in the case of National Health Insurance or Local Authority prescriptions);
- (vi) if to be repeated indefinitely or for a limited number of times, bear a statement to that effect;
- (vii) if the prescriber is a dentist, bear the words "For dental treatment only," and if a veterinary surgeon the words "For animal treatment only."

Doctors and others should note that unless the prescription contains the particulars indicated above, the pharmacist is not permitted to supply the medicine. Further, unless otherwise directed on the prescription he may not supply the medicine on more than one occasion. The pharmacist must also retain the prescription when it is no longer valid for further supply.

SPECIMEN FORM OF PRESCRIPTION FOR FOURTH SCHEDULE
POISONS.

1. *Doctor.*

[Address of
prescriber.]*

[Name and address of
patient.]

[Name and quantity of ingre-
dients, including dose and
total amount of finished
product to be supplied.]

[To be repeated X times.]†

[Date (to be inserted
by prescriber).]

[Signature (not initials)
of prescriber.]

2. *Dentist.*

As above, but in addition the words "For dental treatment only" must be written on the prescription.

3. *Veterinary Surgeon.*

As for a doctor's prescription except that "the name and address of the person to whom the medicine is to be delivered" must be inserted in place of "the name and address of patient," and the words "For animal treatment only" must be written on the prescription.

*Address of doctor is not necessary in the case of National Health Insurance and Local Authority prescriptions.

†If not to be repeated, this entry should be omitted. If to be repeated indefinitely the statement should make it clear that such is the intention of the prescriber. If to be repeated on a limited number of occasions, the number should be clearly stated. If desired, the prescriber may state the actual dates upon which the medicine may be repeated; he may also indicate what period of time should elapse before repeating on any occasion.

B. The pharmacist.

Poisons may be sold or supplied to the general public by the pharmacist only from premises registered under Part I of the Pharmacy and Poisons Act, 1933, and only if he or his employer is an "authorised seller of poisons" within the meaning of that Act and the conditions set out below are fulfilled.

I. Dispensing medicines on prescription of doctor, dentist or veterinary surgeon.**(A) Schedule 4 Poisons.**

The prescription must contain the particulars set out on page 1108.

The medicine must not be supplied more than once unless the prescriber has directed otherwise, in which case it may be supplied only in accordance with the directions. For example, if a prescription is marked by the prescriber "To be repeated X times" it may not be repeated more than X times; if "To be repeated" it may be repeated indefinitely.

The pharmacist must

- (i) mark on the prescription, above the signature of the prescriber, the date on which it was dispensed and the name and address of the seller;
- (ii) when the prescription is no longer valid to be dispensed again, retain it for two years;
- (iii) enter in the prescription book on the day the prescription is dispensed, or on the following day, the following particulars:—
 - (a) the date of supply,
 - (b) the name and address of the person to whom the medicine is supplied,
 - (c) the ingredients and quantity of the medicine,
 - (d) the name or initials and, if known, the address of the prescriber,
 - (e) the date on which the prescription was given.

When the medicine is repeated, the entry in the prescription book must show the quantity of medicine supplied and a reference to the original entry.

N.H.L. prescriptions need not be copied, but should be forwarded in the ordinary way for pricing.

Local Authority prescriptions must be copied unless, in addition to the prescription, a carbon copy is supplied to the pharmacist and retained by him;

- (iv) place the medicine in a container which is impervious to the poison and strong enough to prevent leakage from the ordinary risk of handling and transport. It will be noted that there is no obligation upon the pharmacist to put any 'dispensed' medicine in a 'poison' bottle (fluted vertically with ribs or grooves). This does not prevent him doing so, however, if he considers such course desirable.
- (v) label with the name of the seller and the address of the premises on which the medicine is sold, and if the medicine is a liquid for external application, with the words "For external use only" and the name of the article, e.g., Embrocation, Liniment, etc.

(B) Poisons not included in the Fourth Schedule.

The requirements set out under (iii), (iv) and (v) above for Schedule 4 poisons must be fulfilled, except that if the prescription is given by a doctor (but not a dentist or veterinary surgeon), and is not a First Schedule poison, no entry need be made in the prescription book.

II. Dispensing medicine "counter prescribed" by pharmacist or to purchaser's own formula.**(A) Schedule 4 Poisons.**

In no circumstances may Fourth Schedule poisons be sold or supplied to the general public as a "counter prescribed" medicine or to the purchaser's own formula. A prescription from a doctor, dentist or veterinary surgeon is essential (see page 1109).

(B) Poisons not included in the Fourth Schedule.

The pharmacist must

- (i) enter in the prescription book on the day the prescription is dispensed, or on the following day, the following particulars:—

- (a) the date of supply,
- (b) the name of the person to whom the medicine is supplied,
- (c) the ingredients and quantity of the medicine. If the medicine is repeated, it is sufficient when repeating the entry in the prescription book to state the quantity of the medicine supplied and a reference to the original entry;
- (ii) place the medicine in a container which is impervious to the poison and strong enough to prevent leakage from the ordinary risk of handling and transport. It will be noted that there is no obligation upon the pharmacist to put any 'dispensed' medicine in a 'poison' bottle (fitted vertically with ribs or grooves). This does not prevent him doing so, however, if he considers such course desirable.
- (iii) Label with the name of the seller and the address of the premises on which the medicine is sold, and if the poison is a liquid for external application, with the words "For external use only" and the name of the article, e.g., Embrocation, Liniment, etc.

III. Sales "over the counter."

(A) Schedule 4 Poisons.

In no circumstances may Fourth Schedule poisons be sold to the general public "over the counter." A prescription from a doctor, dentist or veterinary surgeon is essential (see page 1109).

(B) Poisons included in the First Schedule but not in the Fourth Schedule.

The pharmacist must

- (i) know the purchaser to be a person to whom the poison may properly be sold, or receive from the purchaser a certificate in the form prescribed in the Eleventh Schedule given by either
 - (a) a householder known to the pharmacist as a responsible person of good character, or
 - (b) a householder, and endorsed by a police officer in charge of a police station.

The certificate must be retained by the pharmacist;

- (ii) enter in the Poisons Book (which must be kept for at least two years after the date of the last entry) the following particulars:—
 - (a) the date of the sale;
 - (b) the name, address and business, trade or occupation of the purchaser;
 - (c) the name and quantity of the poison;
 - (d) the purpose for which the poison is stated to be required;
 - (e) if a certificate is supplied by the purchaser, the name and address of the person giving the certificate and the date on which the certificate was given;
- (iii) require the purchaser to sign the entry. Where the purchaser requires the poison for the purpose of his business or profession (see page 1107), it is not necessary for the purchaser to sign the entry if he supplies an order in writing giving the particulars set out on page 1107, in which case the pharmacist must enter the words "signed order" in the space provided for the purchaser's signature and a reference number to identify the order. This number must also be placed on the order by the pharmacist. The order must be kept for two years. If the poison is sent by post to a person purchasing it for the purpose of his business or profession it must be sent by registered post;
- (iv) label the poison with the particulars set out below. These must appear clearly and be in a conspicuous position on the actual container of the substance and on each covering, if any, of the container except transparent covering, or covering used solely for the purpose of transport or delivery. Where the poison is contained in an ampoule, cachet or similar article, it is not necessary to label the article itself if every covering in which the article is enclosed is duly labelled.
 - (a) the name of the seller and the address of the premises on which the poison is sold;

- (b) the name of the poison. If the term used in the Poisons List describes the poison specifically, the said term may be used. If the poison is a substance described in a monograph in the *B.P.* or *B.P.C.*, or a preparation contained in the *B.P.* or *B.P.C.*, whether concentrated, diluted or mixed with any other substance or not, or a surgical dressing described with standards in the *B.P.C.*, it is sufficient to use the official name, synonym or abbreviated name followed by the letters *B.P.* or *B.P.C.*, as the case may be. In any other case the accepted scientific name or the name descriptive of the true nature or origin of the poison must be used. For preparations containing a poison specified in the first column of the Sixth Schedule, the corresponding name of the poison contained in the second column may be used. In the case of preparations of nuxvomica or opium, it is sufficient to use the names strychnine or morphine or one of the official names or abbreviated names of strychnine or morphine as set out at the head of the monographs in the *B.P.* or *B.P.C.*
- (c) the proportion of poison present if mixed with other ingredients in a preparation. This is not necessary if the poison is a substance, preparation or surgical dressing described in the *B.P.* or *B.P.C.* If the poison is specified in the first column of the Sixth Schedule, the corresponding particulars stated in the second column should be used. If the statement of proportion is given as a percentage it must also state whether the percentage is weight in weight *w/w*, weight in volume *w/v*, or volume in volume *v/v*. For tablets, pills, cachets, capsules, lozenges, and similar articles, or ampoules, the quantity of poison in each and the number of articles may be stated. If the poison is contained in a *B.P.* or *B.P.C.* substance or preparation which is concentrated, diluted or mixed with any other substance, the proportion of the substance or preparation to the total product may be stated;
- (d) the word "Poison," or if the poison is allylisopropylacetylurea (*e.g.*, the proprietary article "Sedormid") or beta-aminoisopropylbenzene (*i.e.*, amphetamine) or phenylethylhydantoin (*e.g.*, the proprietary article "Nirvanol"), and is made up ready for the internal treatment of human ailments, the words "Caution. It is dangerous to take this preparation except under medical supervision." The required word or words must (i) be in red or on a red background, (ii) appear either on a separate label or within a line containing no words other than the particulars with which the substance is required to be labelled by the Act or Rules, and (iii) not be modified in meaning by other words or marks;
- (e) the words "For external use only" and the name of the substance (*e.g.*, The Embrocation, The Liniment, The Lotion, etc.) in the case of liquid medicines for external application. Mouth-washes, eye-drops, eye-lotions, ear-drops, douches and similar preparations are *not* regarded as medicines for external application for the purpose of this provision;
- (f) the words "Not to be taken" in the case of a liquid other than a medicine contained in a bottle of a capacity of 120 fluid ounces or less;
- (g) If the poison is compressed hydrocyanic acid, the container must be labelled with the words "Warning. This container holds poisonous gas, and should only be opened and used by persons having expert knowledge of the precautions to be taken in its use." If the poison is an arsenate, arsenite, copper acetoarsenite, halide of arsenic, organic compound of arsenic, oxide of arsenic, sodium thioarsenate, or sulphide of arsenic, and is intended for use in agriculture or horticulture for the destruction of bacteria, fungi, insects, vermin, or as weed-killer, it must be coloured with a distinctive water-soluble dye. This does not apply to lead arsenate paste or powder, poisons and sheep-dips which are themselves distinctively coloured, or articles to be exported to purchasers outside the United Kingdom.

(v) place the substance in a container which is

- (a) impervious to the poison and strong enough to prevent leakage from the ordinary risk of handling, and
- (b) fluted vertically with ribs or grooves if the substance is a liquid supplied in a glass bottle of a capacity of 120 fluid ounces or less, and is not a medicine made up ready for the internal treatment of human ailments, or a local anaesthetic for injection in the treatment of human or animal ailments. Mouth-washes, eye-drops, eye-lotions, ear-drops, douches and similar articles are regarded as medicines for external use for the purpose of this provision.

(C) *Poisons not included in either the First or Fourth Schedules.*

The pharmacist must

(i) label the poison with

- a) (i) the word "Poison" in the case of non-medicines, or medicines for external use (including mouth-washes, etc., as under (v) (b) above) or medicines for the internal treatment of human ailments not made up ready to be taken, or (ii) the words "Caution. It is dangerous to exceed the stated dose" in the case of medicines (other than those referred to under (iii) below) which are made up ready for the internal treatment of human ailments, or (iii) the words "Caution. It is dangerous to take this preparation except under medical supervision" in the case of insulin, the active principles of pituitary gland, and the active principles of thyroid gland and their salts, if made up ready for the internal treatment of human ailments. The required word or words must appear either on a separate label or within a line containing no words other than the particulars with which the substance is required to be labelled by the Act or Rules, and must not be modified in meaning by other words or marks;

- (b) the particulars set out under B (iv) (a), (b), (c), (e) and (f) above (page 1111), except that the name and address (*see* (a)) need only appear on the outer cover of the article.

(ii) place the poison in a container as set out under (B) (v) above.

IV. *Sales of poisons for use in business or profession.*

(A) *Schedule 4 Poisons.*

There are no special conditions which apply to the pharmacist in the sale or supply of Fourth Schedule poisons to a person requiring the poison for the purpose of his business or profession. All poisons in the Fourth Schedule are, however, First Schedule poisons, and the normal requirements which apply to such poisons and described in the next paragraph must be observed.

(B) *Poisons included in the First Schedule.*

The purchaser must either attend in person to obtain the poison, or supply an order in writing signed by himself stating his name and address, his business or profession, the name and quantity of the article to be purchased and the purpose for which it is required. It is not necessary to state business or profession or the purpose for which the poison is required when the purchaser is a hospital, infirmary, dispensary or clinic, or the purpose for which the poison is required when the purchaser is a doctor, dentist or veterinary surgeon.

The pharmacist must

(i) satisfy himself

- (a) that the poison is used in the business or profession of the purchaser, and
- (b) that the purchaser is engaged in the business or profession stated, and
- (c) if the purchaser does not attend in person, but supplies a written order, that the signature of the purchaser is genuine;

(ii) comply with the conditions set out under *IIIB* above (pages 1111 to 1113). In sales or supplies to a person or institution concerned with scientific education or research or chemical analysis, for the purposes of that education, research or analysis, the only requirement in regard to container is that it shall be impervious to the poison and strong enough to prevent leakage from the ordinary risk of handling.

See also note on Emergency (page 1108).

(C) Poisons not included in the First Schedule.

The pharmacist must comply with the conditions set out under **B III (C)** (page 1113).

C. The wholesaler.

Subject to the proviso that a person who is carrying on a business which comprises the manufacture of medicines for the treatment of animals, and who has complied with the requirements of Rule 4 of the Poisons Rules, 1935, may sell or supply a poison as a medicine for the treatment of animals, a wholesaler may not sell or supply any poison direct to the public unless he is *either*

- (a) an authorised seller of poisons, in which case he must comply with the requirements set out in this summary under Section **B—The pharmacist** (page 1110).
- or (b) a listed seller of poisons, in which case he may sell only certain poisons and must comply with the requirements affecting transactions by such persons. The requirements to be fulfilled by listed sellers of poisons are not set out in this summary.

Subject to the general prohibitions mentioned on page 1107 any wholesaler who is not carrying on a retail business on the same premises may sell poisons as set out under sections **I** to **IV** below; transactions referred to under sections **V** to **IX** below may only be effected if in addition the wholesaler regularly sells poisons to purchasers who require them either to sell again or to use in their trade or business.

I. To a purchaser (either wholesaler or retailer) who buys for the purpose of selling again.*(A) Poisons included in the First Schedule.*

The wholesaler must

- (i) be satisfied that the purchaser requires the poison for the purpose of selling again;
- (ii) comply with the requirements set out under **B III (B)** (iv) and (v) (pages 1111 to 1113), subject to the proviso that no name and address is necessary if the poison is to be sold again in the same container, and the requirements of **B III (B)** (iv) (b) to (d) need not be satisfied if the poison is included in the Second Schedule, is sold to a wholesaler who carries on a business in the course of which poisons are either regularly sold to purchasers who buy to sell again or regularly used in the manufacture of other articles, and who requires the poison for the purpose of that business, is labelled with the name of the seller and the address of the premises on which it is sold, and the outside of the package is labelled conspicuously with words indicating the dangerous properties of the poison.

(B) Poisons not included in the First Schedule.

The wholesaler must comply with the requirements set out under **B III (C)** (i) and (ii) (page 1113), subject to the proviso that no name and address is necessary if the poison is to be sold again in the same container, and the requirements of **B III (C)** (i) (a) and **B III (B)** (iv) (a) to (c) need not be satisfied if the poison is included in the Second Schedule, is sold to a wholesaler who carries on a business in the course of which poisons are either regularly sold to purchasers who buy to sell again or regularly used in the manufacture of other articles, and who requires the poison for the purpose of that business, is labelled with the name of the seller and the address of the premises on which it is sold, and the outside of the package is labelled conspicuously with words indicating the dangerous properties of the poison.

II. To be exported to purchasers outside the United Kingdom.

The requirements for all poisons, whether or not First Schedule, are the same; the wholesaler must comply with the requirements set out under **B III (B)** (v) (a) (page 1113).

It will be noted that for export there are no requirements prescribed for labelling poisons, other than those for transport. Sales to Northern Ireland are not export sales, but such sales are exempt from the labelling requirements as set out under **B III (B)** (iv) (pages 1111 to 1112) and **B III (C)** (i) (page 1113), if the poisons are labelled in accordance with the laws of Northern Ireland.

III. To a doctor, dentist, or veterinary surgeon for the purpose of their respective professions.

The wholesaler must comply with the requirements as set out under **B IV** (page 1113).

IV. For use in or in connection with any hospital, infirmary, dispensary or similar institution approved by order, whether general or special, of the Secretary of State.

(By the Poisons (Approved Institutions) Order, 1935, the Secretary of State has approved any hospital, infirmary or dispensary maintained by any public authority or out of any public funds, or by a charity or by voluntary subscriptions.)

The wholesaler must comply with the requirements as set out under **B IV** (page 1113).

V. To a person who requires the poison for the purpose of his trade or business.

(A) Poisons included in the First Schedule.

The wholesaler must

(i) be satisfied that the purchaser requires the poison for the purpose of his trade or business;

(ii) comply with the requirements set out under **B III (B) (iv)** and **(v)** (pages 1111 to 1113); except that

(a) if the poison is included in the Second Schedule, is sold to a wholesaler who carries on a business in the course of which poisons are either regularly sold to purchasers who buy to sell again or regularly used in the manufacture of other articles, and who requires the poison for the purpose of that business, is labelled with the name of the seller and the address of the premises on which it is sold, the requirements of **B III (B) (iv) (b)** to **(f)** need not be satisfied, provided the outside of the package is labelled conspicuously with words indicating the dangerous properties of the poison;

(b) if sold to a person concerned with chemical analysis a fluted bottle need not be used.

(B) Poisons not included in the First Schedule.

The wholesaler must comply with the conditions set out under **B III (C)** (page 1113), except that

(a) if the poison is included in the Second Schedule, is sold to a wholesaler who carries on a business in the course of which poisons are either regularly sold to purchasers who buy to sell again or regularly used in the manufacture of other articles and who requires the poison for the purpose of that business, the requirements of **B III (C) (i)** need not be satisfied, provided the requirements of **B III (B) (iv) (a)** are satisfied, and the outside of the package is labelled conspicuously with words indicating the dangerous properties of the poison;

(b) if sold to a person concerned with chemical analysis a fluted bottle need not be used.

VI. To a person who requires the poison for the purpose of enabling him to comply with any statutory requirements in respect of the medical treatment of his employees.

The wholesaler must comply with the statutory requirements as set out under **B IV** (page 1113).

VII. To a Government department or an officer of the Crown requiring the poison for the purposes of the public service.

The wholesaler must comply with the requirements as set out under **B IV** (page 1113).

VIII. To a local authority requiring the poison in connection with the exercise of statutory powers.

The wholesaler must comply with the requirements as set out under **B IV** (page 1113).

IX. To a person or institution concerned with scientific education or research if the poison is required for the purpose of that education or research.

The wholesaler must comply with the requirements as set out under **B IV** (page 1113), except that in no circumstances is it necessary to use a fluted bottle.

D. Hospitals and similar institutions.

I. Out-patients.

The ordinary rules governing the supply of poisons do not apply to any poison which is a medicine supplied for the treatment of human ailments from a hospital, infirmary or dispensary maintained by any public authority, or out of any public funds, or by a charity, or from any institution approved by the Minister of Health for the purpose of section 24 (4) of the National Health Insurance Act, 1924, or for the treatment of animals from a veterinary hospital which is under the superintendence of a veterinary surgeon, if the conditions set out below are satisfied.

(It will be noted that this does not authorise the sale of poisons. "Sales" may only be effected if the institution becomes an authorised seller of poison within the meaning of the Pharmacy and Poisons Act, 1933.)

- (a) the medicine must not be supplied except by or on and in accordance with a prescription of a doctor, for the purposes of medical treatment, or a dentist for the purposes of dental treatment or a veterinary surgeon for the purposes of animal treatment;
- (b) if a First Schedule poison, a record must be kept on the premises so that at any time during the two years following the supply there can readily be traced the following particulars:—
 - (i) the name and quantity of the poison supplied;
 - (ii) the date of supply;
 - (iii) the name and address of the person supplied;
 - (iv) the name of the person who supplied the poison or who gave the prescription upon which it was supplied.

These requirements need not be satisfied in the case of a National Health Insurance prescription.

- (c) The container of the medicine must be labelled
 - (i) with a designation and address sufficient to identify the hospital or other institution from which it was supplied;
 - (ii) with the word "Poison" except in the case of a medicine made up ready for treatment;
 - (iii) with the words "For external use only" and the name of the article, e.g., The Embrocation, The Liniment, etc., if the poison is a liquid for external application;
 - (iv) with the words "For animal treatment only" if the poison is supplied from a veterinary hospital;

II. In-patients.

In any hospital, infirmary, dispensary, clinic, nursing-home, or other institution at which human ailments are treated, and in which medicines are dispensed in a separate dispensing or pharmaceutical department in charge of a person appointed for that purpose, no medicine containing a poison must be supplied from that department (except in cases of emergency) for use in the wards, operating theatres, or other sections of the institution unless

- (a) a written order signed by a doctor, dentist, or by a sister or nurse in charge of a ward, theatre or other section of the institution, is received; and
- (b) the container is labelled
 - (i) with words describing its contents;
 - (ii) in the case of First Schedule poisons with a distinguishing mark or other indication, indicating that the poison is to be stored in a cupboard reserved solely for the storage of poisons.

STORAGE OF POISONS

A. The doctor, dentist or veterinary surgeon.

There are no regulations affecting the storage of poisons in the surgery of a doctor, dentist, or veterinary surgeon.

B. The pharmacist.

With the exception of the general requirement that the container shall be impervious to the poison and stout enough to prevent leakage from ordinary risks of handling, only First Schedule poisons are affected by the provisions governing storage. Such poisons must be stored in manner set out below (but all three systems may be in use at the same time, and for the same substance):

- (i) in a cupboard or drawer reserved solely for the storage of poisons; or
- (ii) in a part of the premises which is partitioned off or otherwise separated from the remainder of the premises, and to which the public have not access; or
- (iii) on a shelf reserved solely for the storage of poisons; provided that
 - (a) no food is kept beneath the shelf; and
 - (b) the container of the poison is rendered distinguishable by touch from the containers of articles and substances other than poisons stored upon the same premises.

First Schedule poisons for use in agriculture or horticulture must be stored only in a cupboard or drawer reserved solely for such poisons or in accordance with (ii) above, provided that food is not kept in that part of the premises.

C. The wholesaler, educational institutions and laboratories.

There are no restrictions affecting the storage of poisons by wholesalers, educational institutions and laboratories, other than the general requirement that the container of the poison shall be impervious to the poison and stout enough to prevent leakage from the ordinary risks of handling.

D. Hospitals and similar institutions.

Under this heading, but for the purpose of storage only, is included any hospital, infirmary, dispensary, clinic, nursing-home, or other institution at which human ailments are treated.

(i) Poisons not issued for use within the institution.

- (a) If there is a dispensing department, poisons not issued for use within the institution must be stored in that department, but subject to any rules in the institution, the pharmacist may decide upon detail;
- (b) If there is no dispensing department, poisons not issued for use within the institution must be stored in charge of a person appointed for the purpose by the governing body or person in control of the institution, and if a First Schedule poison either in a cupboard, or drawer, or on a shelf reserved solely for the storage of poisons.
If a poison is stored on a shelf the container must be distinguishable by touch from the containers of articles other than poisons stored on the same premises.

(ii) Poisons issued to the wards.

Every First Schedule poison must be stored in a cupboard reserved solely for the storage of poisons and poisonous substances.

All places in which poisons are stored in hospitals and similar institutions must be inspected regularly, at intervals not exceeding three months, by a pharmacist or some other person appointed for the purpose by the governing body or person in control of the institution.

TRANSPORT

All poisons consigned for transport must be sufficiently strongly packed to avoid leakage arising from the ordinary risks of handling and transport. In addition, poisons which are not medicines and are included in the Eighth Schedule, and which are consigned for transport by carrier, must be labelled conspicuously on the outside of the package with the name or description of the poison as set out in the Eighth Schedule, and a notice indicating that it is to be kept separate from food and from empty foodstuff containers.

It should also be noted that any poison in the First Schedule which is lawfully sold or supplied to any person on a written order must, if sent by post, be sent by registered post.

MANUFACTURE

In all establishments in which pharmaceutical preparations containing poison are manufactured for the internal treatment of human ailments, the preparation must be manufactured by or under the supervision of a pharmacist, a Fellow or Associate of the Institute of Chemistry, or a person who for a period of at least three years before May 1, 1936, was continuously engaged in such manufacture, and has furnished to the Registrar of the Pharmaceutical Society of Great Britain a statement in writing, verified by a statutory declaration, to that effect; except that preparations containing pituitary, suprarenal or thyroid glands, their active principles or salts of their active principles, may be manufactured by or under the supervision of a doctor.

THE POISONS LIST.

As amended by the Poisons List (Amendment) Orders, 1937, 1938 and 1940.

PART I (marked [P1] in our text).

- Acetanilide; alkyl acetanilides
 Alkali fluorides other than those specified in Part II of this List
 Alkaloids, the following; their salts, simple or complex:—
 Acetyldihydrocodeinone; its esters
 Aconite, alkaloids of
 Apomorphine
 Atropine
 Belladonna, alkaloids of
 Benzoylmorphine
 Benzylmorphine
 Brucine
 Calabar bean, alkaloids of
 Coca, alkaloids of
 Cocaine
 Codeine
 Colchicine
 Coniine
 Cotarnine
 Curarine
 Diacetylmorphine
 Dihydrocodeinone; its esters
 Dihydrohydroxycodeinone; its esters
 Dihydromorphine; its esters
 Dihydromorphinone; its esters
 Ecgonine; its esters
 Emetine
 Ephedra, alkaloids of
 Ergot, alkaloids of
 Ethylmorphine
 Gelsemium, alkaloids of
 Homatropine
 Hyoscyne
 Hyoscyamine
 Jaborandi, alkaloids of
 Lobelia, alkaloids of
 Morphine
 Papaverine
 Pomegranate, alkaloids of
 Quebracho, alkaloids of, other than the alkaloids of red quebracho
 Sabadilla, alkaloids of
 Solanaceous alkaloids not otherwise included in this List
 Stavesacre, alkaloids of
 Strychnine
 Thebaine
 Veratrum, alkaloids of
 Yohimba, alkaloids of
 Allylisopropylacetylurea
 Amidopyrine; its salts
 Amino-alcohols, esterified with benzoic acid, phenylacetic acid, phenylpropionic acid, cinnamic acid or the derivatives of these acids
 Amyl nitrite
 Antimony, chlorides of; oxides of antimony; sulphides of antimony; antimonates; antimonites; organic compounds of antimony
 Arsenical substances, the following, except those specified in Part II of this List:—arsenic, halides of; oxides of arsenic; arsenates; arsenites; organic compounds of arsenic
 Barbituric acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid, its salts, its derivatives, their salts, with any other substance
 Barium, salts of, other than barium sulphate and the salts of barium specified in Part II of this List
 Beta-aminopropylbenzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its salts; its N-alkyl derivatives; their salts
 Butyl chloral hydrate
 Cannabis (the dried flowering or fruiting tops of *Cannabis sativa* Linn.); the resin of cannabis; extracts of cannabis; tinctures of cannabis; cannabin tannate
 Cantharidin; cantharidates
 Chloral formamide
 Chloral hydrate
 Chloroform
 Creosote obtained from wood
 Croton, oil of
 Digitalis, glycosides of; other active principles of digitalis

Dinitrocresols; dinitronaphthols; dinitrophenols; dinitrothymols
 Elaterin
 Ergot (the sclerotia of any species of *Claviceps*); extracts of ergot; tinctures of ergot
 Erythrityl tetranitrate
 Glyceryl trinitrate
 Guanidines, the following:—poly-methylene diguanidines, dipara-anisylphenetyl guanidine
 Hydrocyanic acid; cyanides; double cyanides of mercury and zinc
 Insulin
 Lead acetates; compounds of lead with acids from fixed oils
 Mannityl hexanitrate
 Mercury, oxides of; nitrates of mercury; mercuric ammonium chlorides; potassium-mercuric iodides; mercuric oxycyanides; mercuric thiocyanate
 Metanitrophenol; orthonitrophenol; paranitrophenol
 Nux Vomica
 Opium
 Orthocaine; its salts
 Ouabain
 Oxalic acid
 Oxyinchoninic acid, derivatives of; their salts; their esters
 Para-aminobenzenesulphonamide; its salts; derivatives of para-aminobenzenesulphonamide having any of the hydrogen atoms of the para-amino group or of the sulphonamide

group substituted by another radical; their salts
 Para-amino-benzoic acid; esters of; their salts
 Phenetidylphenacetin
 Phenols (any member of the series of phenols of which the first member is phenol and of which the molecular composition varies from member to member by one atom of carbon and two atoms of hydrogen) except in substances containing less than sixty per cent., weight in weight, of phenols; compounds of phenol with a metal, except in substances containing less than the equivalent of sixty per cent., weight in weight, of phenols
 Phenylcinchoninic acid; salicylcinchoninic acid; their salts; their esters
 Phenylethylhydantoin; its salts; its acyl derivatives; their salts
 Phosphorus, yellow
 Picric acid
 Picrotoxin
 Pituitary gland, the active principles of
 Savin, oil of
 Strophanthus; glycosides of strophanthus
 Sulphonal; alkyl sulphonals
 Suprarenal gland, the active principles of; their salts
 Thallium, salts of
 Thyroid gland, the active principles of; their salts
 Tribromethyl alcohol

PART II (marked [P2] in our text).

Ammonia
 Arsenical substances, the following:—
 Arsenic sulphides
 Arsenious oxide
 Calcium arsenates
 Calcium arsenites
 Copper acetoarsenites
 Copper arsenates
 Copper arsenites
 Lead arsenates
 Potassium arsenites
 Sodium arsenates
 Sodium arsenites
 Sodium thioarsenates
 Barium, salts of, the following:—
 Barium carbonate
 Barium silicofluoride
 Formaldehyde
 Hydrochloric acid
 Hydrofluoric acid; potassium fluoride; sodium fluoride; sodium silicofluoride

Mercuric chloride; mercuric iodide; organic compounds of mercury
 Metallic oxalates
 Nicotine; its salts
 Nitric acid
 Nitrobenzene
 Phenols as defined in Part I of this List in substances containing less than sixty per cent., weight in weight, of phenols; compounds of phenol with a metal in substances containing less than the equivalent of sixty per cent., weight in weight, of phenols
 Phenylene diamines; toluene diamines; other alkylated-benzene diamines; their salts
 Potassium hydroxide
 Sodium hydroxide
 Sulphuric acid

(Note.—Several poisons in this List are exempted by the Poisons Rules (Rule 11 and Third Schedule, pages 1122 to 1124), made by the Secretary of State under the Pharmacy and Poisons Act, 1933, from the application of the Act when present in certain specified substances or articles.)

SCHEDULES TO THE POISONS RULES, 1935.

As amended by the Poisons (Amendment) Rules, 1937, 1938 and 1940.

FIRST SCHEDULE (marked [S1] in our text).

Substances falling within the Poisons List, see pages 1118 to 1119, to which special restrictions apply.

Alkaloids, the following; their salts, simple or complex:—

- Acetyldihydrocodeinone
- Aconite, alkaloids of, except substances containing less than 0.02 per cent. of the alkaloids of aconite
- Apomorphine except substances containing less than 0.2 per cent. of apomorphine
- Atropine except substances containing less than 0.15 per cent. of atropine
- Belladonna, alkaloids of, except substances containing less than 0.15 per cent. of the alkaloids of belladonna calculated as hyoscyamine
- Benzoylmorphine
- Benzylmorphine
- Brucine except substances containing less than 0.2 per cent. of brucine
- Calabar bean, alkaloids of
- Coca, alkaloids of, except substances containing less than 0.1 per cent. of the alkaloids of coca
- Cocaine except substances containing less than 0.1 per cent. of cocaine
- Codeine except substances containing less than one per cent. of codeine
- Colchicine except substances containing less than 0.5 per cent. of colchicine
- Coniine except substances containing less than 0.1 per cent. of coniine
- Cotarnine except substances containing less than 0.2 per cent. of cotarnine
- Curarine
- Diacylmorphine
- Dihydrocodeinone
- Dihydrohydroxycodeinone
- Dihydromorphine
- Dihydromorphine
- Ecgonine except substances containing less than 0.1 per cent. of ecgonine
- Emetine except substances containing less than one per cent. of emetine
- Ergot, alkaloids of
- Ethylmorphine except substances containing less than 0.2 per cent. of ethylmorphine
- Gelsemium, alkaloids of, except substances containing less than 0.1 per cent. of the alkaloids of gelsemium
- Homatropine except substances containing less than 0.15 per cent. of homatropine
- Hyoscine except substances containing less than 0.15 per cent. of hyoscine
- Hyoscyamine except substances containing less than 0.15 per cent. of hyoscyamine
- Jaborandi, alkaloids of, except substances containing less than 0.5 per cent. of the alkaloids of jaborandi
- Lobelia, alkaloids of, except substances containing less than 0.5 per cent. of the alkaloids of lobelia.
- Morphine except substances containing less than 0.2 per cent. of morphine calculated as anhydrous morphine
- Nicotine
- Papaverine except substances containing less than one per cent. of papaverine
- Pomegranate, alkaloids of, except substances containing less than 0.5 per cent. of the alkaloids of pomegranate
- Quebracho, alkaloids of
- Sabadilla, alkaloids of, except substances containing less than one per cent. of the alkaloids of sabadilla
- Solanaceous alkaloids, not otherwise included in this Schedule, except substances containing less than 0.15 per cent. of solanaceous alkaloids calculated as hyoscyamine
- Stavesacre, alkaloids of, except substances containing less than 0.2 per cent. of the alkaloids of stavesacre

- Strychnine except substances containing less than 0.2 per cent. of strychnine
 Thebaine except substances containing less than one per cent. of thebaine
 Veratrum, alkaloids of, except substances containing less than one per cent. of the alkaloids of veratrum
 Yohimbin, alkaloids of
- Allylisopropylacetylurea
 Amidopyrine; its salts
 Amino-alcohols, esterified with benzoic acid, phenylacetic acid, phenylpropionic acid, cinnamic acid or the derivatives of these acids, except in substances containing less than ten per cent. of esterified amino-alcohols
 Antimonial poisons except substances containing less than the equivalent of one per cent. of antimony trioxide
 Arsenical poisons except substances containing less than the equivalent of 0.01 per cent. of arsenic trioxide and except dentifrices containing less than 0.5 per cent. of acetarsol
 Barbituric acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid, its salts, its derivatives, their salts, with any other substance
 Barium, salts of
 Beta-aminopropylbenzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its salts; its N-alkyl derivatives; their salts
 Cannabis; the resin of cannabis; extracts of cannabis; tinctures of cannabis; cannabin tannate
 Cantharidin except substances containing less than 0.01 per cent. of cantharidin
 Cantharidates except substances containing less than the equivalent of 0.01 per cent. of cantharidin
 Digitalis, glycosides and other active principles of, except substances containing less than one unit of activity (as defined in the British Pharmacopœia) in two grammes of the substance
 Dinitrocresols; dinitronaphthols; dinitrophenols; dinitrothymols
 Ergot; extracts of ergot; tinctures of ergot
 Guanidines, the following:—polymethylene diguanidines, dipara-anisylphenetyl guanidine
 Hydrocyanic acid except substances containing less than 0.15 per cent., weight in weight, of hydrocyanic acid (HCN); cyanides except substances containing less than the equivalent of 0.1 per cent., weight in weight, of hydrocyanic acid (HCN); double cyanides of mercury and zinc
 Lead, compounds of, with acids from fixed oils
 Mercuric chloride except substances containing less than one per cent. of mercuric chloride; mercuric iodide except substances containing less than two per cent. of mercuric iodide; nitrates of mercury except substances containing less than the equivalent of three per cent., weight in weight, of mercury (Hg); potassio-mercuric iodides except substances containing less than the equivalent of one per cent. of mercuric iodide; organic compounds of mercury except substances containing less than the equivalent of 0.2 per cent., weight in weight, of mercury (Hg)
 Metanitrophenol; orthonitrophenol; paranitrophenol
 Nux Vomica except substances containing less than 0.2 per cent. of strychnine
 Opium except substances containing less than 0.2 per cent. of morphine calculated as anhydrous morphine
 Ouabain
 Oxycinchonic acid, derivatives of; their salts; their esters
 Para-aminobenzenesulphonamide; its salts; derivatives of para-aminobenzenesulphonamide having any of the hydrogen atoms of the para-amino group or of the sulphonamide group substituted by another radical; their salts
 Phenetidylphenacetin
 Phenylcinchoninic acid; salicyl-cinchonic acid; their salts; their esters
 Phenylethylhydantoin; its salts; its acyl derivatives; their salts
 Picrotoxin
 Savin, oil of
 Strophanthus, glycosides of
 Sulphonals; alkyl sulphonals
 Thallium, salts of
 Tribromomethyl alcohol

SECOND SCHEDULE.

Poisons exempted by Rule 5 (2) from labelling provisions when sold or supplied in certain circumstances.

Alkali fluorides
Ammonia
Antimony, chlorides of; oxides of antimony; sulphides of antimony; antimonates; antimonites
Chloroform
Dinitrocresols; dinitronaphthols; dinitrophenols
Formaldehyde
Glyceryl trinitrate
Hydrochloric acid
Hydrofluoric acid; sodium silicofluoride
Lead acetates; compounds of lead with acids from fixed oils
Mercuric chloride; mercuric iodide; organic compounds of mercury
Mercury, oxides of; nitrates of mercury
Metanitrophenol; orthonitrophenol; paranitrophenol
Nitric acid
Nitrobenzene
Oxalic acid; metallic oxalates
Phenols; compounds of phenol with a metal
Phosphorus, yellow
Picric acid
Potassium hydroxide
Sodium hydroxide
Sulphuric acid

THIRD SCHEDULE (marked [§3] in our text).

Articles exempted by Rule 11 from the provisions of the Act and of these Rules.

GROUP I.

GENERAL EXEMPTIONS.

Adhesives; anti-fouling compositions; builders' materials; ceramics; distempers; electrical valves; enamels; explosives; fillers; fireworks; glazes; glue; inks; lacquer solvents; loading materials; matches; motor fuels and lubricants; paints other than pharmaceutical paints; photographic paper; pigments; plastics; propellants; rubber; varnishes.

GROUP II.

SPECIAL EXEMPTIONS.

<i>Poison.</i>	<i>Substance or article in which exempted.</i>
Acetanilide; alkyl acetanilides	Substances not being preparations for the treatment of human ailments
Alkaloids	
Emetine	Ipecacuanha; extracts and tinctures of ipecacuanha; substances containing less than 0.05 per cent. of emetine
Ephedra, alkaloids of	Substances containing less than one per cent. of the alkaloids of ephedra
Jaborandi, alkaloids of	Substances containing less than 0.025 per cent. of the alkaloids of jaborandi
Lobelia, alkaloids of	Preparations for the relief of asthma in the form of cigarettes, smoking mixtures or fumigants; substances containing less than 0.1 per cent. of the alkaloids of lobelia
Nicotine	Tobacco
Pomegranate, alkaloids of	Pomegranate bark
Solanaceous alkaloids	Stramonium contained in preparations for the relief of asthma in the form of cigarettes, smoking mixtures or fumigants
Stavesacre, alkaloids of	Soaps; ointments; lotions for external use

Ammonia

Substances not being solutions of ammonia or preparations containing solutions of ammonia; substances containing less than five per cent., weight in weight, of ammonia (NH_3); refrigerators; smelling bottles

Antimony, chlorides of

Polishes

Arsenical poisons

Pyrites ores or sulphuric acid containing arsenical poisons as natural impurities

Barium, salts of

Witherite other than finely ground witherite

Beta-aminopropylbenzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its salts; its N-alkyl derivatives; their salts

Appliances for inhalation in which the poison is absorbed in inert solid material

Chloroform

Substances containing less than ten per cent. of chloroform

Creosote obtained from wood

Substances containing less than fifty per cent. of creosote obtained from wood

Dinitrocresols

Substances not being preparations for the treatment of human ailments

Dinitrophenols

Substances not being preparations for the treatment of human ailments

Formaldehyde

Substances containing less than five per cent., weight in weight, of formaldehyde ($\text{H}\cdot\text{CHO}$); photographic glazing or hardening solutions

Hydrochloric acid

Substances containing less than nine per cent., weight in weight, of hydrochloric acid (HCl)

Lead acetate

Substances containing less than four per cent. of lead acetate

Lead, compounds of

Machine-spread plasters

Mercuric chloride

Batteries

Mercuric chloride; mercuric iodide; organic compounds of mercury

Dressings on seeds or bulbs

Mercury, nitrates of

Ointments containing less than the equivalent of three per cent., weight in weight, of mercury (Hg)

Nitric acid

Substances containing less than nine per cent., weight in weight, of nitric acid (HNO_3)

Nitrobenzene

Substances containing less than 0.1 per cent. of nitrobenzene; soaps containing less than one per cent. of nitrobenzene; polishes

Oxalic acid; metallic oxalates

Laundry blue; polishes

Phenols

Carvacrol; creosote obtained from coal tar; essential oils in which phenols occur naturally; medicines containing less than one per cent. of phenols;

nasal sprays, mouth-washes, pastilles, lozenges, capsules, pessaries, ointments, or suppositories containing less than 2.5 per cent. of phenols;

smelling bottles;

soaps for washing;

solid substances, other than pastilles, lozenges, capsules, pessaries, ointments and suppositories, containing less than sixty per cent. of phenols;

tar (coal or wood), crude or refined;

tertiary butyl-cresol;

thymol

Substances other than preparations for the dyeing of hair

Phenylene diamines; toluene diamines; other alkylated-benzene diamines; their salts

NN*

Picric acid	Substances containing less than five per cent. of picric acid
Potassium hydroxide	Substances containing less than twelve per cent. of potassium hydroxide; accumulators; batteries
Sodium ethylmercurithio-salicylate	Therapeutic substances containing less than 0.1 per cent. of sodium ethylmercurithio-salicylate as a preservative
Sodium fluoride	Substances containing less than three per cent. of sodium fluoride as a preservative
Sodium hydroxide	Substances containing less than twelve per cent. of sodium hydroxide
Sodium silicofluoride	Substances containing less than three per cent. of sodium silicofluoride as a preservative
Sulphuric acid	Substances containing less than nine per cent., weight in weight, of sulphuric acid (H_2SO_4); accumulators; batteries; fire extinguishers.

FOURTH SCHEDULE (marked [84] in our text).

Substances required by Rule 12 to be sold by retail only upon a prescription given by a qualified medical practitioner, registered dentist or registered veterinary surgeon.

Amidopyrine; its salts
 Barbituric acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid, its salts, its derivatives, their salts; with any other substance
 Dinitroresols; dinitronaphthols; dinitrophenols; dinitrothymols
 Para-aminobenzenesulphonamide; its salts; derivatives of para-aminobenzenesulphonamide having any of the hydrogen atoms of the para-amino group or of the sulphonamide group substituted by another radical; their salts
 Phenylcinchoninic acid; salicyl-cinchoninic acid; their salts; their esters
 Sulphonals; alkyl sulphonals

FIFTH SCHEDULE.

Form to which the substances specified are restricted when sold by listed sellers of Part II poisons (Rule 14 (2) (a)).

<i>Poison.</i>	<i>Form to which sale is restricted.</i>
Arsenical substances—	
Arsenious oxide	Sheep dips, sheep washes
Arsenic sulphides	" " " "
Calcium arsenates	Agricultural and horticultural insecticides or fungicides
Calcium arsenites	" " " "
Copper acetoarsenite	" " " "
Copper arsenates	" " " "
Copper arsenites	" " " "
Lead arsenates	" " " "
Potassium arsenites	" " " "
Sodium arsenates	Sheep dips, sheep washes
Sodium arsenites	" " " "
Sodium thioarsenates	" " " "
Barium carbonate	Preparations for the destruction of rats and mice

Mercurial substances—
Mercuric chloride

Mercuric iodide

Organic compounds of
mercury

Metallic oxalates other than
potassium quadroxalate

Nitrobenzene

Agricultural and horticultural fungicides,
seed and bulb dressings, insecticides
Agricultural and horticultural fungicides,
seed and bulb dressings

" " " "

Photographic solutions or materials

Agricultural and horticultural insecticides;
substances for the treatment of bee disease;
ointments for the treatment of animals

SIXTH SCHEDULE (marked [§6] in our text).

*Statement of particulars as to proportion of the poison in certain cases permitted
by Rule 18 (2).*

<i>Name of Poison.</i>	<i>Particulars.</i>
Alkaloids	
Aconite, alkaloids of	The proportion of any one alkaloid of aconite that the preparation would be calculated to contain on the assumption that all the alkaloids of aconite in the preparation were that alkaloid.
Belladonna, alkaloids of	The same as above, with the substitution for the reference to aconite of a reference to belladonna, calabar bean or such other of the said poisons as the case may require.
Calabar bean, alkaloids of	
Coca, alkaloids of	
Ephedra, alkaloids of	
Ergot, alkaloids of	
Gelsemium, alkaloids of	
Jaborandi, alkaloids of	
Lobelia, alkaloids of	
Pomegranate, alkaloids of	
Quebracho, alkaloids of, other than the alkaloids of red quebracho	
Sabadilla, alkaloids of	
Solanaceous alkaloids not otherwise included in the Poisons List	
Stavesacre, alkaloids of	
Veratrum, alkaloids of	
Yohimba, alkaloids of	
Antimonial poisons	The proportion of antimony trioxide (Sb_2O_3) or antimony pentoxide (Sb_2O_5) that the preparation would be calculated to contain on the assumption that the antimony (Sb) in the poison had been wholly converted into antimony trioxide or antimony pentoxide as the case may be.
Arsenical poisons	The proportion of arsenic trioxide (As_2O_3) or arsenic pentoxide (As_2O_5) that the preparation would be calculated to contain on the assumption that the arsenic (As) in the poison had been wholly converted into arsenic trioxide or arsenic pentoxide as the case may be.
Barium, salts of	The proportion of one particular barium salt which the preparation would be calculated to contain on the assumption that the barium (Ba) in the poison had been wholly converted into that salt.

Digitalis, glycosides of; other active principles of digitalis	The number of units of activity as defined in the British Pharmacopœia contained in a specified quantity of the preparation.
Hydrocyanic acid; cyanides; double cyanides of mercury and zinc	The proportion of hydrocyanic acid (HCN) that the preparation would be calculated to contain on the assumption that the cyanides in the poison had been wholly converted into hydrocyanic acid.
Insulin	The number of units of activity as defined in the British Pharmacopœia contained in a specified quantity of the preparation.
Lead, compounds of, with acids from fixed oils	The proportion of lead oxide (PbO) that the preparation would be calculated to contain on the assumption that the lead in the poison had been wholly converted into lead oxide.
Mercury, organic compounds of	The proportion of organically-combined mercury (Hg) contained in the preparation.
Nux Vomica	The proportion of strychnine contained in the preparation.
Opium	The proportion of morphine contained in the preparation.
Phenols	The proportion of phenols (added together) contained in the preparation.
Compounds of phenol with a metal	The proportion of phenols (added together) that the preparation would be calculated to contain on the assumption that the compounds of phenols with a metal had been wholly converted into the corresponding phenols.
Pituitary gland, the active principles of	Either— (a) the number of units of activity as defined in the British Pharmacopœia contained in a specified quantity of the preparation; or (b) the proportion of pituitary gland, or of anterior or of posterior lobe of the gland, as the case may be, contained in the preparation; or (c) the amount of pituitary gland, or of anterior or of posterior lobe of the gland, as the case may be, from which a specified quantity of the preparation was obtained, together with an indication whether the amount relates to fresh or to dried gland substance.
Potassium hydroxide	The proportion of potassium monoxide (K_2O) which the preparation would be calculated to contain on the assumption that the potassium hydroxide in the preparation had been wholly converted into potassium monoxide.
Sodium hydroxide	The proportion of sodium monoxide (Na_2O) which the preparation would be calculated to contain on the assumption that the sodium hydroxide in the preparation had been wholly converted into sodium monoxide.
Strophanthus, glycosides of	The amount of Standard Tincture of Strophanthus as defined in the British Pharmacopœia which possesses the same activity as a specified quantity of the preparation when assayed by the method described in the said Pharmacopœia.

Suprarenal gland, the active principles of; their salts

Either—

- (a) the proportion of suprarenal gland or of the cortex or of the medulla of the gland, as the case may be, contained in the preparation; or
- (b) the amount of suprarenal gland, or of the cortex or of the medulla of the gland, as the case may be, from which a specified quantity of the preparation was obtained, together with an indication whether the amount relates to fresh or to dried gland substance.

Thyroid gland, the active principles of; their salts

Either—

- (a) the proportion of thyroid gland contained in the preparation; or
- (b) the amount of thyroid gland from which a specified quantity of the preparation was obtained, together with an indication whether the amount relates to fresh or to dried gland.

SEVENTH SCHEDULE (marked [87] in our text, except substances to which clause 2 of this schedule applies).

Indication of character prescribed by Rule 19 for the purposes of section 18 (1) (c) (iii) of the Act.

1. To be labelled with the words "*Caution. It is dangerous to take this preparation except under medical supervision.*" :—

Medicines made up ready for the internal treatment of human ailments if the poison is one of the following:—

Allylisopropylacetylurea

Beta-aminopropylbenzene; its salts; its N-alkyl derivatives; their salts; beta-aminoisopropylbenzene; its salts; its N-alkyl derivatives; their salts

Insulin

Phenylethylhydantoin; its salts; its acyl derivatives; their salts

Pituitary gland, the active principles of

Thyroid gland, the active principles of; their salts

2. To be labelled with the words "*Caution. It is dangerous to exceed the stated dose.*" :—

Medicines (other than medicines mentioned in paragraph 1 of this Schedule) made up ready for the internal treatment of human ailments except in the case of a substance included in the First Schedule.

3. To be labelled with the words "*Poison. For animal treatment only.*" :—

Medicines made up ready for the treatment of animals.

4. To be labelled with the words "*Caution. This preparation may cause serious inflammation of the skin in certain persons and should be used only in accordance with expert advice.*" :—

Preparations for the dyeing of hair containing phenylene diamines, toluene diamines or other alkylated-benzene diamines or their salts.

5. To be labelled with the words "*Caution. This substance is caustic.*" :—

Potassium hydroxide, sodium hydroxide, and articles containing either of those substances.

EIGHTH SCHEDULE.

Poisons to which Rule 25 (Transport) applies.

Arsenical poisons; barium, salts of; hydrocyanic acid; cyanides; nicotine; strychnine; thallium, salts of

NINTH SCHEDULE.

Form of application to be made to the local authority by a person desiring his name to be entered in the list kept by local authorities in pursuance of section 21 of the Act. (Rule 30 (1).)

TENTH SCHEDULE.

Form of the list to be kept by local authorities in pursuance of section 21 (1) of the Act. (Rule 30 (3).)

ELEVENTH SCHEDULE.

Certificate for the purchase of a poison. (Rule 31.)

TWELFTH SCHEDULE.

Form of entry required by Rule 32 to be made in the book to be kept by sellers of poisons in accordance with section 18 (2) (b) of the Act.

(For further details of Schedules 9 to 12 see Vol. I, 21st Edn.)

THIRTEENTH SCHEDULE.

(Inserted in accordance with the Poisons (Amendment) (No. 2) Rules, 1940.

Authority for the purchase of strychnine in pursuance of proviso (e) to Rule 15.

I hereby authorise (a).....
to purchase within three months of the date hereof, (b).....
ounces of strychnine for the purpose of killing moles.

.....
Signature of Chairman
Executive Officer } * of the.....
Secretary
County War Agricultural Executive Committee. } *
Agricultural Executive Committee.

Date.....

(a) Insert full name of intending purchaser.

(b) Insert amount authorised to be purchased which must not exceed four ounces.

* Delete words which do not apply

PHARMACY AND POISONS ACT (NORTHERN IRELAND), 1925.
Schedule of Poisons Applicable to Northern Ireland
(as amended to 1940)

PART I.

Aconite, Aconitine and their preparations.

Alkaloids. All poisonous alkaloids not specifically named in this Schedule, and their salts, and all poisonous derivatives of alkaloids.

Arsenic and its preparations.

Atropine and its salts and their preparations.

Belladonna and all preparations or admixtures (except belladonna plasters) containing 0·1 or more per cent. of belladonna alkaloids.

- Cannabis**, the dried flowering or fruiting tops of the pistillate plant of *C. sativa*, and the resins prepared therefrom.
- Cantharides** and its poisonous derivatives.
- Chloral Hydrate** and all its preparations.
- Coca**, any preparation or admixture of, containing 0.1 or more per cent. of coca alkaloids.
- Corrosive Sublimate** and preparations of corrosive sublimate.
- Cyanide of Potassium** and all poisonous cyanides and their preparations.
- Diamorphine** (also known as **Heroin**) and all preparations or admixtures containing 0.1 per cent. of diamorphine.
- Diethyl-Barbituric Acid** and other alkyl, aryl or metallic derivatives of barbituric acid, whether described as Veronal, Proponal, Medinal, or by any other trade name, mark or designation, and all poisonous urethanes and ureides.
- Digitalin** and all other poisonous constituents of digitalis.
- Dinitro Phenols, Dinitro Cresols**, preparations or admixtures containing dinitro phenols, preparations or admixtures containing dinitro cresols.
- Ecgonine** and all preparations and admixtures containing 0.1 per cent. of ecgonine.
- Emetic Tartar** and all preparations or admixtures containing 1 or more per cent. of emetic tartar.
- Ergot of Rye** and preparations of ergots.
- Lead**, in combination with oleic acid, or other higher fatty acids, whether sold as Diachylon or under any other designation (except machine-spread plasters).
- Nux Vomica** and all preparations or admixtures containing 0.2 or more per cent. of strychnine.
- Opium** and all preparations or admixtures containing 0.2 or more per cent. of morphine.
- Phenylcinchoninic Acid**, its salts, its esters; derivatives of phenylcinchoninic acid, their salts, their esters; preparations and admixtures containing phenylcinchoninic acid, its salts, its esters; preparations and admixtures containing derivatives of phenylcinchoninic acid, their salts, their esters.
- Picrotoxin**.
- Prussic Acid** and all preparations or admixtures containing 0.1 or more per cent. of prussic acid.
- Savin** and its oil, and all preparations or admixtures containing savin or its oil.
- Strophanthin** and all other poisonous constituents of strophanthus.
- Strychnine**, all preparations and admixtures containing 0.2 or more per cent. of strychnine.
- Sulphuric Ether**.
- Tobacco**, any preparations or admixtures of (except tobacco prepared for smoking and snuff), containing the poisonous alkaloids of tobacco.

PART II.

- Almonds, Essential Oil of** (unless deprived of prussic acid).
- Antimonial Wine**.
- Barium, Salts of**, except barium sulphate.
- Cantharides**, tincture and all vesicating liquid preparations or admixtures of.
- Carbolic Acid**, and liquid preparations of carbolic acid, and its homologues containing more than 3 per cent. of those substances.
- Chloroform** and all preparations or admixtures containing more than 20 per cent. of chloroform.
- Digitalis**.
- Mercury, Ammoniated (White Precipitate)**.
- Mercury, Biniiodide (Mercuric Iodide)**.
- Mercury, Red Oxide (Red Precipitate)** and all oxides of.
- Mercuric Sulphocyanide**.
- Oxalic Acid**.
- Phosphorus** and all preparations and admixtures containing it in a free state (except lucifer matches).
- Poppies**, all preparations of, except red poppy petals and syrup of red poppies (*Papaver rhæas*).
- Strophanthus**.
- Sulphonal** and its homologues, whether described as Trional, Tetronal or by any other trade mark, name or designation.
- Zinc Chloride** and liquid preparations of zinc chloride, except preparations intended to be used for soldering, or other purely industrial purpose, provided that they are contained in closed vessels labelled with the word "Poisonous,"

and bearing the name and address of the seller and a notice of the special purpose for which the preparations are intended.

All preparations or admixtures which are not included in Part I of this Schedule, and contain a poison within the meaning of this Act, except tobacco prepared for smoking and snuff, machine-spread lead plasters, preparations or admixtures the exclusion of which from this Schedule is indicated by the words therein relating to chloroform, and except such substances as come within the provisions of Section 5 of the Poisons and Pharmacy Act, 1908.

SALE OF POISONS (IRELAND) ACT, 1870.
Schedule of Poisons Applicable to Eire
(as amended to 1940)

PART I.

Aconite and its preparations.
 Alkaloids, *see* Strychnine.
 Arsenic and its preparations.
 Barbituric Acid; its salts; derivatives of barbituric acid; their salts; compounds of barbituric acid; its salts; its derivatives; their salts; with any other substance.
 Cantharides.
 Coca, any preparation or admixture of, containing 1 or more per cent. of coca alkaloids.
 Corrosive Sublimate.
 Cyanide of Potassium and all metallic cyanides.
 Diamorphine (also known as heroin) and all preparations or admixtures containing 0.1 per cent. of diamorphine.
 Ecgonine and all preparations or admixtures containing 0.1 per cent. of ecgonine.
 Emetic Tartar.
 Ergot of Rye and its preparations.
 Opium and all preparations or admixtures containing 0.2 or more per cent. of morphine.
 Prussic Acid.
 Savin and its oil.
 Strychnine and all poisonous vegetable alkaloids and their salts.

PART II.

Almonds, Essential Oil of, unless deprived of its prussic acid.
 Ammoniated Mercury.
 Belladonna and its preparations.
 Benzedrine and its salts.
 Cantharides, the tincture and all vesicating liquid preparations of.
 Carbolic Acid, *see* Phenol.
 Chloral Hydrate and all its preparations.
 Chloroform.
 Corrosive Sublimate, preparations of.
 Diethyl Barbituric Acid and other alkyl, aryl, or metallic derivatives of barbituric acid, whether described as Veronal, Proponal, Medinal or by any other trade name, mark or designation; and all poisonous urethanes and ureides.
 Ether, Sulphuric
 Mercury, Biniode of.
 Mercury, Red Oxide of.
 Morphine, preparations of.
 Nux Vomica and its preparations.
 Opium and all preparations of opium or poppies.
 Oxalic Acid and all oxalates.
 Phenol, commonly called carbolic acid, and its homologues containing not more than nine carbon atoms, and all preparations and admixtures thereof, except tooth-pastes, tooth-powders and soaps for washing.
 Phosphorus and all preparations containing it in a free state.
 Poppies, all preparations of, *see* Opium.
 Strychnine, preparations of.
 Synthetic Ephedrine Alkaloids and their salts.
 Thallium, salts of.
 Every Compound containing any of the poisons mentioned in this Schedule when prepared or sold for the destruction of vermin.

SUMMARY OF DANGEROUS DRUGS LEGISLATION**Main Points to Remember in Prescribing and Dispensing**

The drugs (marked [D] in our text) to which the Acts apply are set out on pages 1133 and 1134.

For exempted preparations *see* pages 1139 and 1140.

*Specimen form of prescription for "dangerous drugs."***1. Doctor.**

[Address of
prescriber.]*

[Name and address of
patient.]

[Name and quantity of drug,
or of *B.P.*, *B.P.C.* or *Drug*
Tariff preparation contain-
ing it.]

[See footnote if the prescription is to be repeated]†

[Date (to be inserted
by prescriber).]

[Signature (not initials)
of prescriber.]

2. Dentist.

As above, but in addition the words "For local dental treatment only" must be written on the prescription.

3. Veterinary Surgeon.

As for doctor's prescription except that the "name and address of the person to whom the medicine is to be delivered" must be inserted in place of the "name and address of patient," and the words "For animal treatment only" must be written on the prescription.

*Address of doctor is not necessary in the case of National Health Insurance prescriptions.

†The maximum number of times which a prescription may be ordered to be repeated is two (*i.e.*, it may be dispensed three times in all) and the prescriber must either state the actual dates upon which the medicine may be repeated, or indicate what period of time must elapse before repeating on any occasion.

When dispensing a prescription the pharmacist must

- (i) know the signature of the prescriber;
- (ii) be satisfied that the prescription is genuine. He should make sure if possible that the doctor, dentist, or veterinary surgeon is authorised to prescribe "dangerous drugs";
- (iii) mark the prescription with the date on which it is dispensed;
- (iv) retain the prescription for two years, except Health prescriptions;
- (v) make the required records in the "dangerous drugs" register on the same or following day on which the prescription is dispensed;
- (vi) keep the register, which must be a bound book, in some part of the premises to which it relates so as to be *at all times* available for inspection;
- (vii) make a copy of the prescription in the prescription book, except Health prescriptions.

Sales to doctors, dentists, and veterinary surgeons

The requirements in regard to sales of First Schedule poisons, set out on page 1113, must be complied with and, in addition, records must be made in the "dangerous drugs" register.

SPECIMEN FORM OF "SIGNED ORDER" OF DOCTOR, DENTIST AND VETERINARY SURGEON.

Please supply:—

[Name and quantity of drugs required.]

These drugs are required for use in my medical* practice.]

[Signature (not initials) of practitioner.]

Other points of assistance

All dangerous drugs must be kept in a locked receptacle, the key being kept only by a pharmacist.

All dangerous drugs are [P1-S1] poisons.

Dentists' and veterinary surgeons' (not doctors') prescriptions must have the amount of the dangerous drugs stated on the label.

Typewritten prescriptions are accepted as written.

Doctors may write prescriptions for themselves.

Telephone orders from medical practitioners may be accepted, but the written order must follow within twenty-four hours.

Nursing homes are not authorised persons.

A foreign doctor, dentist, or veterinary surgeon is not authorised to prescribe, or be in possession of, dangerous drugs unless he is registered in Great Britain.

DANGEROUS DRUGS ACT, 1920, SUMMARISED.

(10 AND 11 GEO. V, CHAPTER 46.)

With the amendments of the 1923, 1925 and 1932 Acts incorporated.
[D] throughout our pages means drugs or preparations coming within the provisions of these Acts.

In this Summary "medical practitioner" means "duly qualified," i.e., registered in the Medical Register kept by the General Medical Council, 44 Hallam Street, London, W.1; "dentist" means "registered dentist"; "veterinary surgeon" means "registered veterinary surgeon."

*A dentist should replace the word "medical" with the word "dental," and a veterinary surgeon with the word "veterinary."

PART I.—Raw Opium, Coca Leaves and Indian Hemp. *Sections 1 to 3* prohibit, except under licence and at approved ports, the importation into and exportation from the United Kingdom of raw opium, coca leaves, Indian hemp, resins obtained from Indian hemp and all preparations of which such resins form the base. Where the importation of any of the above-named drugs is prohibited in any foreign country, the Secretary of State may make such conditions in regard to the licence as he deems necessary to prevent exportation from the United Kingdom to that foreign country. The Secretary of State is also empowered to make regulations controlling the production, possession, sale and distribution of these drugs. A summary of these regulations appears on pages 1143 to 1145.

PART II.—Prepared Opium. *Section 4.*—Import and export totally and unconditionally prohibited. *Section 5.*—Any person manufacturing, selling, dealing in, or having in possession prepared opium, or being occupier of premises used for preparation of opium for smoking, or sale or smoking of prepared opium, or being concerned in managing premises so used, or having pipes or utensils for smoking opium or preparing opium for smoking, or smoking or otherwise using prepared opium, or frequenting a place used for smoking, is guilty of offence against this Act.

PART III.—Cocaine, Morphine, etc. (as detailed in Section 8 below). *Section 6.*—Import and export prohibited, except under licence.

Section 7. Sub-section 1.—Provides for the making of regulations controlling the manufacture, sale, possession and distribution of drugs to which this part (Part III) of this Act applies. *Sub-section 2.*—The regulations so made shall provide for authorising any person lawfully carrying on a chemist's business (a) to manufacture at the shop in the ordinary course of his retail business any preparation, admixture or extract of any drug to which this Part of this Act applies; or (b) to carry on at the shop the business of retailing, dispensing or compounding any such drug. This authorisation shall be subject to the power of the Secretary of State, after consulting the Council of the Pharmaceutical Society of Great Britain, withdrawing it from any person convicted of an offence under this Act. *Sub-section 3.*—Nothing in the regulations made under this section shall derogate from the provisions of the Pharmacy Act, 1868, as amended.

Section 8. Sub-section 1.—The drugs to which this part of the Act applies are

- (a) medicinal opium;
- (b) any extract or tincture of Indian hemp;
- (c) morphine and its salts, and diacetylmorphine (commonly known as diamorphine or heroin) and the other esters of morphine and their respective salts;
- (d) cocaine (including synthetic cocaine) and ecgonine and their respective salts, and the esters of ecgonine and their respective salts;
- (e) any solution or dilution of morphine or cocaine or their salts in an inert substance, whether liquid or solid, containing any proportion of morphine or cocaine, and any preparation, admixture, extract or other substance (not being such a solution or dilution as aforesaid) containing not less than one-fifth per cent. of morphine or one-tenth per cent. of cocaine or of ecgonine;
- (f) any preparation, admixture, extract or other substance containing any proportion of diacetylmorphine;
- (g) dihydroxycodeinone, dihydrocodeinone, dihydromorphinone, acetyl-dihydrocodeinone, dihydromorphine, their esters and the salts of any of these substances and of their esters, morphine-N-oxide (commonly known as genomorphine), the morphine-N-oxide derivatives, and any other pentavalent nitrogen morphine derivatives;
- (h) thebaine and its salts, and (with the exception of methylmorphine, commonly known as codeine, and ethylmorphine, commonly known as dionin, and their respective salts) benzylmorphine and the other ethers of morphine and their respective salts;

†By an Order in Council, S.R. & O., 1933, No. 800, these substances became drugs under Part III of the 1920 Act, but are not subject to the regulations which apply to the other drugs in that part. They are subject to special regulations, viz., The Methylmorphine and Ethylmorphine Regulations, 1933 (see page 1145).

- (i) any preparation, admixture, extract or other substance containing any proportion of any of the substances mentioned in paragraph (g) or in paragraph (h) of this sub-section.

For the purpose of the foregoing provision the expression "ecgonine" means lævo-ecgonine, and includes any derivatives of ecgonine from which it may be recovered industrially, and the percentage in the case of morphine shall be calculated as in respect of anhydrous morphine.

Sub-section 2.—By Order in Council this part of the Act may be applied to new derivatives of morphine, cocaine, or any other substance.

PART IV.—General. Section 9.—Application of Customs Acts.

Section 10. Sub-section 1.—A constable or person authorised by a Secretary of State has power to inspect books or documents relating to dealings and stocks. *Sub-section 2.*—Any person delaying, or obstructing, or failing to produce, or concealing, or attempting to conceal books, stocks, drugs or documents shall be guilty of an offence.

Section 11.—Every regulation made under the Act is to be laid before Parliament.

Section 12.—The Secretary of State is empowered to grant licences or authorities on such terms and subject to such conditions, including the payment of a licence fee, as he thinks fit.

Section 13.—Heavy fines with or without imprisonment for offences under the Act. If any person attempts to commit an offence, or solicits or incites another person to commit it, he shall, without prejudice to any other liability, be liable on summary conviction to the same punishment and forfeiture as if he had committed it. Where a person convicted of an offence is a company, the chairman and every director and every officer concerned in the management of the company shall be guilty of the like offence unless he proves that the act constituting the offence took place without his knowledge or consent.

Section 14.—Permits any constable to arrest without warrant in certain circumstances.

Section 15.—Interpretation section, and includes the following definitions:—

"Raw Opium" includes powdered or granulated opium, but does not include medicinal opium.

"Prepared Opium" means opium prepared for smoking, and includes dross and any other residues remaining after opium has been smoked.

"Medicinal Opium" means raw opium which has undergone the processes necessary to adapt it for medicinal use in accordance with the requirements of the *British Pharmacopœia*, whether it is in the form of powder or is granulated, or is in any other form, and whether it is or is not mixed with neutral substances.

Section 16.—Application to Ireland.

DANGEROUS DRUGS AND POISONS (AMENDMENT) ACT, 1923, SUMMARISED.

(13 AND 14 GEO. V, CHAPTER 5.)

This Act amends, by deletion, addition or substitution, certain of the sections of the Dangerous Drugs Act, 1920. The amendments have been incorporated in our notes on that Act. The only entirely new provision is contained in Section 5, which relates to the calculation of percentages in the case of liquid preparations, and, as amended by the Pharmacy and Poisons Act, 1933, is as follows:—

Section 5.—For the purposes of Section 8 of the Dangerous Drugs Act, 1920, percentages, in the case of liquid preparations, shall, unless other provision in that behalf is made by regulations under those Acts respectively, be calculated on the basis that a preparation containing one per cent. of any substance means a preparation in which one gramme of the substance, if a solid, or one millilitre of the substance, if a liquid, is contained in every one hundred millilitres of the preparation, and so in proportion for any greater or less percentage.

DANGEROUS DRUGS ACT, 1925, SUMMARISED.

(15 AND 16 GEO. V, CHAPTER 74.)

This Act amends, by deletion, addition or substitution, certain of the sections of the Dangerous Drugs Act, 1920, and the Dangerous Drugs and Poisons (Amendment) Act, 1923. The amendments have been incorporated in our notes on those Acts. The only entirely new provisions are contained in Sections 1 (ii) and 5, which respectively define "coca leaves" and "Indian hemp," and provide

power to exclude certain preparations from Part III of the Dangerous Drugs Act, 1920, and are as follows:—

Section 1. Sub-section 2.—

“Coca Leaves” means the leaves of any plant of the genus *Erythroxylaceæ* from which cocaine can be extracted either directly or by chemical transformation.

“Indian hemp” means the dried flowering or fruiting tops of the pistillate plant known as *cannabis sativa* from which the resin has not been extracted, by whatever name such tops are called.

Section 5.—If His Majesty in Council thinks fit to declare that a finding with respect to any preparation containing any of the drugs to which Part III of the Dangerous Drugs Act, 1920, as amended by this Act, applies, has in pursuance of Article 8 of the Geneva Convention been communicated by the Council of the League of Nations to the parties of the said Convention, the provisions of the said Part III shall as from such date as may be specified in the Declaration cease to apply to the preparation specified therein.

DANGEROUS DRUGS ACT, 1932, SUMMARISED.

(22 GEO. V, CHAPTER 15.)

This Act amends, by deletion, addition or substitution, certain of the sections of the Dangerous Drugs Acts, 1920 to 1925. The amendments have been incorporated in our notes on those Acts.

The only entirely new provisions are contained in Sections 2 and 4, which respectively provide for the prohibition of trade, etc., in new drugs, including power to apply Part III of the Dangerous Drugs Act, 1920 (described as the principal Act) with or without modifications to certain drugs, and provide power to alter or revoke Orders or Declarations in Council, and are as follows:—

Section 2.—(1) It shall not be lawful for any person in the United Kingdom to trade in or manufacture for the purpose of trade any products obtained from any of the phenanthrene alkaloids of opium or from the ecgonine alkaloids of the coca leaf, not being a product which was on the thirteenth day of July, nineteen hundred and thirty-one, being used for medical or scientific purposes:

Provided that if His Majesty is at any time satisfied as respects any such product that it is of medical or scientific value, he may by Order in Council direct that this sub-section shall cease to apply to that product.

If any person acts in contravention of this sub-section, he shall be guilty of an offence against the principal Act.

(2) If it is made to appear to His Majesty that a decision with respect to any such product as is mentioned in sub-section (1) of this section has in pursuance of Article II of the Geneva Convention (No. 2) been communicated by the Secretary-General of the League of Nations to the parties to the said Convention, His Majesty, by Order in Council, may, as the case requires, either declare that the provisions of the said Part III shall apply to that product in the same manner as they apply to the drugs mentioned in sub-section (1) of section eight of the principal Act as amended by this Act or apply the said Part III to that product with such modifications as may be specified in the Order.

(3) His Majesty may by Order in Council apply Part III of the principal Act, with such modifications as may be specified in the Order, to any of the following drugs, that is to say, methylmorphine (commonly known as codeine), ethylmorphine (commonly known as dionin) and their respective salts.

Section 4.—An Order or Declaration made by His Majesty in Council under the Dangerous Drugs Acts, 1920 to 1932, may be varied or revoked by a subsequent Order or Declaration made in the like manner and subject to the like provisions.

DANGEROUS DRUGS REGULATIONS, 1937 SUMMARISED

MADE IN PURSUANCE OF SECTION 7 OF THE DANGEROUS DRUGS ACT, 1920.

REGULATION 1. *Manufacture.*—Prohibited except by an authorised person on authorised premises and in accord with the terms and conditions of his authority.

2. *Supply, procuring and advertising.*—Prohibited except by an authorised person and in accord with the terms and conditions of his authority.

The administration of a drug, etc., by or under the direct personal supervision, and in the presence of a doctor (or dentist for dental treatment) is not deemed supplying.

3. Possession.—Prohibited unless authorised. A person to whom a drug, etc., is lawfully supplied by a doctor or veterinary surgeon who dispenses his own medicines, or on a prescription given by a doctor, dentist or veterinary surgeon is authorised to be in possession, provided that he is not obtaining drugs, etc., from another doctor unknown to the first. A person is deemed to have possession if the drug is in his actual custody or is held for him by any other person.

4. Delivery to messengers.—Where a drug is to be supplied to a recipient otherwise than by a doctor or on a doctor's prescription, the supplier may only give it to a messenger sent by the recipient if that messenger is an authorised person or if he produces a written statement signed by the recipient to the effect that he is authorised to receive the drug on the latter's behalf. Such a messenger is an authorised person for such period only as suffices for delivery.

5. General authority.—(a) Medical practitioners, (b) dentists, (c) veterinary surgeons, (d) pharmacists dispensing at public hospitals or institutions, (e) persons in charge of a laboratory used for research or instruction and attached to a university, university college, public hospital or other institution approved by the Secretary of State, (*see* Dangerous Drugs (Approved Institutions) Orders, No. 20 and 22), (f) persons appointed by a local authority as analysts of food and drugs under the Food and Drugs (Adulteration) Act, 1928, (g) persons acting as sampling officers under the Food and Drugs (Adulteration) Act, 1928, (h) inspectors appointed by the Pharmaceutical Society under the Pharmacy and Poisons Act, 1933, (i) persons employed or engaged in testing the quality and amount of drugs, preparations and appliances supplied under the National Health Insurance Acts 1936-1937, and the regulations made thereunder, are authorised, so far as may be necessary for their professions or employments, as members of their respective classes, to be in possession of and to supply the drugs, except that a dentist may not supply drugs, etc., unless they are administered by, or under his direct supervision and in his presence to persons receiving treatment from him.

6. (i) Persons who are authorised sellers of poisons within the meaning of the Pharmacy and Poisons Act, 1933, are authorised (a) to manufacture on the registered premises in the ordinary course of their retail business (i) any extract or tincture of Indian Hemp and (ii) any preparation; and (b) subject to the provisions of the Regulations, to carry on on the registered premises the business of retailing, dispensing or compounding drugs, etc.

(ii) Every drug, etc., in the actual custody of a person authorised by this Regulation shall be kept in a locked receptacle which can be opened only by him or some assistant of his being a pharmacist.

7. Withdrawal of authority.—The Secretary of State is empowered to withdraw the authority from authorised persons convicted of offences against the Act. If the person is authorised by virtue of the preceding Regulation, the Council of the Pharmaceutical Society of Great Britain must be first consulted. If he is a doctor, dentist, or veterinary surgeon, the Secretary of State may direct that it shall be unlawful for that person to give prescriptions. If the Secretary of State suspects that a doctor or dentist is using, supplying or prescribing drugs otherwise than properly required for medical or dental treatment, he may refer the matter to a tribunal constituted as stated in the First Schedule to these Regulations, and on its recommendation, withdraw the person's authority.

8. Prescriptions. (1) A prescription means a prescription directing the supply of a drug, and given either by a medical practitioner for medical treatment, by a dentist for dental treatment, or by a veterinary surgeon for animal treatment. (2) The prescription must (a) be in writing and be signed by the person giving it with his usual signature and be dated by him, and (b) except in a health insurance prescription, specify the address of the person giving it, (c) specify the name and address of the person for whose treatment it is given, or, if it is given by a veterinary surgeon, of the person to whom the article prescribed is to be delivered, (d) have written thereon, if given by a dentist, the words "For local dental treatment only," and, if given by a veterinary surgeon, the words "For animal treatment only," (e) specify, if it prescribes a preparation contained, or compounded of preparations all of which are contained in the *B.P.*, the *B.P.C.*, or the *N.H.I. Drug Tariff*, the total amount of the preparation, or of each preparation, as the case may be, and in any other case the total amount of the drug to be supplied.

9. Dispensing of prescriptions.—(1) A person shall not supply a drug on a prescription (a) unless the prescription complies with the above, and (b) unless in the case of a health insurance prescription he has no reason to suppose that it is not genuine, or, in the case of any other prescription, he either (i) is acquainted

with the signature of the person by whom it purports to have been given, and has no reason to suppose that it is not genuine, or (ii) has taken reasonably sufficient steps to satisfy himself that it is genuine. (2) If a prescription expressly states that it may, subject to the lapse of a specified interval or intervals, be dispensed two or three times, the drug may be supplied a second or third time after the specified interval or intervals and no more, but otherwise a prescription shall not be taken to authorise the drug to be supplied more than once. (3) The person dispensing shall, at the time, mark on the prescription the date on which it is dispensed, and, in the case of a prescription which may be dispensed two or three times, the dates of the second and third time, and, unless it is a health insurance prescription, retain it and keep it on the premises to be available for inspection.

10. Marking of packages or bottles.—(1) No person shall (a) supply a drug unless the package or bottle is marked with the amount contained, or (b) supply a preparation, unless the package or bottle is plainly marked (i) in the case of a powder, solution, or ointment, with the total amount contained and the percentage of the drug contained, or (ii) in the case of tablets or other similar articles, with the amount of the drug in each article and the number of articles contained. (2) This does not apply to a prescription lawfully given by a medical practitioner.

11. Records.—(1) Every person authorised to supply shall (a) keep a register as set out as in the Second Schedule to these Regulations and enter therein true particulars as to every quantity of drug or preparation obtained by him and supplied by him, whether to persons within or without Great Britain, (b) use a separate register or separate part of the register for each of the various classes of drugs and preparations, (c) make the entry on the day on which the drug is received, or on which the transaction takes place, or, if that is not practicable, on the following day, (d) keep a separate register in respect of each set of business premises (subject to the approval of the Secretary of State, an authorised person may keep a separate register for each department of the business), (e) make no cancellation, obliteration, or alteration (any correction of an entry must be made by way of a marginal or foot note giving the date of correction), (f) on demand by the Secretary of State or by a person authorised in writing by him, furnish particulars required as to the obtaining or supplying or as to stocks, (g) the register may be used for entries required under Section 18 (2) (b) of the Pharmacy and Poisons Act, 1933, but, save as aforesaid, not for any other purpose. (2) The entering in the register shall not apply to (a) a medical practitioner who enters in a day book particulars of every drug or preparation supplied by him to any person, with the name and address of that person, and the date of supply, and enters in a separate book kept for the purposes of the Regulation a reference to each entry in the day book which relates to the supply, or (b) an authorised seller of poisons within the meaning of the Pharmacy and Poisons Act, 1933, who enters in a separate book kept for the purposes of this Regulation a proper reference to each entry in a Pharmacy Act book which relates to the supply of any drug or preparation. (3) References in the separate book must be made in chronological order, and the book must be kept in separate parts relating respectively to each of the several classes of drugs, and must not be used for any other purpose. (4) The entry in the day book or separate book must be made on the day an entry would have been required to be made in the register. (5) Every register, separate book, or day book in which any entry with respect to the supply of a drug or preparation is made, and every Pharmacy Act book containing an entry referred to in the separate book shall be kept on the premises to which the register or book relates or where the prescription was dispensed, so as to be available at all times for inspection. (6) Every entry and every correction must be made in ink, or indelibly written. (7) In this Regulation (i) a drug or preparation administered by, or under the direct supervision and in the presence of a medical practitioner or a dentist, shall not be deemed to have been supplied by him; (ii) a "proper reference" means a reference entered in the separate book under the same date as the entry in the day book or Pharmacy Act book, and otherwise such as to enable the entry to be easily identified.

12. Export.—Any drugs exported from a foreign country to another foreign country and brought into the U.K. must not, unless it is authorised by the Secretary of State, be diverted to any destination other than that stated in the authority for export from the country of export.

13. Special provisions for ships, farmers, stockowners and midwives.—The master of a ship not carrying a doctor may, subject to certain conditions, supply drugs to members of the crew providing a complete entry

specifying the drug used is made in the log-book. The M.O.H. or assistant M.O.H. of a port may issue a certificate to the master of a foreign ship authorising him to purchase and possess such quantity of drugs as he considers necessary until the ship reaches its home port. A person who supplies drugs on such a certificate shall retain it and mark it with the date on which the drug was supplied and keep it on his premises for inspection.

Farmers and stockowners who have obtained a certificate as set out in the Third Schedule to the Regulations from the Chief Officer of Police for the area in which they carry on business are authorised to be in possession of tincture of opium *B.P.*, for use solely in the treatment of animals, subject to the conditions specified in the certificate.

Certified and practising midwives are authorised to be in possession of and to administer preparations of opium so far as is necessary for the practice of their profession. They must enter in a book kept solely for this purpose particulars of all supplies obtained, including the date on which, and the name and address of the person from whom, the supply was obtained, and the quantity obtained.

14. Preservation of documents.—All records, prescriptions, etc., must be kept for two years from the date of the last entry or the date of issue, as the case may be.

15.—The Secretary of State may, subject to any conditions he may prescribe, exempt any hospital or other public institution from any provision of these Regulations.

16. Exemption of certain drugs and prescriptions.—The following are exempted from the conditions of these Regulations—(a) any drug, etc., mentioned in the Fourth Schedule to these Regulations or a drug, etc., which has been denatured as approved by the Secretary of State; (b) (i) any prescription issued for the purpose of testing the quality and amount of drugs, preparations and appliances supplied under the N.H.I. Acts, and the Regulations made thereunder, (ii) any prescription issued to a sampling officer under the Food and Drugs (Adulteration) Act, 1928.

17. Interpretation.—Includes the following definitions:—

Drug.—Any drug not being a preparation within the meaning of these Regulations to which Part III of the 1920 Act applies.

Registered Premises.—Premises registered under Part I of the Pharmacy and Poisons Act, 1933.

Pharmacy Act Book.—Either of the books required to be kept under Sections 18 (2) and 19 (3) of the Pharmacy and Poisons Act, 1933.

Register.—A bound book and not a loose-leaf register or card index.

In addition (a) a person authorised to manufacture shall be deemed authorised to supply, and (b) a person authorised to supply shall be deemed to be a person authorised to be in possession of, to procure, to offer to supply or procure, and to advertise for sale.

FIRST SCHEDULE.

Constitution of Reference Tribunal for the purpose of Regulation 7, (3).

SECOND SCHEDULE.

FORM OF REGISTER.

PART I.—*Drugs or preparations obtained.*

(The class of drugs and preparations to be specified at the head of each page.)

Date on which received.	Name.	Address.	Amount obtained.	Form in which obtained.
	of person or firm from whom obtained.			

PART II.—*Drugs or preparations supplied.*

(The class of drugs and preparations to be specified at the head of each page.)

Date of trans- action.	Name.	Address.	Authority of person or firm supplied to be in possession.	Amount supplied.	Form in which supplied.
	of person or firm supplied.				

THIRD SCHEDULE.

Certificate authorising farmers and stockowners to purchase tincture of opium, B.P.

FOURTH SCHEDULE.

Drugs and Preparations exempted from these Regulations.

Pasta Arsenicalis, *B.P.C.* 1934.
 Pil. Ipecac. c. Scilla, *B.P.C.* 1934.
 Pil. Digitalis et Opii Co., *B.P.C.* 1923.
 Pil. Hydrarg. c. Cret. et Opii, *B.P.C.* 1934.
 Pulv. Cretæ Aromat. c. Opio, *B.P.* 1932.
 Pulv. Ipecac. et Opii, *B.P.* 1932.
 Suppos. Plumbi c. Opio, *B.P.* 1932.
 Tabellæ Plumbi c. Opio, *B.P.C.* 1934.
 Elixir Diamorphinæ et Terpini c. Apomorphina, *B.P.C.* 1934.
 Linctus Diamorphinæ Camphoratus, *B.P.C.* 1923 and 1934.
 Linctus Diamorphinæ c. Ipecacuanha, *B.P.C.* 1934.
 Linctus Diamorphinæ et Scillæ, *B.P.C.* 1923 and 1934.
 Linctus Diamorphinæ et Thymi, *B.P.C.* 1923 and 1934.
 Mixtures of Pulv. Ipecac. et Opii, *B.P.* 1932 with any of the following:—
 Hydrarg. c. Cret., *B.P.* 1914 and 1932.
 Acetylsalicylic Acid.
 Phenacetin.
 Quinine and its Salts.
 Sodium Bicarbonate.

Cocaine Eyedrops—a preparation consisting of an admixture of cocaine in castor oil with mercuric chloride in a proportion of not more than one part in 200 of cocaine and not less than one part in 3000 of mercuric chloride.

Methyilmorphine and ethylmorphine and their respective salts and any preparation, admixture or other substance containing any proportion of methyilmorphine or ethylmorphine associated with an inert substance whether solid or liquid; and preparations and admixtures or other substances containing more than 2.5 per cent. of methyilmorphine or ethylmorphine (calculated as pure drug) associated with other medicinal substances.

ORDERS IN COUNCIL APPLYING TO DANGEROUS DRUGS ACT, 1920, SUMMARISED.

1. **Methyilmorphine and Ethylmorphine.** (April 13th, 1937). Brings any preparation, admixture or other substance (except Syrupus Codeinæ Phosphatis *B.P.C.* 1934) containing any proportion of methyilmorphine (commonly known as codeine) or ethylmorphine (commonly known as dionin) associated with any inert substance whether solid or liquid, and any preparation, admixture or other substance containing more than 2.5% of methyilmorphine or ethylmorphine (calculated as pure drug) associated with any other medicinal substance into Part III of the 1920 Act. Schedule Four of the Dangerous Drugs Regulations 1937, however, exempts all these preparations, admixtures and substances from the provisions of these regulations. Hence the ultimate effect of the order is to bring the import and export of these substances under control, and in no other way alters the position of codeine and dionin (*see* p. 1145).

2. **Ecgonine and Morphine.** The order of June 8th, 1937, states that after July 1st, 1937, Part III of the 1920 Act shall apply to all preparations of esters of ecgonine or of their respective salts and all preparations of ecgonine containing less than one-tenth per cent. of ecgonine and to all preparations of esters of morphine in the same manner as the said Part III applies to the drugs mentioned in Section 8 (i) of the 1920 Act (*see p. 1133*).

3. **Exemptions.** The order of April 13th, 1937, states that in accordance with Article 8 of the International Opium Convention, Part III of the 1920 Act shall cease to apply to the articles specified in the following schedule after June 30th, 1937.

SCHEDULE.

(a) Morphine Preparations.

1. *Cereoli iodoformi et morphinæ.*—In 1 bougie, iodoform 0.320 g., morphine hydrochloride 0.016 g., oil of theobroma, sufficient to fill a 1 g. mould.
2. *Emplastrum opii.*—Elemi 20 g., terebinthina 30 g., cera flava 15 g., olibanum pulvis 18 g., benzoes pulvis 10 g., opii pulvis 5 g., balsamum peruvianum 2 g.
3. *Emplastrum opii.*—Extract of opium 25 g., refined elemi 25 g., diachylon plaster with gum 50 g.
4. *Emplastrum opii.*—Elemi 8 g., terebinthinæ communis 15 g., cera flavæ 5 g., olibani pulveratæ 8 g., benzoes pulveratæ 4 g., opii pulverati 2 g., balsami peruviani 1 g.
5. *Emplastrum opii.*—Opium, in very fine powder 10 g., resin plaster 90 g.
6. *Emplastrum opii* (*see formula under 5*) mixed with other plasters contained in the B.P. or B.P.C.
7. *Linimentum opii.*—Tincture of opium 500 ml., liniment of soap, 500 ml.
8. *Linimentum opii* (*see formula under 7*) mixed with any other liniment of the B.P. or of the B.P.C.
9. *Linimentum opii ammoniatum.*—Ammoniated liniment of camphor 30, tincture of opium 30, liniment of belladonna 5, strong solution of ammonia 5, liniment of soap to 100.
10. *Linimentum opii ammoniatum* (*see formula under 9*) mixed with any other B.P. or B.P.C. liniment.
11. *Caustic "Nerve Pastes."*—Preparations containing in addition to morphine salts, or morphine and cocaine salts, at least 25% of arsenious acid, and made up with the requisite proportion of creosote or phenol to produce the consistency of a paste.
12. *Diarrhœa pills.*—Camphor 0.0648 g., lead acetate 0.013 g., bismuth subnitrate 0.162 g., tannic acid 0.0648 g., opium powder 0.026 g.
13. *Pilula digitalis et Opii compositæ.*—Digitalis leaves, in powder 0.31 g., opium in powder 0.19 g., ipecacuanha root, in powder 0.13 g., quinine sulphate 0.78 g., syrup of glucose, a sufficient quantity to make 12 pills.
14. *Pilula hydrargyri cum Opio.*—Mercury pill 3.89 g., opium in powder 0.19 g., to make 12 pills.
15. *Pilula hydrargyri cum Creta et Opii.*—Mercury with chalk 0.78 g., compound powder of ipecacuanha (*see formula under 21*) 0.78 g., milk sugar and syrup of glucose, of each a sufficient quantity to make 12 pills.
16. *Pilula ipecacuanhæ cum Scilla.*—Compound powder of ipecacuanha (*see formula under 21*) 30 g., squill, in powder 10 g., ammoniacum, in powder 10 g., syrup of glucose, a sufficient quantity.
17. *Pilula hydrargyri bichlorati cum Opii extracto.*—Bichloride of mercury triturated 10 cg., extract of opium 20 cg., extract of couch-grass 20 cg., liquorice root in powder, *q.s.* for 10 pills.
18. *Pilula hydrargyri iodati cum Opii pulvere.*—Hydrargyrum iodatum, freshly prepared 50 cg., opium powder 20 cg., powdered liquorice 30 g., white honey, *q.s.* for 10 pills.
19. *Pilula plumbi, cum Opio.*—Lead acetate, in powder 80 g., opium, in powder 12 g., syrup of glucose 8 g. (or a sufficient quantity).
20. *Pilula terebinthinæ compositæ.*—Opium 0.5 g., chinini sulfas 2 g., styrax liquidus 2 g., terebinthina laricina 8 g., magnesi subcarbonas, a sufficient quantity to make 100 pills.
21. *Pulvis ipecacuanhæ compositus.* *Syn.* PULVIS IPECACUANHÆ ET OPII, DOVER'S POWDER. Ipecacuanha root, in powder 10 g., opium, in powder 10 g., potassium sulphate in powder 80 g.
22. Mixtures of *Dover's powder* (*see formula under 21*) with mercury and chalk, aspirin, phenacetin, quinine and its salts, and sodium bicarbonate.

23. *Pulvis kino compositus*.—Kino, in powder 75 g., opium, in powder 5 g. cinnamon bark, in powder, 20 g.

24. *Suppositoria plumbi composita*. *Syn.* SUPPOSITORIA PLUMBI CUM OPIO. Lead acetate, in powder 2.4 g., opium, in powder 0.8 g., oil of theobroma, a sufficient quantity for 12 suppositories, each weighing about 1 g.

25. *Coryza Tablets No. 2*.—Powdered opium 0.0043 g., quinine sulph. 0.022 g., ammon. chlor. 0.022 g., camphor 0.022 g., ext. belladonna leaves 0.0043 g., ext. aconite root 0.0043 g.

26. *Diarrhoea Tablets No. 2*.—Powdered opium 0.016 g., camphor 0.016 g., powdered ipecacuanha 0.008 g., lead acetate 0.011 g.

27. *Dysentery Tablets*.—Powdered opium 0.013 g., powdered ipecacuanha 0.0648 g., powdered calomel 0.0324 g., lead acetate 0.0324 g., bismuth betanaphthol 0.1944 g.

28. *Tabella hydrargyri cum Opio*.—Mercurous chloride powder 0.065 g., antimony oxide powder 0.065 g., ipecacuanha-root powder 0.065 g., powdered opium 0.065 g., milk sugar 0.065 g., gelatine solution, a sufficient quantity to make 1 tablet.

29. *Tabella plumbi cum Opio*.—Sugar of lead 0.195 g., powdered opium 0.065 g., gelatine solution, a sufficient quantity to make 1 tablet.

30. *Tabletæ plumbi cum Opio*.—Lead acetate, in fine powder 19.44 g., opium, in powder 3.24 g., refined sugar, in powder 6.48 g., ethereal solution of theobroma 3.60 ml., alcohol 0.90 ml.

31. *Unguentum gallæ compositum*.—Galls in very fine powder 20, extract of opium 4, distilled water 16, wool fat 10, soft paraffin, yellow 50.

32. *Unguentum gallæ compositum* (see formula under 31) mixed with other ointments and plasters contained in the B.P. or B.P.C.

33. *Unguentum gallæ cum Opio*.—Gall ointment 92.5 g., opium in powder 7.5 g.

34. *Unguentum gallæ cum Opio* (see formula under 33) mixed with other ointments and plasters contained in the B.P. or B.P.C.

35. *Yatren*—105 (iodoxyquinoline-sulphonic acid) with 5% opium admixture.

(b) Cocaine Preparations.

1. *Bernatzik's Injections*.—(a) Hydrargyrum bicianatum 0.03 g., cocaineum 0.02 g., (b) Hydrargyrum succinatum 0.03 g., cocaineum 0.01 g.

2. *Sila's Injections*.—(a) Hydrargyrum succinatum 0.03 g., cocaineum muriaticum 0.01 g., (b) Hydrargyrum succinatum 0.05 g., cocaineum muriaticum 0.03 g.

3. *Natrium biboracicum compositum cum cocaino*.—In tablets, compressed tablets, lozenges, pastilles and the like, difficult to break up, and containing not more than 0.2% of cocaine salts in conjunction with not less than 20% borax and not less than 20% antipyrine, or some similar analgesic, and not more than 40% of flavouring matter. Maximum weight of each tablet, etc., 1 g.

4. *Caustic "Nerve Pastes"*.—Preparations containing, in addition to cocaine salts or cocaine and morphine salts, at least 25% of arsenious acid, and made up with the requisite proportion of creosote or phenol to produce the consistency of a paste.

5. *Cocaine and atropine tablets*, with a content of not more than 0.0003 g. of cocaine salts and not less than 0.0003 g. of atropine salts to each tablet. Atropinum sulphuricum 0.0003 g., cocaineum hydrochloricum 0.0003 g., mannite 0.003 g. Weight of one tablet 0.0036 g. Cocaine content 8.3%.

(c) Heroin Preparations.

1. *Elixir camphoræ compositum*.—Camphor 4 gr., oil of anise 5 m., benzoic acid 6 gr., diamorphine hydrochloride 4 gr., liquid extract of ipecacuanha 120 m., tincture of squill 1½ fl. oz., simple syrup to 20 fl. oz.

2. *Elixir diamorphine et terpin*, with *apomorphine*.—Apomorphine hydrochloride 5 gr., diamorphine hydrochloride 4 gr., terpin hydrate 44 gr., alcohol 10 fl. oz., glycerine 5 fl. oz., syrup of wild cherry to 20 fl. oz.

3. *Linctus diamorphine with ipecacuanha*.—Liquid extract of ipecacuanha 120 m., diamorphine hydrochloride 4 gr., tincture of hyoscyamus 1½ fl. oz., spirit of chloroform 1½ fl. oz., syrup of balsam of tolu 3 fl. oz., syrup of wild cherry 3 fl. oz., glycerine to 20 fl. oz.

4. *Linctus senegæ compositus*.—Liquid extract of senega 1 fl. oz., liquid extract of squill 1 fl. oz., tartarated antimony 8 gr., diamorphine hydrochloride 4 gr., glycerine 2 fl. oz., simple syrup to 20 fl. oz.

5. *Linctus thymi compositus*.—Diamorphine hydrochloride 4 gr., apomorphine hydrochloride 5 gr., distilled water 1 fl. oz., liquid extract of thyme (1-1) 5 fl. oz., solution of tolu $1\frac{1}{2}$ fl. oz., glycerine to 20 fl. oz.

(d) **Dicodide Preparations.**

1. *Cardiazol-Dicodide Solutions*.—Solutions containing not less than 10% of cardiazol and not more than 0.5% of dicodide salts.

(e) **Eucodal Preparations.**

1. *Anti-Opium Tablets*.—Eucodal 1 g., pulvis gentianæ 35 g., pulvis ipecacuanhæ 20 g., quinine sulphate 20 g., ca. feine 5 g., sugar of milk 25 g., mix up and make up 5 gr. tablets.

In exempting this preparation from the operation of the Geneva Convention, the Health Committee expressed the wish that it should not be offered to the public under the name of "anti-opium."

2. *Tablets B.B. Compound*.—Berberis vulgaris powder 0.0324 g., nux vomica 0.013 g., eucodal 0.0032 g., ipecacuanha 0.0648 g., rhubarb 0.013 g., pulvis cinnamoni compositus 0.0324 g., aromatic chalk 0.0032 g.

DANGEROUS DRUGS (HOSPITAL GENERAL EXEMPTION) ORDER (1924), SUMMARISED.

By Order dated August 9, 1924, certain hospitals and other institutions are exempted from operation of the Regulations on compliance with certain conditions. This Order substitutes and revokes an Order on the same subject made August 15, 1921. Exempted are:—Any hospital or infirmary, asylum, poor-law institution or sanatorium supported by any public authority, or out of public funds or by a charity or voluntary subscription, in which the drugs are dispensed by a medical practitioner or a pharmacist or—in a poor-law institution—a dispenser whose qualifications and appointment are approved by the Minister of Health, if the conditions of Schedule I (below) are complied with, or, if there is no such dispenser, if the conditions of Schedule II (below) are complied with. Any institution exempted under this Order may be inspected at any time by any person so authorised by the Secretary of State, to ensure that the prescribed conditions are being fulfilled.

SCHEDULE I.

1. Orders for supplies must be signed by the pharmacist, or if no such person is employed, by one of the medical practitioners attached to the hospital.
2. Supplies to be kept in the charge of the person responsible for dispensing, and records to be kept.
3. The medicine only to be dispensed for use of an individual patient, etc.
4. The person responsible for dispensing the drugs shall at the time of dispensing any prescription stamp, or otherwise mark, the prescription with the prescribed particulars, and shall keep records.
5. Prescriptions must be kept for two years.
6. Stock preparations in wards or out-patient department shall only be supplied on the requisition of the sister in charge, who shall keep the drugs under lock and key, and only be used by her in accordance with the directions of one of the medical practitioners in charge of the patients.
7. A requisition shall be marked in the dispensary to show that it has been complied with, filed there, and a copy or note of the requisition kept by the sister in charge.
8. Precautions shall be taken to prevent any theft of the drugs.
9. Preparations may be prescribed by any name known in the hospital.
10. Nothing in this Schedule shall affect any medicine or other substance to which the Regulations do not apply.

SCHEDULE II.

Supplies are to be to, or on the order of, a medical practitioner attached to the hospital (not the dispenser), and he must certify that the supply is necessary for the treatment of the patients. The matron is to be responsible for keeping the drugs (in a locked cupboard, of which she alone shall have the key), and for using or administering them and recording their purchase, but they are only to be used, etc., under the direction of a medical practitioner attached to the hospital. Except so far as this Schedule modifies them, the Regulations must be observed—for instance, the chemist supplying a hospital must record the supplies, get them signed for and mark the packages as on ordinary sales.

DANGEROUS DRUGS (HOSPITAL GENERAL EXEMPTION) (AMENDMENT) ORDER, 1939, SUMMARISED.

(1) Drugs kept at a hospital or other institution to which this Order applies may, during a period of emergency, be distributed, in accordance with arrangements made by the Minister of Health, by the person responsible for dispensing medicines at the hospital or other institutions to a hospital included in the Emergency Hospitals Scheme or first-aid post established for the treatment of persons injured in a hostile attack. The said person must record the name and address of the hospital included in the Emergency Hospital Scheme or first-aid post to which the drug is distributed, the quantity of the drug distributed, the date of distribution, and the person to whom it is delivered for conveyance to the hospital or first-aid post.

(2) This Order applies to any hospital, infirmary, mental hospital, asylum, Poor Law institution or sanatorium supported by any public authority or out of any public funds or by a charity or voluntary subscriptions, in which the drugs dispensed by a doctor or pharmacist or, in the case of a Poor Law institution, by a dispenser whose qualifications and appointment are approved by the Minister of Health, if the conditions of the first schedule to the Dangerous Drugs (Hospital General Exemption) Order, 1924, are complied with.

NURSING HOMES.

The Dangerous Drugs (Hospital General Exemption) Order (1924) does not apply to nursing homes, and drugs to which the Dangerous Drugs Acts and Regulations apply may only be supplied for the use of patients in like manner as the drugs may be supplied to patients in their own homes. A separate prescription must be written by the medical practitioner for the individual patient. The nursing home may not hold a "stock" of drugs. For a note of the conditions under which poisons other than "dangerous drugs" may be supplied to nursing homes to hold as a "stock," see page 1107.

SPECIAL AUTHORISATIONS.

Although persons within the classes indicated below may be supplied with the preparations mentioned, they must comply with the special conditions laid down for each by the Home Office.

In supplying the drugs to the authorised persons the full requirements of the Dangerous Drugs Acts and Regulations, and of the Pharmacy and Poisons Act and Rules, must be observed.

Cocaine in Castor Oil to Owners of British Steam Fishing Vessels. (Dec. 1927.)

Eye-drops of the same formula as that indicated for supply to factory owners may be sold to the owner of a British steam fishing vessel. For conditions of authority of masters of British or foreign ships (other than British steam fishing vessels) to be in possession of certain drugs, see Regulation 13 of the Dangerous Drugs Regulations, 1937, page 1137.

Agents of Overseas Governments. (Dec. 1933.)

Certain persons named in the Schedule to the authorisation may procure "dangerous drugs" for their respective governments. The drugs must be obtained from persons or firms licensed to supply them. The persons named are *not* authorised to be in possession of the drugs.

RAW OPIUM, ETC., REGULATIONS, 1937, SUMMARISED.

MADE UNDER SECTION 3 OF THE DANGEROUS DRUGS ACT, 1920, AND SECTION 1 OF THE DANGEROUS DRUGS ACT, 1925.

1. *Supply, procuring and advertising.*—Prohibited, except by an authorised person in accordance with the terms of his authority.

2. *Possession.*—Only authorised persons may be in possession of a drug, *i.e.*, in his actual custody or held by any other person subject to his control or for him or on his behalf.

3. *Delivery to messengers.*—Where a drug is to be supplied to a recipient, the supplier may only give it to a messenger sent by the recipient if that messenger is an authorised person or if he produces a written statement signed by the recipient to the effect that he is authorised to receive the drug on the latter's

behalf. Such a messenger is an authorised person for such period only as suffices for delivery.

4. General Authority.—(a) Medical practitioners, (b) veterinary surgeons, (c) authorised sellers of poisons within the Pharmacy and Poisons Act, 1933, (d) pharmacists employed as dispensers at public hospitals or institutions, (e) persons in charge of a laboratory used for research or instruction and attached to a university, university college, public hospital or other institution approved by the Secretary of State, (f) persons appointed by a local authority as analysts under Section 15 of the Food and Drugs (Adulteration) Act, 1928, (g) persons acting as sampling officers under the Food and Drugs (Adulteration) Act, 1928, (h) persons appointed by the Pharmaceutical Society of Great Britain as inspectors under Section 25 of the Pharmacy and Poisons Act, 1933, are authorised as far as may be necessary for the practice of their professions or employment as members of their classes, to be in possession of and supply drugs.

5. Withdrawal of authority.—The Secretary of State is empowered to withdraw the authority from any authorised person convicted of an offence against the 1920 Act or under the enactments relating to the Customs as applied by the 1920 Act.

6. Records.—Persons authorised to supply drugs shall keep a record as set out in First Schedule to the Regulations and enter in it all transactions. Separate registers or parts of the register must be kept for raw opium, coca leaves and Indian hemp, including resins obtained from Indian hemp and all preparations, except extract or tincture of Indian hemp, of which such resins form the base. Every entry must be made in ink or indelibly on the day on which the transaction takes place, or on the following day. Corrections must be made by means of a marginal or foot-note only, and dated. Separate registers must be kept for each set of premises, or subject to the approval of the Secretary of State for each department of the business. The register must be kept in some part of the premises to which it relates so as to be available at all times for inspection. The authorised person must, on demand, furnish particulars of all transactions and of stocks of drugs held to the Secretary of State or any person empowered in writing by the Secretary of State.

7. Export.—Any drugs exported from a foreign country to another foreign country and brought into the U.K. must not, unless it is authorised by the Secretary of State, be diverted to any destination other than that stated in the authority for export from the country of export.

8. Preservation of documents.—All registers, records, etc., must be kept for two years from the date of the last entry, and any other documents for two years from the date of issue.

9. Interpretation.—Includes the following definition:—

Drug.—Any drug, resin or preparation, other than extract or tincture of Indian hemp, to which Part I of the 1920 Act applies.

FIRST SCHEDULE

FORM OF REGISTER.

PART I.

Entries to be made in case of drugs obtained.

(The kind of drug to which the entries relate to be specified at the head of each page in the Register.)

Date on which supply received.	Name	Address	Amount obtained.
	of person or firm from whom obtained.		

PART II.

Entries to be made in case of drugs supplied.

(The kind of drug to which the entries relate to be specified at the head of each page in the Register.)

Date on which the transaction was effected.	Name	Address	Authority of person or firm to whom drug supplied to be in possession thereof	Amount supplied.
	of person or firm to whom supplied.			

METHYLMORPHINE AND ETHYLMORPHINE REGULATIONS SUMMARISED.

MADE UNDER SECTION 7 OF THE 1920 ACT, AND SECTION 2 (3) OF THE DANGEROUS DRUGS ACT, 1932, FOR CONTROLLING THE MANUFACTURE, SALE, POSSESSION AND DISTRIBUTION OF METHYLMORPHINE (COMMONLY KNOWN AS CODEINE), ETHYLMORPHINE (COMMONLY KNOWN AS DIONIN) AND THEIR RESPECTIVE SALTS.—S.R. & O., Sept. 13, 1933.

REGULATION 1. Manufacture.—Prohibited, except by a licensed person and in accord with the terms and conditions of his licence.

2. Supply of drugs.—Except as provided, a wholesale druggist shall not supply a drug to any person either in Great Britain or elsewhere (a) unless licensed, (b) otherwise than in accord with the terms and conditions of his licence, (c) if the drug is to be supplied in any one transaction in quantity exceeding one pound avoirdupois, unless the person to whom it is to be supplied is licensed to be in possession of the drug.

3. Possession.—(1) A person shall not be in possession of a drug in a quantity exceeding one pound avoirdupois unless he is so licensed.

(2) A person shall be deemed to be in possession if the drug is in his actual custody, or is held by any other person subject to his control or for him or on his behalf.

4. Marking of packages or bottles.—No wholesale druggist licensed to supply a drug shall supply it unless the container is plainly marked with the amount of the drug contained therein.

5. Keeping of registers.—Every wholesale druggist licensed to supply shall (a) keep a register, and set out as in the Schedule to these Regulations true particulars as to every quantity of drug obtained by him and supplied by him, whether to persons within or without Great Britain, (b) use a separate register or separate part of the register for (i) methyilmorphine and its salts, (ii) ethyilmorphine and its salts, (c) make the entry on the day on which the drug is received or on which the transaction takes place, or, if that is not practicable, on the following day, (d) keep a separate register in respect of each set of business premises (subject to the approval of the Secretary of State, a licensed wholesale druggist may keep a separate register for each department of the business), (e) make no cancellation, obliteration, or alteration (any correction of an entry must be made by way of a marginal or foot note, giving the date of correction), (f) on demand by the Secretary of State, or by a person authorised in writing by him, furnish particulars as to the obtaining or supplying, or as to stocks, (g) the register may be used for entries required under the Pharmacy and Poisons Acts, 1852-1933, but, save as aforesaid, not for any other purpose, (h) every register shall be kept on the premises to which it relates, and so as to be at all times available for inspection.

6. Preservation of registers.—All registers which are kept in pursuance of the requirements of these Regulations are to be kept for a period of two years from the date of the last entry.

7. **Regulations not to apply to certain types of sale.**—Nothing in these Regulations shall apply to any sale or distribution of any of the drugs by a person other than a wholesale druggist, nor to any sale or distribution by an authorised seller of poisons in the course of any retail business.

8. **Interpretation.**—(1) In these Regulations the following expressions have the meanings hereby assigned to them:—

"Licence" means any licence issued by the Secretary of State under Section 12 of the Dangerous Drugs Act, 1920, and the expression "licensed" shall be construed accordingly.

"Authorised seller of poisons" means a person lawfully carrying on business in accordance with the provisions of the Pharmacy and Poisons Act, 1933, as an authorised seller of poisons.

"Drug" means Methymorphine, Ethylmorphine and their respective salts.

"Retail business" means the business of retailing or dispensing (or compounding) drugs carried on at a shop.

"Wholesale druggist" means a person who carries on the business of selling drugs to persons who buy to sell again.

(2) For the purpose of these Regulations, but subject to any limitation attached to his licence: (a) a wholesale druggist licensed to manufacture a drug shall be deemed licensed to supply; and (b) a wholesale druggist licensed to supply shall be deemed to be a person licensed to be in possession of that drug for the purpose of Regulation 3 of these Regulations.

SCHEDULE.

*i.e., wholesale druggist, medical practitioner, pharmacist, etc.

THERAPEUTIC SUBSTANCES ACT, 1925, SUMMARISED.

(15 AND 16 GEO. V. CHAPTER 60.)

AN ACT TO PROVIDE FOR THE REGULATION OF THE MANUFACTURE, SALE, AND IMPORTATION OF VACCINES, SERA, AND OTHER THERAPEUTIC SUBSTANCES.

1. This Act applies to:—
 - (1) Vaccines, sera, toxins, antitoxins and antigens.
 - (2) Salvarsan (dioxo-diamino-arseno-benzol-di-hydrochloride) and analogous substances used for the specific treatment of infective diseases.
 - (3) Preparations of the specific antidiabetic principle of the pancreas known as insulin.
 - (4) Preparations of the posterior lobe of the pituitary body intended for use by injection.
 - (5) Sterilised surgical ligature and sterilised surgical suture (*i.e.*, any ligature or form of binding material prepared from the gut or any tissue of an animal, and offered or intended to be offered for sale as sterile and ready for use in surgical operations upon the human body). (Added S.R. & O. 1931, No. 633.) and any other therapeutic substances, afterwards called "substance," which may from time to time be added by regulations made under this Act as being substances the purity or potency of which cannot be adequately tested by chemical means.
2.
 - (1) To manufacture for sale any substance to which this Act applies licences (personal and premises) from the licensing authority are required.
 - (2) The licence continues in force for such period as may be prescribed (two years), but may from time to time be renewed for a like period.
 - (3) The conditions under which the substances are manufactured, and the premises, must satisfy the licensing authority.
 - (4) A licence may be revoked or suspended if the licensee fails to comply with the requirements.
 - (5) This section does not apply to the preparation by a medical practitioner for any of his own patients or for, and at the request of, another practitioner, if specially prepared with reference to the condition, and for the use, of an individual patient.
3.
 - (1) Importation into Great Britain or Northern Ireland necessitates standards of strength, quality and purity, and the substance is to be consigned to a person licensed by the licensing authority to import; or to a person engaged in scientific research holding a special licence to import.
 - (3) Substances prohibited come under Section 42 of the Customs Consolidation Act, 1876, and any Act amending or extending.
4.
 - (1) Joint Advisory Committees frame regulations.
5.
 - (1) The joint committee has power to make regulations for prescribing standards, tests, adding to the Schedule, prescribing the forms of licences, including inspection of premises and plant, and to take samples, and to exclude any substance used solely for veterinary purposes. If advertised or sold as a proprietary medicine or contained in such medicine, such accepted scientific name, or name descriptive of the true nature and origin of the substance, as may be prescribed, shall appear on the label. Date of manufacture shall be stated on all vessels or packages, and the sale is prohibited after the expiry of the prescribed period.
6. Contravention of the Act renders a person liable on summary conviction to a fine not exceeding £100, and on second or subsequent convictions to a fine and imprisonment, with or without hard labour for not exceeding three months, and in either case goods to be forfeited and licence may be revoked or suspended.
7.
 - (1) The licensing authorities are for England and Wales, the Minister of Health; for Scotland, the Scottish Board of Health; for Northern Ireland, the Minister of Home Affairs for Northern Ireland.

THERAPEUTIC SUBSTANCES REGULATIONS, 1931, SUMMARISED.

With the amendments of subsequent regulations (S.R. & O. 1935, No. 580; S.R. & O. 1937, No. 767; S.R. & O. 1939, No. 1395) incorporated.

PART I. Interpretation; revocation of Regulations; addition of sterilised surgical ligature and suture as substances to which the Act of 1925 applies; licences and applications for licences.

PART II. Licences for manufacture of therapeutic substances.

6. Applicant to satisfy the licensing authority that upon issue or renewal of licence the conditions set out in No. 7 of these Regulations will be observed.
7. (a) Concerns provision of adequate staff and premises for manufacture. (amended by S.R. & O. 1939, No. 1395).
- (b) And for tests of the strength, quality and purity of the substance, including housing for animals used, the licensee shall maintain staff and premises to carry out tests, or make arrangements with some institution approved for such tests to be regularly carried out on his behalf.
- (c) Records of manufacture and tests to be kept with batch-number.
- (d) Inspectors may inspect the premises and plant, and the process of manufacture and the means employed for standardising and testing, and may take samples.
- (e) Any changes in the expert staff responsible and in the premises or plant to be reported.
- (f) Samples to be furnished on request.
- (g and h) Batches may be withheld from sale.
- (i) Licensee to comply with Parts III and IV and further requirements if necessary.

PART III. Provisions with regard to names of substances and to containers, etc.

8. *Name of Substance.*—If any substance is advertised or sold as a proprietary medicine, or is contained in a medicine the "proper name" of the substance shall appear on the label in the manner prescribed in this Part of these Regulations.
9. *Containers.*—The substance is to be sealed in a previously sterilised glass container. (Ligatures and sutures may be in containers other than glass.)
10. *Labelling.*—The following are required on every sealed container:—
 - (a) The proper name of the substance in letters not less conspicuous than those in which the proprietary name, if any, is written or printed, and following immediately after or under such proprietary name.
 - (b) The number of the licence under which the substance is manufactured preceded, in the case of import licences, by the words "Import Licence."
 - (c) A distinctive batch-number.
 - (d) Where a test for potency in units is required by these Regulations, a statement of the potency in units defined in terms of relation to the standard preparation described under these Regulations. (This does not apply to vaccine lymph or surgical ligature or suture.) In addition to the above, the following particulars together with any others specified in the relative schedule must appear either on the label on the container or on a label or wrapper affixed to any package in which the container is issued for sale:—
 - (e) The name and address of the maker, date of manufacture, and statements of toxicity if required, nature of antiseptic if any, are also enforced, also date of removal from cold storage at a temperature not exceeding 5°C.
11. The sale of a substance after prescribed date is prohibited, but a doctor may override this, if his attention has been drawn to the date and he is satisfied it is required by the urgency of the case.

PART IV. Standards of strength, quality and purity, and tests for determining.

15. Tests for living aerobic or anaerobic bacteria are to be made in the case of:—

- (a) Sera and solutions of serum proteins for injection.
 - (b) Certain bacterial vaccines (anti-typhoid, anti-typhoid-paratyphoid (T.A.B.), anti-typhoid-paratyphoid-cholera (T.A.B.C.), anti-plague, anti-dysentery, and whooping-cough vaccines).
 - (c) Toxins, antigens, and mixtures of toxins or antigens with serum which are intended to be used in medical practice for immunising treatment, or for diagnosis by inoculation of the patient.
 - (d) Solutions of insulin.
 - (e) Dry preparations of insulin intended for therapeutic use.
 - (f) Preparations of the posterior lobe of the pituitary body intended for use by injection, except preparations which, after being sealed in the containers, have been sterilised by heat in a manner satisfactory to the licensing authority.
16. The tests are to be applied:—
- (a) To samples taken from each batch of the substance before filling and sealing the containers; and
 - (b) To the contents of sample containers when ready for issue.
17. (a) In the case of samples taken from the batch at the time when the test is made, the quantity taken for test shall be not less than 0.1% of the total volume of the batch if the volume is not more than 10 litres, and not less than 10 Cc. if the volume is 10 litres or more, but shall in no case be less than 1 Cc. If the batch is contained in a number of bulk containers, samples in these proportions shall be taken from each of such bulk containers and separately tested.
- (b) In the case of the contents of sample containers, the number shall be not less than 1% of the total filled from the batch, if this number is not more than 1000, and not less than 10 if the total number is more than 1000.
18. Defines method of preparing and using media.
19. (1) In the case of samples taken from the batch, one-half of the total volume of the sample is to be used for aerobic and one-half for the anaerobic test.
- (2) In the case of the contents of sample containers, the contents of each container shall be tested for aerobic and anaerobic organisms. When the volume in each container is 2 Cc. or more, 1 Cc. shall be used for each test. When the volume in the container is less than 2 Cc., the contents shall be divided into two approximately equal parts, one for the aerobic and the other for the anaerobic test.
- (3) The inoculated tubes shall be incubated at 37°C. for five days and examined after incubation, permanent records being kept of such examination of each tube.
20. (1) If at this examination no growth is found in any tube, the sample has passed the test.
- (2) If at the examination a growth is visible, further samples may be taken and the tests repeated. The taking of samples from the batch may, if necessary, be repeated twice. If the same organism is visible in more than one test, the batch shall be treated as not sterile, and the material contained in the batch shall not be issued or used as part of a further batch unless and until it has been re-sterilised and has passed the tests.
21. Emergency Regulations.
22. Freedom from abnormal toxicity is ensured by injecting 0.5 Cc. of the serum into a normal mouse, and 5 Cc. into a normal guinea-pig.

PART V. Licences for import of substances.

23 and 24.—Broadly, the applicant must furnish a written undertaking signed by, or on behalf of, the manufacturer that the manufacturer will comply with the Regulations as to manufacture and testing.

PART VI. 25. Research Licences. Special modifications apply.

PART VII. 26. Substances manufactured or imported for export only. The licensing authorities may dispense with any of the requirements of the Regulations, if necessary.

PART VIII. Substances for veterinary use only.

27. Containers to be marked "to be used solely for veterinary purposes."

PART IX. Non-sterile Surgical Ligatures and Suture.

28. Containers and wrappers must be labelled in red ink "non-sterile surgical ligature (suture)—not to be used for operations upon the human body unless efficiently sterilised."

FIRST SCHEDULE provides forms of application for, and grant of, licences.

SECOND SCHEDULE, PART I. Vaccines, toxins, antigens, sera and antitoxins.

(A) Provisions applicable to the production of bacterial vaccines.

(1) Defines a bacterial vaccine.

(2) Requirements in respect of the staff of manufacturer.

(3) The proper name of a vaccine is the name of the micro-organism followed by the word "vaccine," except in the following:—

Anti-typhoid vaccine, anti-typhoid-paratyphoid vaccine (T.A.B.), anti-typhoid-paratyphoid A, B and C vaccine, anti-typhoid-paratyphoid cholera vaccine A and B, and anti-plague vaccine, whooping-cough vaccine, anti-dysentery vaccine (as amended 1941).

(6) The label on the container must indicate composition:—

(a) Number of micro-organisms per Cc. or

(b) Weight of dried substance of micro-organisms per Cc. or

(c) Number of micro-organisms or weight of dried substance of organisms used in preparing 1 Cc. of the finished product.

(B) Special provisions for Vaccine Lymph (Vaccinia).

(1) The proper name is "Vaccine Lymph."

Staff of establishment, housing of animals, precautions to observe, containers, labelling, tests for purity (glycerination and cold storage, tests of gas-producing anaerobic organisms, living hæmolytic streptococci) and potency are included.

PART II. Toxins and antigens.

(A) Provisions applicable to reagents used in the Schick Test for the diagnosis of susceptibility to diphtheria.

1.—(1) The reagents used in the Schick Test are two, Schick Toxin and Schick Control. Their proper names respectively are "Schick Test Toxin" and "Schick Control."

(2) Schick Toxin is a sterile filtrate from a culture on nutrient broth of the specific organism of diphtheria (*Corynebacterium diphtheriae*). It may be issued either (i) undiluted, or (ii) already diluted with saline solution to the strength proper for use in the test.

(3) Schick Control is prepared from the same batch of Schick Toxin as that with which it is issued for sale, by destroying the specific toxicity at 70°C. for a time not shorter than 5 minutes.

2. Tests for potency.

(B) Provisions for Diphtheria Prophylactic (amended by S.R. & O. 1935, No. 580).

(C) Provisions for Tuberculin and other preparations from the bacillus tuberculosis and its cultures.

The following has been added by S.R. & O. 1935, No. 580:—

(D) Provisions for Staphylococcus toxoid.

The following has been added by S.R. & O. 1939, No. 1395:—

(E) Provisions for Tetanus toxoid.

PART III. Provisions applicable to production of all sera from living animals.**PART IV. Provisions for particular sera and antitoxins.**

(A) Anti-bacterial sera and anti-toxic sera for which no potency test is prescribed.

(B) Anti-dysentery serum (Shiga) and other anti-dysentery sera.

(C) Diphtheria antitoxin.

(D) Tetanus antitoxin.

(E) Gas-gangrene antitoxin (perfringens).

The following have been added by S.R. & O. 1935, No. 580:—

(F) Antipneumococcus serum (Type I).

(G) Antipneumococcus serum (Type II).

(H) Staphylococcus antitoxin.

(I) Gas-gangrene antitoxin (oedematiens).

(J) Gas-gangrene antitoxin (vibrio septique).

The following has been added by S.R. & O. 1939, No. 1395:—

(K) Gas-gangrene antitoxin (histolyticus).

THIRD SCHEDULE. Arsphenamine and derivatives.

PART I. General provisions applicable to arsphenamine and derivatives. The standard preparations are kept in the National Institute for Medical Research, Hampstead. Biological tests are applied and tests for maximum toxicity and for therapeutic potency.

PART II. Special provisions for arsphenamine. Chemical and physical.

PART III. Special provisions for neo-arsphenamine.

PART IV. Special provisions for sulpharsphenamine.

PART V. Special provisions for derivatives of arsphenamine other than neo-arsphenamine and sulpharsphenamine.

FOURTH SCHEDULE. Insulin.—Proper name. Special conditions of licence. Standard. Units. Quality. Tests. Container. Label.

FIFTH SCHEDULE. Pituitary (Posterior Lobe) Extract.—Proper name. Standard. Units. Quality. Tests. Container. Label.

SIXTH SCHEDULE. Sterilised Surgical Ligature and Suture.—Proper name. Tests for sterility. Label. (Amended by S.R. & O. 1937, No. 767.)

**EMERGENCY POWERS (DEFENCE) (SHORTAGE OF DRUGS)
ORDER, SUMMARISED.**

MADE UNDER REGULATION 60H OF THE DEFENCE (GENERAL) REGULATIONS, 1939.
—S.R. & O. 1941, No. 273 (Feb. 24, 1941).

- Any person dispensing or supplying medicines on prescriptions requiring the use or supply of a quantity of a substance set out in the first column of the Schedule to this order (in this order referred to as a "scarce substance") may use or supply the corresponding amount of the authorised alternative, unless the prescription expressly forbids the use or supply of another substance by the insertion against the scarce substance of the letters "N.A." or of words indicating that no other substance is to be used or supplied in place of the scarce substance.
- The "authorised alternative" to a scarce substance is the substance set out in relation to the scarce substance in the second column of the Schedule to this order, and equal quantities of the scarce substance and of the authorised alternative are deemed to correspond.

SCHEDULE

Scarce substance	Authorised alternative
Potassium bicarbonate	Sodium bicarbonate
Potassium bromide	Sodium bromide
Potassium citrate	Sodium citrate
Potassium iodide	Sodium iodide

THERAPEUTIC INDEX OF DISEASES AND SYMPTOMS

This index is included as a general guide to treatment by drugs and is intended to refer the reader to the text, the number following each entry indicating the page or pages on which information may be found concerning the use of the drug in the disease under consideration (*see also* Preface, p. xxiv).

For bacteriological and clinical notes with reference to special diseases, see Vol. II.

Abortion, Habitual.—Vitamin E, 386; Progesterone, 729; Pregneninolone, 731; Gonadotrophic Factor, 843.

Abortion, Threatened.—Vitamin E, 386; Viburn., 560; Estrogens, 718 *et seq.*; Progesterone, 729; Pregneninolone, 731; Gonadotrophic Factor, 842.

Abscess, Liver, Tropical.—Emet. (and salts), 661; Quinin. Hydrobrom., 883.

Abscesses, Dental.—Calx Sulphur., 342; Emp. Capsic. Mit. *vel* Fort., 361; Dec. Papav. et Anthem. Fort., 770.

Abscesses, General, to abort.—Calx Sulphur., 342; Vaccin. Staphylococcic., 1073; Staphylococcus Toxoid, 1073.

Local.—Liq. Calc. Chlorinat. c. Acid. Boric., 398; Allant., 559; Liq. Hydrog. Perox., 612; Ulm. Fulv., 678; Pot. Permang., 692; Phenol, 808.

Abscesses, Tuberculous.—Allyl. Sulphid., 168; Guaiacol, 462; Glycer., 552; Iodof., 640.

Achlorhydria.—Acid. Hydrochlor. Dil., 58; Betainæ Hydrochlor., 59; Gentian., 547; Ext. Hydrast. Liq., 609; Nux Vom., 712; Pepsin., 790; Strychn., 930.

Local (Lavage).—Liq. Hydrog. Perox., 613.

Acidity of the Stomach.—*See Hyperchlorhydria.*

Acidosis.—Pot. Cit., 40; Sod. Cit., 41; Sod. Lact., 78; Lactate-Ringer Soln., 79; Calc. Phosph., 91; Sod. Phosph., 92; Dextros., 473; Sod. Bicarb., 919.

Acne Rosacea.—Antim. et Pot. Tart., 196; Chrysarob., 411; Ichtham., 622; Ung. Sulphur. Hypochlor., 976; Ung. Sulphur. Iod., 977.

Acne Vulgaris.—Calc. Chlorid., 60; Liq. Sod. Chlorid. Physiol., 66; Ung. Acid. Salicyl., 95; Lappa, 320; Calx Sulphur., 342; Cerevis. Ferment., 384; Guaiac. Res., 453; Creosot., 460; Ichtham., 621; Colloidal Manganese, 694; Phenol, 808; Ol. Terebinth., 828; Potass. Sulphur., 864; Resorcin. Monoacet., 886; Sulphur, 974; Mesulphen, 977; Lot. Potass. Sulphur., 1018; Calamin., 1019; Stann. Oxid., 1020; Acne Bacillus Vaccine, 1030; Vaccin. Staphylococcic., 1073; X-rays, Vol. II.

Acromegaly.—Pituitary (Anterior Lobe), 849; Pituitary (Posterior Lobe), 849.

Actinomycosis.—Pot. Iod., 49; Cupr. Sulph., 471; Iodum, 645; Thiosinam. et Ethyl. Iod., 918; Sulphanilamid., 943; Thymol, 988.

Local.—Cupr. Sulph., 471; X-Rays, Vol. II. *See also* Vol. II.

Addison's Disease.—Sod. Chlorid., 64; Ext. Suprarenal. Cort., 140; Desoxycorticosterone Acetate, 143.

Adhesions.—Bellad. Rad., 291; Inj. Thiosinam. et Sod. Salicyl., 917; Thiosinam. et Ethyl. Iod., 918.

Agranulocytic Angina.—Pentose Nucleotide, 389; Ext. Hepat.; (oral and parenteral), 570.

Agranulocytosis.—Pentose Nucleotide, 389; Blood Transfusion, 1096.

Albuminuria.—Stront. Lact., 79; Visc., 456.

Alcoholism, Acute.—Inj. Apomorph., 201; Nikethamid., 351; Carbon Diox., 367; Chloralformamid., 392. *See also Delirium Tremens.*

Alopecia. **Local.**—Acid. Lact., 75; Lot. Ol. Amygd. Ammon., 180; Lot. Bals. Peruv., 263; Canthar., 356; Carbon Dioxide Snow, 368; Chrysarob., 411; Dithranol, 412; Ung. Hydrarg. Oxid. Rub., 597; Pilocarp., 824; Ol. Cadin., 854; Resorcin., 895; Ultra-violet Light, Vol. II.

Amblyopia, Tobacco.—Acetylcholine, 12; Sod. Nitris, 923; Strychn., 930.

Amenorrhœa.—Apioi, 200; Sagapenum, 237; Tinct. Calend., 363; Ergot., 504; Cimicif., 549; Cauloph., 560; Pulsat., 560; Senecio, 560; Mang. Diox., 691;

Pot. Permang., 692; Estrogens, 717 *et seq.*; Stilbestrol, 726; Hexoestrol, 728; Progesterone, 730; Pregnenolone, 731; Ol. Puleg., 746; Ol. Rut., 746; Ol. Sabin., 747; Gonadotrophic Factors, 843; Pituitary (Posterior Lobe), 849; Thyroid, 994.

Amoebiasis.—See **Dysentery, Amoebic.**

Anæmia, Pernicious.—Acid. Hydrochlor. Dil., 58; Cholesterol, 130; Pyridoxin, 194; Sod. Cacodyl., 216; Sod. Aminoarson., 218; Cerevis. Ferment., 385; Pentose Nucleotide, 389; Ext. Hepat. Sicc., 567; Ext. Hepat. Liq., 568; Anæmin., 574; Ventricul. Desicc., 577; Spleen Substance, 580; Pepsin, 790; Thymus, 849; Blood Transfusion, 1096 *et seq.*

Anæmia, Secondary.—Acid. Ascorb., 22; Hypophosphites, 74; Arsen. Trioxid., 211; Ferr. Cacodyl., 215; Iron Salts, 521 *et seq.*; Spleen Substance, 580; Manganese Salts, 690; Hæmoglob., 799; Medull. Rub., 800; Strych., 930; Thyroxinsod., 998; Blood Transfusion, 1096 *et seq.*

Anæsthesia, to produce. General.—Æther Anæsth., 148; Æthyl. Chlor., 151; Methylene Chlor., 154; Alcohol, 157; Pentothal, 271; Hexobarbiton. Solub., 276; Narconumal, 278; Bromethol, 317; Chlorof., 401; Acetylen., 406; Æthylen., 406; Cyclopropan., 407; Vinyl Ether, 408; Nitrogen. Monox., 775.

Local.—Benzyl Alcohol, 30; Æthyl. Chlor., 151; Æthyl. Brom., 152; Methyl. Chlor., 153; Atrop., 239; Carbon Dioxide Snow, 368; Eugen., 374; Chlorbutol, 393; Cocain. (and salts), 422; Amydricain. Hydrochlor., 426; Amylocain. Hydrochlor., 426; Benzamin. Hydrochlor., 428; Benzamin. Lact., 429; Benzocain., 429; Butyl- β -aminobenzoate, 431; Orthocain., 432; Phenacain. Hydrochlor., 432; Procain. Hydrochlor., 433; Procain. Boras, 437; Butyn., 438; Butethanol, 438; Percaine, 439; Tutocain, 440; Menthol, 694; Papaverin. Sulph., 708; Phenol, 808; Quinin. et Ureæ Hydrochlor., 879.

Basal.—Pentobarbitol. Solub., 269; Pentothal, 271; Amytal, 273; Hexobarbiton. Solub., 276; Narconumal, 278; Bromethol, 316; Paraldehyd., 540; Hyoscine. Hydrobrom., 618; Morph., 701.

Spinal.—Tropacocain. Hydrochlor., 425; Amylocain. Hydrochlor., 426; Procain. Hydrochlor., 438; Butethanol, 438; Percaine, 439.

Anal Fissure.—Inj. Benzocain., 430; Percaine in Oil, 430; Percaine, 440; Ung. Conii, 454; Suppos. Iodof., 642; Quinin. et Ureæ Hydrochlor., 880.

Aneurysm.—Pot. Iod., 49; Tinct. Aconit., 120; Verat. Vir., 364; Digit., 481; Erythrityl. Tetrant., 514.

Angina Pectoris.—Hypertonic Saline, 68; Æthyl. Iod., 152; Amyl. Nitris, 160; Tab. Phenobarb. et Theobrom., 280; Carbon. Diox., 368; Trichlorethylene, 372; Chlorof., 401; Amylocain. Hydrochlor., 426; Dilaudid., 444; Dextros., 475; Digit., 481; Euphorb., 508; Erythrityl. Tetrant., 514; Mannityl Hexanitras, 515; Tissue Extracts, 580; Insulin, 633; Morph., 700; Papaverin. Sulph., 708; Nitroglycer., 710; Sod. Nitris, 923; Sp. Æther. Nitros., 924; Strophanth., 927; Strophanthin., 928; Theobrom. (and salts), 984; Theophyll. (and salts), 987.

Angioneurotic Oedema.—See **Urticaria.**

Angiospasm.—Mag. Sulph., 684.

Ankylostomiasis.—See **Worms.**

Anorexia.—Aneurin. Hydrochlor., 190; Kola, 326; Capsic., 360; Cinchon., 413; Gentian., 547; Calumb., 548; Chirat., 549; Quass., 550; Mag. Perox., 614; Insulin, 634; Malt preparations, 687 *et seq.*; Nux Vom., 712; Quinin., 873; Strych., 930; Thyroid., 994.

Anthrax.—Neocarphenamin., 230; Phenol, 808; Anti-Anthrax Serum, 1031.

Aortic Disease.—Inj. Camph., 344; Tab. Digit. et Nitroglycer., 486; Erythrityl. Tetrant., 514. *See also Angina Pectoris.*

Aphthæ.—See **Stomatitis.**

Arterial Tension.—See **Hypertension and Hypotension.**

Arteriosclerosis.—Pot. Iod., 49; Sod. Silicas, 178; Caffein. et Sod. Iod., 324; Camph., 343; Erythrityl. Tetrant., 514; Muscle and Tissue Extracts, 580; Syr. Iodotann., 650; Nitroglycer., 710; Inj. Thiosinam. et Sod. Salicyl., 917; Theobrom. Calc. Salicyl., 984.

Arthritis.—See **Gout and Rheumatism.**

Arthritis, Rheumatoid.—Acid. Acetylsalicyl. (and salts), 16; Ammon. Ortho-iodoxybenz., 20; Acid. Ascorb., 24; Lith. Iod., 48; Pot. Iod., 49; Sod. Iod., 51; Acid. Lact., 75; Ol. Apii, 201; Sulpharsphenamin., 234; Gold Compounds, 249 *et seq.*; Capsic., 360; Cinchophen., 416; Neocinchophen., 417; Guaiacol. Carb., 463; Dextros., 475; Histam. Phosph. Acid., 511; Tinct. Bleeding, to arrest.—*See Hæmorrhage and Epistaxis.*

Blepharitis.—*See Conjunctivitis.*

Blood Pressure, to decrease.—*See Hypertension.*

Blood Pressure, to increase.—*See Hypotension.*

Boils and Carbuncles. *Internal.*—*Acid. Sulph. Aromat.*, 105; *Acid. Sulph. Dil.*, 106; *Sod. Cacodyl.*, 216; *Calx Sulphur.*, 342; *Carbo*, 367; *Cerevis. Ferment.*, 384; *Ichtham.*, 621; *Mag. Sulph.*, 684; *Mang. Butyras*, 690; *Colloidal Manganese*, 694; *Sulphanilamid.*, 943 *et seq.*; *Sulphathiazol.*, 971; *Stann. Oxid.*, 1020.

Local.—Hypertonic Saline, 68; Cataplas. Kaolin., 175; Viola Cryst., 257; Glycer. Bellad., 290; Bism. Oxyiodogall., 309; Elastic Adhesive Bandages, 358; Liq. Sod. Chlorinat., 399; Glycer., 552; Liq. Hydrog. Perox., 612; Past. Mag. Sulph., 687; Pot. Permang., 692; Phenol, 809; Ung. Phenol. Co., 814; Ol. Terebinth., 828; Vaccin. Staphylococcic., 1073; X-rays, Vol. II.

Prophylactic.—Antitoxin. Staphylococcic., 1073.

Breasts, Inflammation of.—Phytolacc., 665; Estrogens, 723; Androgens, 736; Streptococcus Vaccine, 1068

Breath, Fetid.—Vap. Creosot., 461; Liq. Hydrog. Perox., 612; Pot. Permang., 692; Calc. Permang., 693; Garg. Phenol., 809; Sulphanilamid., 952.

Bright's Disease.—See Nephritis.

Bromidrosis.—Lot. Borac., 37; Pulv. Acid. Salicyl. Co., 95; Liq. Formaldehyd., 536; Liq. Hydrog. Perox., 612; Pot. Permang., 692.

Bronchiectasis.—Allium, 167; Allyl. Sulphid., 168; Neosarsphenamin., 233; Creosot., 460; Guaiacol, 462; X-rays, Vol. II. **Diagnosis.**—Ol. Iodisat., 651.

Bronchitis. Internal.—Ammon. Benz., 29; Tinct. Benz. Co., 30; Citrates, 40; Pot. Iod., 49; Æther, 146; Allium, 167; Allyl. Sulphid., 168; Ammon. Carb., 179; Antim. et Pot. Tart., 195; Apomorph. Hydrochlor., 202; Acetarsol, 219; Ammoniac., 263; Apocodein. Hydrochlor., 444; Copaib., 457; Cubeb., 457; Ol. Santal., 458; Creosot., 460; Creosot. Carb., 461; Guaiacol. Carb., 463; Pot. Guaiacol-sulph., 464; Ephed., 494; Amphetamin. (inhalation), 499; Euphorb., 503; Cimicif., 549; Inula, 550; Glycyrrh., 556; Althæa, 558; Piscid., 560; Ipecac., 656; Eriodict., 664; Grindel., 664; Lobel., 679; Morph., 700; Æthylmorph. Hydrochlor., 704; Diamorph. Hydrochlor., 706; Benzylmorph. Hydrochlor., 707; Ol. Terebinth., 828; Tereben., 830; Terpin. Hydr., 831; Pix. Liq., 851; Pot. Bicarb., 862; Quillaia, 910; Scill., 911; Senega, 912; Cocill., 913; Prun. Serot., 913; Strych., 930; Ol. Thymi, 991; Micrococcus Cattarrhalis Vaccine, 1038; Streptococcus Vaccine, 1068.

Local.—Tinct. Benz. Co. (inhalation), 30; Æthyl. Iod. (inhalation), 152; Lin. Capsic., 361; Cocain., 422; Lin. Succin. Co., 454; Creosot., 460; Ferr. Perchlor., 527; Liq. Hydrog. Perox., 612; Iodum, 645; Menthol, 695; Ol. Eucalypt., 742; Tereben., 830; Sod. Bicarb., 919; Thymol, 989.

Broncho-Pneumonia and capillary bronchitis in infants.—Pholedrine, 138; Ammon. Carb., 179; Bellad. Fol., 289; Mist. Paraldehyd. et Pot. Iod., 541; Ipecac., 656; Emet. Hydrochlor., 662; Sulphapyridin., 964.

Bruises. Local.—Anthem. (as a fomentation), 187; Tinct. Arnic. Flor., 362; Tinct. Arnic. Rad., 363; Tinct. Calend., 363; Hamam., 564; Mag. Sulph., 684; Liq. Plumb. Subacet. Dil., 856; Lot. Plumb. Evap., 857.

Burns, Acute Toxæmia of.—Ext. Suprarenal. Cort., 140; Desoxycorticosterone Acetate, 143; Dextros. (intrav. or rectal), 475. See also Shock.

Burns and Scalds.—Benzoyl. Perox., 31; Amyl. Salicyl., 103; Acid. Tann., 112; Liq. Ammon. Tart., 117 (eye); Acriflavin., 125; Eufavin., 127; Kaolin., 175; Argent. Nit., 204; Viola Cryst., 255; Liq. Tinctur., 258; Bism. Subgall., 312; Lin. Calc. Hydrqx. c. Ol. Lini, 341; Trichlorethylene, 372 (tar burns); Chlorbutol, 393; Cocain., 422; Benzocain., 429; Mercurchrom., 606; Zinc. Perox., 615; Ichtham., 621; Ol. Eucalypt., 742; Ol. Morr., 754; Ung. Ol. Ricin. Co., 763; Oxygen. (injections), 773; Paraff. Dur., 781; Albumen, 798; Ol. Carbol., 811; Lead Lotions, 856; Sod. Bicarb., 919; Sulphanilamid., 952; Thymol. lod., 990; Trinitrophen., 1004; Zinc Oxid., 1015. See also Mustard Gas Burns.

Calculi, Biliary.—Benzyl. Benz., 30; Borax, 37; Acid. Oleic., 86; Sod. Salicyl., 98; Æther, 146; Amyl. Nitris (inhaled), 161; Ephed., 494; Bile Salts, 518; Hexamin., 582 et seq.; Morph., 701; Papaverin. Sulph., 708; Ol. Oliv., 761; Opium, 766; Papaveret., 769; Pilocarp., 823; Podoph. Res., 858; Sod. Oleas, 907; Sp. Æther. Nitros., 924.

Calculi, Urinary.—Pot. Chlorid., 62; Sod. Phosph. Acid., 93; Bellad. Fol., 289; Ammi Visnaga, 320; Piperaz., 365; Hexamin., 582; Papaverin. Sulph., 708; Pot. Bicarb., 862; Sp. Æther. Nitros., 924; Dilute Mineral Acids.

Cancer.—Inj. Sod. o-Coumarat., 32; Alcohol (injection), 157; Fluorescein. Solub., 816; Colloidal Lead, 858; Sod. Oleas, 907; Cobra Venom, 1069; Radium and X-rays, Vol. II.

Cancrum Oris.—See Stomatitis.

Carbuncles.—See Boils and Carbuncles.

Caries. Local.—Past. Arsen., 212; Creosot., 460; Collod. Carbol., 809.

Internal.—Vitamin D, 329.

- Cataract.**—Acid. Ascorb., 22; Senecio, 560.
Catarrh, Bronchial.—*See* Bronchitis.
Catarrh, Gastric.—Bism. Salicyl., 310; Ferr. et Ammon. Cit., 523; Hydrast., 609; Ichtham., 621.
Local.—Acid. Boric., 34; Sod. Bicarb., 919.
Catarrh, Gastro-intestinal.—*See* Gastritis.
Catarrh, Nasal.—Sod. Sulphanilas., 6; Calc. Acetylsalicyl., 18; Neb. Benzoin. Co., 30; Mag. Thiosulph., 109; Adrenal. (in a spray), 134; Atrop., 238; Insuff. Bism. et Morph., 313; Camph., 343; Carbon Diox., 368; Ol. Cinnam. (inhaled), 418; Neb. Cocain., 422; Cubeb., 457; Ephed. (in a spray), 494; Amphetamina (inhaled), 499; Euphorb., 503; Mucin, 579; Hydrast., 609; Syr. Iodotann., 650; Pulv. Ipecac. et Opii, 658; Menthol, 695; Ol. Eucalypt. (inhaled), 742; Ol. Menth. Pip., 744; Phenazon. Salicyl., 804; Phenol, 808; Ol. Pini Pumil. (inhaled), 830; Ol. Pic. (inhaled), 851; Quinin. (and salts), 873; Sod. Bicarb. (local), 919; Sulphanilamid., 943 *et seq.*; Thymol, 989; Anti-Catarrhal Vaccines, 1032; Oral Cold Vaccine, 1034.
Catarrh, Spring.—Acid. Acet. Dil., 8; Quinin. Bisulph., 876.
Catarrh, Uterine. *Local.*—Argent. Picras. (and other Silver Salts), 206; Glycer., 552; Glycer. Plumb. Subacet., 856; Zinc. Sulph., 1018.
Catarrh, Vesical.—*See* Cystitis.
Cellulitis.—Iodum, 646; Sulphanilamid., 943 *et seq.*; Sulphathiazol., 971.
Local.—Glycer., 552; Mag. Sulph., 684; Mag. Sulph. and Ethylene Glycol Paste, 687.
Cerebrospinal Fever.—*See* Meningitis.
Cervicitis.—Mercurochrom., 606; Ichtham., 621; Electrotherapy, Vol. II.
Chancres, Soft.—Arsphenamin., 227; Neosarsphenamin., 230.
Local.—Bism. Oxyiodogall., 309; Pyrogall., 868; Resorcin., 895. *See also* Syphilis.
Chancroid.—Antim. et Pot. Tart., 196; Sulphanilamid., 943 *et seq.*; Sulphapyridin., 961 *et seq.*
Local.—Bism. Benz., 300; Iodof., 640.
Cheyne-Stokes' Respiration.—Histam. Phosph. Acid., 511; Theophyll. c. Æthylenediamin., 987.
Chilblains.—Calc. Chlorid., 60; Calc. Lact., 76; Calc. et Sod. Lact., 77; Calc. Glucon., 339; Ext. Parathyroid., 1001; Ultra-violet Light, Vol. II; Electrotherapy, Vol. II.
Local.—Calc. Iod., 48; Collod. Atrop., 240; Capsic., 362; Ung. Calc. Chlorinat., 398; Glycer., 552; Liq. Iod. Decol., 648; Ung. Rusc. Co., 854; Calamin., 1019.
Chloasma.—Acid. Sulphuros., 109; Sod. Thiosulph., 110.
 (The following lotion is advocated by Chopra: Mercuric chloride, 1 to 2 gr., bismuth subnitrate 10 gr., tragacanth powder, 5 gr., water 1 oz.; to be painted on dark patches.)
Chlorosis.—*See* Anæmia, Secondary.
Cholangitis.—Ext. Fel. Bov., 517.
Cholecystitis.—Bile Salts, 518; Hexamin., 582; Mag. Sulph., 684; Ol. Oliv., 761; Curcumin, 1021.
Cholelithiasis.—*See* Calculi, Biliary.
Cholera.—Hypertonic Saline, 67; Acid. Sulph. Aromat., 105; Acid. Sulph. Dil., 106; Acid. Sulphuros., 109; Ol. Allii, 167; Kaolin., 175; Betanaph., 297; Mist. Cret. Co., 338; Cupr. Sulph., 471; Pot. Permang., 692; Morph., 701; Opium, 768; Papaveret., 769; Bism. Tribromphen., 815; Plumb. Acet., 856; Anti-Cholera Vaccine, 1037; Cholera Bacteriophage, 1037.
 (Tomb's Essential Oil Mixture.—Aniseed oil, cajuput oil, juniper oil, of each 5 m., aromatic sulphuric acid 15 m., spirit of ether 30 m.; $\frac{1}{2}$ dr. in an ounce of water every 15 minutes for 2 or 3 hours.)
Chordee.—Bromides, 55; Bellad. Rad., 291; Camph., 343; Camph. Monobrom., 346; Cannab., 354.
Chorea.—Acid. Acetylsalicyl. (and salts), 16; Acetyl-para-amidosalol, 21; Calc. Chlorid., 60; Bulbocapnine, 123; Argent. Oxid., 205; Arsen. Trioxid., 211; Sod. Cacodyl., 216; Phenylethylhydantoin, 286; Bromal Hydr., 315; Camph. Monobrom., 346; Cannab., 354; Chloral Hyd., 391; Chlorbutol, 393; Conium, 454; Visc., 456; Gelsem., 546; Cimicif., 549; Hexamin., 583; Hyoscin. Hydrobrom., 618; Mag. Sulph., 685; Non-specific Vaccines, 794; Phenazon., 802.
Cicatricial Tissue.—Inj. Thiosinamin. et Sod. Salicyl., 917; Thiosinamin, et Æthyl. Iod., 918,

Claudication, Intermittent.—Acetylcholine, 12; Carbachol, 13; Acetyl- β -methylcholine Chloride, 14; Tissue Extracts, 580.

Cold, Common.—See *Catarrh, Nasal*.

Colic, Biliary.—See *Calculi, Biliary*.

Colic, Intestinal.—Benzyl. Benz., 30; Bellad. Fol., 289; Cannab., 354; Carum, 375; Chlorof., 401; Tinct. Chlorof. et Morph., 405; Hyoscy., 616; Ol. Cajuput., 740; Ol. Lavand., 744; Ol. Menth. Pip., 744; Ol. Ricin., 763; Opium, 766; Papaveret., 769; Physostig., 820; Stramon., 925; Zingib., 1021.

Colic, Lead.—Acid. Sulph. Dil., 106; Chlorof. (inhaled), 401; Tinct. Chlorof. et Morph., 405; Erythrityl. Tetranit., 515; Morph., 701; Opium, 766; Papaveret., 769; Ext. Parathyroid., 1000.

Colic, Renal.—Benzyl. Benz., 30; Amyl. Nitris (inhaled), 161; Atrop., 238; Bellad. Fol., 289; Chlorof. (inhaled), 401; Ephed., 494; Hyoscy., 616; Morph., 701; Opium, 766; Papaveret., 769; Stramon., 925.

Colic, Uterine.—Benzyl. Benz., 30.

Colitis.—Acid. Lact. Bacilli, 80; Ammon. Mandel., 83; Alumin. Hydrox., 174; Argentoprot., 207; Argent. Protein. Mit., 207; Methylthionin. Chlor., 258; Enema Bism. et Sod. Salicyl., 313; Hexamin. Salicyl., 584; Iodum, 644; Ol. Oliv., 761; Oxygen., 773; Polyvalent Antidysentery Serum, 1048.

Colitis, Mucous.—Acid. Lact. Bacilli, 80; Ammon. Mandel., 83; Enema Bism. et Sod. Salicyl., 313; Hexamin. Salicyl., 584; Ol. Oliv., 761; Sod. Bicarb., 919; B. Coli Vaccine, 1038.

Per rectum.—Daily irrigations with warm Normal Saline Solution; Enema Ol. Oliv., 761; Oxygen., 773.

Colitis, Ulcerative.—Alumin. Hydrox., 174; Bism. Subgall., 312; Ol.; Morr., 755; Tinct. Opii, 766; Polyvalent Anti-Dysentery Serum, 1048.

Per rectum.—Liq. Sod. Chlorid. Physiol., 65; Alumin. Hydrox., 174; Argent. Protein. Mit., 207; Methylthionin. Chlor., 258; Enema Opii, 766.

Collapse and Fainting.—Adrenal., 135; Pholedrine, 138; Ether, 146. Alcohol, 157; Ammon. Carb., 179; Sp. Ammon. Aromat., 179; Caffein. et Sod. Benz., 323; Camph., 343; Sod. Camphorsulphon., 346; Leptazol, 348; Nikethamid., 350; Digitalin., 485; Ephed., 494; Histam. Phosph. Acid., 511; Nitroglycer., 711; Ext. Pituit. Liq., 833; Strych., 930. See also *Shock*.

Coma, Diabetic.—Inj. Sod. Chlorid. et Acac., 1; Liq. Sod. Chlorid. Physiol., 66; Insulin, 631; Sod. Bicarb., 920.

Conjunctivitis.—Acid. Boric., 35; Acriflavin., 125; Eusflavin., 127; Proflavin., 129; Argent. Iod., 203; Argent. Nit., 204; Argentoprot., 206; Argent. Protein. Mit., 207; Aur. et Sod. Chlorid., 248; Viola Cryst., 256; Methylthionin. Chlor., 258; Cupr. Sulph., 471; Hydrarg. Cyanid., 590; Oculet. Flav., 596; Ung. Hydrarg. Oxid. Flav., 596; Hydrarg. Oxycyanid., 597; Mercurochrom., 606; Liq. Hydrog. Perox., 612; Ichtham., 622; Iodum, 644; Ol. Morr., 755; Ol. Ricin., 763; Quinin. Bisulph., 876; Ethylhydrocuprein. Hydrochlor., 894; Resorcin., 895; Sulphapyridin., 961 *et seq.*; Zinc. Chlorid., 1014; Zinc. Sulph., 1018.

Constipation. (Cholagogues).—Sod. Salicyl., 98; Euonym., 516; Ext. Fel. Bov., 517; Sod. Taurogylcolchol., 517; Dehydrocholic Acid, 518; Hydrarg., 567; Ext. Hydrast., 609; Mag. Sulph., 684; Podoph. Res., 858; Tarax., 900; Sod. Oleas, 907.

(By hypodermic injection).—Physostig., 820; Prostigmin, 821; Ext. Pituit. Liq., 833.

(Laxatives).—Sod. Chlorid., 64; Acid. Lact. Bacilli, 80; Agar, 154; Casc. Sagr., 376; Cerevis. Ferment., 384; Cass. Fruct., 418; Glycer., 552; Pulv. Glycyrrh. Diabetes Insipidus.—Ext. Pituit. Liq., 833; Pituitary (Posterior Lobe), 849.

Diabetes Mellitus.—Liq. Pot. Arsen. et Brom., 213; Diabetic Foods, 383; Codein., 442; Insulin., 630; Protamine Insulinate, 635; Protamine Zinc Insulin, 635; Oral Diabetic Preparations, 638-9; Ovolecithin., 771.

Diarrhœa.—Benzyl. Benz., 30; Agaric., 33; Glycer. Borac., 38; Cer. Oxal., 44; Liq. Sod. Chlorid. Physi., 66; Acid. Lact., 75; Acid. Lact. Bacilli, 80; Acid. Sulph. Aromat., 105; Acid. Sulph. Dil., 106; Sod. Sulph., 106; Album. Tann., 115; Acetanin., 116; Kaolin., 175; Anthem., 187; Argent. Nit., 204; Betanaph., 296; Naphthalen., 298; Bism. Carb., 300; Bism. Naphthol., 309; Bism. Nitras., 309; Bism. Salicyl., 310; Bism. Subgall., 312; Bism. Tann., 314; Guaran., 325; Calc. Carb., 337; Cret., 337; Sp. Camph. Fort., 345; Carbon Disulph., 370;

Alston., 414; Cuspar., 414; Cocain. (local), 422; Guaiacol. Benz., 463; Guaiacol. Camph., 463; Cupr. Sulph., 471; Pectin., 544; Apple Powder, 545; Hexamin. Salicyl., 584; Mist. Hydrarg. Perchlor., 600; Berberin. Sulph., 610; Mag. Perox., 614; Iodum., 644; Kramer., 668; Kino., 669; Kino Eucalypt., 669; Catech., 669; Ispagh., 677; Ulm. Fulv., 678; Morph., 700; Ol. Ricin., 763; Opium., 766; Granat. Fruct. Cort., 789; Bism. Tribromphen., 815; Ext. Pini Canad. Liq., 827; Plumb. Acet., 856; Rheum., 898.

Diphtheria. *Treatment*.—Acid. Ascorb., 22; Pholedrine, 138; Desoxycorticosterone Acet., 143; Hydrarg. Cyanid., 590; Strych., 930; Antitox. Diphtheric., 1038.

Prophylaxis.—Acetarsol, 220; Toxin. Diphtheric. Detoxicat., 1043; Alum Precipitated Toxoid, 1046.

Local.—Borax, 37; Acid. Iodic., 52; Acid. Lact., 75; Acid. Sulphuros., 109; Acid. Malic., 119; Alcohol, 157; Argent. Colloid., 208; Formaldehyd., 536; Hydrarg. Cyanid., 590; Lot. Hydrarg. Biniod. Spirit., 593; Liq. Hydrarg. Perox., 612; Pig. Menthol. et Toluen., 696.

Dipsomania, Chronic.—Sod. Brom., 57; Aneurin. Hydrochlor., 190; Atrop., 239; Mist. Antidipsomania, 241; Aur. et Sod. Chlorid., 248; Colloidal Gold, 252; Capsic., 362; PicROTOX., 934.

Dropsy, Cardiac.—Asparagin., 44; Caffein., 322; Caffein. et Sod. Iod., 324; Apocyn., 355; Canthar., 356; Elaterium, 451; Scopar., 455; Spart. Sulph., 456; Digit., 481; Pil. Digit. Co., 484; Digitalin and other glycosides, 485 et seq.; Pil. Hydrarg., 588; Mersaly., 608; Scilla, 911; Strophanth., 927; Strophanthin., 927; Theobrom. (and salts), 984; Theophyll. (and salts), 985; Urea, 1006. *See also Heart Disease.*

Dropsy, Hepatic.—Sod. Sulph., 106.

Dropsy, Renal.—Pot. Acet., 8; Sod. Acet., 9; Pot. Tart. Acid., 118; Sod. et Pot. Tart., 119; Elaterium, 451; Lactos., 477; Mersaly., 608; Pilv. Jalap. Co., 666; Pilocarp., 823; Theophyll. (and salts), 985. *See also Nephritis.*

Dupuytren's Contraction.—Inj. Thiosinam. et Sod. Salicyl., 917; Thiosinam. et Æthyl. Iod., 918.

Dysentery, Amœbic.—Kaolin., 175; Acetarsol, 219; Carbarsone, 222; Bism. Subgall., 312; Bism. Subnitras, 313; Bism. Tann., 314; Guaran., 325; Calc. Carb., 337; Cerevis. Ferment., 384; Cuspar., 414; Cocain. (local), 422; Cupr. Sulph., 471; Hexamin. Salicyl., 584; Iodof., 641; Ipecac., 656; Emetin. (and salts), 660; Holarrh., 665; Plumbi Acet., 856; Chiniofon., 861; Heptyresorcinol., 898; Santonin., 903.

Dysentery, Bacillary.—Benzyl. Benz., 30; Sod. Sulph., 106; Argent. Nitras, 204; Argent. Oxid., 205; Argentoprot., 207; Argent. Protein. Mit., 207; Silver Gelatose, 208; Bism. Carb., 301; Bism. Subgall., 312; Creosot., 460; Hexamin. Salicyl., 584; Ulm. Fulv., 678; Pot. Permang., 692; Ol. Ricin., 763; Rheum., 898; Bacteriophage, 1026; Serum Antidysenteric. (Shiga), 1047; Antidysentery Vaccine, 1048.

Dysmenorrhœa.—Acetanilid., 3; Calc. Acetylsalicyl., 19; Benzyl. Benz., 30; Amyl. Nitris, 160; Apioi, 200; Atrop., 238; Tab. Phenobarbiton. et Theobrom., 280; Cannab., 354; Chlorbutol, 393; Guaiac. Res., 453; Gelsem., 547; Cimicif., 549; Gossyp. Cort., 559; Cauloph., 559; Piscid., 560; Pulsat., 560; Senecio, 560; Viburn., 560; Hydrast., 609; Hydrastinin. Hydrochlor., 610; Insulin., 633; Mist. Morph. et Phenazon. Co., 703; Oestrogens, 717 et seq.; Stilbæstrol, 726; Hexæstrol, 728; Progesterone, 730; Pregneninone, 731; Androgens, 736; Phenazon., 802; Amidopyrin., 805; Sp. Æther. Nitros., 924; Valerian., 1011; Castor., 1013.

Dyspepsia.—Vanillin., 33; Stront. Brom., 57; Mag. Chlorid., 62; Acid. Hydrocyan. Dil., 71; Acid. Lact., 75; Sod. Sulphis, 109; Æther., 146; Alumin. Hydrox., 173; Kaolin., 175; Mag. Trisilic., 177; Bellad. Fol., 289; Betanaphthol., 296; Bismuth Salts, 300 et seq.; Caffein., 322; Calc. Sacchar., 341; Capsic., 360; Carbo, 366; Cardam., 374; Cerevis. Ferment., 384; Pot. Dichrom., 410; Cuspar., 414; Creosot., 460; Bile Salts, 516; Gentian., 547; Calumb., 548; Chirac., 549; Conduran., 549; Quass., 550; Mucin, 579; Hexamin. Salicyl., 584; Berberin. Sulph., 610; Liq. Hydrog. Perox., 612; Ichtham., 621; Bela, 669; Mag. Carb. Lev. vel Pond., 681; Mag. Hydrox., 682; Mag. Oxid. Lev. vel Pond., 683; Diast., 689; Nux Vom., 712; Pancreatin., 778; Papain., 780; Pepsin., 790; Sod. Phenolsulphon., 814; Quinin., 873; Rheum., 898; Sod. Bicarb., 919; Strych., 930.

Dyspnœa.—Aceton., 9; Æthyl. Iod., 152; Amyl. Nitris, 160; Carbon. Diox., 368; Euphorb., 503; Erythrit. Tetramit., 514; Morph., 700; Nitroglycer., 710; Opium, 766; Papaverin., 769; Oxygen., 772; Theophyll. c. Æthylenediamin., 937.

Earache.—Ung. Lano-Boric. Camphorat., 37; Cocain., 421; Aurist. Phenol., 810.

Eclampsia.—Calc. Chlorid., 60; Apomorph. Hydrochlor., 202; Calc. Glucon., 339; Verat. Vir., 364; Chloral Hydr., 391; Insulin., 833; Mag. Sulph., 685; Morph., 701; Papaverin. Sulph., 708; Pilocarp., 823; Theophyll. c. Æthylendiamin., 987; Parathyroid, 1000.

Eczema. *Internal.*—Hydrochlor. Acid Milk, 76; Lac Coactum, 80; Aneurin. Hydrochlor., 191; Vitamins A and D, 329; Colloidal Manganese, 694.

Local.—Oleod. Brom. (intrav.), 57; Ung. Plumb. Oleat., 88; Ung. Zinc. Oleas., 89; Zinc. Oleostear., 89; Ung. Acid. Salicyl., 95; Sod. Thiosulph., 110; Acid. Tann., 112; Acriflavin., 125; Amyl. Nitris., 161; Alum., 171; Cataplasma Amyli., 185; Argent. Nit., 204; Arsen. Trioxid., 211; Sod. Arsen. Anhydros., 214; Sod. Cacodyl., 216; Viola Cryst., 257; Methylthionin. Chlor., 258; Betanaph., 297; Glycer. Bism. Nit., 309; Bism. Subgall., 312; Liq. Calc. Sulphur., 342; Carbo., 367; Carbon Dioxide Snow, 368; Eugen., 374; Dithranol, 412; Cocain., 421; Benzocain., 428; Cupr. Sulph., 472; Formaldehyd., 536; Ung. Hydrarg. Ammon., 590; Ung. Hydrarg. Nit., 594-5; Ung. Hydrarg. Oxid. Flav., 596; Cotarn. Chlorid., 611; Ung. Hydrog. Perox., 614; Ichtham., 621; Estron., 723; Ol. Oliv., 761; Glycer. Papain., 780; Whole Blood Injections, 795; Phenol., 808; Pix Liq., 851; Ol. Pic., 851; Pix Carbon., 852; Past. Zinc. et Pic. Carbon., 853; Ol. Cadin., 853; Ung. Rusc. Co., 854; Glycer. Plumb. Subacet., 856; Pot. Carb., 862; Potass. Sulphur., 864; Pyrogall., 868; Resorcin., 895; Sod. Bicarb., 919; Sod. Carb., 921; Sulphur., 974; Thymol, 988; Thymol. Iod., 990; Trinitrophen., 1004; Zinc. Oxid., 1015; Calamin., 1019; X-rays and Ultra-Violet Light, Vol. II.

Embolism.—Acetylcholine, 12; Liq. Ammon. Dil., 181; Heparin, 575.

Emphysema.—Caffein. et Sod. Iod., 324; Morph., 704; Æthylmorph. Hydrochlor., 704; Oxygen., 772; Strych., 930.

Empyema.—Acid. Iodic., 52; Neoparsphenamin., 233; Viola Cryst., 255; Hydrarg. Perchlor., 599; Sulphanilamid., 943; Pneumococcus Vaccine, 1057.

Encephalitis Lethargica.—Sod. Salicyl., 98; Hyoscine. Hydrobrom., 618.

Endocarditis.—Stront. Iod., 51; Pot. Salicyl., 97; Eufavin., 127; Argent. Colloid., 208; Sod. Cacodyl., 216; Viola Cryst., 255; Sulphanilamid., 943 *et seq.*; Sulphapyridin., 966; Serum Antistreptococcic., 1068; Vaccin. Streptococcic., 1068; Vaccin. Staphylococcic., 1073.

Enteritis.—*See* Gastritis.

Enuresis.—Citrates, 40; Tinct. Lycopod., 186; Atrop., 238; Bellad. Fol., 289; Maidis Stig., 321; Elix. Camph., Monobrom., 346; Ephed., 494; Ergot., 504; Hyoscy., 616; Pituitary (Posterior Lobe), 849; Stramon., 925.

Epidermophytosis.—Lint. Acid. Boric., 35; Æthyl. Iod. (inhalation), 153; Fuchsin Paint, 254; Virid. Nit., 260; Dithranol, 412; Phenylmercuric Nitrate, 596; Sulphur. Sublim., 975.

Epididymitis.—Calc. Chlorid., 61; Sulpharsphenamin., 234; Mag. Sulph., 684; Sulphur., 975; Vaccin. Gonococcic., 1051.

Epilepsy.—Borax, 37; Cer. Oxal., 44; Acid. Hydrobrom. Dil., 53; Bromides, 53-57; Pot. Borat., 118; Æthyl. Brom., 152; Amyl. Nitris., 160; Argent. Oxid., 205; Liq. Pot. Arsen. c. Brom., 213; Atrop. Methylbrom., 242; Aur. Brom., 248; Colloidal Gold, 252; Phenobarbiton., 279; Pemiton., 281; Sod. Diphenylhydantoin., 284; Bromal Hydr., 315; Brom-Albumen, 315; Camph. Monobrom., 346; Conium, 454; Paraldehyd., 540; Morph. Methylbrom., 707; Pot. Nitris., 864; Picrotox., 934; Parathyroid., 1000; Zinc. Brom., 1014; Cobra Venom, 1069; Puff-adder Venom, 1070; Venene, 1070; Moccasin Venom, 1071.

Epistaxis.—Adrenal., 134; Alum., 171; Congo Red, 254; Hamam., 565; Cotarn. Chlorid., 611; Liq. Hydrog. Perox., 612; Kramer., 668; Kino, 669; Ol. Terebinth., 828; Moccasin Venom, 1071. *See also* Hemorrhage.

Erysipelas.—Mist. Ferr. Salicyl., 96; Tinct. Aconit., 120; Eufavin., 127; Profavin., 128; Liq. Alumin. Acet., 173; Argent. Nit., 205; Carbo., 367; Cocain., 421; Liq. Ferr. Perchlor., 528; Cotarn. Chlorid., 611; Ichtham., 622; Mag. Sulph., 684; Milk Injections, 798; Ol. Terebinth., 828; Sulphanilamid., 943 *et seq.*; Trinitrophen., 1004; Gelat. Zinc., 1015; Serum Antistreptococcic., 1068; Streptococcus Vaccine, 1068; Ultra-Violet Light, Vol. II.

Eunuchoidism.—Androgens, 734 *et seq.*

Exophthalmic Goitre.—Acid. Hydrobrom. Dil., 53; Sod. Fluor., 69; Supraren., 139; Sod. Cacodyl., 216; Ergotamin. Tart., 508; Iodum, 644; Pancreatic Extract, 777; Pituitary Body, 848; Posterior Pituitary, 849; Thymus Gland, 849; Quinin. Hydrobrom., 883.

Local.—Ung. Hydrarg. Iod. Rub., 593; Quinin. et Ureæ Hydrochlor., 880
X-rays, Vol. II.

Fainting.—See **Collapse.**

Favus.—See **Mycotic Diseases of the Skin.**

Fibrositis.—Acid. Acetylsalicyl., 16; Streptococcus Vaccine, 1068.

Local.—Pig. Camph., Chloral. et Menthol., 345; Procin. Hydrochlor., 434;
Electrotherapy and Ultra-Violet Light, Vol. II. See also **Rheumatism.**

Fistula.—Aluminium, 171; Kaolin, 175; Cupr. Sulph., 472.

Flatulence.—Mag. Salicyl., 96; Alumin. Hydrox., 173; Asafet., 236; Camph., 343; Caryoph., 374; Cerevis. Ferment., 384; Chlorof., 401; Lactos., 477; Mag. Perox., 614; Mag. Hydrox., 683; Ol. Cajuput., 740; Ol. Lavand., 744; Ol. Menth. Pip., 744; Sod. Phenolsulphon., 814; Ol. Terebinth., 828; Sod. Bicarb., 919; Zingib., 1021. See also **Dyspepsia.**

Folliculitis.—Acriflavin., 125; Viola Cryst., 257.

Frambœsia.—See **Yaws.**

Furunculosis.—See **Boils.**

Gall-stones.—See **Calculi, Biliary.**

Gangrene. *Internal.*—Acetylcholine, 12; Carbachol, 13; Acetyl- β -methylcholine Chloride, 14; Allium, 167.

Local.—Acriflavin., 125; Neosarsphenamin., 233; Liq. Calc. Chlorinat. c. Acid. Boric., 398; Liq. Hydrog. Perox., 612; Zinc Perox., 615.

Gas Gangrene.—Zinc. Perox., 615; Sulphanilamid., 943; Gas Gangrene Antitoxins, 1050.

Gastric Fermentation.—Acid. Sulphuros., 109; Sod. Sulphis, 109; Calc. Thiosulph., 111; Papain., 780; Sod. Phenolsulphon., 814.

Gastritis.—Acid. Hydrochlor. Dil., 58; Betain. Hydrochlor., 59; Acid. Lact., 75; Acid. Lact. Bacilli, 80; Ammon. Mandel., 83; Argent. Colloid., 208; Arsen. Triiod., 213; Bism. Carb., 300; Pot. Guaiacolsulph., 464; Pectin., 544; Gentian., 547; Mucin., 579; Hexamin. Salicyl., 584; Hydrast., 609; Calc. Permang., 693; Peptonised Milk, 778; Papain., 780; Phenol, 808; Strych., 930.

Gingivitis.—See **Gums, Inflamed, and Vincent's Angina.**

Glandular Enlargements.—Syr. Iodotann., 650.

Local.—Calc. Iod., 48; Ung. Hydrarg. Co., 589; Iodum, 644.

Glaucoma.—Acetylcholine, 12; Carbachol, 13; Æthylmorph. Hydrochlor., 704; Physostig., 820; Pilocarp., 824.

Gleet.—See **Gonorrhœa.**

Glossitis.—Acid. Nicotin., 193; Hydrarg. Perchlor., 599.

Goitre. *Internal.*—Pot. Iod., 49; Sod. Iod., 51; Stront. Iod., 51; Sod. Fluor., 69; Fucus, 155; Iodof., 640; Thyroid., 994; Thyroxinsod., 997; See also **Exophthalmic Goitre.**

Gonorrhœa. *Internal.*—Sulpharsphenamin., 234; Bals. Gurjun., 263; Bism. Subgall., 312; Buchu., 319; Agropyrr., 320; Cannab., 354; Copaib., 457; Cubeb., 457; Ol. Santal., 458; Sabal., 459; Hexamin. Sod. Acet., 585; Colloidal Manganese, 694; Milk Injections, 793; Pot. Bicarb., 862; Sulphanilamid., 943 *et seq.*; Sulphapyridin., 960 *et seq.*; Sulphathiazol., 971; Sulphur. Præcip., 974; Vaccin. Gonococcic., 1051.

Local.—Zinci Sulphanil., 7; Liq. Sod. Chlorid. Physiol., 66; Acriflavin., 125; Eufavin., 127; Alum., 171; Argent. et Pot. Iod., 203; Argent. Nit., 204; Argentoprot., 206; Argent. Protein. Mit., 207; Methylthionin. Chlor., 253; Chloram., 395; Dichloram., 395; Liq. Calc. Chlorinat. c. Acid. Boric., 398; Cupr. Sulph., 472; Glycer., 552; Hydrarg. Benz., 590; Lot. Hydrarg. Biniod. Spirit., 593; Hydrarg. Oxycyanid., 597; Hydrarg. Perchlor., 599; Hydrarg. Salicyl., 602; Mercurochrom., 605; Hydrast., 609; Liq. Hydrog. Perox., 612; Ichtham., 622; Pot. Permang., 692; Zinc. Phenolsulphon., 815; Quinin. Lact., 884; Zinc. Sulph., 1018; Diathermy, Vol. II.

Gout.—Acid. Acetylsalicyl. (and salts), 16; Pot. Benz., 29; Ammon. Hipp., 32; Mag. Borocit., 40; Citrates, 42; Acid. Form. (and salts), 42; Asparagin., 44; Lith. Iod., 48; Pot. Iod., 49; Pot. Chlorid., 62; Lith. Salicyl., 96; Sod. Salicyl., 98; Stront. Salicyl., 100; Lappa, 320; Caffein. Iod., 324; Piperaz., 365; Cinchophen., 416; Neocinchophen., 417; Colch., 445; Colchicin., 447; Guaiac. Res., 452; Pot. Bicarb., 862; Sulphur. Sublim., 975.

Local.—Lot. Borac., 37; Lin. Atrop., 241; Lin. Bellad., 293; Lin. Opii, 767.

Granuloma Inguinale.—Antim. et Pot. Tart., 195; Stibophen., 198; Sulphapyridin., 961 *et seq.*

Grave's Disease.—*See* Exophthalmic Goitre.

Gumma.—Pot. Iod., 50.

Gums, Inflamed or Spongy.—Acid. Tann., 112; Tinct. Myrrh. et Borac., 237; Kramer., 668; Sod. Ricinoleas, 764; Pot. Chloras, 863; Sulphanilamid., 943 *et seq.*

Hæmatemesis.—Adrenal., 135; Gelat., 542; Pectin, 545; Morph., 700; Serum Normal., 1028; Viper Venom, 1072.

Hæmoglobinuria.—Dec. Hæmatox., 117; Cholesterol, 130; Gelat., 542.

Hæmoglobinuric Fever.—*See* Blackwater Fever.

Hæmophilia.—Acid. Ascorb., 22; Thymus Gland, 849; Serum Normal., 1028.

Local.—Egg Protein, 799; Phenazon., 803; Viper Venom, 1072.

Hæmoptysis.—Adrenal., 135; Amyl. Nitris, 160; Antim. et Pot. Tart., 196; Congo Red, 253; Liq. Ferr. Subsulph., 533; Gelat., 542; Emet. Hydrochlor., 660; Morph., 701; Diamorph. Hydrochlor., 706; Nitroglycer., 710; Opium, 766; Papaveret., 769; Oxygen., 773; Ext. Pini Canad. Liq., 827; Ext. Pituit. Liq., 834; Theophyll. c. Æthylenediamin., 987.

Hæmorrhage.—Acac., 1; Acid. Ascorb., 23; Methyl-naphthoquinone, 26; Vitamin K, 26; Amadou, 34; Calc. Chlorid., 60; Pot. Chlorid., 63; Liq. Sod. Chlorid. Physiol., 66; Adrenal., 134; Amyl. Nitris, 160; Alum., 171; Alumin. Subacet., 172; Congo Red, 254; Ferr. Perchlor., 527; Gelat., 542; Pectin, 545; Glycer., 552; Hydrastinin. Hydrochlor., 610; Kramer., 668; Kino Eucalyp., 669; Morph., 700; Phenazon., 803; Ol. Terebinth., 828; Theophyll. c. Æthylenediamin., 987; Serum Normal., 1028; Thromboplastin, 1029; Moccasin Venom, 1071; Viper Venom, 1072.

Hæmorrhage, Uterine.—*See* Menorrhagia.

Hæmorrhoids.—Æsculus, 116; Casc. Sagr., 376; Paraff. Liq., 782; Senna, 914.

Local.—Acid. Tann. (and preps.), 112 *et seq.*; Dec. Querc., 117; Adrenal. (and preps.), 134 *et seq.*; Ung. Bism. c. Camph., 302; Bism. Oxyiodogall., 309; Bism. Subchlor., 603; Hydrast., 609; Supp. Iodof., 642; Sod. Morrh., 759; Phenol, 810; Plumb. Acet., 856; Quinin. et Ureæ Hydrochlor., 879; Inj. Quinin. et Urethan., 881.

Hair, to Remove.—Baryt. Sulphur., 288; Liq. Sod. Æthylat., 918; Electrotherapy and X-rays, Vol. II.

Halitosis.—*See* Breath, Fetid.

Hay Fever. *Internal.*—Calc. Chlorid., 61; Pot. Chlorid., 63; Euphorb., 503; Pepton., 792; Pollen Vaccine, 796; Quinin., 873; Hay Fever Vaccine, 1052.

Local.—Adrenal., 134; Cocain., 422; Benzocain., 429; Ephed., 494; Amphetamin., 499; Liq. Hydrog. Perox., 612; Ung. Menthol. et Camph., 696; Quinin., 873; Quinin. Sulph., 885; Ionisation, Vol. II.

Headache.—Acetanilid., 3; Acid. Acetylsalicyl. (and salts), 16; Acetyl-paramidosalol, 21; Acid. Hydrobrom. Dil. (and Bromides), 53; Sod. Phosph., 93; Adrenal., 135; Sp. Ammon. Arom., 179; Caffein., 322; Guaran., 325; Cannab., 354; Histam. Phosph. Acid., 511; Mag. Sulph., 685; Menthol, 694; Phenacet., 801; Phenazon et Caffein. Cit., 803; Amidopyrin., 805. *See also* Migraine and Neuralgia.

Heart Block.—Adrenal., 135; Atrop., 238; Digit., 481.

Heart Disease.—Adrenal., 135; Ammon. Carb., 179; Caffein., 322; Camph., 343; Sod. Camphorsulphon., 346; Leptazol., 347; Nikethamid., 350; Chloralformamid., 392; Spartein. Sulph., 456; Dextros., 474; Sucros., 478; Digitalis and glycosides, 481 *et seq.*; Cereus, 489; Convallaria, 489; Cratægus, 489; Insulin., 633; Grindel., 664; Liq. Glyc. Trinit., 710; Scill., 911; Strophanth., 927; Strophanthin., 927; Ouabain., 928; Strych., 930; Theophyll. c. Æthylenediamin., 987.

Hernia.—Phenol, 809; Obturatin, 810.

Herpes Zoster.—Sod. Iod., 51; Neoarsphenamin., 233; Phenobarbiton., 279; Cannab., 354.

Local.—Cocain., 421; Procain. Hydrochlor., 435; Ung. Hydrarg. Ammon., 590; Cotarn. Chlorid., 611; Paraff. Liq., 783; Ext. Pituit. Liq., 834.

Hiccough.—Benzyl. Benz., 30; Amyl. Nitris, 160; Camph., 343; Mosch., 352; Chlorof., 401; Sp. Cajuput, 740; Pilocarp., 823.

Hodgkin's Disease.—See **Lymphadenoma**.

Hydrocele.—Morestin's Fluid, 537; Iodum, 645; Sod. Morrh., 758; Phenol, 808; Quinin. et Urea Hydrochlor., 880; Inj. Quinin. et Urethan., 881; Trinitrophen., 1004.

Hyperchlorhydria.—Sod. Brom., 57; Calc. Phosph., 91; Alumin. Hydrox., 173; Kaolin., 175; Mag. Silicas, 177; Bellad. Fol., 289; Bism. Carb., 301; Bism. Hydrox., 307; Calc. Carb., 337; Cret., 337; Calc. Perox., 614; Mag. Carb. Lev. vel Pond., 681; Mag. Hydrox., 682; Mag. Oxid. Lev. vel Pond., 683; Mag. Phosph., 683; Pot. Bicarb., 862; Sod. Bicarb., 919.

Hyperhidrosis.—See **Perspiration, Excessive**.

Hyperkeratosis.—Sulpharsphenamin., 234; Vitamin A, 333.

Hypertension.—Acetylcholine, 12; Carbachol, 13; Acetyl-β-methylcholine Chloride, 14; Hippurates, 31; Pot. Iod., 49; Pot. Thiocyan., 72; Sod. Thiocyan., 73; Ethyl. Iod., 153; Amyl. Nit., 160; Atrop., 239; Tab. Phenobarbiton. et Theobrom., 280; Bism. Subnit., 313; Nikethamid., 351; Verat. Vir., 364; Sparg. Sulph., 456; Visc., 456; Erythrityl. Tetranit., 514; Mannityl. Hexanit., 515; Tissue Extracts, 580; Pil. Hydrarg., 588; Mist. Alba, 686; Nitroglycer., 712; Sod. Nitris, 923; Theobrom. (and salts), 984; Theophyllin. (and salts), 985.

Hypertrichosis.—See **Hair, to Remove**.

Hyperchlorhydria.—See **Achlorhydria**.

Hypotension.—Adrenal., 134; Pholedrine, 138; Caffein., 322; Digitalis, 481; Ephed., 494; Amphetamin. Sulph., 500; Strych., 930.

Hysteria.—Cer. Oxal., 44; Acid. Hydrobrom. Dil. and Bromides, 52; Asafœt., 236; Sagapenum, 237; Aur. Brom., 248; Caffein. Valer., 325; Camph. Monobrom., 346; Mosch., 352; Chloral Hydr., 391; Chloralformamid., 392; Visc., 456; Phenacet., 801; Quinin. Valer., 887; Valerian., 1011; Acid. Valerian. (and salts), 1012; Sumbul, 1013; Zinc. Oxid., 1015.

Ileus.—Choline Chloride, 11; Acetylcholine, 12; Carbachol, 13; Acetyl-β-methylcholine, 14; Liq. Sod. Chlorid. Physiol., 66; Hypertonic Saline, 67; Ext. Fel. Bov., 517; Ol. Rut., 746; Physostig., 820; Prostigmin, 822; Ext. Pituit. Liq., 834; Pituitary (Posterior Lobe), 849.

Impetigo.—Acid. Tann., 112; Acriflavin., 125; Ung. Fuchsin, 254; Viola Cryst., 257; Virid. Nit., 260; Carbo, 367; Ung. Hydrarg. Ammon., 590; Ung. Hydrarg. Nit. Fort., 594; Vaccin. Staphylococcic., 1073. See also **Eczema**.

Impotence.—Cannab., 354; Cantharidin., 356; Nux Vom., 712; Damian., 714; Adrogens, 734 et seq.; Zinc. Phosph., 819; Gonadotrophic Factor, 843; Strych., 930; Yohimb. Hydrochlor., 936.

Incontinence of Urine.—See **Enuresis**.

Indigestion.—See **Dyspepsia**.

Influenza.—Acid. Acetylsalicyl. (and salts), 16; Acid. Ascorb., 22; Sod. Salicyl., 97; Salicin, 102; Eufllavin., 127; Acid. Nucleic., 388; Ol. Cinnam., 418; Neb. Cocain., 422; Gelsem., 547; Garg. Hydrarg. Perchlor., 599; Menthol, 695; Pulv. Ipecac. et Opii, 657; Ol. Eucalypt., 742; Phenacet., 801; Phenocoll. Hydrochlor., 802; Phenazon. Acetylsalicyl., 803; Phenazon. Salicyl., 804; Amidopyrin., 805; Cinchonidin. Salicyl., 872; Quinin. (and salts), 885; Mixed Vaccines, 1032; Influenza Vaccine, 1053.

Insect Bites.—See **Bites and Stings**.

Insomnia.—Acid. Acetylsalicyl., 16; Pot. Brom., 55; Sod. Brom., 57; Alcohol, 156; Barbiton., 266; Barbiton. Solub., 267; Butylethylbarbituric Acid, 268; Amytal, 273; Hexobarbiton., 275; Phenobarbiton., 279; Allobarbiton., 282; Bromal Hydr., 315; Chloral Hydr., 391; Chloralformamid., 392; Butylchloral Hydr., 393; Chlorbutol, 393; Paraldehyd., 540; Lupulus, 550; Piscid., 560; Morph., 700; Opium, 766; Papaveret., 769; Sulphonal, 973; Methylsulphonal, 974; Urethan., 1007; Bromoisovalerianylurea, 1008; Carbrom., 1008.

Intermittent Claudication.—See **Claudication**.

Intertrigo.—Acid. Boric., 34; Viola Cryst., 257; Methylthionin. Chlor., 258; Bism. Oxyiodogall., 309; Benzocain., 429; Past. Zinc. c. Amylo, 1016; Ung. Zinc. Oxid., 1017; Lot. Calamin., 1019.

Intestinal Obstruction.—See **Ileus**.

Intestinal Worms.—See **Worms**.

Iritis.—Calc. Acetylsalicyl., 19; Atrop. (and salts), 238; Homatrop., 244; Aur. et Sod. Chlorid., 248; Caffein. et Sod. Salicyl., 323; Hyoscin. (and salts), 617; Hyoscy. (and salts), 617; Ethylmorph. Hydrochlor., 704.

Itch.—See **Scabies**.

Jaundice.—Sod. Phosph., 92; Dextros., 475; Ext. Fel. Bov. (and Bile Salts), 517; Hyd. Subchlor., 603; Podoph. Res., 858.

Jaundice, Catarrhal.—See **Jaundice.**

Jaundice, Obstructive.—Vitamin K, 26; Methyl-naphthoquinone, 26.

Kala-azar.—See **Leishmaniasis.**

Keloid.—Inj. Thiosinam. et Sod. Salicyl., 917; Thiosinam. et Æthyl. Iod., 918; Electrotherapy, Radium and X-rays, Vol. II.

Keratitis.—Calc. Acetylsalicyl., 19; Antim. et Pot. Tart., 196; Argent. Protein. Mit., 208; Atrop., 238; Hyoscin. (and salts), 617; Hyoscy. (and salts), 617; Æthylmorph. Hydrochlor., 704; Ol. Morr., 755; Quinin. Bisulph., 876; Æthylhydrocuprein. Hydrochlor., 894.

Kraurosis Vulvæ.—Œstrogens, 718 *et seq.*; Stilbæstrol, 726.

Labour, to relieve pains of.—Pot. Brom., 56; Æther (rectal), 150; Methylen. Chlorid., 154; Pentobarbital. Solub., 269; Pentothal, 271; Amytal, 273; Hexobarbiton. Solub., 277; Bromethol, 318; Chlorof., 404; Paraldehyd., 540; Hyoscin. Hydrobrom., 618; Morph., 700; Opium, 766; Papaveret., 769.

Lambliasis.—Acetarsol, 219; Mepacrin. Hydrochlor., 892.

Laryngismus Stridulus.—Amyl. Nitris, 160; Bellad. Fol., 289; Calc. Glucon., 339; Hyoscy., 616; Ipecac., 656; Stramon., 925.

Laryngitis.—Sod. Sulphanil., 6; Tinct. Aconit., 120; Ipecac., 656; Diamorph. Hydrochlor., 706.

Local.—Æthyl. Acet. (inhaled), 8; Tinct. Benz. Co. (inhaled), 30; Æthyl. Iod. (inhaled), 152; Argent. Nit., 204; Cocain., 422; Ephed., 494; Menthol, 695; Pot. Chloras, 863; Sod. Chloras, 922; Thymol, 989.

Leishmaniasis.—Antim. et Pot. Tart., 196; Antim. et Sod. Tart., 197; Colloidal Antimony, 198; Urea Stibamine, 200; Berberin. Sulph., 610; Symmetrical Ureas, 1009.

Leprosy.—Pot. Iod., 50; Colloidal Antimony, 198; Sod. Cacodyl., 216; Ephed., 494; Ol. Hydnocarp., 750; Sod. Hydnocarp., 750; Ol. Hydnocarp. Æth., 751; Ol. Chaulmoog., 752; Sod. Chaulmoog., 753; Æth. Chaulmoog., 753; Milk Injections, 793. See also Vol. II.

Local.—Acid. Trichloracet., 10.

Leucorrhœa.—Copaib., 457; Cubeb., 457; Hydrast., 608.

Local.—Zinc. Sulphanil. 7; "Oxygenated" Water, 39; Acid. Lact., 75; Alum., 171; Chloram., 395; Liq. Chrom. Triox., 409; Glycer., 552; Pessus Ichtham., 622; Œstrogens, 719 *et seq.*; Granat. Fruct. Cort., 789; Phenol, 808; Zinc. Phenol-sulphon., 815; Ext. Pini Canad. Liq., 827; Pessus Quinin. Hydrochlor., 883.

Leukæmia.—Arsen. Trioxid., 211; Sod. Arsen. Anhydros., 214; Benzen., 295; Iron Salts, 521 *et seq.*; Thymus Gland, 849; X-rays, Vol. II.

Lichen.—Vin. Antim., 197; Arsen. Trioxid., 211; Sod. Cacodyl., 216; Bism. Salicyl., 310.

Locomotor Ataxia.—Acetanilid., 3; Calc. Acetylsalicyl., 19; Alumin. Chlorid., 173; Aneurin. Hydrochlor., 190; Tryparsamid., 223; Neosarsphenamin., 229; Sulpharsphenamin., 233; Aur. et Sod. Chlorid., 248; Hexamin., 582; Ovocicithin., 771; Phenazon., 802; Cobra Venom, 1069.

Lumbago.—Acid. Acetylsalicyl. (and salts), 16; Sod. Salicyl., 98; Camph., 343; Cinchophen., 418; Cimicif., 549.

Local.—Emplast. Plumb., 88; Methyl. Salicyl., 100; Lin. Atrop., 241; Bellad. Rad., 291; Capsic., 360; Procain. Hydrochlor., 434; Menthol, 695; Quinin. et Urea. Hydrochlor., 880; Electrotherapy and Ultra-Violet Light, Vol. II. See also **Rheumatism.**

Lupus Erythematosus.—Aur. et Sod. Chlorid., 248; Aur. et Sod. Thio-sulph., 249; Bism. Oxychlor., 310.

Local.—Pig. Acid. Lact. c. Phenol., 76; Carbon Dioxide Snow, 368.

Lupus Vulgaris.—Arsen. Trioxid., 211; Arsen. Triiod., 213; Sod. Cacodyl., 216; Phenylethyl. Hydnocarp., 751; Tuberculin, 1078.

Local.—Acid. Lact., 75; Ung. Acid. Salicyl., 95; Allium, 167; Allyl. Sulphid., 168; Carbon Dioxide Snow, 368; Liq. Chrom. Triox., 409; Chrysarob., 411; Liq. Hydrarg. Nit. Acid., 594; Pyrogall., 868; Liq. Sod. Æthylat., 916; Zinc. Chlorid., 1014; Ultra-Violet Light, Vol. II.

Lymphadenitis.—Pot. Iod., 49; Iod., 644; Iodotann., 650.

Lymphadenoma.—Arsen. Trioxid., 211; Coley's Fluid, 1068; X-rays, Vol. II.

Lymphangitis.—Pot. Iod., 49; Acriflavin, 125; Eufilavin, 127; Ichtham., 622; Iod., 644; Sulphanilamid., 943 *et seq.*; Streptococcus Vaccine, 1068.

Lymphogranuloma Inguinale.—Antim. et Pot. Tart., 195; Stibophen., 198; Sulphapyridin., 961 *et seq.* See also Vol. II.

Malaria.—Adrenal., 135; Mist. Arsen. Quinin. et Ferr., 212; Sod. Cacodyl., 216; Sod. Aminoarsen., 218; Acetarsol., 219; Arsphenamin., 227; Neoarsphenamin., 230; Methylthionin. Chlor., 258; Alston., 414; Spleen Substance, 580; Berberin. Sulph., 610; Phenocoll. Hydrochlor., 802; Quinidin., 870; Cinchonidin., 872; Cinchonin. Dihydrochlor., 873; Quinin. (and salts), 874; Quinet., 887; Totaquin., 888; Pamaquin., 889; Mepacrin. Hydrochlor., 890; Mepacrin. Methanolsulph., 892; Quino-Plasmoquin., 890; Sulphanilamid., 943.

Mammitis.—See **Breasts, Inflammation of.**

Mania.—Pot. Brom., 55; Sod. Brom., 57; Inj. Apomorph., 202; Barbiton. (and other barbiturates), 264 *et seq.*; Cannab., 354; Chloral Hydr., 391; Conium, 454; Paraldehyd., 540; Hyoscyamin. Sulph., 617; Hyoscin. Hydrobrom., 618; Morph., 700; Sulphonal, 973; Methylsulphonal, 974.

Mastitis.—See **Breasts, Inflammation of.**

Mastodynia.—Estrogens, 718 *et seq.*; Androgens, 736.

Mastoiditis.—Tinct. Aconit., 120; Hyd. Subchlor., 603; Sulphanilamid., 943.

Prophylactic.—Antitox. Staphylococcic., 1073.

Measles.—Amidopyrin., 805; Sulphanilamid., 943 *et seq.*; Adult Serum, 1054; Convalescent Serum, 1054; Immune Globulin, 1055; Parental Blood, 1055.

Melancholia, Involutional.—Estrogens, 718 *et seq.*; Stilbæstrol, 726.

Ménière's Disease.—Pot. Chlorid., 63; Salt-free Diet, 65; Ammon. Chlor., 65; Pot. Nitras, 86; Bulbocapnine, 123; Histam. Phosph. Acid., 511. See also **Tinnitus Aurium.**

Meningitis.—Antim. et Pot. Tart., 195; Sulphanilamid., 943; Sulphapyridin., 961 *et seq.*; Sulphathiazol., 971; Serum Antimeningococcic., 1035; Meningococcus Antitoxin, 1036; Meningococcus Toxin, 1037.

Menopause.—Estrogens, 717 *et seq.*; Stilbæstrol, 726; Hexæstrol, 728.

Menorrhagia.—Calc. Chlorid., 61; Adrenal., 134; Amyl. Nitris, 160; Alum. Subacet., 172; Cannab., 354; Ergot., 504; Ergomet., 507; Ergotamin. Tart., 508; Ergotox., 509; Ferr. et Pot. Tart., 525; Glycer., 552; Hydrast., 609; Hydrastin. Hydrochlor., 609; Hydrastinin. Hydrochlor., 610; Berberin. Sulph., 610; Cotarn. Chlorid., 611; Estrogens, 717 *et seq.*; Pregneninolon., 731; Androgens, 736; Extr. Pituit. Liq., 834; Thyroid., 995; Moccasin Venom, 1071; Radium and X-rays, Vol. II.

Metropathia Hæmorrhagica.—Progesterone, 730; Pregneninolon., 731.

Metrorrhagia.—See **Menorrhagia.**

Migraine.—Acetanilid., 3; Cer. Oxal., 44; Calc. Lact., 76; Adrenal., 136; Amyl. Nitris, 160; Aur. Brom., 248; Colloidal Gold, 252; Phenobarbiton., 278; Caffein., 322; Cannab., 354; Butylchloral Hydr., 393; Ergotamin. Tart., 508; Bile Salts, 518; Dehydrocholic Acid, 518; Mag. Sulph., 685; Nitroglycer., 710; Estrogens, 718 *et seq.*; Oxygen., 772; Phenacet., 801; Phenazon., 802; Amidopyrin., 805; Pot. Nitris, 864; Zinc. Oxid., 1015. See also **Headache.**

Milk, Deficient Secretion of.—Ext. Gossypii Cort., 559; Edestine, 559; Lactogenic Hormone, 845.

Milk, Excessive Secretion of.—Atrop., 238; Bellad. Fol., 289; Camph., 343.

Local.—Emp. Bellad. Virid., 289; Glycer. Bellad., 290; Estrogens, 718 *et seq.*; Stilbæstrol, 726; Hexæstrol, 728; Testosterone, 737.

Moles.—See **Nævi.**

Morphine Habit.—Sod. Brom., 57; Colloidal Gold, 252; Amphetamin. Sulph., 501; Codein. Sulph., 698; Hyoscin. Hydrobrom., 698; Strych., 698; Ethylmorph., 699; Pil. Hydrarg., 699; Hydrarg. Subchlor., 699; Pilocarp., 699; Quinin. Hydrochlor., 699; Spartein. Sulph., 699; Ovolecithin, 700; Autosero-therapy, 700.

Mumps.—See **Parotitis.**

Muscular Dystrophy.—Pyridoxin, 194; Vitamin E, 386. See also **Myasthenia Gravis.**

Mustard Gas Burns. *Body.*—Chloramine Ointment, 395; Bleach Cream, 397; Bleach Ointments, 398-9; Zinc. Oxid., 1015.

Eye.—Ol. Morr., 755; Sod. Bicarb. Lotions, 919. See also Vol. II.

Myasthenia Gravis.—Glycine, 10; Pot. Chlorid., 64; Desoxycorticosterone Acetate, 145; Pyridoxin, 194; Guanidin., 390 and 822; Ephed., 494; Physostig., 820; Prostigmin, 821; Prostigmin Bromide, 822.

Mycotic Affections of the Skin.—Acid. Salicyl., 94; Æthyl. Iod., 153; Magenta, 254; Viola Cryst., 255; Virid. Nit., 260; Chrysarob., 411; Dithranol,

412; Phenylmercuric Nitrate, 595; Iodum, 644; Mang. Butyras, 690; Pot. Permang., 692; Sulphur. Sublim., 974; X-rays and Ultra-Violet Light, Vol. II.

Myotonia.—Quinin. Hydrochlor., 883; Quinin. Sulph., 885.

Myxœdema.—Spleen Substance, 580; Thyroid., 994; Thyroxinsod., 997.

Nævi.—Carbon Dioxide Snow, 368; Potass. Hydrox., 864; Inj. Quinin. et Urethan., 881; Liq. Sod. Æthylat., 918; Electrotherapy, Radium and X-rays, Vol. II. *See also* Warts.

Narcoplepsy.—Ephed., 494; Amphetamin. Sulph., 500.

Nephritis.—Pot. Acet., 8; Sod. Acet., 8; Pot. Cit., 40; Calc. Chlorid., 61; Pot. Chlorid., 62; Salt-free Diet, 65; Stront. Lact., 79; Pot. Nitrates, 85; Pot. Tart. Acid., 118; Sod. et Pot. Tart., 119; Kidney Substance, 145; Caffein., 322; Apocyn. 355; Digital., 481; Erithrityl. Tetramit., 514; Mist. Ferr. Acet., 521; Hexamin. Camphor., 584; Jalap., 666; Nitroglycer., 710; Sod. Bicarb., 919; Theobrom. et Sod. Salicyl., 985; Theophyllin. (and salts), 986; Urea, 1006. *See also* Dropsy, Renal.

Nephrosis.—Thyroid., 995.

Neuralgia.—Acetanilid., 3; Methylacetanilid., 4; Acid. Acetylsalicyl. (and salts), 16; Acetylpara-amidosalol., 21; Phenylsemicarbazid., 29; Acid. Hydrobrom. Dil. and Bromides, 57; Sod. Salicyl., 98; Borneol Salicyl., 103; Salicyl. Salicyl., 103; Tinct. Aconit., 120; Aconitin., 122; Aneurin. Hydrochlor., 190; Caffein., 322; Cannab., 354; Chloralformamid., 392; Butylchloral Hydr., 393; Chlorof., 401; Cinchophen., 416; Neocinchophen., 417; Codein., 442; Dilaudid., 444; Conium., 454; Gelsem., 546; Piscid., 560; Hyoscyamin. Sulph., 617; Nitroglycer., 710; Phenacetin., 801; Phenazon., 802; Amidopyrin., 805; Cinchonidin. Sulph., 872; Quinin. (and salts), 873.

Local.—Ext. Æsculus. Liq., 116; Lin. Aconit., 120; Æthyl. Brom., 152; Methyl. Chlorid., 153; Alcohol, 157; Chlorof. Atrop., 240; Bellad. Rad., 291; Capsic., 360; Veratrin., 363; Carbon. Disulphid., 370; Trichlorethylene., 372; Ol. Caryoph., 374; Chloral Camph., 391; Chlorof., 402; Cocain., 421; Guaiacol., 462; Menthol., 694; Ol. Menth. Pip., 744; Lin. Opii., 766; Dec. Papav. et Anthem. Fort., 770. *See also* Headache.

Neuralgia, Trigeminal.—Sod. Brom., 57; Alcohol (injection), 157; Aneurin. Hydrochlor., 191; Trichlorethylene. (inhalation), 372; Procain. Hydrochlor., 435; Gelsem., 547; Cobra Venom, 1069.

Neurasthenia.—Acid. Glycerophosph. (and salts), 45; Hypophosphites, 74; Ext. Suprarenal. Cort., 140; Arsen. Trioxid., 211; Acid. Cacodyl., 215; Aur. Brom., 248; Liq. Aur. et Hydrarg. Brom., 248; Colloidal Gold, 252; Calc. Glucon., 339; Ferrum (and salts), 520; Nux Vom., 712; Androgens, 734; Ovolecithin., 771; Quinin. (and salts), 873; Strych., 930; Yohimb., 935; Thyroid., 994; Valerian., 1011. *See also* Debility.

Neuritis.—Sod. Iod., 51; Sod. Chlorid., 65; Sod. Salicyl., 98; Aneurin. Hydrochlor., 190; Arsen. Triod., 213; Cinchophen., 416; Neocinchophen., 417.

Local.—Acid. Hydrochlor., 58; Canthar., 356; Quinin. et Urea Hydrochlor., 880; Sod. Nitris., 923; Cobra Venom, 1070; Electrotherapy, Vol. II. *See also* Neuralgia.

Neurosyphilis.—Acetarsol., 220; Tryparsamid., 223; Arsphenamin., 227; Arsphenamin. Argent., 228.

Nervous Debility, Nervousness.—*See* Neurasthenia and Debility.

Night Sweats.—Agaric., 33; Acid. Agaric., 34; Atrop., 238; Acid. Camph., 346; Guaiacol. Camph., 463; Guaiacol. Carb., 463; Ext. Pini Canad. Liq., 827; Picrotox., 934; Zinc. Oxid., 1015.

Nipples, Fissured.—Cocain., 422; Benzocain., 429; Hydrast., 609; Ung. Benzoin. et Zinc., 1017.

Nyctalopia.—Vitamin A, 333.

Obesity.—Pot. Chlorid., 64; Fucus, 155; Pituitary Body, 848; Thyroid., 994.

Œdema.—Calc. Chlorid., 61; Pot. Chlorid., 62; Pot. Nitrates, 85; Tinct. Bryon., 122; Ammon. Nitrates, 182; Aneurin. Hydrochlor., 190; Atrop., 238; Caffein., 322; Calc. Glucon., 339; Jalap., 666; Mag. Sulph., 684; Pepton., 792.

Local.—Sod. Sulph., 107; Æthyl. Iod. (inhaled), 152. *See also* Dropsy,

Cardiac, Hepatic and Renal.

Ophthalmia.—*See* Conjunctivitis.

Ophthalmia Neonatorum.—Alumin. Subacet., 172; Argent. Acet., 202; Argent. Nit., 204; Argentoprot., 206; Argent. Protein. Mit., 207; Bism. Oxyiodogall., 309; Hydrarg. Cyanid., 590; Hydrarg. Oxycyanid., 597; Hydrarg. Perchlor., 599; Quinin. Bisulph., 876; Sulphapyridin., 961.

Ophthalmia, Purulent.—Argent. Acet., 202; Argent. Nit., 204; Bism. Oxy-iodogall., 309; Formaldehyd., 536; Quinin. Bisulph., 876.

Orchitis. *Local.*—Methyl. Salicyl., 100; Guaiacol, 462; Iodum, 644; Mag. Sulph., 684.

Oriental Sore.—Antim. et Pot. Tart., 195; Antim. et Sod. Tart., 197; Stibophen., 198; Past. Bism. et Iodof., 314; Cupr. Sulph., 471; Berberin. Sulph., 610; Emet. Hydrochlor., 660; Mag. Sulph., 686; Pot. Permang., 692; Ol. Phosphor., 818; Mepacrin. Hydrochlor., 892.

Osteitis.—Past. Bism. et Iodof., 314; Ext. Parathyroid., 1001.

Osteomalacia.—Vitamin D, 326 *et seq.*; Phosphor., 818.

Osteomyelitis.—Past. Zinc. et Iodof., 642; Ol. Morr., 755; Antitox. Staphylococcic., 1073; Vaccin. Staphylococcic., 1073.

Otitis and Otorrhœa.—Sod. Sulphanil., 6; Acid. Boric., 34; Glycer. Acid. Boric., 35; Acriflavin., 125; Æther, 147; Methylthionin. Chlor., 258; Chlorbutol, 393; Hydrarg. Perchlor., 599; Mercurochrom., 606; Liq. Hydrog. Perox., 612; Insuff. Iod. et Acid. Boric., 647; Mag. Sulph., 686; Creosoted Oil, 783; Phenazon., 803; Phenol, 808; Sulphanilamid., 943; Urea, 1006; Electrotherapy, Vol. II.

Otosclerosis.—Sex Hormones, 733; Thyroxinsod., 997.

Ozena.—Carbachol, 13; Acid. Iodic., 52; Liq. Chrom. Triox., 409; Vap. Creosot., 461; Pig. Glucos., 477; Formaldehyd., 536; Glycerin and Glucose, 553; Liq. Hydrog. Perox., 612; Thymol. Iod., 990.

Paget's Disease.—Ext. Suprarenal. Cort., 140.

Pain, to relieve.—Acetanilid., 3; Methylacetanilid., 4; Acid. Acetylsalicyl. (and salts), 16; Sod. Salicyl., 98; Aconit., 120; Æther., 146; Cannab., 354; Chlorof., 401; Cinchophen., 416; Neocinchophen., 417; Codein., 442; Colch., 445; Colchicin., 447; Ephed., 494; Hyoscyamin. Sulph., 617; Hyoscyin. Hydrobrom., 618; Morph., 700; Diamorph. Hydrochlor., 705; Opium, 766; Papaveret., 769; Phenacet., 801; Phenazon., 802; Amidopyrin., 804.

Local.—Sod. Sulph., 107; Aconit., 120; Alcohol, 157; Atrop., 239; Bellad. Fol., 290; Bellad. Rad., 291; Cocain., 422; Benzamin. Lact., 429; Cobra Venom, 1069; Electrotherapy and Ultra-Violet Light, Vol. II. *See also Anæsthesia, to produce.*

Pannus.—Argent. Iod., 203.

Paralysis Agitans.—Bulbocapnine, 123; Pyridoxin, 194; Trypan Blue, 261; Coniin., 454; Hyoscyamin. Sulph., 617; Hyoscin. Hydrobrom., 618; Parathyroid., 1000; Cobra Venom, 1070. *See also Parkinsonism, Post-Encephalitic.*

Paralysis, General.—Sod. Iod., 51; Tryparsamid., 224; Ovocleithin., 771; Milk Injections, 793; Non-Specific Vaccines, 794; Malaria Therapy, 794; Strych., 930; Sulphur., 975.

Paralysis, Infantile.—*See Poliomyelitis.*

Paratyphoid.—*See Typhoid.*

Parkinsonism, Post-Encephalitic.—Pyridoxin, 194; Atrop., 238; Bellad. Fol., 289; Bellad. Rad., 291; Amphetamin. Sulph., 500; Hyoscy., 616; Hyoscin. Hydrobrom., 618; Nicotin., 867; Stramon., 925.

Parkinson's Disease.—*See Paralysis Agitans.*

Paronychia.—*See Whitlow.*

Parotitis.—Pot. Iod., 49.

Local.—Methyl. Salicyl., 100; Glycer. Bellad., 290; Guaiacol, 462; Ichtham., 622; Ung. Iod. Denig., 650; Phytolacc., 665.

Pediculosis.—Oleat. Hydrarg. c. Morph., 87; Benzen., 295; Paradichlorbenzen., 295; Safrol., 352; Ol. Sassa., 352; Cevadill., 363; Ung. Veratrin., 364; Trichlorethylen., 372; Sod. Tauroglycochol., 517; Quass., 550; Ung. Hydrarg., 588; Ung. Mercur., 589; Ung. Hydrarg. Ammon. Dil., 590; Lot. Hydrarg. Acetic., 600; Lot. Hydrarg. c. Acid. Carbol., 600; Phenol, 808; Staphisag., 868; Quill., 910; Mesulphen., 977.

Pellagra.—Sod. Thiosulph., 110; Acid. Nicotin., 193; Nicotinic Acid Amide, 193; Cerevis. Ferment., 384; Ventricul. Desic., 577. *See also Vol. II.*

Pemphigus.—Acriflavin., 125; Argent. Nit., 205; Sod. Cacodyl., 216; Whole Blood Injections, 795; Sulphapyridin., 967.

Periostitis, Dental.—Fig. Iod. et Aconit., 120; Calx Sulphur., 342; Iodum, 644.

Peritonitis.—Pentose Nucleotide, 389; Glycer., 552; Morph., 701; Opium, 766; Papaveret., 769; Oxygen., 773; Sulphanilamid., 943 *et seq.*; Gas Gangrene Antitoxins, 1049; Vaccin. Staphylococcic., 1073.

Perspiration, Excessive.—Zinc. Oleostear., 89; Alum., 171; Atrop., 238; Betanaph., 297; Pot. Dichrom., 410; Hydrast., 609; Past. Zinc. c. Amylo., 1016.
Perspiration, Fetid. *Local.*—Borax, 37; Zinc. Oleostear., 89; Alum., 171; Lig. Chrom. Triox., 409; Pot. Dichrom., 410; Sulphur., 974. *See also* Bromidrosis.

Pertussis.—*See* Whooping Cough.

Pharyngitis.—*See* Throat, Inflamed, and Tonsillitis.

Phlebitis.—Bellad. Rad., 291; Heparin, 576; Iodum, 644; Gelat. Zinc., 1015.

Phosphaturia.—Ammon. Benz., 29; Nux Vom., 712.

Phthisis.—*See* Tuberculosis.

Pityriasis.—Lot. Chloral. Hydr., 391; Chrysarob., 411; Phenol, 808; Lot. Resorcin. Co., 896.

Pleurisy.—Acid. Acetylsalicyl., 16; Tinct. Aconit., 120; Tinct. Bryon., 122; Caffein. et Sod. Iod., 324; Apocyn., 355; Dilaudid, 444; Morph., 701; Oxygen., 773.

Local.—Atrop. Methylbrom., 242; Liq. Epispast., 357; Guaiacol, 462; Ung. Mercurial., 589; Iodof., 641; Iodum, 644.

Pneumonia.—Acid. Ascorb., 22; Pot. Nitras, 85; Tinct. Aconit., 120; Euffavin., 127; Pholedrine, 138; Alcohol, 157; Ammon. Carb., 179; Vin. Antim., 197; Bellad. Fol., 289; Inj. Camph., 344; Leptazol, 347; Nikethamid., 350; Carbon. Diox., 368; Acid. Nucleic., 388; Creosot., 460; Creosot. Carb., 461; Pot. Guaiacolsulph., 464; Dextros., 475; Digital., 481; Liq. Ferr. Acet., 521; Hydrarg. Perchlor., 599; Hyoscy., 616; Iodum, 645; Potass. Permang., 693; Morph., 701; Oxygen., 772; Ethylhydrocuprein., 894; Stramon., 925; Strych., 930; Sulphapyridin., 960 *et seq.*; Sulphathiazol., 971; Pneumococcus Vaccine, 1056; Anti-pneumococcus Serum, 1058; Felton's Serum, 1060.

Poliomyelitis.—Pot. Chlorid., 63; Zinc. Sulph., 1018; Convalescent Serum and Immune Serum, Vol. II.

Polycythæmia.—Phenylhydrazinæ Hydrochloridum, 6; Acetylphenylhydrazina, 6.

Post-operative Distension.—Acetylcholine, 12; Acetyl- β -methylcholine, 14; Phystostig., 820; Prostigmin, 822.

Pregnancy, Toxæmia of.—Calc. Sulphid., 342; Vitamin E, 386; Dextros., 475; Sod. Bicarb., 919. *See also* Eclampsia and Puerperal Fever.

Pregnancy, Vomiting of.—Ceri Oxalas, 44; Ext. Suprarenal. Cort., 140; Amyl. Nitris, 161; Argent. Nit., 204; Phenobarbiton., 279; Chlorbutol, 393; Cocain., 424; Dextros., 474; Berberin. Sulph., 610; Insulin., 633; Nitroglycer., 710. *See also* Vomiting.

Prickly Heat.—Hydrarg. Perchlor., 599.

Prolapsus Ani.—Myrobal., 117; Alcohol, 158; Phenol, 808.

Prostatic Hypertrophy.—Testosterone Propionate, 738.

Prurigo.—Calc. Chlorid., 60; Lappa, 320.

Local.—Menthol, 694; Ung. Rusc. Co., 854. *See also* Pruritus.

Pruritus.—Calc. Chlorid., 60; Acid. Sulphuros., 109; Sod. Silicas, 178; Bism. Oxid., 309; Cocain., 421; Ung. Benzamin., 428; Histam. Phosph. Acid., 511; Erythrityl. Tetrant., 515; Ung. Hydrarg. Ammon., 590; Ichtham., 621; Whole Blood Injection, 795; Phenol, 808; Ung. Trinitrophen., 1005; Lot. Calamin., 1019; X-rays, Vol. II.

Pruritus Ani.—Lot. Borac., 37; Sod. Salicyl., 98; Argent. Nit., 204; Fuchsin Paint, 254; Naphthalen., 298; Bism. Oxid., 309; Cocain., 421; Inj. Benzocain., 429; Percain., 440; Ung. Conii, 454; Hydrarg. Subchlor., 603; Menthol, 695; Ung. Rusc. Co., 854; Plumb. Acet., 856; Ung. Zinc. Oxid., 1017.

Pruritus Vulvæ.—Lot. Borac., 37; Acid. Hydrochlor. Dil. (intern.), 58; Alcohol (injection), 158; Tinct. Aloes, 169; Argent. Nit., 204; Chlorbutol, 393; Inj. Benzocain., 430; Estrogens, 718 *et seq.*; Stilbæstrol, 726.

Psoriasis.—Calc. Acetylsalicyl., 19; Lac Coactum, 80; Salicin., 102; Vin. Antim., 197; Pil. Asiaticæ, 213; Ferri Arsenas, 214; Sod. Cacodyl., 216; Lappa, 320; Colloidal Manganese, 694; Whole Blood Injections, 795; Sarsa, 900.

Local.—Acid. Acet. Glac., 7; Acetyl-para-amidosalol, 21; Ethyl. Iod. (inhalation), 153; Betanaph., 297; Carbon Dioxide Snow, 369; Chrysarob., 411; Dithranol, 412; Ung. Creosot., 460; Ung. Hydrarg. Nit. Dil., 595; Ichtham., 621; Ol. Chaulmoog., 752; Ol. Oliv., 761; Pix Liq., 851; Pix Carbon., 852; Ol. Cadin., 853; Ung. Rusc. Co., 854; Pyrogall., 868; Resorcin., 895; Sulphur, 974; Thymol, 988; Thymol. Iod., 990; X-rays and Ultra-Violet Light, Vol. II.

Psychoneurosis.—Amphetamin. Sulph., 501; Nux Vom., 713.

Puerperal Fever.—Eufavin., 127; Apomorph. Hydrochlor., 202; Calx Sulphur., 842; Acid. Nucleic., 388; Glycer., 552; Sulphanilamid., 943 *et seq.*; Serum Antistreptococcic., 1068. *See also* Eclampsia and Pregnancy, Toxæmia of.

Purpura.—Vitamin P, 27; Hepar., 571; Moccasin Venom, 1071.

Purpura Hæmorrhagica.—Vitamin P, 27; Moccasin Venom, 1071; Blood Transfusion, 1096.

Pyelitis.—Sod. Benz., 29; Acid. Mandel. (and salts), 82; Buchu, 319; Hexamin., 582; Hexamin. Triboras, 585; Mercurochrom., 605; Hexyl-resorcin, 897; Sod. Bicarb., 919; Sulphanilamid., 954. *See also* Urinary Tract Infections.

Pyloric Stenosis.—Atrop., 239; Atrop. Methyl-nitras, 242; Inj. Thiosinam. et Sod. Salicyl., 917; Thiosinam. et Æthyl. Iod., 918.

Pyorrhœa.—Liq. Calc. Chlorinat. c. Acid. Boric., 398; Cupr. Sulph., 471; Fig. Ipecac. et Arsen., 657; Emet. Hydrochlor., 660; Zinc. Permang., 694; Sod. Ricinoleas, 764; Sulphanilamid., 952.

Pyrexia.—Acetanilid., 3; Acid. Acetylsalicyl. (and salts), 16; Acetyl-paramidosalol, 21; Mag. Benz., 29; Salicin., 102; Sod. Salicyl., 118; Tinct. Aconit., 120; Alcohol, 157; Ammon. Acet., 181; Camphor., 343; Phenacet., 801; Phenocoll. Hydrochlor., 802; Phenazon., 802; Phenazon. Salicyl., 804; Amidopyrin., 805; Quinidin., 871; Quinin., 873.

Pyrosis.—Acid. Hydrocyan. Dil., 71; Alumin. Hydrox., 173; Atrop. Methylbrom., 242; Mag. Perox., 614; Mang. Diox., 691. *See also* Hyperchlorhydria.

Quinsy.—*See* Throat, Inflamed.

Raynaud's Disease.—Acetylcholine, 12; Carbachol, 13; Acetyl- β -methylcholine Chloride, 14; Erythrit. Tetranit., 514; Papaverin. Hydrochlor., 708; Non-specific Vaccines, 794.

Rectum, Prolapse of.—*See* Prolapsus Ani.

Relapsing Fever.—Antim. et Pot. Tart., 195; Sod. Aminarson., 218; Arsphenamin., 227; Neoarsphenamin., 230; Sod. Pot. Bismuthyltart., 305.

Renal Calculi.—*See* Calculi.

Rheumatism.—Acid. Acetylsalicyl. (and salts), 16; Ammon. o-Iodoxybenzoate, 20; Mag. Benz., 29; Phenylsemicarbazide, 29; Acid. Form. (and salts), 42; Ammon. Iod., 48; Lith. Iod., 48; Pot. Staphylococcic., 1072; Vaccin. Staphylococcic., 1073.

Serum Sickness.—Adrenal., 136; Calc. Glucon., 339.

Sexual Desire, to lessen.—Pot. Brom., 55; Camph., 343.

Shingles.—See Herpes Zoster.

Shock.—Inj. Sod. Chlorid. et Acac., 1; Liq. Sod. Chlorid. Physiol., 66; Pholedrine, 138; Ext. Suprarenal. Cort., 140; Corticosterone, 142; Desoxycorticosterone Acetate, 143; Ether, 146; Caffein. et Sod. Benz., 323; Sod. Camphorsulph., 346; Leptazol, 347; Nikethamid., 350; Dextros., 473; Ephed., 494; Morph., 700; Oxygen., 773; Ext. Pituit. Liq., 833; Strychn., 930; Blood Transfusion, 1096. See also Collapse and Fainting.

Smallpox.—Pot. Permang., 692; Phenol, 808; Vaccin. Vaccinæ, 1091.

Snake-bite.—Liq. Ammon. Dil., 181; Pot. Permang., 692; Strychn. Nit., 931; Mistura-Oleo-Balsamica, 989; Serum Antivenenos., 1069.

Spasm.—Benzyl. Benz., 30; Benzyl. Succin., 31; Adrenal., 134; Amyl Nitris, 160; Atrop., 238; Bellad. Fol., 289; Calc. Glucon., 339; Camph., 343.

Chlorbutol, 393; Chlorof., 401; Ephed., 493; Hyoscyamin. Sulph., 617; Hyoscin. Hydrobrom., 618; Morph. (and salts), 700; Papaverin. Sulph., 708.
See also Asthma, Convulsions and Epilepsy.

Spasmophilia.—Vitamin D, 326 *et seq.*

Sprains.—Tinct. Arnica. Flor., 362; Tinct. Arnica. Rad., 363; Tinct. Calend., 363; Procin. Hydrochlor., 434; Hamam., 565; Iodum, 650; Mag. Sulph., 684; Ol. Tereb., 828; Lead Lotions, 856 *et seq.*; Gelat. Zinc., 1015.

Sprue.—Acid. Hydrochlor. Dil., 58; Acid. Lact. Bacilli, 80; Acid. Nicotin., 193; Pulv. Creta. Arom., 338; Ext. Hepat. (intravenous), 570; Pancreatin., 778; Pepsin., 790; Santonin., 903; Parathyroid., 1000.

Sterility.—Vitamin E, 386; Gonadotrophic Factor, 843.

Stings.—*See Bites.*

Stokes-Adams Attacks.—Adrenal., 136; Ephed., 495.

Stomatitis.—Sod. Thiosulph., 110; Acid. Nicotin., 193; Nicotinic Acid Amide, 193; Acetarsol, 219.

Local.—Acid. Boric., 34; Borax, 37; Acid. Sulphuros., 109; Sod. Sulphis, 109; Past. Acid. Tann., 113; Alum., 171; Argent. Nit., 204; Argentoprot., 206; Argent. Protein. Mit., 207; Tinct. Myrrh. et Borac., 237; Viola Cryst., 257; Chrom. Triox., 409; Pig. Ipecac. et Arsen., 657; Pot. Permang., 692; Troch. Phenol., 813; Pot. Chloras, 863; Quinin. Hydrochlor., 883; Sod. Chloras, 922; Trinitrophen., 1004.

Styes.—Argent. Nit., 204; Cupr. Sulph., 471; Sulphanilamid., 953; Stann. Oxid., 1020.

Sunburn.—Ung. Salol. c. Menthol., 103; Ung. Æsculin., 116; Calamin., 1019.
Sycosis.—Acriflavin., 125; Viola Cryst., 257; Virid. Nit., 260; Ung. Hydrarg. Ammon., 590; Ung. Hydrarg. Nit. Fort., 594; Ichtham., 621; Phenol., 808; Resorcin., 895; Resorcin. Monoacet., 896; Vaccin. Staphylococcic., 1073; X-rays, Vol. II.

Synovitis.—Calc. Acetylsalicyl., 19; Oleat. Hydrarg. c. Morph., 87; Capsic., 361; Ung. Hydrarg. Co., 589; Gelat. Zinc., 1015.

Syphilis.—Ammon. Iod., 48; Pot. Iod., 49; Zinc. Iod., 52; Sod. Cacodyl., 216; Sod. Aminarson., 218; Acetarsol, 219; Tryparsamid., 223; Treparsol, 224; Arsphenamin., 227; Arsphenamin. Argent., 228; Neoarsphenamin., 232; Sulpharsphenamin., 234; Mapharside, 235; Bism. Præcip., 299; Bism. et Sod. Tart., 304; Sod. Pot. Bismuthyltart., 305; Sobismminol Mass, 306; Bism. Arsanil., 306; Quinin. Iodobismuth., 307; Sod. Iodobismuth., 307; Thio-bismol, 308; Bism. Salicyl., 310; Bism. Oxychlor., 310; Bism. Subnit., 313; Mercury and its preparations, 587 *et seq.*; Iodof., 640; Iodum, 644; Pil. Quinin. Hydrarg. et Opii, 887; Sarsa, 900.

Local.—Oleat. Hydrarg. c. Morph., 87; Acid. Sulphuros., 109; Æthyl. Iod. (inhalation), 153; Chrom. Triox., 409; Mercury Ointments, 588 *et seq.*; Hydrarg. Cyanid., 590; Hydrarg. Perchlor., 599; Hydrarg. Subchlor., 603; Liq. Hydrog. Perox., 612; Iodof., 640; Pot. Permang., 692; Pyrogall., 869; Resorcin., 895.

Tabes Dorsalis.—*See Locomotor Ataxia.*

Tachycardia.—Acetylcholine, 12; Carbachol, 13; Acetyl- β -methylcholine Chloride, 14; Quinidin. Sulph., 871; Quinin. Dihydrochlor., 878.

Tænia.—*See Worms.*

Tetanus.—Pot. Brom., 55; Amyl. Nitris, 160; Pentobarb. Solub., 271; Sodium Amytal, 273; Hexobarbiton. Solub., 277; Bromethol, 318; Chloral Hydr., 391; Chlorbutol, 394; Paraldehyd., 540; Mag. Sulph., 686; Phenol., 809; Physostig., 820; Curara, 932; Curarine, 933; Antitox. Tetanic., 1075; Toxin. Tetanic. Detoxicat., 1076.

Tetany.—Calc. Chlorid., 61; Vitamin D, 329; Calcium Salts, 329; Dihydrotylchysterol, 331; Parathyroid., 1000.

Throat, Inflamed, and Tonsillitis. *Internal.*—Acid. Acetylsalicyl. (and salts), 16; Sod. Benz., 29; Pot. Iod., 50; Ferr. Salicyl., 96; Sod. Salicyl., 98; Tinct. Aconit., 120; Calx Sulphur., 342; Guaiac. Resin., 452; Hydrarg. Subchlor., 603; Colloidal Manganese, 694; Sod. Phenolsulphon., 814; Quinin. Hydrochlor., 883; Sulphanilamid., 943 *et seq.*; Streptococcus Vaccine, 1068.

Local.—Acid. Trichloracet., 10; Acid. Acetylsalicyl., 16; Sod. Perbor., 39; Acid. Salicyl., 94; Pig. Salol., 102; Acid. Sulphuros., 109; Acid. Tann., 112; Glycer. Acid. Tann., 114; Alcohol, 157; Alum., 171; Argent. Nit., 204; Argentoprot., 206; Argent. Protein. Mit., 207; Tinct. Myrrh. et Borac., 237; Bals. Peruv., 262; Dichloram., 395; Liq. Calc. Chlorinat., 397; Cocain., 422; Guaiac. Res., 452; Vap. Creosot., 461; Guaiacol, 462; Ferr. Perchlor., 529; Formaldehyd.,

536; Hamam., 565; Mucin., 579; Garg. Hydrarg. Perchlor., 599; Liq. Hydrog. Perox., 612; Iodum., 644; Kramer., 668; Kino., 669; Kino Eucalypt., 669; Pig. Menthol. c. Guaiacol., 696; Papain., 780; Phenol., 808; Zinc. Phenolsulph., 815; Pot. Chloras., 863; Garg. Chlor., 863; Pasta Londinensis., 864; Quinin. Disalicylosalicyl., 879; Quinin. et Urea Hydrochlor., 880; Quinin. Hydrochlor., 883; Resorcin., 895; Sod. Chloras., 922; Thymol., 989.

Thrombosis, Coronary.—Nikethamid., 351; Heparin., 575.

Thrush. *Local.*—Acid. Sulphuros., 109; Sod. Metabisulph., 110; Argent. Nit., 205; Viola Cryst., 257. *See also* Stomatitis.

Tic Douloureux.—*See* Neuralgia.

Tinea.—*See* Ringworm.

Tinnitus Aurium.—Pot. Iod., 49; Acid. Hydrobrom. Dil., 52; Ammon. Brom., 53; Nitroglycer., 710; Pilocarp., 823; Inj. Thiosinam. et Sod. Salicyl., 917; Thiosinam. et Ethyl. Iod., 918.

Tonsillitis.—*See* Throat, Inflamed, and Tonsillitis.

Toothache.—Benzyl Alcohol., 30; Acid. Hydrobrom. Dil., 53; Ol. Caryoph., 374; Chlorof., 402; Creosot., 460; Gelsem., 546; Piscid., 560; Menthol., 695; Phenol., 808; Tinct. Pyreth., 866. *See also* Neuralgia.

Tracheitis.—Citrate., 40; Ipecac., 656.

Trachoma.—Antim. et Pot. Tart., 196; Argent. Protein. Mit., 207; Betanaph., 297; Carbon Dioxide Snow., 368; Cupr. Sulph., 471; Formaldehyd., 536; Quinin. Bisulph., 876; Sulphanilamid., 943 *et seq.*; Sulphapyridin., 961 *et seq.*

Travel Sickness.—*See* Sea-Sickness.

Trichinosis.—Arsphenamin. Argent., 229.

Trypanosomiasis.—Antim. et Pot. Tart., 196; Sod. Aminoarson., 218; Tryparsamid., 223; Antrypol., 1009; Suramin., 1009. *See also* Vol. II.

Tuberculosis.—Choline Chloride., 11; Sod. Cinnam., 32; Ethyl. Cinnam., 32; Inj. Sod. o-Coumarat., 32; Acid. Malic., 119; Cholesterol., 130; Allium., 167; Allyl. Sulphid., 168; Sod. Silicas., 178; Colloidal Antimony., 198; Arsen. Trioxid., 211; Sod. Cacodyl., 216; Aur. et Sod. Thiosulph., 249; Cannab., 354; Ol. Caryoph., 374; Acid. Nucleic., 388; Creosot., 460; Creosot. Carb., 461; Guaiacol., 462; Guaiacol. Carb., 463; Pot. Guaiacolsulph., 464; Guaiacol. Benz., 463; Formaldehyd., 536; Spleen Substance., 580; Hexamin. Triboras., 585; Insulin., 633; Iodof., 640; Iodum., 645; Eriodict., 664; Diamorph. Hydrochlor., 705; Ol. Morr., 754; Mutton Bird Oil., 761; Ovolecithin., 771; Oxygen., 773; Artificial Pneumothorax., 774; Medull. Rub., 800; Terpin. Hydr., 831; Sulphapyridin., 967; Anti-Catarrhal Vaccines., 1032; Tuberculin., 1078; B.C.G., 1083.

Tuberculosis, Laryngeal. *Local.*—Acid. Trichloracet., 10; Acid. Lact., 75; Argent. Nit., 204; Benzocain., 429; Formaldehyd., 536; Liq. Hydrog. Perox., 612; Iodof., 640; Menthol., 695; Ol. Chaulmoog., 753; Ol. Morr., 755; Quinin. et Urea Hydrochlor., 880.

Tympanites.—Physostig. Sulph., 821; Ol. Terebinth., 828.

Typhoid Fever.—Acid. Iodic., 52; Sod. Salicyl., 98; Acid. Sulphuros., 109; Ext. Suprarenal Cort., 141; Alcohol (local), 157; Argent. Nit., 204; Betanaph., 296; Bism. Salicyl., 310; Guaiacol. Carb., 463; Spleen Substance., 580; Hexamin., 583; Hyd. Subchlor., 602; Mag. Perox., 614; Tribromophenol., 816; Ol. Terebinth., 828; Mist. Chlor. c. Quinin., 886; Sulphanilamid., 943 *et seq.*; Sulphapyridin., 961 *et seq.*; Bacteriophage., 1026; Vaccin. Typho-Paratyphos., 1087; Oral Typhoid Vaccine., 1088; Anti-Typhoid Serum., 1089.

Ulcers.—Acetylcholine., 12; Acetarsol., 219; Pastil. Phenol., 812; Thyroid., 995; Streptococcus Vaccine., 1068; Vaccin. Staphylococcic., 1073.

Local.—Benzoyl. Perox., 31; Calc. Iod., 48; Acid. Iodic., 52; Sod. Iodas., 52; Ung. Cupr. Oleas., 87; Sod. Persulph., 108; Sevum., 131; Alum., 171; Alum. Exsic., 172; Alumin. Sulph., 174; Argent. Nit., 204; Viola Cryst., 255; Virid. Nit., 260; Rub. Scarlet., 260; Bism. Benz., 300; Bism. Naphthol., 309; Bism. Oxyiodogall., 309; Carbo., 366; Eusol., 398; Liq. Sod. Chlorinat., 399; Liq. Chrom. Triox., 409; Cupr. Sulph., 471; Formaldehyd., 536; Symphyt., 558; Allant., 558; Hydrarg. Subchlor., 603; Hydrast., 609; Liq. Hydrog. Perox., 612; Zinc. Perox., 615; Ichtham., 621; Insulin., 632; Iodof., 640; Past. Zinc. et Iodof., 641; Mag. Sulph., 686; Pot. Permang., 692; Ol. Morr., 754; Papain., 780; Ung. Phenol., 813; Sulphanilamid., 954 *et seq.*; Zinc. Chlorid., 1014; Past. Carb. et Zinc., 1016; Ung. Benzoin. et Zinc., 1017; Lot. Rub., 1018; Electrotherapy and Ultra-Violet Light, Vol. II.

Ulcers, Gastric and Duodenal.—Acid. Ascorb., 22; Calc. Phosph., 91; Alumin. Hydrox., 173; Kaolin., 175; Mag. Silicas., 177; Argent. Nit., 204; Atrop.,

238; Bism. Carb., 300; Pulv. Bism. Co., 301; Bism. Subnit., 313; Calc. Carb., 337; Pot. Dichrom., 410; Benzocain., 429; Codein., 442; Histidine Hydrochlor., 513; Sympbyt., 558; Allant., 558; Mucin., 579; Emet. Hydrochlor., 662; Mag. Carb. Lev. *vel* Pond., 681; Calc. Permang., 693; Ol. Menth. Pip., 745; Ol. Morr., 755; Ol. Oliv., 761; Peptonised Milk, 778; Pepsin., 790; Pituitary (Posterior Lobe), 849; Serum Normal., 1028.

Ulcers, Rodent.—Acid. Trichloracet., 10; Carbon Dioxide Snow, 368; Liq. Chrom. Triox., 409; Calc. Permang., 693; Resorcin., 895; Radium, X-rays and Electrotherapy, Vol. II.

Ulcer, Tropical.—*See* **Oriental Sore.**

Ulcers, Tuberculous.—Allium, 167; Allyl. Sulphid., 168; Liq. Hydrog. Perox., 612; Iodof., 640; Iodum, 645; Zinc. Chlorid., 1014.

Ulcers, Varicose.—Acetyl- β -methylcholine Chloride, 14; Sod. Salicyl., 99; Aneurin. Hydrochlor., 191.

Local.—Elastic Adhesive Bandages, 358; Insulin., 634; Iodum, 645; Ol. Morr., 754; Sod. Ricinoleas, 764; Gelat. Zinc., 1015; Ultra-Violet Light, Vol. II.

Undulant Fever.—Stibophen., 198; Sulphanilamid., 943 *et seq.* *See also* Vol. II.

Uræmia.—Sod. Acet., 9; Liq. Sod. Chlorid. Physiol., 66; Apocyn., 355; Colchicin., 447; Dextros., 475; Jalap., 666; Mag. Sulph., 686; Papaverin. Sulph., 708; Pilocarp., 823. *See also* **Nephritis.**

Urethritis.—Uva Ursi, 321; Cannab., 354; Sulphapyridin., 961 *et seq.*; Vaccin. Gonococcic., 1051.

Local.—Argent. Nit., 204; Argentoprot., 206; Argent. Prot. Mit., 207; Benzocain., 429; Cupr. Sulph., 471; Zinc. Permang., 694. *See also* **Gonorrhœa.**

Urinary Tract Infections.—Ammon. Chlor., 59; Sod. Lact., 78; Acid. Mandel. (and salts), 82; Ammon. Phosph., 91; Sod. Phosph. Acid., 93; Pot. Tart. Acid., 118; Acriflavin., 125; Euflavin., 127; Proflavin., 128; Ammon. Nitras., 182; Argent. Nit., 204; Argentoprot., 206; Argent. Prot. Mit., 207; Methylthionin. Chlor., 258; Phenothiazine, 259; Buchu, 319; Agropy., 320; Uva Ursi, 321; Copab., 457; Cubeb., 457; Ol. Santal., 458; Sabal., 459; Hexamin., 582; Mercurochrom., 605; Hydrast., 609; Hexyl-resorcin., 897; Sod. Bicarb., 919; Sulphanilamid., 943 *et seq.*; Sulphathiazol., 970; Sulphamethylthiazol., 971; Colon Bacillus Vaccine, 1038. *See also* **Cystitis, Pyelitis and Gonorrhœa.**

Urine, Retention.—Carbachol, 13; Acetyl- β -methylcholine Chloride, 14; Spart. Sulph., 456; Hexamin., 582; Mercurochrom., 606; Prostigmin., 821; Pilocarp., 824.

Urticaria.—Calc. Chlorid., 60; Calc. Lact., 76; Calc. et Sod. Lact., 76; Adrenalin., 134; Calc. Glucon., 339; Pepton., 792; Whole Blood Injections, 795.

Local.—Acid. Benz., 28; Tinct. Benzoin. Simp., 30; Adrenal., 134; Amyl. Nitris., 161; Cocain., 421; Histam. Phosph. Acid., 511; Menthol, 694; Pot. Carb., 862; Sod. Bicarb., 919.

Vaginitis.—Hypertonic Saline, 68; Argent. Picras., 206; Argent. Protein. Mit., 208; Chloram., 395; Cupr. Sulph., 471; Oestrogens, 718 *et seq.*; Stilbœstrol, 726; Sulphanilamid., 954; Sulphapyridin., 961.

Varicose Veins.—Hypertonic Saline, 67; Lith. Salicyl., 96; Sod. Salicyl., 99; Dextros., 473; Invert Sugar, 479; Glycer., 553; Iodum, 645; Sod. Morr., 758; Sod. Ricinoleas, 764; Phenol, 809; Iq. Quinin. et Urethan., 881; Quinin. Lact., 884; Monoethanolam. Oleas, 910.

Variola.—*See* **Smallpox.**

Vertigo.—Acid. Hydrobrom. Dil., 53; Bulbocapnine, 123; Camph. Monobrom., 346. *See also* **Ménière's Disease and Tinnitus Aurium.**

Vincent's Angina.—Sod. Perbor., 39; Acid. Nicotin., 493; Liq. Arsen., 211; Acetarsol, 219; Arsphenamin., 227; Neoarsphenamin., 230; Collut. Arsen., 656; Fig. Ipecac. et Arsen., 657; Sod. Ricinoleas, 764; Zinc. Oxid., 1015. *See also* **Stomatitis.**

Vomiting.—Cer. Oxal., 44; Stront. Brom., 57; Liq. Sod. Chlorid. Physiol., 66; Acid. Hydrocyan. Dil., 71; Chlorbutol, 393; Coca, 420; Mag. Perox., 614; Menthol, 694; Morph., 701; Papaverin. Sulph., 708; Pepton., 792; Phenazon., 802; Phenol, 809; Sod. Bicarb., 919. *See also* **Sea-Sickness.**

Vomiting of Pregnancy.—*See* **Pregnancy, Vomiting of.**

Warts, Corns and Small Nævi.—Acid. Acet. Glac., 7; Acid. Trichloracet., 10; Acid. Monochloracet., 10; Acid. Nit., 85; Ung. Cupr. Oleas, 87; Acid. Salicyl., 94; Emp. Salicyl., 95; Alum., 171; Argent. Nit., 204; Carbon Dioxide Snow, 368.

Liq. Chrom. Triox., 409; Pot. Dichrom., 410; Formaldehyd., 536; Paraform., 538; Glycer. Papain., 780; Pot. Hydrox., 864; Resorcin., 895; Liq. Sod. Æthylat., 918; Electrotherapy and X-rays, Vol. II.

Warts, Venereal.—Acid. Trichloracet., 10; Liq. Hydrarg. Nit. Acid., 594.

Whitlow.—Sod. Perbor., 39; Viola Cryst., 257; Bism. Oxyiodogall., 309; Iodum, 645; Uln. Fulv., 678; Sulphanilamid., 953.

Whooping Cough.—Acid. Ascorb., 22; Benzyl. Benz., 30; Æther, 146; Æthyl. Iod., 152; Amyl. Nitris, 160; Allium, 167; Apomorph. Hydrochlor., 202; Atrop., 238; Aur. Brom., 248; Phenobarbiton. Solub., 279; Bellad. Fol., 289; Bromof., 315; Caffein. Valerian., 325; Camph., 343; Camph. Monobrom., 346; Cannab., 354; Carbon. Diox., 368; Chlorbutol, 393; Ol. INDEX

As far as possible the names of substances and preparations are given in Latin. Acids are indexed under "Acid(um)." Salts are included under the Latin name of the base, and effervescent preparations under the word "Effervescent."
